Documentation Updates

The title page of this document contains the following identifying information:

- Software Version number, which indicates the software version.
- Document Release Date, which changes each time the document is updated.
- Software Release Date, which indicates the release date of this version of the software.

To check for recent updates or to verify that you are using the most recent edition of a document, go to: **http://h20230.www2.hp.com/selfsolve/manuals**

This site requires that you register for an HP Passport and sign in. To register for an HP Passport ID, go to: **http://h20229.www2.hp.com/passport-registration.html**

Or click the **New users - please register** link on the HP Passport login page.

You will also receive updated or new editions if you subscribe to the appropriate product support service. Contact your HP sales representative for details.

Support

Visit the HP Software Support Online web site at: **http://www.hp.com/go/hpsoftwaresupport**

This web site provides contact information and details about the products, services, and support that HP Software offers.

HP Software online support provides customer self-solve capabilities. It provides a fast and efficient way to access interactive technical support tools needed to manage your business. As a valued support customer, you can benefit by using the support web site to:

- Search for knowledge documents of interest
- Submit and track support cases and enhancement requests
- Download software patches
- Manage support contracts
- Look up HP support contacts
- Review information about available services
- Enter into discussions with other software customers
- Research and register for software training

Most of the support areas require that you register as an HP Passport user and sign in. Many also require a support contract. To register for an HP Passport ID, go to:

http://h20229.www2.hp.com/passport-registration.html

To find more information about access levels, go to:

http://h20230.www2.hp.com/new_access_levels.jsp

HP Software Solutions Now accesses the HPSW Solution and Integration Portal Web site. This site enables you to explore HP Product Solutions to meet your business needs, includes a full list of Integrations between HP Products, as well as a listing of ITIL Processes. The URL for this Web site is **http://h20230.www2.hp.com/sc/solutions/index.jsp**

Contents

Welcome to HP Operations Analytics

Operations Analytics is a unique platform for both simple and complex IT operational problem-solving. Use Operations Analytics to access, combine, and compare the metric, topology, event, and log file data that your Operations Analytics administrator configures to be collected from diverse sources in your IT environment. See "Collection Data Sources" on page 34 for more information about possible data sources. Because this data is collected from multiple domains, Operations Analytics enables you to identify answers to problems that are not easily solved using other methods.

What can Operations Analytics do for me?

Operations Analytics processes data according to your search query. These results assist you with the following kinds of tasks:

- Identify and analyze the pattern of problems in your IT environment.
- Identify the cause of resource or application usage problems.
- Troubleshoot server and network performance problems.
- Identify configuration or inventory changes.

Operations Analytics displays search query results using different types of visualizations, including tables, bar charts, line charts, pie charts, sunburst charts, and heat maps.

How do I use Operations Analytics?

To use Operations Analytics:

- Enter a search query that describes the type of information you want Operations Analytics to gather and analyze.

  For example, you might query for CPU utilization information for a specific host name or for memory utilization for all database instances for a specified application.

  As you type, Operations Analytics provides a list of suggestions to help define the context of the problem you are trying to get information about. See "Use a Search Query to Define the Context of a Problem or Area to Investigate" on page 109 for more information.

- Select an existing dashboard from the **Dashboards** menu.
- Create a new dashboard by selecting **New** from the **Dashboards** menu.

Each dashboard is comprised of one or more **query panes**[1] that provide results from one or more search queries.

[1] Each query pane displays the results of an Analytic Query Language (AQL) query, AQL function, or AQL expression. If you use the Phrased Query Language (PQL) in your search, HP Operations Analytics converts the PQL query to one or more AQL queries and subsequent query panes.

Note: You can share the troubleshooting knowledge that is built within the context of your IT environment by saving and sharing your dashboards and their associated queries with others in your IT organization user community. See "Manage Your Dashboards" on page 263 for more information.

How do I work with Dashboards?

Operations Analytics provides the dashboard options described in the following HP Operations Dashboard Options table.

Note: If a search query results in too many instances to display, Operations Analytics uses the query to return log file messages matching any phrases in the search query.

Operations Analytics Dashboards Options

Option	Description
Dashboard Name List	Operations Analytics lists all of the dashboards available for your use. These include: • Dashboards created by the current user. • Dashboards shared by other users in the same user community (tenant). **Note:** The shared dashboards, including those provided by Operations Analytics appear at the top of the list.
New	Creates a new dashboard. **Note:** You are not required to use the **New** option to create a dashboard. You can also create a dashboard by changing your search query and then clicking **Save** when you are ready to save the results. When you create or save a dashboard, you provide a **Dashboard Name**.
Manage	Enables you to copy, share, unshare, or delete a dashboard that you no longer need from the **Dashboards** menu. **Note:** You can delete only dashboards that you created. See "Manage Your Dashboards" on page 263 for more information.

If you are an Operations Analytics user, also see "Getting Started with HP Operations Analytics" on page 28.

If you are an Operations Analytics administrator, also see "Operations Analytics Concepts" on page 266 and "Operations Analytics Administrator Tasks" on page 275.

About the Operations Analytics Console

The Operations Analytics console is the graphical user interface that enables you to access or create dashboards for troubleshooting your IT operations problems.

Note: The Operations Analytics session timeout limit is 20 minutes.

Review the name of each feature below the image to learn about the different areas.

1 Home Page

Console Feature

Feature	Details	
1 Home Page	**Description:**	The Operations Analytics logo enables you to navigate to the OAEnvironmentOverview dashboard. This dashboard provides an overview of the following information for the hosts in your IT environment: • Top five CPU utilization (cpu_util) • Top five disk utilization (disk_io_rate) • Top five memory utilization (mem_util) • Top five network utilization (net_packet_rate) Use this dashboard to help determine, at a glance, problem areas to investigate more closely in your network environment. Note the following: • Operations Analytics displays the LogsOverview dashboard when you initially log on to Operations Analytics. • Each subsequent time you log on, Operations Analytics displays the last saved dashboard you accessed. In the **Dashboards** menu a check mark indicates the dashboard in use. • Shared dashboards that have been provided by other members of your user community are appended with the name of the user who provided the dashboard.
	How to Use:	Click the Operations Analytics logo to return to the OAEnvironmentOverview dashboard. See "Dashboards Provided by Operations Analytics" on page 102 for more information

2 Search Query

Console Feature

Feature	Details	
2 Search Query	**Description:**	Defines the context for the data you want to examine. Operations Analytics gathers and analyzes the data based on the search query you enter.

Console Feature, continued

Feature	Details	
	How to Use:	1. Enter your search query. **Note:** To create a dashboard using AQL queries, use the + to add one or more **query panes**[1]. Operations Analytics does not accept AQL queries in the search query box. See "Using an Operations Analytics Dashboard" on page 76 for more information. As you type, HP Operational Analytics provides a list of suggestions to help define the context of the problem you are trying to get information about. For example: **Tip:** Use the arrows keys to navigate the list of suggestions.  **Tip:** Suggestions are organized using the **Metadata**, **Dashboards**, and **History** categories. See "About Phrased Query Suggestions" on page 134 for more information. 2. *Optional*. Select a Time Range.

[1]Each query pane displays the results of an Analytic Query Language (AQL) query, AQL function, or AQL expression. If you use the Phrased Query Language (PQL) in your search, HP Operations Analytics converts the PQL query to one or more AQL queries and subsequent query panes.

Console Feature, continued

Feature	Details	
		Tip: After you select a time range, Operations Analytics executes your search query. 3. If you did not select a time range, press **Enter** or Click to execute your query. See "Use a Search Query to Define the Context of a Problem or Area to Investigate" on page 109 for more information about the search query syntax.

3 Time Range

Console Feature

Feature	Details	
3 Time Range	**Description:**	Specifies the time frame within which Operations Analytics should obtain the data to display. Use the Time Range menu to specify the time in hours, days, or months. **Note:** The time range is a historical. It spans the selected time range ending at the current time. Use the **Custom Time** option when you want to specify a start and end date using the Operations Analytics calendar. By default, Operations Analytics uses a time range of 1 Hour.

Console Feature, continued

Feature	Details	
	How to Use:	1. In the Time Range menu, click ⌄ . 2. Select the time in hours, days, or months.  3. To specify a start and end date using the Operations Analytics calendar, select **Custom Time** . 4. Click the calendar icon to display the calendar for either **Start Time** or **End Time** as shown in the following example.  5. After you have completed selecting your Start Time and End Time Dates, click **Apply**. See "Filter Search Query Results " on page 251 for more information.

4 Time Line

Console Feature

Feature	Details	
4 Time Line	**Description:**	Enables you to filter the time segment for which the data is displayed. This feature is useful when you want to fine tune the Time Range selected.
	How to Use:	To filter your analysis by time segment, slide each end of the time line to the beginning and end point of the time you want to use:  See "Filter Search Query Results " on page 251 for more information.

5 Time Segment

Console Feature

Feature	Details	
5 Time Segment	**Description:**	Displays the time segment you selected from the Time Line. See "Filter Search Query Results " on page 251 for more information.
	How to Use:	After you slide each end of the time line to the beginning and end point of the time you want to use, the From and To time changes to match the latest selection. 
6 New Query Pane

Console Feature

Feature	Details	
6New Query Pane	**Description:**	Enables you to add one or more query panes using one of the following: • Analytics Query Language (AQL) query • AQL function • AQL expression

Console Feature, continued

Feature	Details	
	How to Use:	**To add a new query pane, click** +. In the **NEW PANE** attribute, enter the name of the query pane. Use the **Query** tab to provide the AQL query or AQL function you want to use: 1. Navigate to the **Query** tab. 2. Do one of the following: ▪ Select an AQL function. Enter values for any of the AQL function arguments that apply. Note the following: ○ Your Operations Analytics administrator can provide descriptions for the arguments required for each AQL Function provided. See "Select an AQL Function for a New Query Pane" on page 101 for information about how to view these descriptions. ○ If descriptions are not provided, you can also view the collection information configured for your IT environment. This collection information might also assist you in providing values for the arguments required. Click **Show Tags** to view a new query pane that displays the collections (property group uid), tags (tag name), and columns (property uid) available. Click **Show Properties** to view a new query pane that displays the collections (property group uid), columns (property uid), and whether the column contains **metric**[1] or **attribute**[2] values. Also see "View Collection Information" on page 73 for more information about how to view the meta data stored for your collections. Click here for a brief description of the possible AQL function argument types.

[1]Typically a measurement stored in a collection. For example, CPU utilization.
[2]A descriptor stored in a collection for an entity, such as host_name.

Console Feature, continued

Feature	Details	
		AQL Function Argument Types See "About Analytic Functions" on page 179 for more information.

Argument Type	Description
analytic	Specifies an analytic function that can be applied to overall aggregate analytic functions, moving aggregate analytic functions, or raw metrics. These analytic functions include: topN, bottomN, inverse_pctile, pctile, outlier, or rank.
collection	Specifies the name of the collection for which Operations Analytics should return search results.
custom	Indicates that Operations Analytics cannot identify the argument type. Check the description for the AQL function that appears in the Query tab when adding or editing a query pane. Also, check with your Operations Analytics administrator for assistance with providing values for these arguments.
entity	Specifies the type of entity attribute on which you want to filter; for example, host_name.
filter	Specifies the filter value to use in the `where` clause of the AQL function. For example, when used with host name, you might enter the following filter value to return data for only the servers in the co.usa.enterprise. com domain: `\"*\.co.usa.enterprise.com"`.
grouping	Specifies an argument required for the group by clause.

Console Feature, continued

Feature	Details	

AQL Function Argument Types, continued

Argument Type	Description
function	Specify the overall aggregate or moving aggregate analytic function you want Operations Analytics to use. See "Analytic Functions Provided by Operations Analytics" on page 181 for the list of analytic functions provided by Operations Analytics.
metric	Either of the following: ○ Name of the metric column. ○ Tag that represents the metric column.
ordering	Specifies an argument required for the `order by` clause.

See "Select an AQL Function for a New Query Pane" on page 101 for more information about selecting AQL functions.

- In the **(NEW PANE)** attribute, enter the AQL query, AQL function name, or AQL expression for the new query pane.

3. Navigate to another tab or click **OK**.

Optional. Use the **Visualization** tab to change the visualization that is displayed.

Note: If you select a visualization that is not valid for the data displayed, Operations Analytics displays the default visualization for the AQL query.

1. Navigate to the **Visualizations** tab.
2. Navigate to the Visualizations options:

3. Select the visualization you want to use.
4. Navigate to another tab or click **OK**.

Console Feature, continued

Feature	Details	
		See "Interpret Dashboard Results" on page 235 for more information about visualizations. Use the **Parameters** tab to provide the parameter values, if any, to the selected AQL function. **Note:** Any parameter value you provide overrides the associated value selected using another method in the Operations Analytics console. For example, if you specify a time interval using the $interval parameter, Operations Analytics uses the value for $interval rather than the time line segment selected. See "Filter Search Query Results " on page 251for more information about time line segments. 1. Navigate to the **Parameters** tab. 2. Provide the parameter values you want to use. **Tip:** Mouse over the parameter of interest to view its description. To restore the parameter values to their original default values, click **Defaults**. 3. Navigate to another tab or click **OK** to save your changes.

