Support

Visit the HP Software Support Online web site at:

<http://www.hp.com/go/hpssoftwaresupport>

This web site provides contact information and details about the products, services, and support that HP Software offers.

HP Software online support provides customer self-solve capabilities. It provides a fast and efficient way to access interactive technical support tools needed to manage your business. As a valued support customer, you can benefit by using the support web site to:

- Search for knowledge documents of interest
- Submit and track support cases and enhancement requests
- Download software patches
- Manage support contracts
- Look up HP support contacts
- Review information about available services
- Enter into discussions with other software customers
- Research and register for software training

Most of the support areas require that you register as an HP Passport user and sign in. Many also require a support contract. To register for an HP Passport ID, go to:

<http://h20229.www2.hp.com/passport-registration.html>

To find more information about access levels, go to:

http://h20230.www2.hp.com/new_access_levels.jsp

Documentation Updates

The title page of this document contains the following identifying information:

- Software Version number, which indicates the software version.
- Document Release Date, which changes each time the document is updated.
- Software Release Date, which indicates the release date of this version of the software.

To check for recent updates or to verify that you are using the most recent edition of a document:

<http://h20230.www2.hp.com/selfsolve/manuals>

This site requires that you register for an HP Passport and sign in. To register for an HP Passport ID, go to:

<http://h20229.www2.hp.com/passport-registration.html>

Or click the **New users - please register** link on the HP Passport login page.

You will also receive updated or new editions if you subscribe to the appropriate product support service. Contact your HP sales representative for details.

Welcome to Middleware Patching

This document describes the WebSphere 8 workflows in the HP DMA Application Server Patching solution pack. You can use the workflows in this solution pack to automate the patching of one or more WebSphere 8 application servers.

Audience

This solution is designed for IT architects and engineers who are responsible for planning, implementing, and maintaining application-serving environments that use IBM WebSphere Application Server Network Deployment version 8 (WebSphere 8).

To use this solution, you should be familiar with WebSphere 8 and its requirements (see the [WebSphere 8 Product Documentation](#) on page 10).

Document Map

The following table shows you how to navigate this guide:

Topic	Description
The WebSphere 8 Patching Solution	General information about this solution, including what it contains and what it does
WebSphere 8 Patching Quick Start	A step-by-step tutorial that shows you how to run HP DMA workflows, using the Patch WebSphere 8 StandAlone Profile workflow as an example.
Workflow Details	Information about each of the two workflows included in this solution, including: prerequisites, how it works, how to run it, sample scenarios, and a list of input parameters
Tips and Best Practices	Simple procedures that you can use to accomplish a variety of common HP DMA tasks
Troubleshooting	Tips for solving common problems

Important Terms

Here are a few basic HP DMA terms that you will need to know:

- In HP DMA, a **workflow** executes a process —such as installing a software product or checking a database instance for compliance with a specific security benchmark.
- A workflow consist of a sequence of **steps**. Each step performs a very specific task. Steps can be shared among workflows.
- Steps can have input and output **parameters**, whose values will be unique to your environment.

If you provide correct values for the input parameters that each scenario requires, the workflow will be able to accomplish its objective. Output parameters from one step often serve as input parameters to another step.

- A **solution pack** contains a collection of related workflows and the steps, functions, and policies that implement each workflow.

More precisely, solution packs contain **workflow templates**. These are read-only versions of the workflows that cannot be deployed. To run a workflow included in a solution pack, you must first create a deployable copy of the workflow template and then customize that copy for your environment.

- The umbrella term **automation items** is used to refer to those items to which role-based permissions can be assigned. Automation items include workflows, deployments, steps, and policies.

Organizations also have role-based permissions. Servers, instances, and databases inherit their role-based permissions from the organization in which the server resides.

- The **software repository** contains any files that a workflow might need to carry out its purpose (for example, software binaries or patch archives). If the files that a workflow requires are not in the software repository, they must be stored locally on each target server.

When you are using HP DMA with HP Server Automation (HP SA), the software repository is the HP SA Software Library.

- An **organization** is a logical grouping of servers. You can use organizations to separate development, staging, and production resources—or to separate logical business units. Because user security for running workflows is defined at the organization level, organizations should be composed with user security in mind.

Additional terms are defined in the [Glossary](#) on page 59.

Chapter 1

The WebSphere 8 Patching Solution

The HP Database and Middleware Automation WebSphere 8 patching solution automates the process of applying fixes and updates to one or more WebSphere 8 application servers.

This solution contains the following workflows:

- Patch WebSphere 8 Standalone Profile
- Patch WebSphere 8 Network Deployment Cell

The WebSphere 8 patching workflows perform extensive validation checks prior to performing their intended function. All parameter values are validated to ensure that they do not contain any prohibited characters. Additional validation checks are performed at the operating system level. These include file system space checks and RPM checks (on Red Hat Linux platforms). The workflows determine whether the pertinent files exist on the target machine; if they do not, the files are downloaded from the HP DMA server.

Although minimal HP DMA Application Server Patching Solution Pack knowledge is required to run this workflow using its default settings, the workflow is highly customizable and can support complex environment-specific deployment scenarios.

The remaining topics in this chapter provide the following contextual information about these workflows:

- [Supported Products and Platforms](#) on next page
- [Prerequisites](#) on next page
- [WebSphere 8 Product Documentation](#) on next page
- [Additional Resources](#) on page 11

Supported Products and Platforms

Operating Systems

WebSphere 8 patching workflows are supported on AIX, Solaris, Red Hat Enterprise Linux, and Windows platforms.

For specific target operating system versions supported by each workflow, see the *HP Database and Middleware Automation Support Matrix* available on the HP Software Product Manuals web site:

<http://h20230.www2.hp.com/selfsolve/manuals>

Hardware Requirements

For HP DMA server hardware requirements, see the *HP DMA Installation Guide* and the *HP DMA Release Notes* (version 10.00 or later).

Software Requirements

This solution requires HP DMA version 10.00 (or later).

Prerequisites

The following prerequisites must be satisfied before you can run the WebSphere 8 patching workflows in this solution pack.

1. You have installed the HP DMA Application Server Patching Solution Pack.
2. You have an HP Software support contract
3. IBM Installation Manager software exists on each target machine.

WebSphere 8 Product Documentation

For the current list of hardware requirements, software requirements, and supported platforms for WebSphere 8, see:

<http://www.ibm.com/software/webservers/appserv/doc/latest/prereq.html>

For WebSphere 8 product documentation, see:

<http://pic.dhe.ibm.com/infocenter/wasinfo/v8r0/index.jsp>

For IBM Red Book resources for WebSphere 8, see:

<http://publib-b.boulder.ibm.com/Redbooks.nsf/portals/WebSphere>

Note: The links to the documents listed here were correct as of the publication of this guide.

Additional Resources

For information about using the HP DMA web interface, see the *HP DMA User Guide* and the *HP DMA Administrator Guide* (version 10.00 or later).

These documents are part of the HP DMA documentation library, which is available on the HP Software Product Manuals web site:

<http://h20230.www2.hp.com/selfsolve/manuals>

Chapter 2

WebSphere 8 Patching Quick Start

This tutorial shows you how to install the HP DMA Application Server Patching solution pack and run a workflow. There are five basic steps:

1. [Import the Solution Pack](#)
2. [Create a Deployable Workflow](#)
3. [Create a Deployment](#)
4. [Run Your Workflow](#)
5. [View the Results](#)

Note: This tutorial uses the [Patch WebSphere 8 StandAlone Profile](#) workflow. You would follow the same steps to run the [Patch WebSphere 8 Network Deployment Cell](#) workflow.

In this tutorial, default values will be used for most input parameters. Before executing these steps, make sure that these default values are suitable for your environment.

The information presented in this tutorial assumes the following:

- HP DMA is installed and operational.
- At least one valid target is available.

Note: This tutorial uses a very simple scenario to help you get started quickly. For detailed information about how the application server patching workflows work and how you can customize them for your environment, see the [Workflow Details](#).

Import the Solution Pack

The following instructions assume that you have purchased a license for the HP DMA solution pack that you want to import.

The HP DMA 10.00 solution packs are included on the HP DMA 10.00 installation media. They are located in the following folders:

- The `DMA_10.0_Server_and_Client` folder contains the Discovery solution pack.
- The `DMA_10.0_Database_Solution_Packs` folder contains all of the database solution packs (provisioning, advanced provisioning, patching, advanced patching, compliance, refresh, and release management).
- The `DMA_10.0_Middleware_Solution_Packs` folder contains all of the application server solution packs (provisioning, patching, and release management).

Note: The Discovery solution pack is not automatically installed in HP HP DMA version 10.00 (and later). You must import it if you want to use the discovery workflows.

Always check to see if there are more recent versions of the HP DMA solution packs available online. Due to frequent releases, it is likely that the solution packs provided on the installation media have since been updated.

