

Compatibility Matrix for AssetCenter 4.3.1

Notes:

Database engines are client-server applications. What we call '*database server*' here is the computer where the server part of the database engine is installed, especially the databases. What we call '*client*' here is any of the computers where the client part of the database engine is installed. AssetCenter, AssetCenter Server and all the other programs provided with AssetCenter, rely on the database engine layer on the client computer to access data from the databases on the server, so no part of AssetCenter needs to be installed on the server.

The Unix packages (for Linux, Solaris or AIX) contain only command line tools. The programs are available with a graphical interface only with MS-Windows.

NWLINK is another name for IPX/SPX. We just mention here IPX/SPX.

NetBEUI is another name for Netbios. We just mention here Netbios.

AssetCenter Web is based on top of OAA 4.1.1.1. For more information about OAA, please refer to the corresponding documentation.