7 Save

Console Feature

Feature	Details	
7Save	**Description:**	Save a dashboard and its associated search queries. **Tip:** Also use **Save** to save changes to **query pane**[1] settings. See "Customize a Dashboard" on page 255 for more information. When saving a dashboard, note the following: • When you Save a dashboard that you own, Operations Analytics overwrites the original dashboard with any changes. • When you Save a shared dashboard that you do not own, Operations Analytics prompts you to save the dashboard using a new name. • To save (Save As...) a dashboard you own using a new name without overwriting your original dashboard, use the **Manage... Copy** option of the **Dashboard** menu before making any changes. See "Manage Your Dashboards" on page 263 for more information.
	How to Use:	1. Click **Save**. 2. If you are creating a new dashboard, Operations Analytics prompts for a **Dashboard Name**. Type a name that describes the dashboard purpose or results. Only alpha-numeric characters and periods (.), plus sign (+), and dashes (-) are permitted, Spaces and other special characters (~ ! @ # $ % ^ &; * ( ) -) are not permitted. **Note:** Do not begin or end a dashboard name with a space. See "Save a Dashboard " on page 262 for more information.

[1]Displays the results of an Analytic Query Language (AQL) query, AQL function, or AQL expression. If you use the Phrased Query Language (PQL) in your search, HP Operations Analytics converts the PQL query to one or more AQL queries and subsequent query panes.

8 Log In Information

Console Feature

Feature	Details	
8 Log In Information	**Description:**	Displays your user name. See "About User Accounts" on page 272 for more information. Enables you to do the following: • Access user settings ▪ Change your password. See "Change Your User Account Password" on page 26 for more information. ▪ Log out.
	How to Use:	To change your password, click your user account name and select **Change Password**. See "Change Your User Account Password" on page 26 for more information. To log out, click your user account name and select **Logout**.

9 HP ArcSight Logger

Console Feature

Feature	Details	
9 HP ArcSight Logger	**Description:**	Access HP ArcSight Logger
	How to Use:	To launch HP ArcSight Logger, click and select the HP ArcSight Logger IP address or host name to which you want to connect.

10 Settings

Console Feature

Feature	Details	
10 Settings	**Description:**	Access the following settings (⚙). • *Operations Analytics administrators only*. **User Management** • **Topology Management**
	How to Use:	*Operations Analytics administrators only* To add, delete and modify user accounts, click ⚙ and select **User Management**. See "Manage Users" on page 279 for more information. To configure the topology relationships for one or more services, click ⚙ and select **Topology Management**.

11 Help, Reference Pages and About

Console Feature

Feature	Details	
11 Help, Reference Pages and About	**Description:**	Access the following information for Operations Analytics: • Help • Reference pages • License, database, and version information
	How to Use:	To access the Help , click and select **Help**. To access the Reference Pages that describe the command line interface, click and select **Reference Pages**. To access the License, database, and version information, click and select **About**. Navigate to the tab of interest.

12 Dashboards

Console Feature

Feature	Details	
12 Dashboards	**Description:**	Lists the following saved dashboards: • Provided by Operations Analytics. • Shared by the users in your user community (tenants). • Saved by the current user. You can select a dashboard from this list rather than using the search query to create your own. **Note:** The Dashboards menu also enables you to share, unshare, copy, and delete saved dashboards. See "Manage Your Dashboards" on page 263
	How to Use:	Select a dashboard from this list rather than creating your own. To create a dashboard, select **New** . To share, unshare, copy, or delete a dashboard, select **Manage**. See "Manage Your Dashboards" on page 263 for more information.

13 Playback

Console Feature

Feature	Details	
13 Playback	**Description:**	Replay Operations Analytics results. This option is useful to help you identify when a problem began to occur. When using this feature, note the following: • Operations Analytics uses the start and end time specified in the time line. • Operations Analytics selects the optimum time segment within the specified start and end time in which to display the results. For example, if the time line specifies 1 day, Operations Analytics might choose a time interval of 1 hour. If the time line specifies 1 hour, Operations Analytics might choose a time interval of 5 minutes. **Note:** If you provide an $interval parameter value in a **query pane**[1], Operations Analytics uses the $interval value you specify for the time segment for only that query pane . See "Using an Operations Analytics Dashboard" on page 76 for more information.

[1]Displays the results of an Analytic Query Language (AQL) query, AQL function, or AQL expression. If you use the Phrased Query Language (PQL) in your search, HP Operations Analytics converts the PQL query to one or more AQL queries and subsequent query panes.

Console Feature, continued

Feature	Details	
	How to Use:	1. Click « Playback. 2. Click ▶ (Play). Operations Analytics displays the results using the time interval specified in the time line. As the results are displayed, the following actions occur: ▪ The time interval segment moves along the time line ▪ The time stamp information for each time interval is displayed, as shown in the following example:  3. Click ▶▶ to Fast Forward. 4. Click ◀◀ to Rewind. 5. Click ❚❚ to Pause. 6. Click ◀ to access Reverse Play. See "Play Back Search Query Results " on page 253for more information.

14 Dashboard Area

Console Feature

Feature	Details	
14 Dashboard Area	**Description:**	An Operations Analytics dashboard is the graphical user interface for troubleshooting your IT operations problems. When using an Operations Analytics dashboard note the following: • Search query results are grouped by query panes. Each query pane represents an Analytic Query Language (AQL) query, an AQL function or an AQL expression. **Note:** If you use Phrased Query Language (PQL), the results might appear in multiple query panes. This is because Operations Analytics translates each PQL query into the required AQL queries before displaying the query results.
	How to Use:	To access an Operations Analytics dashboard, do one of the following: • Enter a new search query in the Search Query field. • Select an existing dashboard from the **Dashboards** menu. • Create a new dashboard by selecting **New** from the **Dashboards** menu. See "Use a Search Query to Define the Context of a Problem or Area to Investigate" on page 109 and "Using an Operations Analytics Dashboard" on page 76 for more information.

Also see "Using an Operations Analytics Dashboard" on page 76

Access Help and About Information

Help, Reference Pages, and About information is available from the Operations Analytics Help menu.

To access the help:

1. Select the Help icon from the Operations Analytics Console main menu.
2. From the help you can access all the information described in the table below.

Help Links

Help Link	Description
Help	Describes how to use Operations Analytics to troubleshoot your IT operations problems. Also lists the configuration tasks for Operations Analytics administrators and describes important concepts.
Welcome	Provides an overview of Operations Analytics features so that you can quickly get started using Operations Analytics to create and view dashboards. **Tip:** The **Welcome** page is displayed the first time you access Operations Analytics. You can return to this overview at any time.
Reference Pages	Lists links to the command descriptions for the Operations Analytics command line interface.
About	Describes information for the following: • The component versions that comprise Operations Analytics. • Database information, including database license information as well as the amount of storage allocated and in use. • License information for Operations Analytics. **Note:** Operations Analytics licensing is based on the number of Operations Analytics (OA) nodes for which data is collected. An OA node is a real or virtual computer system, or a device (for example a printer, router, or bridge) within a network. Operations Analytics is sold in packages of 50 nodes

Related Topics

"Search the Help Topics" below

Search the Help Topics

To search for specific information across all help topics:

1. In the navigation pane of the Help window, click the **Search** tab.
2. Type in a search string (see table).
3. Click the **Search** button. The order of the resulting list of topics is based on the following ranking order:
   a. Topic title

b. Headings in topic

c. File name

Search Variables

Description	Variable	Example
Search for one or more words. When you enter a group of words into the search field, "or" is inferred.		search query
Search for a phrase.	" " (wrap a text string in quotes)	"search query"
Search for "either of" or "any of" specific strings.	OR (case insensitive) | (pipe symbol)	metric or log or hostname "search query"|"metric"
Search for two or more specific strings.	AND (case insensitive) + (plus symbol) & (ampersand)	metric And hostname And analysis "search query"+hostname "search query"&"metric"
Search for all topics that do not contain something.	NOT (case insensitive) ! (exclamation mark)	not hostname ! hostname
Search for all topics that contain one string and do not contain another.	^ (carat symbol)	hostname ^ metric
Combinations of the above.	( ) parenthesis	hostname and (name or metric) hostname or metric (!search)

Note: Results returned are case insensitive. However, results ranking takes case into account and assigns higher scores to case matches. Therefore, a search for "metrics" followed by a search for "Metrics" would return the same number of help topics, but the order in which the topics are listed would be different.

Change Your User Account Password

You can change your user account password at any time.

To change your user account password:

1. In the upper right-hand corner of the Operations Analytics console, click your user account name.
2. Select **Change Password**.

   The **Change Password** dialog box appears.
3. In the **Current Password** field, enter the current password.
4. In the **New Password** field, enter the password value.

   The password must be at least four characters.
5. In the **Confirm Password** field, re-enter the new password.
6. Click **Update**.

Part 1: Help for Users

This is the online help for users of Operations Analytics 2.00.

> **Tip:** If you are an Operations Analytics administrator, see "Help for Administrators" on page 265.

To access more information about Operations Analytics, select any entry in the Table of Contents. Good starting points are:

- "About the Operations Analytics Console" on page 8
- "Getting Started with HP Operations Analytics" on page 28
- "Using an Operations Analytics Dashboard" on page 76

To learn more about the help options available while using Operations Analytics, see "Access Help and About Information" on page 23.

To use the online help Search feature, see "Search the Help Topics" on page 24.

Chapter 1: Getting Started with HP Operations Analytics

Welcome to Operations Analytics, an analysis tool that provides a unified approach to proactively manage and solve simple and complex IT operations problems.

In today's complex data center environments, the source of a problem is not always easy to detect using traditional management and troubleshooting tools that look only for pre-determined solutions to known potential problems. For example, many management and troubleshooting tools are designed to provide analytics for a specific problem context, such as root cause isolation, outlier detection, and service level agreement violation. They provide these services by using a specific data set and analytics technique.

With Operations Analytics you generate insights from the data in your IT environment that you choose to collect. And because identifying the most useful analytics to derive from the data generally depends on the problem context, with Operations Analytics you, the user, provide each data request in the form of a search query.

Operations Analytics enables you to use simple search queries using the Phrased Query Language (PQL) to view metric, topology, event, and log file information related to the context you specify. Operations Analytics also enables you to use its Analytics Query Language (AQL) for more precise searches; for example, when you know the exact log file message or combination of analytics required to troubleshoot a problem.

When entering a search query, Operations Analytics offers suggestions as you type.

It then uses your query to analyze the information available and displays the most important and related metrics.

To get started using Operations Analytics, do either of the following:

- From the **SystemMetaInfo** dashboard, explore information about the collections configured for your IT environment. This information includes, collection names, tags, if any, and the column names stored in each collection. See "View Collection Information" on page 73 for more information.

  Becoming familiar with the data collected is useful to help determine the type of queries you might want to perform. See "Use a Search Query to Define the Context of a Problem or Area to Investigate" on page 109 for more information.

- From the Operations Analytics console, do one of the following:

  - Use the OAEnvironmentOverview dashboard to help determine, at a glance, problem areas to investigate more closely in your IT environment.

    Click 

    to navigate to the **OAEnvironmentOverview** dashboard. See "Using an Operations Analytics Dashboard" on page 76 for more information.

- Enter a search query that defines the context of the problem you are trying to solve. See "Use a Search Query to Define the Context of a Problem or Area to Investigate" on page 109 for more information.
- Select an existing dashboard from the **Dashboards** menu.
- Create a new dashboard by selecting **New** from the **Dashboards** menu.

For more information about getting started with Operations Analytics, see the topics described in Additional Topics that Might be of Interest.

Additional Topics that Might be of Interest

Information	Topic

The dashboards provided by Operations Analytics	"Dashboards Provided by Operations Analytics" on page 102
List of common user tasks	"HP Operations Analytics User Tasks" on page 30

Chapter 2: HP Operations Analytics User Tasks

Operations Analytics enables you to use the rich source of data that is available in your IT environments to generate insights into a problem. For example, you can use Operations Analytics to assist you in the following kinds of tasks:

- Identify and analyze the pattern of problems in your IT environment
- Identify the cause of resource usage problems
- Troubleshoot server and network performance problems
- Identify configuration or inventory changes

To investigate and subsequently resolve IT operations problems, use the iterative process described in the following Common User Tasks table.

Common User Tasks

Task	Description
Create a Dashboard to Begin Your Analysis	To create an Operations Analytics dashboard, do one of the following: • Enter a new search query in the Search Query field. • Create a new dashboard by selecting **New** from the **Dashboards** menu. See "Use a Search Query to Define the Context of a Problem or Area to Investigate" on page 109 for information about the search queries to provide.
Access an Existing Dashboard	To access an existing dashboard, navigate to the **Dashboards** menu and select the dashboard name of interest. See "Dashboards Provided by Operations Analytics" on page 102 for a description of the dashboards provided by Operations Analytics.
"Manage Your Dashboards" on page 263	Operations Analytics enables you to copy, share, unshare, and delete a dashboard that you no longer need from the **Dashboards** menu. **Note:** You can delete only those dashboards you created.

Common User Tasks, continued

Task	Description
"View Collection Information" on page 73	A collection is a set of metrics, topology, inventory, event, or log file data stored as a database table in Operations Analytics. When viewing collection information you can determine the following: • Collection names • Attribute names (database columns) per collection • Tag names, if any, per collection • Tag names, if any, for **metrics**[1] or **attributes**[2] (database columns) stored in the collection. Becoming familiar with the data collected is useful to help determine the type of queries you might want to perform. See "Use a Search Query to Define the Context of a Problem or Area to Investigate" on page 109 for more information.

[1]Typically, measurements stored in a collection. For example, CPU utilization.
[2]Descriptors stored in a collection for an entity, such as host_name.