To get the most recent version of a solution pack:

1. Go to the following web site: [HP Software Support Online](#)
2. Go to the Self-Solve tab, and sign in using your HP Passport credentials (see [Support](#) on page 3 for more information).
3. On the Advanced Search page, specify the following search criteria:

Product:	Database and Middleware Automation Solution Packs
Version:	All Versions
Operating System:	All Operating Systems
Document Type:	Patches

4. Click **Search**.
5. If there is a more recent version of the solution pack that you want to import, do the following:
 - a. Click the link for the solution pack that you want to import (for example: discovery 10.0x).
 - b. Click the **DOWNLOAD PATCH** link, and download the ZIP file that contains the patch.
 - c. From the patch ZIP file, extract the ZIP file that contains the solution pack.

Note: This ZIP file may be included in a larger ZIP file that contains multiple solution packs.

To import the solution pack:

1. On the system where you downloaded the solution pack, open a web browser, and go to the following address:
`https://<HP_DMAserver>:8443/dma/login`
2. Log in to the HP DMA server using an account with Administrator capability.
3. On the Solutions > Installed tab, click the **Browse** button in the lower right corner. The Choose File dialog opens.

Note: This button and the dialog that subsequently opens may have different names depending on the browser that you are using.

4. Locate and select the solution pack ZIP file that you extracted earlier, and click **Open**.
5. Click **Import solution pack**.

To view basic information about the solution pack, hover your mouse over its name in the left pane:

The screenshot shows the HP Database & Middleware Automation web interface. The top navigation bar includes 'Home', 'Automation', 'Reports', 'Environment', 'Solutions', and 'Setup'. Below this, there are tabs for 'Installed' and 'History'. The main content area is titled 'Installed Solutions' and features a green notification banner stating 'Successfully imported HP DMA Application Server Patching Solution Pack'. Below the banner, there are two panes: 'SOLUTION PACKS' and 'DETAILS'. The 'SOLUTION PACKS' pane lists several solution packs, with 'HP DMA Application Server Patching Solution Pack' (Version 10.0) highlighted in blue. The 'DETAILS' pane provides information for the selected pack: Name: HP DMA Application Server Patching Solution Pack, Version: 10.0, Targets: 23, Installed: 26 Nov, 2012, and Description: Patching workflows for WebSphere WebLogic Build 31995.

To view detailed information about the solution pack, click its name in the left pane. To view a list of the workflows that the solution pack contains, go to the Workflows tab.

The screenshot shows the HP Database & Middleware Automation console interface. At the top, there is a navigation bar with the HP logo, the text "Database & Middleware Automation", and user information: "Server: dma1.mycompany.com", "User: admin", and a "Logout" link. Below this is a secondary navigation bar with tabs for "Home", "Automation", "Reports", "Environment", "Solutions", and "Setup". Under "Solutions", there are sub-tabs for "Installed" and "History".

The main content area displays the "HP Server Automation Application Server Patching Solution Pack" with "Version 9.15". Below the title are tabs for "General", "Policies", "Workflows", "Steps", and "Reports". The "Workflows" tab is active, showing a list of workflow steps in a numbered sequence:

- WebSphere 8 StandAlone Patching Parameter Validation
- WebSphere 8 Check File Download
- Failure
- Download Software
- WebSphere 8 Backup Config
- Failure
- WebSphere 8 Stop Application Server
- Verify All Java Processes Stopped
- WebSphere 8 Patching Extract Archive
- Verify Install Manager Exists
- WebSphere 8 Apply Patches
- WebSphere 8 Start Server

At the bottom of the console, there is a red "X" icon followed by the text "DELETE".

Create a Deployable Workflow

The workflow templates provided by HP in your solution pack are read-only and cannot be deployed. When you are viewing a read-only item in the HP DMA web UI, you will see the lock icon in the lower right corner:

Read-only workflows are not deployable. You can create a deployable workflow by making a copy of a workflow template.¹

To create a deployable copy of the workflow template:

1. In the HP DMA web interface, go to Automation > Workflows.
2. From the list of workflows, select the workflow template that you want to use (for example, Patch WebSphere 8 Standalone Profile).
3. Click the **Copy** button in the lower left corner.
4. On the Documentation tab, specify the following:
 - Name – Name that will appear in the list of available workflows
 - Tags – Keywords that you can use later to search for this workflow (optional)
 - Type – Either OS or the specific type of database (the correct type will be selected as a result of the copy)
 - Target level – Server, Instance, or Database (the correct target level will be selected as a result of the copy)
5. On the Roles tab, grant Read access to at least one user or group and Write access to at least one user or group.
6. Click **Save**.

Your new workflow now appears in the list of available workflows, and the following message is displayed:

✓ Workflow saved successfully. Would you like to [deploy the workflow now?](#)

7. Click the **deploy the workflow now** link in the green message bar.

¹For more information about creating and working with workflows, see “Workflows” in the *HP DMA User Guide*. This document is available on the HP Software Product Manuals web site: <http://h20230.www2.hp.com/selfsolve/manuals>

Create a Deployment

Before you can run your new workflow, you must create a deployment. A deployment associates a workflow with one or more specific targets (servers, instances, or databases).

To create a deployment:

1. If you do not see the green message bar—for example, if you navigated to another page after you created your copy of the workflow template—follow these steps:
 - a. Go to the Automation > Deployments page.
 - b. In the lower right corner, click **New deployment**.
2. Specify the following:
 - Name – Name that will appear in the list of available deployments.
 - Workflow – From the drop-down list, select the deployable workflow (the copy) that you just created.
 - Schedule – Frequency or date when the workflow will run. Select None so that the workflow will run once when you explicitly tell it to run.

3. From the list of AVAILABLE targets on the left side of the Targets area, click the **ADD** link for the server where the workflow will run.

hp Database & Middleware Automation Server: dma1.mycompany.com User: admin Logout

4. On the Parameters tab, specify values for the following input parameters:

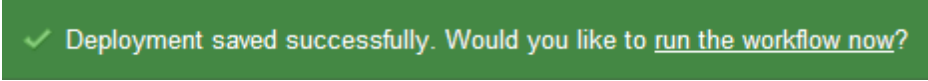

The screenshot shows the 'Parameters' tab of the 'Deploy Patch WebSphere 8 Standalone Profile' configuration page. The page title is 'WebSphere 8 Standalone Patching Parameter Validation'. The form contains the following parameters:

- Config Backup File:** /opt/IBM/WebSphere/backup/backup.zip (Text field). Required: Fully qualified file path to where the WebSphere BackupConfig utility will write the backup file. For example /opt/IBM/WebSphere/newbackup/backup.zip.
- Install Manager Location:** /opt/IBM/InstallManager (Text field). Required: Fully qualified file path to where the WebSphere Install Manager is located.
- Trust SSL Certificates:** True (Text field). Optional: If "True", this step will trust any SSL used to connect to the DMA Web Service.
- WAS Admin Password:** [Redacted] (Text field). Optional: If global security is enabled, this is the password for a user that is apart of a group that can change state of a given application server.
- WAS Admin User:** wasadmin (Text field). Optional: If global security is enabled, this is the user account for a user that is apart of a group that can change state of a given application server.
- Web Service Password:** Discovery.Web Service Password (Policy Attribute dropdown). Required: Password for the discovery web service API.
- Web Service URL:** Discovery.Web Service URL (Policy Attribute dropdown). Required: URL for the discovery web service API.
- Web Service User:** Discovery.Web Service User (Policy Attribute dropdown). Required: User capable of modifying the managed environment through the discovery web service API.
- WebSphere Patch Extract Location:** /opt/IBM/WebSphere/patches (Text field). Required: Fully qualified directory path to where the WebSphere patches will be uncompressed into. For example /opt/IBM/WebSphere/patches
- WebSphere Patch File List:** /opt/IBM/WebSphere/patches/8.0.0-WS-WAS-FP00000 (Text field). Required: Fully qualified path to the compressed WebSphere cumulative patch files on the target machine. For example /usr/IBM/WebSphere/patches/8.0.0-WS-WAS-FP0000003-part1.zip,/usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part2.zip
- WebSphere Server Name:** server1 (Text field). Required: Name of the application server that will be stopped before the patching process proceeds and started back up once the patching completes. For example AppServer1.

Note: These are a subset of the required parameters for this workflow. Parameters that are not visible in the deployment will have default values. See [Parameters for Patch WebSphere 8 StandAlone Profile](#) for descriptions of all available input parameters for this workflow, including default values.

5. Click **Save**.

Your new deployment now appears in the list of available workflows, and the following message is displayed:

✓ Deployment saved successfully. Would you like to [run the workflow now?](#)

6. Click the **run the workflow now** link in the green message bar.

Run Your Workflow

Now you are ready to run your workflow against the target that you selected.

