
Service Test Installation QuickStart Sheet

This sheet explains the steps to perform a basic installation of Service Test. Complete details on all elements of the Service Test installation can be found in the *HP Service Test Installation Guide*.

Before You Install

- **Upgrading:** If you are moving from a version of Service Test 10.00 or later, the installation process will automatically uninstall your old version of Service Test and install Service Test.
- **Silent Installation:** Service Test supports the MSI silent installation mechanism. For details, see the *HP Service Test Installation Guide*.

Installation Instructions

1. Prerequisites

- Make sure you have administrator privileges on the drive to which you are installing Service Test (must be a local drive). If you have problems installing, you may have to adjust other Windows settings. See the "Setting Required Access Permissions" section in the *HP Service Test Installation Guide*.
- Know what type of license you are using. If you are using a concurrent license, have the license server URL available.
- Know if you want to install all Service Test features or the Service Test run-time features only.

2. Start the Installation.

When the startup screen opens, select **Service Test Setup**. (If the startup screen does not automatically run, enter the following path in the command window: <DVD drive>/setup.exe.)

3. Follow the on-screen instructions.

While You Install

Custom Installation Screen

If you want to run but not edit Service Test tests, select only the **HP Service Test Runtime** option.

Additional Installation Requirements Screen

If your network requires special DCOM settings, clear the **Configure DCOM Settings** option. For details on manual configuration of the DCOM settings, see the *HP Unified Functional Testing Installation Guide*.