Common User Tasks, continued

Task	Description
"Use a Search Query to Define the Context of a Problem or Area to Investigate" on page 109	When using Operations Analytics, you first define the context of the problem you are trying to solve. You can choose to use the Phrased Query Language (PQL) and let Operations Analytics guide your search or specify a more flexible and precise search query using the Analytics Query Language (AQL). AQL enables you to be more specific about the data collected as well as about the type of analysis to perform. It also enables you to filter, order or group the results. **Note:** To create a dashboard using AQL queries, use the + to add one or more **query panes**[1]. Operations Analytics does not accept AQL queries in the Search Query field. See "Using an Operations Analytics Dashboard" on page 76 for more information. When guiding your search, Operations Analytics provides suggestions using the following information: • Dashboards that have been saved by you or shared by other members of your user community (Tenant). • Meta data stored with collection information, including tags and metric column names. • Your search history. See "About Phrased Query Suggestions" on page 134 for more information.
"Filter Search Query Results " on page 251	You can filter your results using any of the following methods: • Specify the time range using the time range drop-down menu. • Specify a time range using the time line that appears above the metrics and log file and event information displayed. • Tables only. Use the **Filter** option. • Include a time range in your Analytics Query Language (AQL) query. See "About the Analytics Query Language (AQL) " on page 152 for more information. • Filter the scope of a Phrased Query Language (PQL) query.

[1]Each query pane displays the results of an Analytic Query Language (AQL) query, AQL function, or AQL expression. If you use the Phrased Query Language (PQL) in your search, HP Operations Analytics converts the PQL query to one or more AQL queries and subsequent query panes.

Common User Tasks, continued

Task	Description
"Play Back Search Query Results " on page 253	Play back your search query results using the Playback feature.
"Customize a Dashboard" on page 255	Operations Analytics enables you to customize your dashboard in the following ways: • Customize the window size of your dashboard. **Note:** As you reduce the size of the dashboard, the **query panes**[1] are stacked. • Rearrange a query pane by dragging it to a new location. • Delete a query pane by clicking **x** in the upper right-hand corner of the pane to close the pane and remove it from the dashboard. • Change the label name for a query pane. • Edit the search query. • Add a query pane. • Resize the query pane.
"Save a Dashboard " on page 262	Operations Analytics enables you to save a dashboard and the associated search queries for later use, fine tuning, or both. After a dashboard is saved, you can choose to make the dashboard and its associated queries available for use by other users in your user community (Tenant). See "Manage Your Dashboards" on page 263 for more information.
"Change Your User Account Password" on page 26	Click your user account name to change your password.
Logout	Click your user account name and select Logout.

[1]Each query pane displays the results of an Analytic Query Language (AQL) query, AQL function, or AQL expression. If you use the Phrased Query Language (PQL) in your search, HP Operations Analytics converts the PQL query to one or more AQL queries and subsequent query panes.

Chapter 3: Collection Data Sources

Operations Analytics gathers metrics, topology, inventory, event, and log file data from a diverse set of possible sources.

See the HP Operations Analytics Collection Data Sources table for a description of these possible sources.

Note the following:

- The Operations Analytics administrator configures the collection data sources.
- Operations Analytics data sources marked with an asterisk (*) indicate the data sources for which Operations Analytics provides configuration templates.
- If you are an Operations Analytics administrator, see the *HP Operations Analytics Installation and Configuration Guide* for more information
- For the latest version of HP documentation, see **http://h20230.www2.hp.com/selfsolve/manuals**

Collection Data Sources

Data Source	Details		Metrics	Inventory	Topology	Log	Events
Business Process Monitor (BPM)*	**Description:**	Collects metrics data from HP Business Process Monitor. Click here for examples of the metrics collected by default: • Application • Application_Id • Transaction • Transaction_Id • Location • Location_Id • Status • Transaction_ Response_Time • Transaction_SSL_ Time • Transaction_ Network_Time • Transaction_ BackEnd_Time • Transaction_Client_ Time	✔				
	Required Software:	HP Business Process Monitor (BPM)					

Collection Data Sources, continued

Data Source	Details		Metrics	Inventory	Topology	Log	Events
Custom CSV files	**Description:**	Collects data that resides in a CSV file.	✔	✔	✔	✔	✔
	Required Software:	No requirements. Many applications export data, such as topology and metrics information, into CSV files. In addition, your network administrator might have written customized scripts to export data to CSV files.					

Collection Data Sources, continued

Data Source	Details		Metrics	Inventory	Topology	Log	Events
Log Files	**Description:**	Collects **raw log**[1] file information. **Note:** These log files must be configured in HP ArcSight Logger or Splunk. If you are an Operations Analytics administrator, see the *HP Operations Analytics Installation and Configuration Guide* for more information. Examples of the types of log files that can be configured for use with Operations Analytics include: • syslog • database • applications • network device log files				✔	
	Required Software:	HP ArcSight Logger					

[1]Log files that contain messages as they appear in the log source from which they are collected. These log files must be configured using the log file management software supported by HP Operations Analytics. See the HP Operations Analytics Support Matrix for more information.

Collection Data Sources, continued

Data Source	Details		Metrics	Inventory	Topology	Log	Events
Log Files (Structured)	**Description**:	Collects **structured log** [1] file information. **Note:** These log files must be configured as collections. If you are an Operations Analytics administrator, see the *HP Operations Analytics Installation and Configuration Guide* for more information. Examples of the types of log files that can be configured for use with Operations Analytics include: • syslog • database • applications • network device log files				✔	
	Required Software:	HP Operations Analytics or Splunk					

[1] Fragments of log file data that are stored as collections in HP Operations Analytics. Structured logs are log files that are configured as collections. These collections are created so that users can perform analytics on the log file contents. For example, you might want to query for all outliers by host name and application for a particular time range.

	Required Software:	HP SiteScope					

Chapter 4: View Collection Information

Operations Analytics stores metrics, topology, inventory, log file, and event information in the form of collection tables. Becoming familiar with the data collected is useful to help determine the type of queries you might want to perform. For example, you can include the collection name (AQL search query) or its associated tag name (PQL search query), if any, to return all data from a specified collection. Because each collection is stored as part of a database table, you might also specify a collection column name (for example, cpu_util) to return a subset of data across one or more collections. See "Use a Search Query to Define the Context of a Problem or Area to Investigate" on page 109 for more information.

When viewing collection information, use the mapping described in Column Descriptions for Meta Data Tables to determine the collection information to include in your queries.

Note: As shown in the mapping table, collection tables are also known as property groups. The columns that represent the metrics collected and that store values within these tables are also known as properties. A property can be either an **attribute**[1] or a **metric**[2]. The property groups are uniquely identified by **property group uid** and properties are uniquely identified within a property group by **property uid**. When specifying a collection name or column name in your search query, use the **property group uid** and **property uid** values.

Column Descriptions for Meta Data Tables

Information	Table Column Name Displayed in the Dashboard
Collection names	property group uid
Columns (metrics or attributes) per collection	property uid
Tag names, if any, per collection or column	tag name
Columns defined as keys.	Look for rows in which the iskey value is true

Note: You can also use opsa-tag-manager.sh to view tag information.

To view collection information:

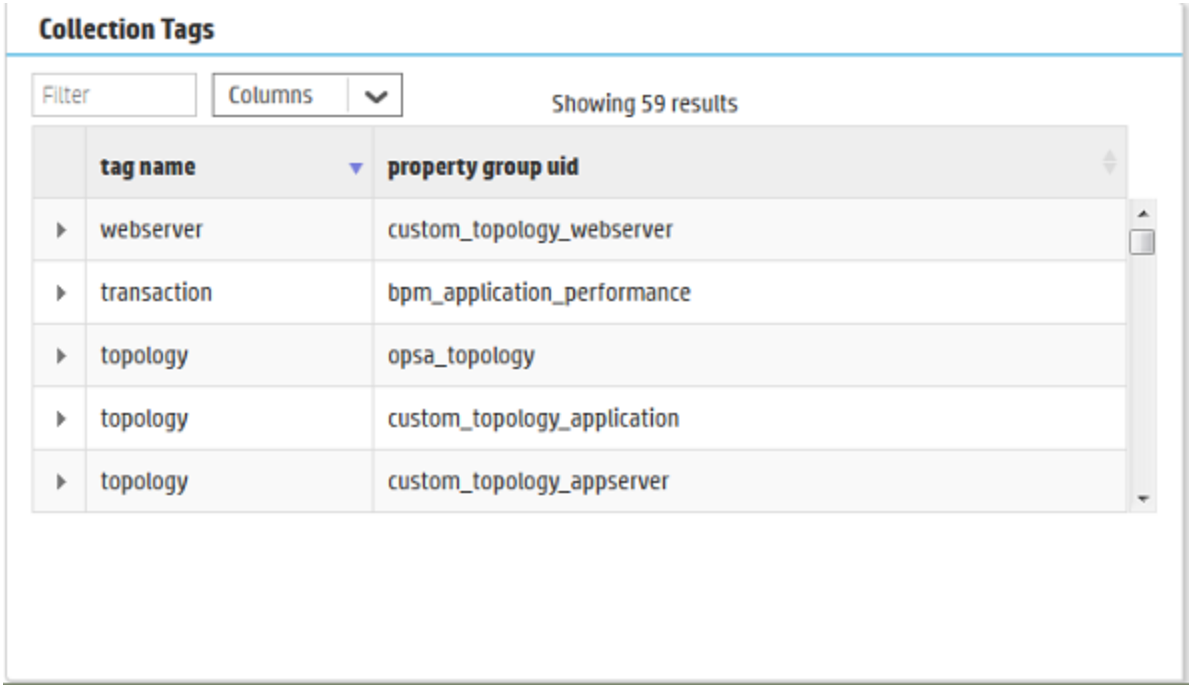
1. Navigate to the **Dashboards** menu.
2. Select **SystemMetaInfo**.

[1]A descriptor stored in a collection for an entity, such as host_name.
[2]Typically a measurement stored in a collection. For example, CPU utilization.

Tip: You can also access this dashboard using the **Show SystemMetaInfo** option when adding or editing a query pane. See "Using an Operations Analytics Dashboard" on page 76 for more information.

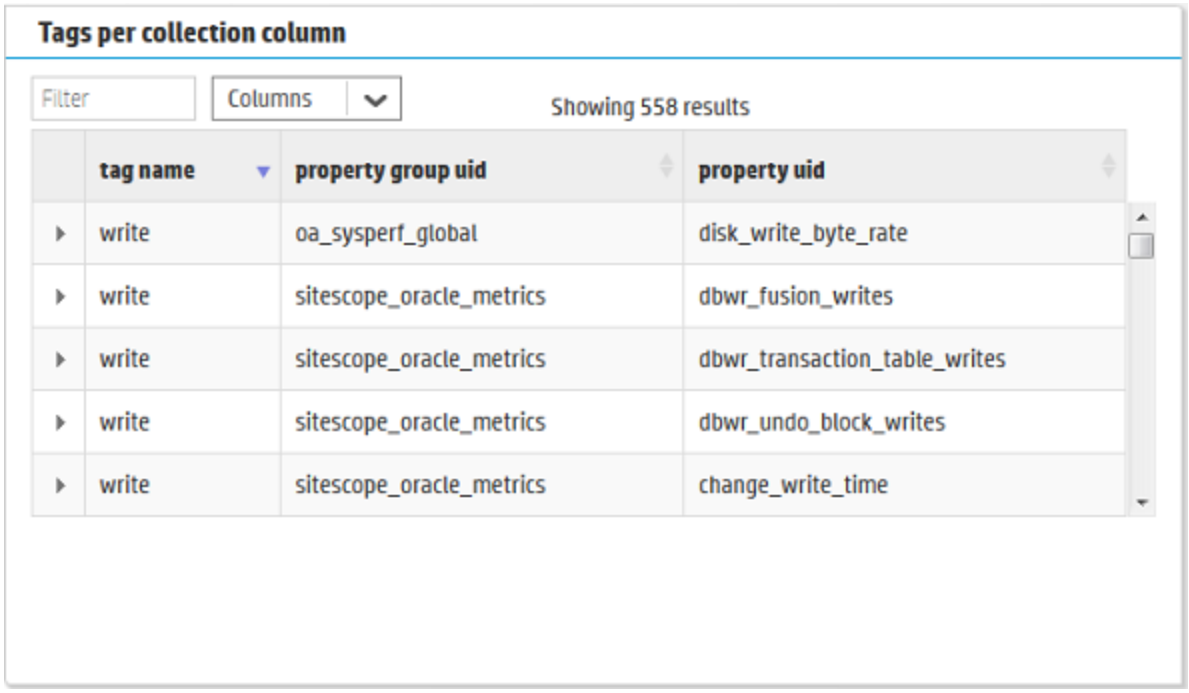
Operations Analytics displays tables that include the following information:

- Tags, if any, assigned to each collection (property group uid):