To run the workflow:

1. If you do not see the green message bar—for example, if you navigated to another page after you created your deployment—follow these steps: show
 - a. Go to the Automation > Run area.
 - b. In the list of WORKFLOWS on the left side, select the workflow that you created.
 - c. In the list of DEPLOYMENTS in the center, select the deployment that you just created.

2. Select the target selector check box for the server where you want to run the workflow.

The screenshot shows the 'Run Workflow' interface in the Database & Middleware Automation console. The workflow 'Copy of Patch WebSphere 8 StandAlone Profile' is selected, and the target server 'WebSphere8.mycompany.com' is chosen. The 'WebSphere 8 StandAlone Patching Parameter Validation' dialog is open, showing various configuration parameters.

Workflow name: Copy of Patch WebSphere 8 StandAlone Profile

Deployment name: Deploy Patch WebSphere 8 Standalone Profile

Server: WebSphere8.mycompany.com

Target selector: [checked]

Parameters:

- Config Backup File: /opt/IBM/WebSphere/bac
- Install Manager Location: /opt/IBM/InstallManager
- Trust SSL Certificates: True
- WAS Admin Password:
- WAS Admin User:
- Web Service Password: Discovery.Web Service
- Web Service URL: Discovery.Web Service
- Web Service User: Discovery.Web Service
- WebSphere Patch Extract Location: /opt/IBM/WebSphere/pa
- WebSphere Patch File List: /opt/IBM/WebSphere/pa
- WebSphere Server Name: server1

Buttons: Select targets, Run workflow

3. Click the **Run workflow** button.
4. The following message is displayed:

✓ Workflow started successfully. For status, see the [console](#) or [history](#).

5. To view the progress of your deployment, click the **console** link in the green message bar.

View the Results

While your workflow is running, you can watch its progress on the Automation > Console page.

The screenshot shows the 'Automation > Console' page. The top navigation bar includes 'Home', 'Automation', 'Reports', 'Environment', 'Solutions', and 'Setup'. Below this is a sub-navigation bar with 'Workflows', 'Steps', 'Functions', 'Policies', 'Deployments', 'Run', 'Console', and 'History'. The 'Console' section has a 'Filter' input field and a table with the following data:

	Workflow	Started	Run by	Server	Instance	Database
RUNNING	Copy of Patch WebSphere 8 StandAlone Profile	21 Aug 17:58	admin	dma1.mycompany.com		

To view the progress of the workflow as the deployment proceeds, click the workflow name in the upper box on the Console page.

To view the outcome of a specific step, select that step in the left box in the Output area. Informational messages are displayed in the right box, and the values of any output parameters are listed.

This screenshot shows the 'Automation > Console' page with the workflow 'Copy of Patch WebSphere 8 StandAlone Profile' selected. The table in the Console section is as follows:

	Workflow	Started	Run by	Server	Instance	Database
RUNNING	Copy of Patch WebSphere 8 StandAlone Profile	21 Aug 18:25	admin	dma1.mycompany.com		

Below the table is the 'Output' section. On the left, a list of steps is shown with their status:

- WebSphere 8 StandAlone Patching Parameter Validation: Finished
- WebSphere 8 Check File Download: Finished
- WebSphere 8 Backup Config: Finished (highlighted)
- WebSphere 8 Stop Application Server: Running

On the right, the output for the selected step is displayed:

```
[INFO]: cmd /opt/IBM/WebSphere/AppServer/bin/backupConfig.sh /opt/IBM/WebSphere/backup/backup.zip - nostop -username ..... -password .....
jobid = 90cec2e038e8a77701394bc9327e1701
```

At the bottom right of the console area, there is a 'Cancel workflow' button.

While the workflow is running, its status indicator on the Console says RUNNING. After the workflow finishes, its status indicator changes to SUCCESS, FAILURE, or FINISHED depending on the outcome of the workflow.

This screenshot shows the 'Automation > Console' page after the workflow has completed. The table in the Console section is as follows:

	Workflow	Started	Run by	Server	Instance	Database
SUCCESS	Copy of Patch WebSphere 8 StandAlone Profile	21 Aug 18:25	admin	dma1.mycompany.com		

After the workflow has finished running, you can view a summary of your deployment on the History page. This page lists all the deployments that have run on this HP DMA server during the time period specified in the Filter box.

To view step-by-step results, select the row in the table that corresponds to your deployment.

The screenshot shows the HP Database & Middleware Automation console interface. At the top, there is a navigation bar with the HP logo and the text "Database & Middleware Automation". On the right side of the navigation bar, it displays "Server: dma1.mycompany.com", "User: admin", and a "Logout" link. Below the navigation bar, there are several tabs: "Home", "Automation", "Reports", "Environment", "Solutions", and "Setup". The "Automation" tab is currently selected. Underneath, there are more specific tabs: "Workflows", "Steps", "Functions", "Policies", "Deployments", "Run", "Console", and "History". The "History" tab is active, showing a table of deployment records. The table has columns for description, time, user, server, and status. One record is visible: "Copy of Patch WebSphere 8 StandAlone Profile" and "Deploy Patch WebSphere 8 Standalone Profile" at "21 Aug 17:58" by "admin" on "dma1.mycompany.com", with a status of "SUCCESS". Below the table, there are three tabs: "Output", "Errors", and "Header". The "Output" tab is selected, displaying a log of system messages. The log includes information about running tests, validating paths, checking for existing installations, and backing up configuration files. It also shows the execution of commands to check for file downloads and stop the application server.

```
[INFO]: Running test: validate_path
[INFO]: validate_path file path /opt/IBM/WebSphere/patches
[INFO]: NOT creating a directory with os.makedirs(file_path) /opt/IBM/WebSphere/patches
[INFO]: Running test: validate_existing_install
[INFO]: Checking for existing install
[INFO]: Existing Installation /opt/IBM/WebSphere/AppServer/bin/manageprofiles.sh Exists
[INFO]: All parameters have been validated successfully.

[INFO]: Config Backup File /opt/ibm/websphere/backup/backup.zip

WebSphere 8 Check File Download
00:43:55 - 00:43:59 Exit: 0
Check if files exists
Verified /opt/IBM/WebSphere/patches/8.0.0-WS-WAS-FP0000003-part1.zip
Verified /opt/IBM/WebSphere/patches/8.0.0-WS-WAS-FP0000003-part2.zip

WebSphere 8 Backup Config
00:44:04 - 00:44:15 Exit: 0
[INFO]: cmd /opt/IBM/WebSphere/AppServer/bin/backupConfig.sh /opt/IBM/WebSphere/backup/backup.zip -nostop

WebSphere 8 Stop Application Server
00:44:20 - 00:44:32 Exit: 246
[INFO]: Running command /opt/IBM/WebSphere/AppServer/bin/stopServer.sh server1 -username *** -password ***
```

The tabs below the table show you information about each step in the workflow. This includes the start and end time for each step, the exit code, and the following information:

- Output tab – any informational messages that were produced
- Errors tab – any errors that were reported
- Header tab – values assigned to any output parameters

Chapter 3

Workflow Details

The HP DMA Application Server Patching solution pack includes the following WebSphere 8 patching workflows:

- [Patch WebSphere 8 StandAlone Profile](#) on next page
- [Patch WebSphere 8 Network Deployment Cell](#) on page 37

Each workflow included in this solution pack has a set of input parameters whose values will be unique to your environment. If you provide correct values for the parameters that each scenario requires, the workflow will be able to accomplish its objective.

There are two steps required to customize this solution. First, ensure that all required parameters are visible. You do this by using the workflow editor. Then, specify the values for those parameters. You do this when you create a deployment.

Note: For detailed instructions, see the "How to Use this Workflow" topic associated with each workflow.

The information presented here assumes the following:

- HP DMA is installed and operational.
- At least one suitable target server is available.
- You are logged in to the HP DMA web interface.
- You have permission to create, edit, and deploy copies of the workflows included in this solution pack.

Note: For information about the input parameters used by each workflow, see the "Parameters" topic associated with each workflow.

Patch WebSphere 8 StandAlone Profile

This workflow installs cumulative fixes and updates for WebSphere 8. The workflow patches a single WebSphere 8 application server instance.

Fixes and updates are installed by the workflow using the IBM Installation Manager software, which must exist on the target machine.

To use this workflow in your environment, see the following information:

Topic	Information Included
Prerequisites for this Workflow	List of prerequisites that must be satisfied before you can run this workflow
How this Workflow Works	Information about what the workflow does, including validation checks performed, steps executed, and a high-level process flow
How to Run this Workflow	Instructions for running this workflow in your environment
Sample Scenario	Examples of typical parameter values for this workflow
Parameters	List of input parameters for this workflow

Prerequisites for this Workflow

Be sure that the following prerequisites are satisfied before you run this workflow:

1. You have installed the HP DMA Application Server Patching solution pack.
2. You have a valid HP Software support contract for this solution pack.
3. You have downloaded and installed all available HP DMA patches and hot fixes.
4. IBM Installation Manager software exists on each target machine.