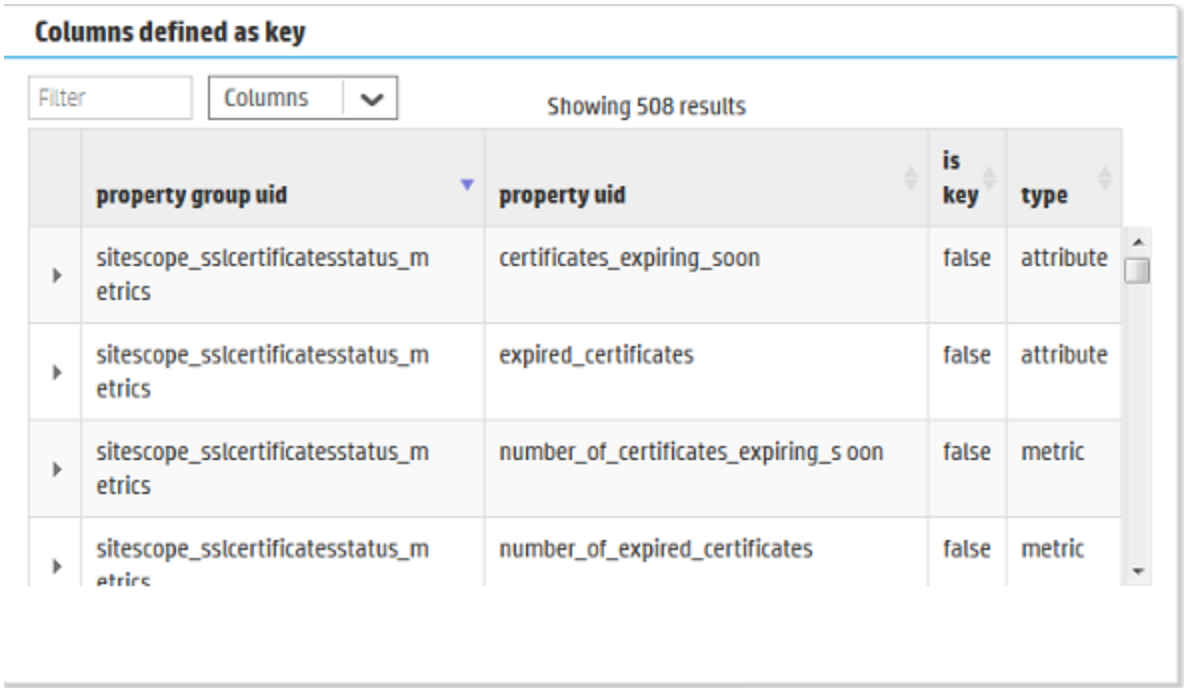


- Tags associated with columns (property uid) within each collection.

Tip: You can also access this table using the **Show Tags** option when adding or editing a query pane. See "Using an Operations Analytics Dashboard" on page 76 for more information.



- Columns that are configured as key columns (iskey) in each collection. Key columns are used to filter metrics across collections.



See "About Table Data" on page 248 for more information about working with tables.

Chapter 5: Using an Operations Analytics Dashboard

An Operations Analytics dashboard is the graphical user interface for troubleshooting your IT operations problems.

To access an Operations Analytics dashboard, do one of the following:

- Enter a new search query in the Search Query field.
- Select an existing dashboard from the **Dashboards** menu.
- Create a new dashboard by selecting **New** from the **Dashboards** menu.

The search query is the starting point for guided troubleshooting. You can provide search queries using either the Operations Analytics Phrased Query Language (PQL) or the more structured and specific query language known as Analytics Query Language (AQL). See "Use a Search Query to Define the Context of a Problem or Area to Investigate" on page 109 for more information.

The data sources from which the data is collected depends on the collections configured by your Operations Analytics administrator. See "Collection Data Sources" on page 34 for more information. You can view this collection information using the **SystemMetaInfo** dashboard. See "View Collection Information" on page 73 for more information.

When using an Operations Analytics dashboard note the following:

- The first time you access Operations Analytics, it displays the **LogsOverview** dashboard. This dashboard lists all of the log messages from the log files that have been configured to be collected in your IT environment. Use this dashboard as a starting point to look for errors that might have occurred.

  See "Dashboards Provided by Operations Analytics" on page 102 for more information about dashboards provided by Operations Analytics.

- Each subsequent time you access Operations Analytics, it returns you to the saved dashboard that you last accessed.

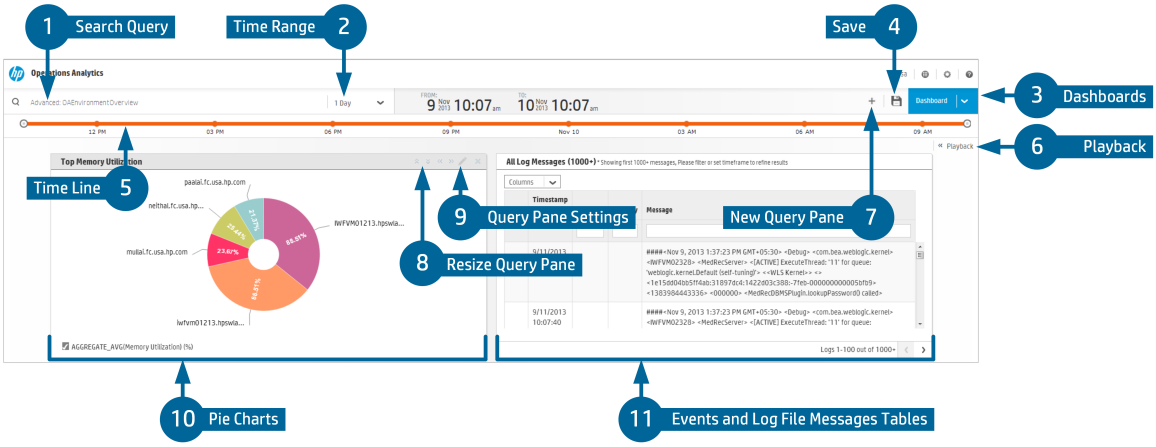
- Results are grouped by query panes. Each query pane represents an Analytic Query Language (AQL) query, an AQL function or an AQL expression.

  Note: If you use Phrased Query Language (PQL), the results might appear in multiple query panes. This is because Operations Analytics translates each PQL query into the required AQL queries before displaying the query results.

- You can customize dashboard results. See "Customize a Dashboard" on page 255 for more information.

Tip: You can use the **Dashboards** menu to select a saved dashboard rather than create your own.

Review the tables below the image for descriptions of the Operations Analytics console and dashboard features that assist you in creating and modifying dashboard results as well as customizing the dashboard layout.



1 Search Query

Dashboard Details

Feature	Details	
1 Search Query	**Description:**	Defines the context for the data you want to examine. Operations Analytics gathers and analyzes the data based on the search query you enter.

Dashboard Details, continued

Feature	Details	
	How to Use:	1. Enter your search query. **Note:** To create a dashboard using AQL queries, use the + to add one or more **query panes**[1]. Operations Analytics does not accept AQL queries in the search query box. See "Using an Operations Analytics Dashboard" on page 76 for more information. As you type, HP Operational Analytics provides a list of suggestions to help define the context of the problem you are trying to get information about. For example: **Tip:** Use the arrows keys to navigate the list of suggestions.  **Tip:** Suggestions are organized using the **Metadata**, **Dashboards**, and **History** categories. See "About Phrased Query Suggestions" on page 134 for more information. 2. *Optional*. Select a Time Range.

[1]Each query pane displays the results of an Analytic Query Language (AQL) query, AQL function, or AQL expression. If you use the Phrased Query Language (PQL) in your search, HP Operations Analytics converts the PQL query to one or more AQL queries and subsequent query panes.

Dashboard Details, continued

Feature	Details	
		Tip: After you select a time range, Operations Analytics executes your search query. 3. If you did not select a time range, press **Enter** or Click to execute your query. See "Use a Search Query to Define the Context of a Problem or Area to Investigate" on page 109 for more information about the search query syntax.

2 Time Range

Dashboard Details

Feature	Details	
2 Time Range	**Description:**	Specifies the time frame within which Operations Analytics should obtain the data to display. Use the Time Range menu to specify the time in hours, days, or months. **Note:** The time range is a historical. It spans the selected time range ending at the current time. Use the **Custom Time** option when you want to specify a start and end date using the Operations Analytics calendar. By default, Operations Analytics uses a time range of 1 Hour.

Dashboard Details, continued

Feature	Details	
	How to Use:	1. In the Time Range menu, click ⌄. 2. Select the time in hours, days, or months.  3. To specify a start and end date using the Operations Analytics calendar, select **Custom Time** . 4. Click the calendar icon to display the calendar for either **Start Time** or **End Time** as shown in the following example.  5. After you have completed selecting your Start Time and End Time Dates, click **Apply**. See "Filter Search Query Results " on page 251 for more information.

3 Dashboards

Dashboard Details

Feature	Details	
3 Dashboards	**Description:**	Lists the following saved dashboards: • Provided by Operations Analytics. • Shared by the users in your user community (tenants). Shared dashboards that have been provided by other members of your user community are appended with the name of the user who provided the dashboard. • Saved by the current user. You can select a dashboard from this list rather than creating your own. See "Save a Dashboard " on page 262 for more information. **Note:** The Dashboards menu also enables you to share, unshare, copy and delete saved dashboards. See "Manage Your Dashboards" on page 263
	How to Use:	Select a dashboard from this list rather than creating your own. To create a dashboard, select **New** . To share, unshare, copy, or delete a dashboard, select **Manage** See "Manage Your Dashboards" on page 263 for more information.

4 Save

Dashboard Details

Feature	Details	
4 Save	**Description:**	Save a dashboard and its associated search queries. **Tip:** Also use **Save** to save changes to **query pane**[1] settings. See "Customize a Dashboard" on page 255 for more information. When saving a dashboard, note the following: • When you Save a dashboard that you own, Operations Analytics overwrites the original dashboard with any changes. • When you Save a shared dashboard that you do not own, Operations Analytics prompts you to save the dashboard using a new name. • To save (Save As...) a dashboard you own using a new name without overwriting your original dashboard, use the **Manage... Copy** option of the **Dashboard** menu before making any changes. See "Manage Your Dashboards" on page 263 for more information.
	How to Use:	1. Click **Save**. 2. If you are creating a new dashboard, Operations Analytics prompts for a **Dashboard Name**. Type a name that describes the dashboard purpose or results. Only alpha-numeric characters and periods (.), plus sign (+), and dashes (-) are permitted, Spaces and other special characters (~ ! @ # $ % ^ &; * ( ) -) are not permitted. **Note:** Do not begin or end a dashboard name with a space. See "Save a Dashboard " on page 262 for more information.

[1]Displays the results of an Analytic Query Language (AQL) query, AQL function, or AQL expression. If you use the Phrased Query Language (PQL) in your search, HP Operations Analytics converts the PQL query to one or more AQL queries and subsequent query panes.

5 Time Line

Dashboard Details

Feature	Details	
5 Time Line	**Description:**	Enables you to filter the time segment for which the data is displayed. This feature is useful when you want to fine tune the Time Range selected.
	How to Use:	To filter your analysis by time segment, slide each end of the time line to the beginning and end point of the time you want to use:  The From and To time changes to match the latest selection:  See "Filter Search Query Results " on page 251for more information.

6 Playback

Dashboard Details

Feature	Details	
6 Playback	**Description:**	Replay Operations Analytics results. This option is useful to help you identify when a problem began to occur. When using this feature, note the following: • Operations Analytics uses the start and end time specified in the time line. • Operations Analytics selects the optimum time segment within the specified start and end time in which to display the results. For example, if the time line specifies 1 day, Operations Analytics might choose a time interval of 1 hour. If the time line specifies 1 hour, Operations Analytics might choose a time interval of 5 minutes. **Note:** If you provide an $interval parameter value in a **query pane**[1], Operations Analytics uses the $interval value you specify for the time segment for only that query pane . See "Using an Operations Analytics Dashboard" on page 76 for more information.

[1]Displays the results of an Analytic Query Language (AQL) query, AQL function, or AQL expression. If you use the Phrased Query Language (PQL) in your search, HP Operations Analytics converts the PQL query to one or more AQL queries and subsequent query panes.

Dashboard Details, continued

Feature	Details	
	How to Use:	1. Click « Playback. 2. Click ▶ (Play). Operations Analytics displays the results using the time interval specified in the time line. As the results are displayed, the following actions occur: ▪ The time interval segment moves along the time line ▪ The time stamp information for each time interval is displayed, as shown in the following example:  3. Click ▶▶ to Fast Forward. 4. Click ◀◀ to Rewind. 5. Click ❚❚ to Pause. 6. Click ◀ to access Reverse Play. See "Play Back Search Query Results " on page 253for more information.

7 New Query Pane

Dashboard Details

Feature	Details	
7 New Query Pane	**Description:**	Enables you to add one or more query panes using one of the following queries: • Analytics Query Language (AQL) • AQL function • AQL expression

Dashboard Details, continued

Feature	Details	
	How to Use:	**To add a new query pane, click** +. In the **NEW PANE** attribute, enter the name of the query pane. Use the **Query** tab to provide the AQL query or AQL function you want to use: 1. Navigate to the **Query** tab. 2. Do one of the following: ▪ Select an AQL function. Enter values for any of the AQL function arguments that apply. Note the following: ○ Your Operations Analytics administrator can provide descriptions for the arguments required for each AQL Function provided. See "Select an AQL Function for a New Query Pane" on page 101 for information about how to view these descriptions. ○ If descriptions are not provided, you can also view the collection information configured for your IT environment. This collection information might also assist you in providing values for the arguments required. Click **Show Tags** to view a new query pane that displays the collections (property group uid), tags (tag name), and columns (property uid) available. Click **Show Properties** to view a new query pane that displays the collections (property group uid), columns (property uid), and whether the column contains **metric**[1] or **attribute**[2] values. Also see "View Collection Information" on page 73 for more information about how to view the meta data stored for your collections. Click here for a brief description of the possible AQL function argument types.