For specific target operating system versions supported by each workflow, see the *HP Database and Middleware Automation Support Matrix* available on the HP Software Product Manuals web site:

<http://h20230.www2.hp.com/selfsolve/manuals>

Dependency: This workflow runs as root.

For information about prerequisites for WebSphere 8 patching, refer to the WebSphere 8 [Product Documentation](#).

How this Workflow Works

The following information describes how the [Patch WebSphere 8 StandAlone Profile](#) workflow works.

Overview

This workflow installs cumulative fixes and updates for WebSphere 8. The workflow patches a single WebSphere 8 application server instance.

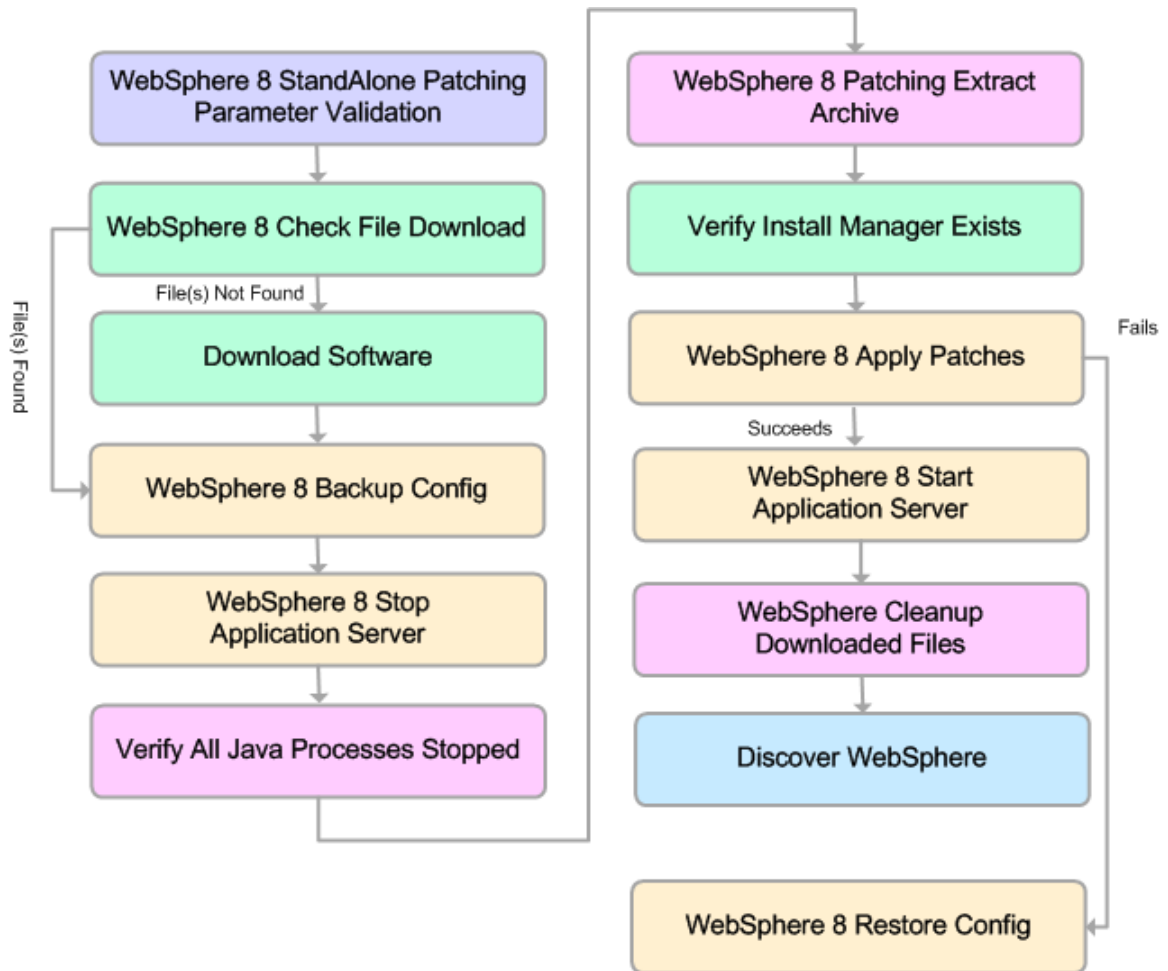

Validation Checks Performed

The validation centers on the input parameters:

- The input parameters have the proper syntax (no special characters or spaces).
- Specified files exist and have valid permissions.

Steps Executed

The Patch WebSphere 8 StandAlone Profile workflow includes the following steps. Each step must complete successfully before the next step can start. If a step fails, the workflow restores the configuration, cleans up files as necessary, reports a failure, and skips all subsequent steps.

KEY:

- Workflow preparation
- OS or file system operation
- WebSphere Specific Operation
- Pre/post validation
- Parameter gathering and validation

Steps for Patch WebSphere 8 StandAlone Profile

Workflow Step	Description
WebSphere 8 StandAlone Patching Parameter Validation	Prepares the parameters needed to patch WebSphere 8.
WebSphere 8 Check File Download	Checks for the existence of a file on the target machine before downloading that file from the HP DMA server. For each file in the list: <ol style="list-style-type: none"> 1. The step determines whether the file is in the expected location on the target machine. 2. If the file is not in the expected location, the step adds that file to a list of files that need to be downloaded.
Download Software	Automates the transfer of files from the software repository to individual managed servers for use in downstream workflow steps.
WebSphere 8 Backup Config	Uses the <code>backupConfig</code> utility to backup the WebSphere configurations for the specified WebSphere 8 installation.
WebSphere 8 Stop Application Server	Stops the specified application server before patching the WebSphere 8 installation.
Verify All Java Processes Stopped	Verifies that all Java processes relevant to the WebSphere services on the specified target have been stopped.
WebSphere 8 Patching Extract Archive	First checks to ensure that the archive file exists. Then, based on the archive extension, extracts the archive to the specified directory.
Verify Install Manager Exists	Verifies that an IBM Installation Manager instance exists on the specified target machine.
WebSphere 8 Apply Patches	Uses the IBM Installation Manager to apply the cumulative patches to the specified WebSphere 8 installation.
WebSphere 8 Start Server	Starts the stand-alone application server.
WebSphere 8 Cleanup Downloaded Files	Removes all temporary downloaded files and archives.
Discover WebSphere	Examines the target server's physical environment to discover information about WebSphere 8 cells, clusters, and managed servers. <p>Note: Discovery is ONLY additive. It will not remove instances or databases currently in your environment. It is your HP DMA administrator's responsibility to delete content that is no longer in use.</p>

Steps for Patch WebSphere 8 StandAlone Profile (continued)

Workflow Step	Description
WebSphere 8 Restore Config	If the patching process fails, this step is called to restore the configuration via the <code>restoreConfig</code> utility.

How to Run this Workflow

The following instructions show you how to customize and run the [Patch WebSphere 8 StandAlone Profile](#) workflow in your environment.

Note: Before following this procedure, review the [Prerequisites for this Workflow](#), and ensure that all requirements are satisfied.

To use the Patch WebSphere 8 StandAlone Profile workflow:

1. Create a deployable copy of the workflow (see [Create a Deployable Workflow](#)).
2. Determine the values that you will specify for the following parameters:

Parameter Name	Default Value	Required	Description
Config Backup File	no default	required	Fully qualified file path where the WebSphere BackupConfig utility will write the backup file. For example: <code>/opt/IBM/WebSphere/newbackup/backup.zip</code>
Install Manager Location	no default	required	Fully qualified file path where the WebSphere Install Manager is located. For example: <code>/usr/IBM/installManager</code> or <code>/opt/IBM/InstallManager</code>
Trust SSL Certificates	True	optional	If this parameter is set to True, the workflow will trust any Secure Sockets Layer (SSL) certificate used to connect to the HP DMA web service.
WAS Admin Password	no default	optional	If global security is enabled, this is the password for a user who belongs to a group that has permission to change the state of a specific application server.
WAS Admin User	no default	optional	If global security is enabled, this is the user account for a user who belongs to a group that has permission to change the state of a specific application server.
Web Service Password	no default	required	Password for the HP DMA Discovery web service API.
Web Service URL	no default	required	URL for the HP DMA Discovery web service API. For example: <code>https://example.com/4433/dma</code>

Parameter Name	Default Value	Required	Description
Web Service User	required	required	User who is capable of modifying the HP DMA managed environment by using the HP DMA Discovery web service API.
WebSphere Patch Extract Location	no default	required	Fully qualified path to the directory where the Update Installer package will be uncompressed. For example: <code>/opt/IBM/WebSphere/WebSphere_Updater</code>
WebSphere Patch File List	no default	required	Comma-separated list of fully qualified paths to the compressed WebSphere cumulative patch files on the target machine. For example: <code>/usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part1.zip,</code> <code>/usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part2.zip</code>
WebSphere Server Name	no default	required	Name of the application server that will be stopped before the patching process proceeds (for example: server1).