[1]Typically a measurement stored in a collection. For example, CPU utilization.
[2]A descriptor stored in a collection for an entity, such as host_name.

Dashboard Details, continued

Feature	Details	
		AQL Function Argument Types **Argument Type** / **Description** analytic: Specifies an analytic function that can be applied to overall aggregate analytic functions, moving aggregate analytic functions, or raw metrics. These analytic functions include: topN, bottomN, inverse_pctile, pctile, outlier, or rank. See "About Analytic Functions" on page 179 for more information. collection: Specifies the name of the collection for which Operations Analytics should return search results. custom: Indicates that Operations Analytics cannot identify the argument type. Check the description for the AQL function that appears in the Query tab when adding or editing a query pane. Also, check with your Operations Analytics administrator for assistance with providing values for these arguments. entity: Specifies the type of entity attribute on which you want to filter; for example, host_name. filter: Specifies the filter value to use in the `where` clause of the AQL function. For example, when used with host name, you might enter the following filter value to return data for only the servers in the co.usa.enterprise. com domain: `\"*\.co.usa.enterprise.com"`. grouping: Specifies an argument required for the group by clause.

Feature	Details	
		AQL Function Argument Types, continued | Argument Type | Description | | --- | --- | | function | Specify the overall aggregate or moving aggregate analytic function you want Operations Analytics to use. See "Analytic Functions Provided by Operations Analytics" on page 181 for the list of analytic functions provided by Operations Analytics. | | metric | Either of the following: ○ Name of the metric column. ○ Tag that represents the metric column. | | ordering | Specifies an argument required for the `order by` clause. | See "Select an AQL Function for a New Query Pane" on page 101 for more information about selecting AQL functions. ▪ In the **(NEW PANE)** attribute, enter the AQL query, AQL function name, or AQL expression for the new query pane. 3. Navigate to another tab or click **OK**. *Optional*. Use the **Visualization** tab to change the visualization that is displayed. **Note:** If you select a visualization that is not valid for the data displayed, Operations Analytics displays the default visualization for the AQL query. 1. Navigate to the **Visualizations** tab. 2. Navigate to the Visualizations options:  3. Select the visualization you want to use. 4. Navigate to another tab or click **OK**.

Dashboard Details, continued

Feature	Details	
		See "Interpret Dashboard Results" on page 235 for more information about visualizations. Use the **Parameters** tab to provide the parameter values, if any, to the selected AQL function. **Note:** Any parameter value you provide overrides the associated value selected using another method in the Operations Analytics console. For example, if you specify a time interval using the $interval parameter, Operations Analytics uses the value for $interval rather than the time line segment selected. See "Filter Search Query Results " on page 251for more information about time line segments. 1. Navigate to the **Parameters** tab. 2. Provide the parameter values you want to use. **Tip:** Mouse over the parameter of interest to view its description. To restore the parameter values to their original default values, click **Defaults**. 3. Navigate to another tab or click **OK** to save your changes.

8 Resize Query Pane

Dashboard Details

Feature	Details	
8 Resize Query Pane	**Description:**	Enables you to resize the query pane.

Dashboard Details, continued

Feature	Details	
	How to Use:	1. Navigate to the query pane you want to change. 2. Mouse over the top of the query pane. The query pane toolbar appears. 3. Use the query pane toolbar to change the height and width of the query pane.: Operations Analytics increments the height and width settings as described in Resize a Query Pane Options. **Resize a Query Pane Options** **Resize Option** / **Description** Decreases the query pane height in predefined increments. Increases the query pane height in predefined increments. Decreases the query pane width in predefined increments. Increases the query pane width in predefined increments. See "Customize a Dashboard" on page 255 for more information.

9 Query Pane Settings

Dashboard Details

Feature	Details	
9 Query Pane Settings	**Description:**	Enables you to change the following pane settings: • Name of the query pane. • The search query used to create the query pane. • The visualization to display. You can also view the search query that was used to generate each query pane.

Dashboard Details, continued

Feature	Details	
	How to Use:	Click the **Edit Settings** icon in the query pane you want to change. Use the **Query** tab to provide the AQL query or AQL function you want to use: 1. Navigate to the **Query** tab. 2. Do one of the following: ▪ Select an AQL function. Enter values for any of the following AQL function arguments that apply. Note the following: ○ Your Operations Analytics administrator can provide descriptions for the arguments required for each AQL Function provided. See "Select an AQL Function for a New Query Pane" on page 101 for information about how to view these descriptions. ○ If descriptions are not provided, you can also view the collection information configured for your IT environment. This collection information might also assist you in providing values for the arguments required. Click **Show Tags** to view a new query pane that displays the collections (property group uid), tags (tag name), and columns (property uid) available. Click **Show Properties** to view a new query pane that displays the collections (property group uid), columns (property uid), and whether the column contains **metric**[1] or **attribute**[2] values. Also see "View Collection Information" on page 73 for more information about how to view the meta data stored for your collections. Click here for a brief description of the possible AQL function argument types.

[1]Typically a measurement stored in a collection. For example, CPU utilization.
[2]A descriptor stored in a collection for an entity, such as host_name.

Provide the parameters you want to use. **Tip:** Mouse over the parameter of interest to view its description. To restore the parameter values to their original default values, click **Defaults**. 3. Navigate to another tab or click **OK** to save your changes. .

Click each visualization for information about visualizations that might be displayed.

10 Pie Charts

Dashboard Visualizations

Visualization	Details	
10 Pie Charts	**Description:**	Operations Analytics presents aggregate data as bar charts, pie charts, sunburst charts, or heat maps. Aggregate data is data that is grouped by total, average, minimum, or maximum values within a specified time range. For example, you might want to view the total number of log messages generated by each host within a specified domain within the last hour. Aggregate data might also be displayed for a specified time interval within a time range. You can also use heat map, line charts, bar charts, and pie charts to visualize time series data. Time series data is data that displayed according to a time interval within a specified time range. This data might include actual metric values or total, average, minimum, or maximum values calculated at each interval over the specified time range. For example, you might want to view CPU utilization for each unique host in a specified domain at 1 hour intervals for the last 24 hours.
	How to Use:	To access more details for a pie segment, mouse over the pie segment of interest. See "About Pie Charts" on page 245 for more information.

11 Events and Log File Messages Tables

Dashboard Visualizations

Visualization	Details	
11 Events and Log File Messages Tables	**Description:**	Displays the events and log file messages that are related to your search query and that have occurred within the specified time range. **Note:** Operations Analytics displays log file information in table format by default.

Dashboard Visualizations, continued

Line Charts or Bar Charts

Dashboard Visualizations

Visualization	Details	
Line Charts or Bar Charts	**Description:**	Operations Analytics presents aggregate data as heat maps, line charts, bar charts, and pie charts. Aggregate data is data that is grouped by total, average, minimum, or maximum values within a specified time range. For example, you might want to view the total number of log messages generated by each host within a specified domain within the last hour. You can also use heat map, line charts, bar charts, and pie charts to visualize time series data. Time series data is data that displayed according to a time interval within a specified time range. This data might include actual metric values or total, average, minimum, or maximum values calculated at each interval over the specified time range. For example, you might want to view CPU utilization for each unique hosts in a specified domain at 1 hour intervals for the last 24 hours. **Note:** Operations Analyticsdisplays time series information in line chart format by default. See "Analytic Functions Provided by Operations Analytics" on page 181 for more information about aggregate functions that can be used in your AQL queries.

Dashboard Visualizations, continued

Visualization	Details	
	How to Use:	For each query pane, you can perform the tasks described in the Working with Metric Results table. **Working with Metric Results** **Task** / **How** View a data value at a particular point in time. — Mouse over the data point of interest. Operations Analytics displays the value for the point in time you select. View additional results. — Click › and ‹ to page through the data returned.

Heat Maps

Dashboard Visualizations

Visualization	Details	
Heat Maps	**Description:**	Operations Analytics presents aggregate data as heat maps, line charts, bar charts, and pie charts. Aggregate data is data that is grouped by total, average, minimum, or maximum values within a specified time range. For example, you might want to view the total number of log messages generated by each host within a specified domain within the last hour. You can also use heat map, line charts, bar charts, and pie charts to visualize time series data. Time series data is data that displayed according to a time interval within a specified time range. This data might include actual metric values or total, average, minimum, or maximum values calculated at each interval over the specified time range. For example, you might want to view CPU utilization for each unique hosts in a specified domain at 1 hour intervals for the last 24 hours. **Note:** Operations Analytics displays aggregate information in heat map format by default. See "Analytic Functions Provided by Operations Analytics" on page 181 for more information about aggregate functions that can be used in your Analytic Query Language (AQL) search queries.

Dashboard Visualizations, continued

Visualization	Details	
	How to Use:	For each metrics heat map results query pane, you can perform the tasks described in the Working with Metrics Heat Map Results table. **Note:** See the legend for the colors used to indicate the metrics value ranges. **Working with Metrics Heat Map Results** **Task** / **How** View a data value at a particular point in time in a line chart or heat map. / Mouse over the data point of interest. Operations Analytics displays the value for the point in time you select. View additional results. / Click › and ‹ to page through the data returned. See "About Heat Maps" on page 238 for more information.

Sunburst Charts

Dashboard Visualizations

Visualization	Details	
Sunburst Charts	**Description:**	Sunburst charts display the relationship among topology data items. For example, a sunburst chart might show the relationship among servers for an application, including the servers on which the application reside and metrics for each of those servers. To show these relationships, a sunburst chart is organized using a tree relationship, starting with a the center, which is the root, moving out to include children and leaf nodes. **Note:** Operations Analytics displays topology information in sunburst chart format by default.

Dashboard Visualizations, continued

Visualization	Details	
	How to Use:	To access more details for a segment of the sunburst chart, mouse over the sunburst segment of interest. To zoom in on a section in the sunburst chart, click the sunburst chart segment of interest until you are viewing only the segment or segments of interest. To return the sunburst chart to its original detail level, click the center of the sunburst chart until it returns to its initial image. See "About Sunburst revuewCharts" on page 246 for more information.

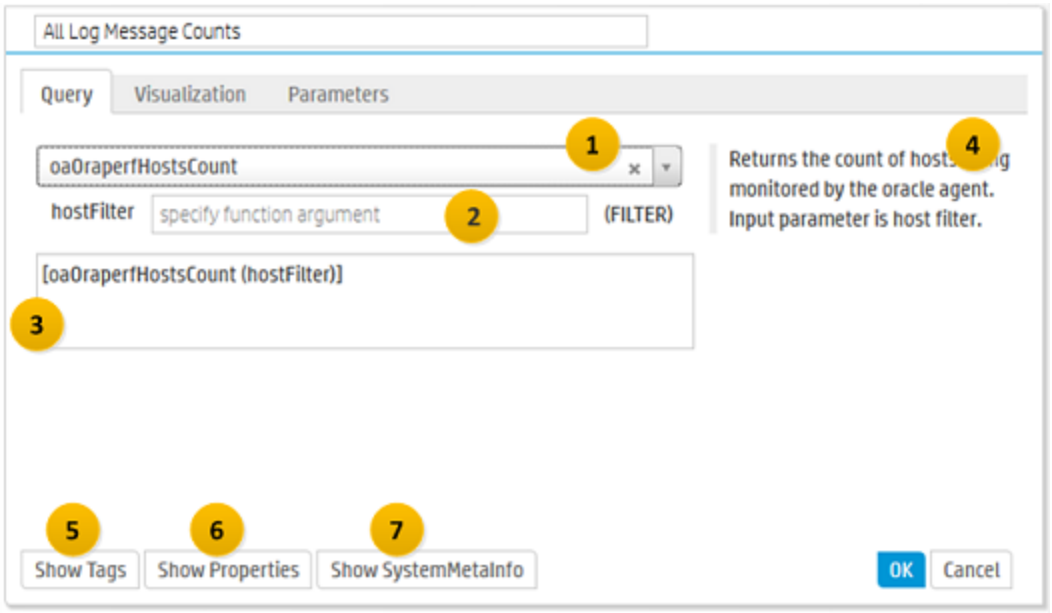
Select an AQL Function for a New Query Pane

When adding a new query pane, you can use the **Query** tab to specify the pre-defined AQL function you want to use as your search query.

The following illustration highlights the main features of the Query tab.

Note: You can also choose to enter your own AQL query. If you want to use an AQL function, either select one from the list or create the function using a text editor. See "Define Analytic Query Language (AQL) Functions" on page 283 for more information.

Click each number for information about a feature.



Dashboards Provided by Operations Analytics

Operations Analytics provides the dashboards described in Dashboards Provided by Operations Analytics.

To access a dashboard provided by Operations Analytics:

1. Navigate to the **Dashboards** menu
2. Select the dashboard name of interest.

Note: The names of shared dashboards are appended with the name of the user who created the dashboard.

Note the following about dashboards provided by Operations Analytics:

- Only a user assigned to the Tenant Admin user group can change a dashboard provided by Operations Analytics. See "About User Groups" on page 272 and opsa-tenant-manager.sh for more information about the Tenant Admin user group.
- To save a dashboard provided by Operations Analytics, make your changes and click Save to rename the dashboard.

  Note: Do not save a dashboard that Operations Analytics provides using the same name.

- Each time you enter a Phrased Query Language (PQL) query that is not a dashboard name, Operations Analytics displays the default visualizations for the metrics, topology, inventory, event, and log file information available in response to your search query. To change the results, see "Customize a Dashboard" on page 255. See "Interpret Dashboard Results" on page 235 for more information about default visualizations.
- If a search query results in too many instances to display, Operations Analytics uses the query to return log file messages matching any phrases in the search query. See "Refine Your Search Query " on page 151for more information.
- If no tags, metrics or dashboards match the query, Operations Analytics returns log file messages matching any phrases in the search query.
- If a search query does not return results, Operations Analytics displays the message that no matches could be found.
- Also see "Using an Operations Analytics Dashboard" on page 76 for more information about using dashboards.

Dashboards Provided by Operations Analytics

Name	Description
Apache Logs	**Note:** This dashboard is available only if you have installed the *Apache HTTP Server Access File* and *Apache HTTP Server Error File* SmartConnectors provided by HP ArcSight Logger. SmartConnectors are not included as part of Operations Analytics. Displays the following information. Information for access log and error log are displayed next to each other: • Log messages count over time • Log messages count by severity • Top 10 hosts with failure messages • Total errors per host • Log messages
BPMDashboard	**Note:** See "Configuring an HP Business Process Monitor Collection" in the HP Operations Analytics Installation and Configuration Guide for the configuration steps required to display this dashboard information. Use the BPMDashboard to view the following: • Application Availability Over Time The heat map value in this dashboard is the number of failed transactions. • Application Performance Over Time • Application Layer Performance Over Time • Top 10 Transactions Performance • Top 10 Locations Performance

Dashboards Provided by Operations Analytics, continued

Name	Description
Linux Logs	**Note:** This dashboard is available only if you have installed the *Linux Audit File* and *Linux Syslog File* SmartConnectors provided by HP ArcSight Logger. SmartConnectors are not included as part of Operations Analytics. Displays the following information. Information is calculated per host. • Log messages count over time • Log messages count by severity • Top 10 hosts with failure messages • Top 10 log message categories • Log messages
LogsOverview	**Note:** See "Installing and Configuring HP ArcSight Logger" in the HP Operations Analytics Installation and Configuration Guide for the configuration steps required to display this dashboard information. Displayed by default when you initially log on to Operations Analytics. This dashboard provides an overview of the following information for the log messages in your IT environment: • Log Messages Count Over Time - All • Log Messages Count Over Time - Syslog Only • Log Messages - All • Log Messages - Syslog Only

Dashboards Provided by Operations Analytics, continued

Name	Description
NNMiSPINetworkOverview	Displays the following information: • Top 10 Network Interfaces with Utilization Out • Top 10 Network Interfaces with Error Percentage • Top 10 network interfaces based on highest error percentages • Top 10 network interfaces based on highest in and out throughput • Top 10 network devices based on highest CPU utilization • Top 10 network devices based on highest memory utilization • Top 10 unavailable nodes • Top 10 network devices based on highest SNMP response times
OAEnvironmentOverview	**Note:** See "Configuring an HP Operations Agent Collection" in the HP Operations Analytics Installation and Configuration Guide for the configuration steps required to display this dashboard information. This dashboard provides an overview of the following information for the hosts in your IT environment: • Top 5 CPU utilization (cpu_util) • Top 5 disk utilization (disk_io_rate) • Top 5 memory utilization (mem_util) • Top 5 network utilization (net_packet_rate) Use this dashboard to help determine, at a glance, problem areas to investigate more closely in your network environment. To return to this dashboard, click  .

Name	Description
OMEventDashboard	**Note:** See "Configuring an HP Operations Manager (HPOM) Events Collection" in the HP Operations Analytics Installation and Configuration Guide for the configuration steps required to display this dashboard information. Use the OMEventDashboard to view the following information: • Event Count Over Time • Top 10 Hosts with Event Count Over Time • Event Count by Host - Current Week • Event Count by Host - Previous Week • Event Count by Severity - Current Week • Event Count by Severity - Previous Week • Table of the first 500 OM events

Dashboards Provided by Operations Analytics, continued

Name	Description
OMiEventDashboard	**Note:** See "Configuring an HP Operations Manager (OMi) Events Collection" in the HP Operations Analytics Installation and Configuration Guide for the configuration steps required to display this dashboard information. Use the OMiEventDashboard to view the following information: • Total count of the OMi events over time • Percentage of OMi events by host • Total count of OMi events by State • Top hosts that have highest number of OMi events • Percentage of OMi events by application • Event count by the host • Event count by host from the previous week • Event count by severity • Event count by severity from the previous week • Table of the first 500 OMi events
OpsaSystemHealth	**Note:** See "Checking Operations Analytics System Health" in the HP Operations Analytics Installation and Configuration Guide for the configuration steps required to display this dashboard information. Displays the metrics, topology, and log information available for the following Operations Analytics servers and appliances: • Operations Analytics Collector Appliance • Operations Analytics Server Appliance • List of configured collections that OpsA is collecting data for. This dashboard provides current details about Operations Analytics system health. See "Check the Health of Operations Analytics" on page 285 for more information.

Dashboards Provided by Operations Analytics, continued

Name	Description
SiteScope	Displays the following information monitored by SiteScope: • Top CPU Utilization • Top Disk Utilization • Top Memory Utilization • Ping Roundtrip Time Over Time • URL Content Roundtrip Time Over Time • JMX Physical Memory Over Time
SystemMetaInfo	Displays the following information for the collections in your IT environment: • Collections and any tags for each collection • Columns (metrics) per collection and tag names per column • Columns defined as keys. See "View Collection Information" on page 73 for more information.
Windows Logs	**Note:** This dashboard is available only if you have installed the *Microsoft Windows Event Log - Local* SmartConnector provided by HP ArcSight Logger. SmartConnectors are not included as part of Operations Analytics. Displays the following information. Information is calculated per host. • Log messages count over time • Log messages count by severity • Top 10 log message categories • Top 10 hosts with failure messages • Log messages

Chapter 6: Use a Search Query to Define the Context of a Problem or Area to Investigate

To use Operations Analytics, you must first define the context of the problem or area for which you want information. To do so, use the Search Query field. Operations Analytics then uses the search query you specify to determine the related metrics, topology, inventory, event, and log file information to display.

Tip: You can also view information in an existing dashboard without entering a search query. To do so, select a dashboard from the **Dashboards** menu. The **Dashboards** menu lists the dashboards that are provided by Operations Analytics and that have been saved by you or shared by other users in your user community (Tenant). See "Dashboards Provided by Operations Analytics" on page 102 for more information.

You can take any of the following approaches to your search query:

- **Phrased Query Language (PQL)**:

  PQL is a more natural search language that uses phrases to define your search. You must select or enter PQL in the Search Query field. Each PQL query results in a dashboard that is comprised of one or more **query panes**[1].

  Use this search as a starting points for troubleshooting a problem or investigating your environment.

  Use the list of suggestions provided by Operations Analytics for guidance.

  Operations Analytics provides suggested searches based on the Phrased Query Language described in "Elements in a Phrased Query (for Metrics)" on page 138.

  See "About Guided Search (PQL)" on page 127 and "About the Phrased Query Language (PQL)" on page 131 for more information.

- **Analytics Query Language** (**AQL**):

  AQL is a more structured query language. It requires a specific syntax and results in a single query pane. Each query pane contains a visualization (for example, line chart, pie chart, heat map, bar chart, or sunburst chart) of the data returned.

  Use the Operations Analytics AQL, when the Phrased Query Language syntax is not specific enough to return the data you need. It is also useful when you want to perform more detailed queries. When using the more flexible, but more complex AQL, it is helpful if you have some

[1] Each query pane displays the results of an Analytic Query Language (AQL) query, AQL function, or AQL expression. If you use the Phrased Query Language (PQL) in your search, HP Operations Analytics converts the PQL query to one or more AQL queries and subsequent query panes.

knowledge of databases and are familiar with the data that is being collected by Operations Analytics. See "About the Analytics Query Language (AQL) " on page 152 for more information.

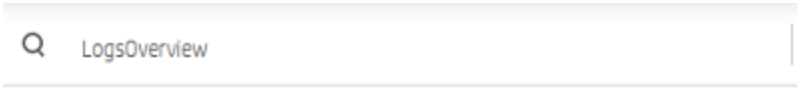
Note: Any PQL search that you use to create a dashboard is converted to one or more Analytics Query Language (AQL) queries.

Tip: The best way to start using AQL is to edit the AQL query that has been used to create an existing query pane. You can view the associated AQL query for any dashboard query pane by editing the query pane. When editing a query pane you can also select an Analytic Function that contains one or more AQL queries. See "Customize a Dashboard" on page 255 for more information.

Note: Operations Analytics does not accept AQL queries in the Search Query field. To create a dashboard using AQL queries, use + to add one or more **query panes**[1]. See "Using an Operations Analytics Dashboard" on page 76 and "About the Analytics Query Language (AQL) " on page 152for more information.

To enter a search query:

1. Navigate to the Search Query field:



2. Do one of the following:

[1]Each query pane displays the results of an Analytic Query Language (AQL) query, AQL function, or AQL expression. If you use the Phrased Query Language (PQL) in your search, HP Operations Analytics converts the PQL query to one or more AQL queries and subsequent query panes.

- Start with an entity.

  i. Place your cursor in the Search Query field.

  Operations Analytics displays a list of possible queries for the entity selected.

  Tip: Use the arrows keys to navigate the list of suggestions.

  ii. Select an entity from the list of options:

  iii. Each time you select a suggested query, press the space bar to view the next set of possible queries..

  iv. Continue this process until your query is complete.

- Start typing.

  i. Place your cursor in the search field and select **Start typing** from the list of options:

  
  Note: Using the meta data available, Operations Analytics provides up to 15 suggestions per query. Operations Analytics also lists up to five suggestions from your Search History.

  See "About Phrased Query Suggestions" on page 134 for more information.

  ii. Do one of the following:

    i. Select from the list of suggestions.

    Press the space bar to continue to view suggestions.

    ii. Type a word or phrase.

    As you type, Operations Analytics provides a list of suggested phrases to continue to define possible queries.

  iii. Continue selecting a suggestion or typing a word or phrase until you find or enter the query that best matches the information you want to view.

3. *Optional*. Select a time range from the menu. The default time range is 1 Hour. See "Filter Search Query Results " on page 251 for more information.

   Tip: Selecting a time range also executes your search query. See "Using an Operations Analytics Dashboard" on page 76 for more information.

4. Press **[Enter]** to execute your query.

Operations Analytics adds the completed search query to your search history for later suggestions.

Note: If a search query results in too many instances to display, Operations Analytics uses the query to return log file messages matching any phrases in the search query. See "Refine Your Search Query " on page 151for more information.

Operations Analytics uses its default dashboard layout and populates the dashboard with the data requested by your search.

See "Using an Operations Analytics Dashboard" on page 76 for more information about using the Operations Analytics dashboards.

Determine the Search Approach to Use

To use Operations Analytics, you define the context of the problem or area for which you want information. To do so, use the Search Query field to select or enter a search query. Operations Analytics then uses the search query you specify to determine the related metrics, topology, inventory, event, and log file information to display.

Tip: To view information in an existing dashboard without entering a search query, select a dashboard from the **Dashboards** menu. The **Dashboards** menu lists the dashboards that are provided by Operations Analytics and that have been saved by you or shared by other users in your user community (Tenant). See "Dashboards Provided by Operations Analytics" on page 102 for more information.

Operations Analytics offers multiple ways for you to search your data. Decide Which Search to Use describes ways to decide which search is best for your needs.

Note: You cannot use the Analytics Query Language (AQL) in the Search Query field. To use AQL, click + to add a new query pane to your dashboard.

Decide Which Search to Use

When you want to...	Use this...	How to Get Started...	For More Information
You are using Operations Analytics for the first time	PQL	1. Place your cursor in the Search Query field:  You should view the following options:  2. Select the option that best describes the entity might be related to the area you want to investigate. **Tip:** Select **Advanced** only if you do not know the entity for which you want information.	"About Guided Search (PQL)" on page 127

Decide Which Search to Use, continued

When you want to...	Use this...	How to Get Started...	For More Information
You know the problem is related to a host, service, application, or database	PQL	1. Place your cursor in the Search Query field:  2. Select an entity (**Host**, **Service**, **Application**, **Database**) that might be related to the area you want to investigate.	"About Guided Search (PQL)" on page 127

Decide Which Search to Use, continued

When you want to...	Use this...	How to Get Started...	For More Information
You want to view information about a service; for example the topology relationships among servers for a service	PQL	1. In the Search Query field menu, select **Service**:  2. Select the suggestion that includes the service name. 3. Continue to select the suggestions that best describes the service information you want to view.	"Define a Service Using Topology Manager" on page 281 "About the Phrased Query Language (PQL)" on page 131 "Elements in a Phrased Query (for Metrics)" on page 138

About Guided Search (PQL)

Use the Guided Search approach to the Operations Analytics Phrased Query Language (PQL) in the early stages of troubleshooting a problem or investigating your IT environment.. With this approach, place the cursor in the Search Query field and let Operations Analytics guide your search.

When using Guided Search you need to understand the following concepts:

Collection

Operations Analytics stores metrics, topology, inventory, log file, and event information in the form of collections. Each collection is associated with a database table in which an Operations Analytics Collector stores the data collected.

Data is stored in a collection as either a metric or an attribute.

Each collection is associated with one or more tags.

Metric

A metric is a measurement stored in a collection; for example, disk_write_byte_rate.

Key Column

A column in a collection table that is considered to uniquely identify an entity can be configured as a key column. Operations Analytics recognizes values that reside in a key column in a PQL search. When using Guided Search, any value listed as a suggestion is either a metric value that resides in a key column, a column name or a tag.