Tip: To avoid having to re-enter passwords whenever they change, you can create a policy to provide them to the workflow (see [How to Use a Policy to Specify Parameter Values](#) on page 53).

Note: See [Parameters for Patch WebSphere 8 StandAlone Profile](#) on page 35 for detailed descriptions of all input parameters for this workflow, including default values.

3. Create a new deployment (see [Create a Deployment](#) on page 17 for instructions).
4. On the Targets tab, specify one or more targets for this deployment.
5. Save the deployment (click **Save** in the lower right corner).
6. Run the workflow using this deployment (see [Run Your Workflow](#) on page 21 for instructions).

To verify the results:

The workflow will complete and report SUCCESS on the Console if it has run successfully. If an error occurs during workflow execution, the error is logged, and the workflow terminates in the FAILURE state.

Sample Scenario

It is very straightforward to run the [Patch WebSphere 8 StandAlone Profile](#) workflow. This topic shows you typical parameter values to use.

For the sample use case scenario below, global security is not enabled, and the workflow will trust any Secure Sockets Layer (SSL) certificates.

Parameter Name	Example Value	Description
Config Backup File	see description	Fully qualified file path where the WebSphere BackupConfig utility will write the backup file. For example: <code>/opt/IBM/WebSphere/newbackup/backup.zip</code>
Install Manager Location	see description	Fully qualified file path where the WebSphere Install Manager is located. For example: <code>/usr/IBM/installManager</code> or <code>/opt/IBM/InstallManager</code>
Trust SSL Certificates	True	If this parameter is set to True, the workflow will trust any Secure Sockets Layer (SSL) certificate used to connect to the HP DMA web service.
WAS Admin Password	myPwd	If global security is enabled, this is the password for a user who belongs to a group that has permission to change the state of a specific application server.
WAS Admin User	myUsername	If global security is enabled, this is the user account for a user who belongs to a group that has permission to change the state of a specific application server.
Web Service Password	myWebSvcPwd	Password for the HP DMA Discovery web service API.
Web Service URL	see description	URL for the HP DMA Discovery web service API. For example: <code>https://example.com/4433/dma</code>
Web Service User	JohnDoe	User who is capable of modifying the HP DMA managed environment by using the HP DMA Discovery web service API.
WebSphere Patch Extract Location	see description	Fully qualified path to the directory where the Update Installer package will be uncompressed. For example: <code>/opt/IBM/WebSphere/WebSphere_Updater</code>

Parameter Name	Example Value	Description
WebSphere Patch File List	see description	Comma-separated list of fully qualified paths to the compressed WebSphere cumulative patch files on the target machine. For example: <code>/usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part1.zip,</code> <code>/usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part2.zip</code>
WebSphere Server Name	see description	Name of the application server that will be stopped before the patching process proceeds (for example: server1).

Parameters for Patch WebSphere 8 StandAlone Profile

The following tables describe the required and optional input parameters for this workflow.

Parameters Defined in this Step: WebSphere 8 StandAlone Patching Parameter Validation

Parameter Name	Default Value	Required	Description
Config Backup File	no default	required	Fully qualified file path where the WebSphere BackupConfig utility will write the backup file. For example: <code>/opt/IBM/WebSphere/newbackup/backup.zip</code>
Install Manager Location	no default	required	Fully qualified file path where the WebSphere Install Manager is located. For example: <code>/usr/IBM/installManager</code> or <code>/opt/IBM/InstallManager</code>
Trust SSL Certificates	True	optional	If this parameter is set to True, the workflow will trust any Secure Sockets Layer (SSL) certificate used to connect to the HP DMA web service.
WAS Admin Password	no default	optional	If global security is enabled, this is the password for a user who belongs to a group that has permission to change the state of a specific application server.
WAS Admin User	no default	optional	If global security is enabled, this is the user account for a user who belongs to a group that has permission to change the state of a specific application server.
Web Service Password	no default	required	Password for the HP DMA Discovery web service API.
Web Service URL	no default	required	URL for the HP DMA Discovery web service API. For example: <code>https://example.com/4433/dma</code>
Web Service User	no default	required	User who is capable of modifying the HP DMA managed environment by using the HP DMA Discovery web service API.
WebSphere Patch Extract Location	no default	required	Fully qualified path to the directory where the Update Installer package will be uncompressed. For example: <code>/opt/IBM/WebSphere/WebSphere_Updater</code>

Parameters Defined in this Step: WebSphere 8 StandAlone Patching Parameter Validation (continued)

Parameter Name	Default Value	Required	Description
WebSphere Patch File List	no default	required	Comma-separated list of fully qualified paths to the compressed WebSphere cumulative patch files on the target machine. For example: <code>/usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part1.zip,</code> <code>/usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part2.zip</code>
WebSphere Server Name	no default	required	Name of the application server that will be stopped before the patching process proceeds (for example: server1).

Patch WebSphere 8 Network Deployment Cell

This workflow installs cumulative fixes and updates for WebSphere 8 application server.

The workflow supports the patching of WebSphere 8 running in a Network Deployment topology.

Fixes and updates are installed by the workflow using an existing instance of the IBM Installation Manager software, which must exist on each target machine.

This workflow takes into account the multiple components related to a Network Deployment implementation and makes sure that all components (`dmgr`, `nodeagent`, and application servers) are stopped before proceeding with the patching.

To use this workflow in your environment, see the following information:

Topic	Information Included
Prerequisites for this Workflow	List of prerequisites that must be satisfied before you can run this workflow
How this Workflow Works	Information about what the workflow does, including validation checks performed, steps executed, and a high-level process flow
How to Run this Workflow	Instructions for running this workflow in your environment
Sample Scenario	Examples of typical parameter values for this workflow
Parameters	List of input parameters for this workflow

Prerequisites for this Workflow

Be sure that the following prerequisites are satisfied before you run this workflow:

1. You have installed the HP DMA Application Server Patching solution pack.
2. You have a valid HP Software support contract for this solution pack.
3. You have downloaded and installed all available HP DMA patches and hot fixes.
4. IBM Installation Manager software exists on each target machine.

For specific target operating system versions supported by each workflow, see the *HP Database and Middleware Automation Support Matrix* available on the HP Software Product Manuals web site:

<http://h20230.www2.hp.com/selfsolve/manuals>

Dependencies:

- This workflow runs as root.
- The workflow supports the patching of WebSphere 8 running in a Network Deployment topology.
- When patching a Network Deployment Cell, the workflow must be set up to first patch the server that runs the Deployment Manager process and then patch the other nodes in the cell.
- The workflow requires that an instance of IBM Installation Manager be installed on each of the target servers.

For more information about prerequisites for WebSphere 8 patching, refer to the [WebSphere 8 Product Documentation](#).

How this Workflow Works

The following information describes how the [Patch WebSphere 8 Network Deployment Cell](#) workflow works:

Overview

This workflow installs cumulative fixes and updates for WebSphere 8 application server.

The workflow supports the patching of WebSphere 8 running in a Network Deployment topology.

Validation Checks Performed

The validation centers on the input parameters:

- The input parameters have the proper syntax (no special characters or spaces).
- Specified files exist and have valid permissions.

Steps Executed

The Patch WebSphere 8 Network Deployment Cell workflow includes the following steps. Each step must complete successfully before the next step can start. If a step fails, the workflow restores the configuration, cleans up files as necessary, reports a failure, and skips all subsequent steps.

Steps for Patch WebSphere 8 Network Deployment Cell

Workflow Step	Description
WebSphere 8 Network Cell Patching Parameter Validation	Prepares the parameters needed to patch WebSphere 8.
Gather WebSphere 8 Environment Data	Determines what the Network Deployment cell looks like.
Get WSAAdmin Call Wrapper	Creates the necessary call wrapper to call <code>wsadmin</code> to execute certain operations within the WebSphere 8 environment.
WebSphere 8 Check File Download	Checks for the existence of a file on the target machine before downloading that file from the HP DMA server. For each file in the list: <ol style="list-style-type: none"> 1. The step determines whether the file is in the expected location on the target machine. 2. If the file is not in the expected location, the step adds that file to a list of files that need to be downloaded.
Download Software	Automates the transfer of files from the software repository to individual managed servers for use in downstream workflow steps.
WebSphere 8 Backup Config	Uses the <code>backupConfig</code> utility to backup the WebSphere configurations for the specified WebSphere 8 installation.
WebSphere 8 Stop Application Servers	Stops all application servers first before patching the installation of WebSphere.
WebSphere 8 Stop Management Processes	First stops <code>nodeagents</code> . If there is a <code>dmgr</code> process running, the step will then stop that process before patching the WebSphere 8 installation.
Verify All Java Processes Stopped	Verifies that all Java processes relevant to the WebSphere services on the specified target have been stopped.
WebSphere 8 Patching Extract Archive	First checks to ensure that the archive file exists. Then, based on the archive extension, extracts the archive to the specified directory.
Verify Install Manager Exists	Verifies that an IBM Installation Manager instance exists on each of the specified target machines.
WebSphere 8 Apply Patches	Uses the IBM Installation Manager to apply the cumulative patches to the specified WebSphere 8 installation.
WebSphere 8 Start Management Processes	First starts the <code>dmgr</code> process first if one exists. Then, starts the <code>nodeagent</code> process.