Attribute

An attribute is a descriptor stored in a collection for an entity, such as host_name.

Tag

A tag is a word that is associated with a collection or with a metric or attribute that is stored as part of a collection.

Tags are used in the Operations Analytics Phrased Query Language (PQL) to create an Operations Analytics dashboard. They help to define the following:

Note: Tags are not limited to these example uses.

- Entities for which you want information, such as **host**, **database**, and **application**
- Hardware and software components, such as **cpu**, **memory**, **disk**, **interface**, **tablespace**, **process**, and **threads**
- Metrics or problem areas, such as **utilization**, **availability**, **performance**, and **change**

See "About Tags" on page 267 for more information.

Service

Your Operations Analytics administrator might have configured one or more services using the Topology Manager.

When a service is configured, the Operations Analytics administrator specifies the groups that are included in the service. These groups, can include any of the following entities:

- application servers
- database servers
- web servers
- other groups; for example, based on location

You can select a Guided Search entry that queries information on an entire service, on a single group of a service, or on a particular instance (for example, database instance) that is associated with a service.

See "Searching for a Service Defined in Topology Manager" on page 150 for more information.

Using Guided Search can be a one- to two-step process.

Step One: Select the entity for which you want information. See Entity Descriptions.

1. Place your cursor in the Search Query field.
2. Select an entity from the list of suggestions.

   Entity Descriptions

Entity	Description
Host	Select **Host** when you want to return information about a specific host in your IT environment. In response, Operations Analytics provides a list of the hosts for which it has collected information.
Service	**Note:** To use this option, your Operations Analytics administrator must have configured one or more services using the Topology Manager. See "Define a Service Using Topology Manager" on page 281 for more information. Select **Service** when you want to view information about one of your services. You can select a Guided Search entry that queries information on an entire service, on a single group of a service, or on a particular instance (for example, database instance) that is associated with a service.
Application	Select **Application** when you want to view information about an application. For example, a user group might have reported that an application has slow response times.
Database	Select **Database** when you suspect a problem is associated with a database, database server, or when you want to view information about one or more database servers in your IT environment.

3. Press the space bar to view suggestions to continue your search.

   Operations Analytics suggests the names of the first 15 hosts for which information is available.

   Note: You can choose to press Enter at any time to view the results. If a search query

results in too many instances to display, Operations Analytics uses the query to return log file messages matching any phrases in the search query. See "Refine Your Search Query " on page 151for more information.

Step Two: Narrow Your Search (Select Drill to: or Focus on:)

Narrowing your search can be an iterative process. Each subsequent list of suggestions further limits the information returned.

Tip: If you do not want to narrow your search, select **All** to return all of the data available for the entity selected.

Operations Analytics provides two ways to narrow your search: **Drill to:** and **Focus on:**. See Narrow Your Guided Search.

Narrow Your Guided Search

Suggestion	Description
Drill to:	Applies to **Service** only. **Note:** Your Operations Analytics administrator must have configured one or more services using the Topology Manager. When a service is configured, the Operations Analytics administrator specifies each group that is included in the service. See "Define a Service Using Topology Manager" on page 281 for more information. Use **Drill to**: when you want to filter your query using topology information. For example, you can narrow your search using a host name that is configured for the service you selected.
Focus on:	Applies to **Host**, **Application**, and **Database** only. Use **Focus on:** when you want to narrow your search using a tag . Use the **SystemMetaInfo** dashboard to view the tags available in your IT environment. See "View Collection Information" on page 73 for more information.

Operations Analytics adds the completed search query to your search history for later suggestions.

Note: If a search query results in too many instances to display, Operations Analytics uses the query to return log file messages matching any phrases in the search query. See "Refine Your Search Query " on page 151for more information.

The results of each phrased query is an Operations Analytics dashboard. Operations Analytics uses its default dashboard layout and populates the dashboard with the data requested by your search. See "Using an Operations Analytics Dashboard" on page 76 for more information.

About the Phrased Query Language (PQL)

Use Phrased Query Language (PQL) in the early stages of troubleshooting a problem or investigating your IT environment.

Note: To access the PQL described in this topic, select **Start typing:** from the Search Query field options and type a word or phrase that begins to describe the type of problem you want to resolve or the area you want to investigate. Use the list of suggestions provided by Operations Analytics for guidance to continue typing or select from the list of suggestions.

The Operations Analytics Phrased Query Language (PQL) dynamically incorporates the information described in the PQL Suggestions table to guide you as you define the context of the problem you are trying to solve.

Note: Operations Analytics organizes suggestions by category. See PQLSuggestions for possible categories.

PQL Suggestions

Suggestion Types	Provided by
Text strings used to identify either a collection or specific metric or attribute. These text strings are known as tags.	Operations Analytics and your Operations Analytics administrator
Text strings that represent column names. For example, you might want Operations Analytics to return all values for **cpu_util** for a specified host. **Note:** Precede any column name with the tag of interest. See "Filter the Scope of a Phrased Query Language (PQL) Query " on page 146 for more information.	Operations Analytics and your Operations Analytics administrator

PQL Suggestions, continued

Suggestion Types	Provided by
Text strings that are values for columns defined as keys. Operations Analytics uses columns defined as keys to understand topology relationship across collections. These suggestions use the following syntax: withkey <*key_column_value_1*>, <*key_column_value_2*>,<*key_column_value_3*> When selecting key column values in your search, note the following: • Up to three key column values can be included in each **withkey** combination for a single query. For example, both of the following queries are valid: **withkey myhost.enterprise.com, oracledbhost1, private** **withkey host1,instance1 withkey state1** When you enter a query that includes multiple column values Operations Analytics displays information for only those records (rows) that match all values. Using the first example, Operations Analytics returns the data requested for any record (row) that includes both **myhost.enterprise,com** and **oraclehost1** and **private**. • A key column value that includes spaces is enclosed in quotes; for example: **withkey "my instance1"** • A key column value that includes an asterisk is defining a pattern for which Operations Analytics should search. It is most useful for defining a host name pattern. For example, the following key column value finds all host names that include **enterprise**: **withkey *enterprise** • A single query can contain column values that include quotes, do not include quotes, or that include both types of values; for example: **withkey oracledbhost, "my instance"** See "About Keys and Link Tags" on page 270 and "Filter the Scope of a Phrased Query Language (PQL) Query " on page 146for more information.	Operations Analytics and your Operations Analytics administrator

PQL Suggestions, continued

Suggestion Types	Provided by
When querying for topology service information, you can also use key column values to narrow your search to return information for only a specified group or a specified instance within a group. To do so, use the **filtering** keyword as shown in the following syntax: service withkey <*service_name*> filtering <*node_grouptier_tag*> withkey <*group_name_value*> The following example returns all information for MyService1: **service withkey MyService1** The following example returns all information for the group configured for MyService1: **service withkey MyService1 filtering groups** The following example returns the related groups information for only the instance named **groupName1**: **service withkey MyService1 filtering groups withkey groupName1** See "About Keys and Link Tags" on page 270, Using the Phrased Query Language (PQL) with Custom Topology Collections and "Filter the Scope of a Phrased Query Language (PQL) Query " on page 146for more information.	Operations Analytics and your Operations Analytics administrator
Search history **Note:** When using your search history, Operations Analytics orders the suggestions according to historical frequency. For example, searches that have been entered more often and more recently, appear closer to the top of the list.	The Operations Analytics user community (Tenant)

See Suggestion Categories for the maximum number of suggestions that Operations Analytics displays per category.

Suggestion Categories

Category	Maximum Number of Suggestions
Metadata	15
Search History	5

See "About Phrased Query Suggestions" on the next page for more information.

Click here for information about how Operations Analytics is able to provide suggestions.

Each time you press [**Enter**] to execute a search query, Operations Analytics does the following:

Tip: Selecting a time range also executes your search query. See "Using an Operations

Analytics Dashboard" on page 76 for more information.

- Stores your search history.
- Uses the meta data information stored about the metrics, topology, inventory, event, log files, and tags to understand and identify patterns, including synonyms. For example, if Oracle, db, and database are valid entries in the meta data information, Operations Analytics recognizes each of the following search query entries and determines you want to obtain information about one or more Oracle databases: `oracle`, `oracles`, `db`, or `database`.

The results of each phrased query is an Operations Analytics dashboard. See "Using an Operations Analytics Dashboard" on page 76 for more information.

For more information about PQL, see the topics described in the following table.

Examples of phrased queries mapped to a possible task and the type of results to expect for each.	"Phrased Query Examples" on page 148

About Phrased Query Suggestions

When you begin to type a Phrased Query Language (PQL) search query, Operations Analytics dynamically incorporates the meta data and search history information available to guide you as you type.

Note: To access the PQL suggestions described in this topic, select **Start typing:** from the Search Query field options and type a word or phrase that begins to describe the type of problem you want to resolve or the area you want to investigate. Use the list of suggestions provided by Operations Analytics for guidance to continue typing or select from the list of suggestions.

Click each suggestion category for more information.

Note: As you type, Operations Analytics finds the character sequence anywhere within the

possible suggestions list. Only suggestions that narrow your search are displayed. For complete PQL search queries, see PQL Example Queries (for Metrics) and "Phrased Query Examples" on page 148.

Meta Data

Operations Analytics also tries to match your query to meta data using the methods described in the following **Meta Data Suggestions** table.

Note: Operations Analytics stores metrics, topology, inventory, log file, and event information in the form of collection tables. These collection tables are also known as property groups. The columns that represent the metrics collected and that store values within these tables are also known as properties. A property can be either an **attribute**[1] or a **metric**[2].

Meta Data Suggestions

Suggestions	Description	Example Phrases
Column names	Operations Analytics looks for any column names that begin with the phrase you specify.	If you type **util**, Operations Analytics looks for any column name that includes **util** (for example, **cpu_util** and **mem_util**). If you use a column name, Operations Analytics also checks for topology relationships. See **Column values** in this table.
Tags associated with collections or collection columns (**metrics**[3] or **attributes**[4])	Operations Analytics looks for any tags associated with collection or column names that begin with the phrase you specify.	If you enter the character string **perf,** Operations Analytics suggestions include any tag combinations that include **perf** (for example, **performance** and **network performance**).

[1]A descriptor stored in a collection for an entity, such as host_name.
[2]Typically a measurement stored in a collection. For example, CPU utilization.
[3]Typically, measurements stored in a collection. For example, CPU utilization.
[4]Descriptors stored in a collection for an entity, such as host_name.

Meta Data Suggestions, continued

Suggestions	Description	Example Phrases
Column values	Operations Analytics looks for the value in the key columns for each applicable collection.	Operations Analytics suggestions include values for columns configured as keys. These key columns can be used to define topology relationships. For example, **withkey oracleinst1** indicates that you want Operations Analytics to search across collections for only information related to **oracleinst1**. When selecting suggestions that contain column values, note the following: • Up to three key column values can be included in each **withkey** combination for a single query. For example, both of the following queries are valid: **withkey myhost.enterprise.com, oracledbhost1, private** **withkey host1,instance1 withkey state1** When you select a suggestion that includes multiple column values Operations Analytics displays information for only those records (rows) that match all values. Using the first example, Operations Analytics returns the data requested for any record (row) that includes both **myhost.enterprise,com** and **oraclehost1** and **private**. • A key column value that includes spaces is enclosed in quotes; for example: **withkey "my instance1"** • A key column value that includes an asterisk is defining a pattern for which Operations Analytics should search. It is most useful for defining a host name pattern. For example, the following key column value finds all host names that include **enterprise**: **withkey *enterprise** • A single suggestions can contain column values that include quotes, do not include

Meta Data Suggestions, continued

Suggestions	Description	Example Phrases
		quotes, or that include both types of values; for example: **withkey oracledbhost, "my instance"** See "Elements in a Phrased Query (for Metrics)" on the next page and "Filter the Scope of a Phrased Query Language (PQL) Query " on page 146for more information.
Service topology information	The keyword **service** indicates you want Operations Analytics to return only the data related to the service you specify. **Note:** The service must be configured using the **Topology Management** option from the Settings menu. See "Define a Service Using Topology Manager" on page 281 for more information.	To query for only the data related to a specified service, select the keyword **service**. You define services using the **Topology Management** option from the Settings menu. When defining a service, you specify each group that is associated with the service. You can query for all information available for a specified group. The following example returns all of the groups information related to the service named **MyService1:** **service withkey MyService1 filtering groups** When querying for service information, you can also narrow your search to return information for only a specified instance within a group. To do so, select the **filtering** keyword. The following example returns the related group information for only the instance named **groupName1**: **service withkey MyService1 filtering groups withkey groupName1**

Search History

Operations Analytics tries to match your query to your search history using the methods described in the following **Search History Suggestions** table.

Search History Suggestions

Suggestions	Description	Example Phrases
Search history queries	Operations Analytics looks for any phrases you have used previously. When using your search history, Operations Analytics orders the suggestions according to historical frequency. For example, searches that have been entered more often and more recently, appear closer to the top of the list.	If you type **my**, Operations Analytics might include the phrase **myhost.co.com** if it was used recently in a previous search.

Also see "About the Phrased Query Language (PQL)" on page 131

Elements in a Phrased Query (for Metrics)

The Phrased Query Language (PQL) is comprised of the following types of elements to query metric or other structured collections.

Note: To access the PQL described in this topic, select **Start typing:** from the Search Query field options and type a word or phrase that begins to describe the type of problem you want to resolve or the area you want to investigate. Use the list of suggestions provided by Operations Analytics for guidance to continue typing or select from the list of suggestions.