Steps for Patch WebSphere 8 Network Deployment Cell (continued)

Workflow Step	Description
WebSphere 8 Start Application Servers	Starts all application servers.
WebSphere 8 Cleanup Downloaded Files	Removes all temporary downloaded files and archives.
Discover WebSphere	<p>Examines the target server's physical environment to discover information about WebSphere 8 cells, clusters, and managed servers.</p> <div data-bbox="545 590 1370 772" style="background-color: #f0f0f0; padding: 10px;"> <p>Note: Discovery is ONLY additive. It will not remove instances or databases currently in your environment. It is your HP DMA administrator's responsibility to delete content that is no longer in use.</p> </div>
WebSphere 8 Restore Config	If the patching process fails, this step is called to restore the configuration via the <code>restoreConfig</code> utility.

For parameter descriptions and defaults, see [Parameters for Patch WebSphere 8 Network Deployment Cell](#).

How to Run this Workflow

The following instructions show you how to customize and run the [Patch WebSphere 8 Network Deployment Cell](#) workflow in your environment.

Note: Before following this procedure, review the [Prerequisites for this Workflow](#) on page 38, and ensure that all requirements are satisfied.

To use the Patch WebSphere 8 Network Deployment Cell workflow:

1. Create a deployable copy of the workflow (see [Create a Deployable Workflow](#)).
2. Determine the values that you will specify for the following parameters:

Parameter Name	Default Value	Required	Description
Config Backup File	no default	required	Fully qualified file path where the WebSphere BackupConfig utility will write the backup file. For example: <code>/opt/IBM/WebSphere/newbackup/backup.zip</code>
Enable Security	false	required	Enables administrative security. Must be set to either true or false. If Enable Security is true, the WAS Admin User and WAS Admin Password parameters must have values.
Install Manager Location	no default	required	Fully qualified file path where the WebSphere Install Manager is located. For example: <code>/usr/IBM/installManager</code> or <code>/opt/IBM/InstallManager</code>
Trust SSL Certificates	True	optional	If this parameter is set to True, the workflow will trust any Secure Sockets Layer (SSL) certificate used to connect to the HP DMA web service.
WAS Admin Password	no default	optional	If global security is enabled, this is the password for a user who belongs to a group that has permission to change the state of a specific application server.
WAS Admin User	no default	optional	If global security is enabled, this is the user account for a user who belongs to a group that has permission to change the state of a specific application server.
Web Service Password	no default	required	Password for the HP DMA Discovery web service API.

Parameter Name	Default Value	Required	Description
Web Service URL	no default	required	URL for the HP DMA Discovery web service API. For example: <code>https://example.com/4433/dma</code>
Web Service User	required	required	User who is capable of modifying the HP DMA managed environment by using the HP DMA Discovery web service API.
WebSphere Patch Extract Location	no default	required	Fully qualified path to the directory where the Update Installer package will be uncompressed. For example: <code>/opt/IBM/WebSphere/WebSphere_Upgrader</code>
WebSphere Patch File List	no default	required	Comma-separated list of fully qualified paths to the compressed WebSphere cumulative patch files on the target machine. For example: <code>/usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part1.zip, /usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part2.zip</code>

Tip: To avoid having to re-enter passwords whenever they change, you can create a policy to provide them to the workflow (see [How to Use a Policy to Specify Parameter Values](#) on page 53).

Note: See [Parameters for Patch WebSphere 8 Network Deployment Cell](#) on page 46 for detailed descriptions of all input parameters for this workflow, including default values.

3. Create a new deployment (see [Create a Deployment](#) on page 17 for instructions).
4. On the Targets tab, specify one or more targets for this deployment.
5. Save the deployment (click **Save** in the lower right corner).
6. Run the workflow using this deployment (see [Run Your Workflow](#) on page 21 for instructions).

To verify the results:

The workflow will complete and report SUCCESS on the Console if it has run successfully. If an error occurs during workflow execution, the error is logged, and the workflow terminates in the FAILURE state.

Sample Scenario

It is very straightforward to run the [Patch WebSphere 8 Network Deployment Cell](#) workflow. This topic shows you typical parameter values to use.

For the sample use case scenario below, security is enabled, and the workflow will trust any Secure Sockets Layer certificates.

Parameter Name	Example Value	Description
Config Backup File	see description	Fully qualified file path where the WebSphere BackupConfig utility will write the backup file. For example: <code>/opt/IBM/WebSphere/newbackup/backup.zip</code>
Enable Security	true	Enables administrative security. Must be set to either true or false. If Enable Security is true, the WAS Admin User and WAS Admin Password parameters must have values.
Install Manager Location	see description	Fully qualified file path where the WebSphere Install Manager is located. For example: <code>/usr/IBM/installManager</code> or <code>/opt/IBM/InstallManager</code>
Trust SSL Certificates	True	If this parameter is set to True, the workflow will trust any Secure Sockets Layer (SSL) certificate used to connect to the HP DMA web service.
WAS Admin Password	myPwd	If global security is enabled, this is the password for a user who belongs to a group that has permission to change the state of a specific application server.
WAS Admin User	myUsername	If global security is enabled, this is the user account for a user who belongs to a group that has permission to change the state of a specific application server.
Web Service Password	myWebSvcPwd	Password for the HP DMA Discovery web service API.
Web Service URL	see description	URL for the HP DMA Discovery web service API. For example: <code>https://example.com/4433/dma</code>
Web Service User	JohnDoe	User who is capable of modifying the HP DMA managed environment by using the HP DMA Discovery web service API.
WebSphere Patch Extract Location	see description	Fully qualified path to the directory where the Update Installer package will be uncompressed. For example: <code>/opt/IBM/WebSphere/WebSphere_Upgrader</code>

Parameter Name	Example Value	Description
WebSphere Patch File List	see description	Comma-separated list of fully qualified paths to the compressed WebSphere cumulative patch files on the target machine. For example: <code>/usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part1.zip,</code> <code>/usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part2.zip</code>

Parameters for Patch WebSphere 8 Network Deployment Cell

The following tables describe the required and optional input parameters for this workflow.

Parameters Defined in this Step: WebSphere 8 Network Cell Patching Parameter Validation

Parameter Name	Default Value	Required	Description
Config Backup File	no default	required	Fully qualified file path where the WebSphere BackupConfig utility will write the backup file. For example: <code>/opt/IBM/WebSphere/newbackup/backup.zip</code>
Enable Security	false	required	Enables administrative security. Must be set to either true or false. If Enable Security is true, the WAS Admin User and WAS Admin Password parameters must have values.
Install Manager Location	no default	required	Fully qualified file path where the WebSphere Install Manager is located. For example: <code>/usr/IBM/installManager</code> or <code>/opt/IBM/InstallManager</code>
Trust SSL Certificates	True	optional	If this parameter is set to True, the workflow will trust any Secure Sockets Layer (SSL) certificate used to connect to the HP DMA web service.
WAS Admin Password	no default	optional	If global security is enabled, this is the password for a user who belongs to a group that has permission to change the state of a specific application server.
WAS Admin User	no default	optional	If global security is enabled, this is the user account for a user who belongs to a group that has permission to change the state of a specific application server.
Web Service Password	no default	required	Password for the HP DMA Discovery web service API.
Web Service URL	no default	required	URL for the HP DMA Discovery web service API. For example: <code>https://example.com/4433/dma</code>
Web Service User	no default	required	User who is capable of modifying the HP DMA managed environment by using the HP DMA Discovery web service API.
WebSphere Patch Extract Location	no default	required	Fully qualified path to the directory where the Update Installer package will be uncompressed. For example: <code>/opt/IBM/WebSphere/WebSphere_Upgrader</code>

Parameters Defined in this Step: WebSphere 8 Network Cell Patching Parameter Validation (continued)

Parameter Name	Default Value	Required	Description
WebSphere Patch File List	no default	required	Comma-separated list of fully qualified paths to the compressed WebSphere cumulative patch files on the target machine. For example: <code>/usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part1.zip,</code> <code>/usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part2.zip</code>

Tips and Best Practices

This portion of the document contains a collection of tips and best practices that will enable you to use HP DMA more effectively. It contains the following topics:

[How a Solution Pack is Organized](#) on next page

[How to Expose Additional Workflow Parameters](#) on page 52

[How to Use a Policy to Specify Parameter Values](#) on page 53

[How to Import a File into the Software Repository](#) on page 56

How a Solution Pack is Organized

Note: This topic uses the Run Oracle Compliance Audit workflow in the Database Compliance solution pack as an example. The information provided here, however, pertains to any solution pack.

In HP DMA, a **workflow** executes a process —such as installing a software product or checking a database instance for compliance with a specific security benchmark.

A solution pack contains one or more related workflow templates.

Each workflow template has a Documentation tab that provides detailed information about that workflow.

The screenshot shows the HP Database & Middleware Automation console. The main navigation bar includes Home, Automation, Reports, Environment, Solutions, and Setup. A secondary navigation bar includes Workflows, Steps, Functions, Policies, Deployments, Run, Console, and History. The current page is titled 'My Copy of Run Oracle Compliance Audit' and has tabs for Documentation, Workflow, Deployments, and Roles. The 'Documentation' tab is active, showing a form with the following fields: Name (My Copy of Run Oracle Compliance Audit), Tags, Type (Oracle), and Target level (Instance). Below the form is a 'Documentation' section with three sub-sections: Purpose, Description, and Parameters. The Purpose section states: 'Audit an Oracle Database instance for compliance with the following Center for Internet Security (CIS) benchmarks and, optionally, compare the audit results to the related PCI and SOX requirements: CIS Security Configuration Benchmark for Oracle Database Server 11g, version 1.1.0, December 2011; CIS Security Benchmark for Oracle 9i/10g, version 2.01, April 2005; Payment Card Industry (PCI) Data Security Standard Version 2.0, October 2010; Sarbanes-Oxley (SOX) Sarbanes-Oxley Act of 2002 Section 302'. The Description section states: 'This workflow will audit an Oracle Database instance using CIS Level 1 and Level 2 auditing. It will then compare the results to the pertinent PCI and SOX requirements, where applicable. This audit, which runs in conjunction with the HP DMA reporting tool, can identify more than 175 compliance related problems with an Oracle database. You can view information about the audit on the Console while the audit is running. After the audit has finished, the workflow sends a summary report to each specified email address. You can also view a compliance report on the Reports page.' The Parameters section is currently empty. At the bottom of the documentation area are links for HELP, PDF, and EDIT. At the bottom of the console are buttons for DELETE, EXPORT, EXTRACT POLICY, and DEPLOY, along with Copy, Save, and CANCEL buttons.

A workflow consists of a sequence of steps. Each step performs a very specific task. Each step includes a documentation panel that briefly describes its function.

Note: The workflow templates included in this solution pack are read-only and cannot be deployed. To use a workflow template, you must first create a copy of the template and then customize that copy for your environment.

How to Expose Additional Workflow Parameters

Each workflow in this solution pack has a set of input parameters. Some are required and some are optional. To run a workflow in your environment, you must specify values for a subset of these parameters when you create a deployment.

By default, only a few of the input parameters for each workflow are visible on the Deployment page, and the rest are hidden. In order to specify a value for a parameter that is currently hidden, you must first expose that parameter by changing its mapping in the workflow editor.

To expose a hidden workflow parameter:

1. In the HP DMA web interface, go to Automation > Workflows.
2. From the list of workflows, select a deployable workflow.
3. Go to the Workflow tab.
4. In the list of steps below the workflow diagram, click the ► (blue arrow) to the immediate left of the pertinent step name. This expands the list of input parameters for this step.
5. For the parameter that you want to expose, select - User Selected - from the drop-down list.
For example:

Step	Name	Required Result	Next
▼ 1	Gather Parameters for Oracle Compliance		2
	Compliance Type:	- User selected -	ⓘ
	Excluded Compliance Checks:	- User selected -	ⓘ
	Inventory Files:	- User selected -	ⓘ

6. Repeat steps 4 and 5 for all the parameters that you would like to specify in the deployment.
7. Click **Save** in the lower right corner.

How to Use a Policy to Specify Parameter Values

It is sometimes advantageous to provide parameter values by using a policy rather than explicitly specifying the values in a deployment. This approach has the following advantages:

- The policy can be used in any deployment.
- It is faster and less error-prone than specifying parameter values manually.
- For parameter values that change frequently—for example, passwords that must be changed regularly—you only need to update them in one place.

To establish a policy, you can either [Create a Policy](#) or [Extract a Policy](#) from a workflow.

After you establish the policy, you must [Reference the Policy in the Deployment](#).

For more information, see the *HP DMA User Guide*. This document is available on the HP Software Product Manuals web site: <http://h20230.www2.hp.com/selfsolve/manuals>

Create a Policy

The first step in this approach is to create a policy that provides parameter values. There are two ways to do this: (1) create a new policy, and define all attributes manually (as shown here) or (2) extract a policy from a workflow (see [Extract a Policy](#) on next page).

To create a policy that provides parameter values:

1. In the HP DMA web UI, go to Automation > Policies.
2. Click **New Policy**.
3. In the **Name** box, specify the name of the policy
4. For each parameter value that you want to provide using this policy, perform the following actions on the Attributes tab:
 - a. From the drop-down list, select the type of attribute:
 - A Text attribute contains simple text that users can view while deploying and running workflows.
 - A List attribute contains a comma-separated list of values (or a large amount of text not suitable for a Text attribute).
 - A Password attribute contains simple text, but the characters are masked so that users cannot see the text.
 - b. In the text box to the left of the Add button, specify the name of the attribute.

For your convenience, this name should be similar to the parameter name used in the pertinent workflow (or workflows).
 - c. Click **Add**.
 - d. In the new text box to the right of the attribute's name, enter a value for this attribute.

To remove an attribute, click the **Remove** button.
5. On the Roles tab, grant Read and Write permission to any additional users and groups who will

be using this policy. By default, any groups to which you belong have Read and Write permission.

6. Click the **Save** button (lower right corner).

Extract a Policy

An alternative to creating your own policy one attribute at a time is to extract the policy. This automatically creates a reusable policy that provides values for all input parameters associated with a workflow. This is a convenient way to create a policy.

To extract a policy:

1. Go to Automation > Workflows.
2. Select the Workflow that you want to work with.
3. Click the Extract Policy link at the bottom of the screen.
4. Specify values for each attribute listed.
5. *Optional:* Remove any attributes that you do not want to use.
6. *Optional:* Add any new attributes that you want to use.
7. *Optional:* On the Roles tab, select the Read box for any users or user groups that you want to be able to use this policy to provide parameter values in a Deployment. Select the Write box for any users or groups that you want to be able to modify this Policy (add or remove attributes).
8. Click **Save**.

Reference the Policy in the Deployment

After you create a policy, you can reference its attributes in a deployment.

To reference policy attributes in a deployment:

1. Create or access the deployment.
See “Deployments” in the *HP DMA User Guide* for details.
2. On the Parameters tab, perform the following steps for each parameter whose value you want to provide by referencing a policy attribute:
 - a. In the drop-down menu for that parameter, select **Policy Attribute**.
 - b. In the text box for that parameter, type any character. A drop-down list of policy attributes appears. For example:

Admin Pwd: Policy Attribute

- MS SQL: Provisioning.Virtual Server Name
- MyParameterValues.MyAdminPassword
- MyParameterValues.MyAdminUser
- MyParameterValues.MyDBUser
- MyParameterValues.MyDBUserPassword
- Oracle Compliance.Oracle Mandatory Checks
- Oracle Compliance.Oracle Recommended Checks
- Oracle Provisioning.Additional Groups
- Oracle Provisioning.Backup Directory
- Oracle Provisioning.Base
- Oracle Provisioning.Binaries Host
- Oracle Provisioning.Bit Mode

- c. From the drop-down list, select the attribute that you want to reference. For example:

Admin Pwd: Policy Attribute

3. Click **Save** to save your changes to the deployment.

How to Import a File into the Software Repository

Many HP DMA workflows are capable of downloading files from the software repository on the HP DMA server to the target server (or servers) where the workflow is running. The following procedure shows you how to import a file into the software repository so that it can be downloaded and deployed by a workflow.

HP DMA uses the HP Server Automation (HP SA) Software Library as its software repository.

Tip: Be sure to use unique file names for all files that you import into the software repository.

To import a file into the HP SA Software Library:

1. Launch the HP SA Client from the Windows Start Menu.

By default, the HP SA Client is located in Start → All Programs → HP Software → HP Server Automation Client

If the HP SA Client is not installed locally, follow the instructions under “Download and Install the HP SA Client Launcher” in the *HP Server Automation Single-Host Installation Guide*.
2. In the navigation pane in the HP SA Client, select Library → By Folder.
3. Select (or create) the folder where you want to store the file.
4. From the Actions menu, select **Import Software**.
5. In the Import Software dialog, click the **Browse** button to the right of the File(s) box.
6. In the Open dialog:
 - a. Select the file (or files) to import.
 - b. Specify the character encoding to be used from the Encoding drop-down list. The default encoding is English ASCII.
 - c. Click **Open**. The Import Software dialog reappears.
7. From the Type drop-down list, select **Unknown**.
8. If the folder where you want to store the files does not appear in the Folder box, follow these steps:
 - a. Click the **Browse** button to the right of the Folder box.
 - b. In the Select Folder window, select the import destination location, and click **Select**. The Import Software dialog reappears.
9. From the Platform drop-down list, select all the operating systems listed.
10. Click **Import**.

If one of the files that you are importing already exists in the folder that you specified, you will be prompted regarding how to handle the duplicate file. Press F1 to view online help that explains the options.
11. Click **Close** after the import is completed.

Chapter 4

Troubleshooting

These topics can help you address problems that might occur when you install and run the workflows in this solution pack:

- [Target Type](#) below
- [User Permissions and Related Requirements](#) below
- [Discovery in HP DMA](#) on next page

Target Type

In your deployment, make sure that you have specified the correct type of target. The workflow type and the target type must match. A workflow designed to run against an instance target, for example, cannot run against a server target.

User Permissions and Related Requirements

Roles define access permissions for organizations, workflows, steps, policies, and deployments. Users are assigned to roles, and they gain access to these automation items according to the permissions and capabilities defined for their roles.

Roles are assigned by your server management tool administrator. They are then registered in HP DMA by your HP DMA administrator.

Your HP DMA administrator will ensure that the users in your environment are assigned roles that grant them the permissions and capabilities they need to accomplish their tasks. For example:

- To create a workflow, your role must have Workflow Creator capability.
- To view a workflow, your role must have Read permission for that workflow.
- To edit a workflow, your role must have Write permission for that workflow.
- To view a deployment, your role must have Read permission for that deployment.
- To modify a deployment, your role must have Write permission for that deployment.
- To run a deployment, your role must have Execute permission for that deployment and Deploy permission for the organization where it will run.

Capabilities determine what features and functions are available and active in the HP DMA UI for each user role.

For more information, see the *HP DMA Administrator Guide*. This document is available on the HP Software Product Manuals web site: <http://h20230.www2.hp.com/selfsolve/manuals>

Discovery in HP DMA

HP DMA uses a process called “discovery” to find information about the servers, networks, and database instances on target machines in your managed environment.

You must explicitly initiate the process of discovery—it is not automatic. See the *HP DMA User Guide* for instructions. This document is available on the HP Software Product Manuals web site: <http://h20230.www2.hp.com/selfsolve/manuals>

Glossary

A

automation items

The umbrella term automation items is used to refer to those items to which role-based permissions can be assigned. Automation items include workflows, deployments, steps, and policies.

B

bridged execution

A bridged execution workflow includes some steps that run on certain targets and other steps that run on different targets. An example of a bridged execution workflow is Extract and Refresh Oracle Database via RMAN (in the Database Refresh solution pack). This workflow extracts the contents of a database on one target (the Source) and creates a new database with the same contents on another target (the Destination). This workflow is useful when you want to clone a database - for example, to move it from a traditional IT infrastructure location into a private cloud. Bridged execution workflows are supported on HP DMA version 9.11 (and later).

C

capability

Capabilities are collections of related privileges. There are three capabilities defined in HP DMA. Login Access capability enables a user to log in to the web interface. This capability does not guarantee that this user can view any

organizations or automation items—permissions are required to access those items. Workflow Creator capability enables a user to create new workflows and make copies of other workflows. Administrator capability enables a user to perform any action and view all organizations. If you have Administrator capability, you do not need Workflow Creator capability. The Administrator can assign any of these capabilities to one or more roles registered roles.

connector

HP DMA includes a Connector component that enables it to communicate with your server management tool. You must configure the Connector before you can run an workflow against a target.

cross-platform

Cross-platform database refresh involves converting the data from one type of byte ordering to another. This is necessary, for example, if you want to load a database dump file on a little-endian Linux target that was created on a big-endian Solaris server.

D

deployment

Deployments associate a workflow with a target environment in which a workflow runs. You can customize a deployment by specifying values for any workflow parameters that are designated - User Selected - in the workflow. You must save a deployment before you can run the workflow. You can re-use a saved deployment as many times as you like.

destination

In a database refresh scenario, the contents of a database dump file are loaded into the DESTINATION database.

DESTINATION

In a database refresh scenario, the contents of a database dump file are loaded into the DESTINATION database.

F

function

Functions are reusable pieces of code that can be included in automation steps. Any common routine or operation that multiple steps perform is a good candidate for a function. Functions can be tagged with keywords indicating the language in which they are written and the operating system with which they work. Functions are "injected" into the step code just prior to step execution.

I

input parameters

A workflow has a set of required parameters for which you must specify a value. The required parameters are a subset of all the parameters associated with that workflow. The remaining parameters are considered optional. You can specify a value for an optional parameter by first exposing it using the workflow editor and then specifying the value when you create a deployment.

M

mapping

An input parameter is said to be "mapped" when its value is linked to an output parameter from a previous step in the workflow or to a metadata field. Mapped parameters are not visible on the Deployment page. You can "unmap" a

parameter by specifying - User Selected - in the workflow editor. This parameter will then become visible on the Deployment page.

O

Oracle Data Pump

Oracle Data Pump is a utility that enables you to move data or metadata from one database to another. You can use Data Pump to move a complete database or a subset of a database.

organization

An organization is a logical grouping of servers. You can use organizations to separate development, staging, and production resources - or to separate logical business units.

P

parameters

Parameters are pieces of information - such as a file system path or a user name - that a step requires to carry out its action. Values for parameters that are designated User Selected in the workflow can be specified in the deployment. Parameters that are marked Enter at Runtime in the deployment must be specified on the target system when the workflow runs.

policy

Policies are reusable sets of attributes that can be used as parameter values in deployments. Deployments can reference policy attributes to change the automation behavior. Policies provide values for input parameters. They can contain fixed values or reference Custom Fields. Policies enable HP DMA to manage groups of hundreds or thousands of servers at a time without the need to configure each individual server.

R

raw devices

In Sybase ASE version 15, you can create and mount database devices on raw bound devices. This enables Sybase ASE to use direct memory access from your address space to the physical sectors on the disk. This can improve performance by reducing memory copy operations from the user address space to the operating system kernel buffers.

Recovery Manager (RMAN)

Oracle Recovery Manager (RMAN) is a backup and recovery tool included in Oracle Database Enterprise Edition (and related products). RMAN enables you to efficiently backup and restore data files, control files, server parameter files, and archived redo log files. It provides block-level corruption detection during both the backup and restore phases. It is optimized for performance and space consumption.

role

Each HP DMA user has one or more roles. Roles are used to grant users permission to log in to and to access specific automation items and organizations. Roles are defined in your server management tool. Before you can associate a role with an automation item or organization, however, you must register that role in HP DMA.

S

software repository

The software repository is where the workflow will look for any required files that are not found on the target server. If you are using HP DMA with HP Server Automation (SA), this repository is the SA Software Library.

solution pack

A solution pack contains one or more related workflow templates. These templates are read-only and cannot be deployed. To run one of the workflows included in a solution pack, you must first create a deployable copy of that template and then customize that copy for your environment. Solution packs are organized by function - for example: database patching or application server provisioning.

source

In a database refresh scenario, the contents of the SOURCE database are extracted and stored in a file (or multiple files).

SOURCE

In a database refresh scenario, the contents of the SOURCE database are extracted and stored in a file (or multiple files).

source database

In the context of MS SQL database refresh, the "source database" is the database from which the backup file is created.

steps

Steps contains the actual code used to perform a unit of work detailed in a workflow.

T

target instance

In the context of MS SQL database refresh, the term "target instance" refers to the SQL Server instance where the database that will be restored resides.

W

workflow

A workflow automates the process followed for an operational procedure. Workflows contain steps, which are linked together to form business logic for a common task. Workflows connect existing tasks in order to perform a new business process by building on existing best practices and processes.

workflow editor

The workflow editor is the tool that you use to assemble steps into workflows. You can map each input parameter to output parameters of previous steps or built-in metadata (such as the server name, instance name, or database name). You can also specify User Selected to expose a parameter in the deployment; this enables the person who creates the deployment to specify a value for that parameter.

workflow templates

A workflow template is a read-only workflow that cannot be deployed. To run one of the workflows included in a solution pack, you must first create a deployable copy of the workflow template and then customize that copy for your environment.