Tip: You can use **log** key word in any query to include log messages in the query results. See "Elements in a Phrased Query (for Log Files)" on page 145 for more information.

Tags

Note: When using tags in your PQL search, you must use the tags configured for use by your Operations Analytics administrator or provided by Operations Analytics. If you do not know the list of tags available, see "View Collection Information" on page 73. Operations Analytics also includes possible tags in the list of suggestions.

Type a tag name that describes the problem you are investigating. Operations Analytics displays suggestions as you type.

Note: Tags are not case sensitive. They are always converted into lower case when stored.

Tip: When determining the tags to enter, think in terms of the **entity** (software and hardware) , the type of **metrics** you want to view for the entity, and the **analysis** you want Operations Analytics to apply to the metric. See the Types of Information to include in PQL table for more information.

Entity Instance

Represents the hosts or host for which you want information. Entity instance might also be an application or database instance.

To specify an entity instance using an column value.

Column Name

Column name is the name of a column in a collection. For example, a collection might include **host_name** or **cpu_util** as the column name.

When you include the name of a column in your search, Operations Analytics returns the metrics stored in that column.

Column Values

PQL enables you to include a column value (for example, the name of a database instance) in your search query. Any column value that you provide must reside in a column that is configured as a key. It can also be part of a link tag configuration in the collection.

To include a key column value in your search query, use the following syntax:

```
withkey <key_column_value_1>, <key_column_value_2>,<key_column_value_3>
```

For example: `withkey *enterprise.com,dbhostname1`

When including key column values in your search, note the following:

- Up to three key column values can be included in each **withkey** combination for a single query. For example, both of the following queries are valid:

  withkey myhost.enterprise.com, oracledbhost1, private

  withkey host1,instance1 withkey state1

  When you enter a query that includes multiple column values Operations Analytics displays information for only those records (rows) that match all values. Using the first example, Operations Analytics returns the data requested for any record (row) that includes both **myhost.enterprise,com** and **oraclehost1** and **private**.

- A key column value that includes spaces is enclosed in quotes; for example:

  withkey "my instance1"

- A key column value that includes an asterisk is defining a pattern for which Operations Analytics should search. It is most useful for defining a host name pattern. For example, the following key column value finds all host names that include **enterprise**:

  withkey *enterprise

- A single query can contain column values that include quotes, do not include quotes, or that include both types of values; for example:

  withkey oracledbhost,"my instance"

To include any column value in your search, use the following syntax:

<tag> <column_name>=<column_value>

For example: **database dbname=vnode1**

See "View Collection Information" on page 73 for more information about how to view the keys and link tags available in your IT environment.

Click here for more information about **keys**.

The Operations Analytics administrator can specify one or more columns in a collection as a **key**. Keys identify columns in a collection that you want Operations Analytics to use to match metrics for one entity (collection row) to the same or related entity (collection row) across collections. For example, your Operations Analytics administrator might find that host_name is an attribute that identifies the host in most of the collections. However, perhaps in one or two collections, server_name is the attribute used to identify the host. In this scenario, the Operations Analytics administrator specifies **host_name** as a key column in the collections that include the host_name attribute and **server_name** as a key column in the collections that include server_name. When you enter a host name value in your PQL search, Operations Analytics looks for that value in all key columns across collections.

Key columns can also be used to narrow a search within a single collection. When using a key column to search within only one collection, Operations Analytics returns only those metrics for the specified key column value. For example, if the **host_name** column is defined as a key in a cpu metrics collection, the host_name key column enables you to search for cpu metrics for a specific host name.

To specify a column value for a column that is configured as a key, use the `withkey` keyword. See the Types of Information to include in PQL table for more information.

Keys also enable you to filter the scope of a search using link tags. They are used when you want to search custom collections using topology relationships to specify the metrics you want Operations Analytics to return. For example, you might want to search multiple collections for only metrics related to a database instance for an application. See link tags and "About Keys and Link Tags" on page 270 for more information.

To specify a column value that is associated with a link tag, use the `withkey` and `filtering` keywords in your search.

Click here for more information about **link tags**.

Link tags are special tags that associate two collections. They establish relationships between one or more columns defined as keys . Values contained in a key column can then be used to filter one collection by the instances in another collection.

Link tags are useful when you have a custom collection that stores topology information and you want to filter additional collections to return only the data related to a specified host or application instance.

See "About Keys and Link Tags" on page 270 for more information.

To view the collections, keys and tags available select the **SystemMetaInfo** dashboard. For more information, see "View Collection Information" on page 73.

Note: For complete PQL search queries, see PQL Example Queries (for Metrics) and "Phrased Query Examples" on page 148.

Types of Information to include in PQL

Category	Description	Example Phrases
Entity Tags	Represents the type of object or the instance of the object or objects for which you want information. Entity classes can have the following relationships: • An entity can be contained in another. For example an application resides on a host. • An entity can depend on another. For example, an application might depend on a database. • When entities have a relationship, you can use both entities in your query; for example **host interface** or **application database**,	**host**, **application**, **database**, **interface**
Entity Instance	Represents an instance of the object or objects for which you want information. Operations Analytics supports specifying entity instances using the following methods: • Enter a column value.	**withkey eth0 server_ name=myoracledb**
Metric Tags	Represents the metric or set of metrics from the collection that you want to include in your results. To view the collection, tag, and metric information defined for your IT environment, see "View Collection Information" on page 73.	**performance**, **change**, **error**, **disk utilization**, **memory performance** **Tip:** You can also combine tags; for example: **cpu utilization**

Types of Information to include in PQL, continued

Category	Description	Example Phrases
Analytic Tags	Your Operations Analytics administrator can also use tags to identify the metrics that have values that assist with a particular kind of analysis, such as **status** or **health**. The analytic tag you provide must be configured as a tag in one or more collections.	**status**, **health**
Column Name	When you want all values for a particular attribute (column), include the column name in your search	**cpu_util**
Column value	A column value can be specified in either of the following ways: • <tag> <*column_name*>=<*column_value*> For example: `cpu dbname=vnode1` **Tip:** When using multiple <*column_name*>=< *column_value*> entries in the same search, **do not** separate each entry using commas. • <tag> withkey <*key_column_value_1*>, <*key_column_value_2*>,<*key_column_value_3*> `cpu withkey oracleinstance1,virtual` When you specify a column value without its column name, the column must be configured as a key. **Tip:** You can include <*column_name*>=<*column_value*> and withkey <*key_column_value*> in the same search. See "Filter the Scope of a Phrased Query Language (PQL) Query " on page 146 for more information.	**server_name=server1.enterprise.com withkey oracleinstance1, virtual**

Types of Information to include in PQL, continued

Category	Description	Example Phrases
Topology service information	The keyword **service** indicates you want Operations Analytics to return only the data related to the topology service you specify. **Note:** The topology service must be configured using the **Topology Management** option from the Settings menu. See "Define a Service Using Topology Manager" on page 281 for more information.	To query for only the data related to a specified topology service, select the keyword **service**. You define topology services using the **Topology Management** option from the Settings menu. When defining a service, you specify groups that are associated with the service. You can query for all information available for a specified group. The following example returns all of the database groups related to the service named **MyService1:** **service withkey MyService1 filtering database** When querying for service information, you can also narrow your search to return information for only a specified instance within a group. To do so, select the **filtering** keyword. The following example returns the related groups information for only the database instance named **instance1**: **service withkey MyService1 filterring dabase withkey instance1** **Note:** If the **filtering** keyword is used in the query, it can also include up to three key column values, as shown in the following example: **withkey host1 state2 withkey instance1 filtering <tag> host10,instance10,state10**

See Suggestion Categories for the maximum number of suggestions that Operations Analytics displays per category.

Suggestion Categories

Category	Maximum Number of Suggestions
Metadata	15
Search History	5

See "About Phrased Query Suggestions" on page 134 for more information.

Note: If a search query results in too many instances to display, Operations Analytics uses the query to return log file messages matching any phrases in the search query. See "Dashboards Provided by Operations Analytics" on page 102 and "Refine Your Search Query " on page 151for more information.

Click here to see the PQL Examples table for possible search queries.

Note: The actual phrases available in your environment depend on the tags configured by your Operations Analytics administrator. If you are an Operations Analytics administrator, see "Configuring Tenants and Collections" in the HP Operations Analytics Installation and Configuration Guide for more information about how to configure tags.

PQL Example Queries (for Metrics)

Entity Class	Metric Tag	Analytic Tag	Entity Instance or Column Value	Possible Results
database	performance primary		withkey oracleinstance1	• Primary performance metrics for the database instance oracleinstance1.
	primary		withkey *enterprise.com	• Metrics that are tagged as primary in all collections for hosts in the enterprise.com domain.
	events		severity="critical"	• Events with a severity of critical.
	network performance primary			• Primary performance metrics for all NNMi-related collections.
	memory	status	withkey 10.53.46.78	• Metric values related to memory for the host with an IP address of 10.53.46.78.
	cpu performance		withkey myhost.mycompany.com	• CPU performance metrics values for the host myhost.mycompany.com.

PQL Example Queries (for Metrics), continued

Entity Class	Metric Tag	Analytic Tag	Entity Instance or Column Value	Possible Results
host		status		• Metrics values tagged with **status** for all hosts in the IT environment.
	memory utilization			• Memory usage for all hosts in the IT environment.
database		health	withkey myhost	• Database health metrics for myhost.
host		health		• Health metrics for all hosts in the IT environment.
	cpu utilization			• CPU utilization metrics for all hosts in the IT environment.

You can include additional keywords and tags to use for filtering your query. See "Filter the Scope of a Phrased Query Language (PQL) Query " on the next page for more information.

To view the required syntax for search log files, see "Elements in a Phrased Query (for Log Files)" below

To view more examples organized by task, see "Phrased Query Examples" on page 148.

Note: To filter your query by time, you do not need to use a search query. See "Filter Search Query Results " on page 251 for more information.

Elements in a Phrased Query (for Log Files)

Note: To access the PQL described in this topic, select **Start typing:** from the Search Query field options.

The Phrased Query Language (PQL) uses the following syntax to query log files:

```
"<string>"
```

```
log ("<string> AND|OR <string>")
```

Note the following:

- To include quotes within your search query, precede each quote with the backslash character.
- Log file queries for log files configured in HP ArcSight Logger are not used for metric searches.

Tip: To search log files for metrics information use an AQL query. See Log Collection Queries Using Analytics Query Language (AQL) for more information.

- If you have multiple HP ArcSight Logger servers configured, Operations Analytics searches for the text string or strings in the log files of each server.
- You can also include tags in your log queries. For example, `system log("severity AND critical")` finds all metrics tagged system and log file messages containing **severity** and **critical**.

Click here for example log file queries for log files that are configured in HP ArcSight Logger:

PQL Example Queries (for Logs)

Log File Message String	Example Log File Queries	Results
connection error	log ("connection error")	• Error messages containing the text string **connection error.** • Log file entries containing the text string **connection error**.
connection error "	log ("connection error\"")	• Error messages containing the text string **connection error** followed by a value that begins with the quote (") character (for example **connection error "port 80"**) • Log file entries containing the text string **connection error**.followed by a value that begins with the quote (") character (for example **connection error "port 80"**
severity AND critical	log("severity AND critical")	• Error messages containing the text string **severity** and **critical**. • Log file entries containing the text string **severity** and **critical**.
error OR warning	log("error OR warning")	• Error messages containing the text string **error** or **warning**. • Log file entries containing the text string **error** or **warning**.

Filter the Scope of a Phrased Query Language (PQL) Query

Note: To access the PQL described in this topic, select **Start typing:** from the Search Query field options and type a word or phrase that begins to describe the type of problem you want to resolve or the area you want to investigate. Use the list of suggestions provided by Operations Analytics for guidance to continue typing or select from the list of suggestions.

You can filter the scope of your Phrased Query Language (PQL) search by specifying one or more of the following:

- Collection column name and the value that you want to use to filter the results
- Column value

Note: To filter your query by time, you do not need to use a search query. See "Filter Search Query Results " on page 251 for more information.

To specify a filter in a PQL query, use the syntax described in Filter PQL Queries. See "Elements in a Phrased Query (for Metrics)" on page 138 for more information.

Click here for information about using pattern matching in your PQL query.

Use the asterisk when you want Operations Analytics to match a text string pattern. The asterisk can appear anywhere within the text string. See Pattern Matching in PQL Queries for examples.

Pattern Matching in PQL Queries

Example	Results
"*.co.enterprise.com"	Returns results for all host names that end with **co.enterprise.com**
"co.*.com"	Returns results for all host names that begin with **co** and end with **.com** (for example: **co.fc.com** and **co.denver.com**).

Note: To view the collections available, select the **SystemMetaInfo** dashboard from the Dashboards menu. See "View Collection Information" on page 73 for more information.

Filter PQL Queries

Filter	Syntax	Example
tag column name and value	<tag> <*column name*>=<*column value*>	`database dbname=vnode1`

Filter PQL Queries, continued

Filter	Syntax	Example
column value using a column configured as a key **Tip:** Use this search when you don't know the column name. Your Operations Analytics administrator can configure a maximum of three key columns per collection. **Note:** You can include up to three key column values in the same <tag> withkey search.	<tag> **withkey** <*key_column_value_1*>, <*key_column_value_2*,<*key_column_value_3*	`database withkey oracleinstance1`
filter collections using the **filtering** keyword	**service withkey** <*service_name*> **filtering** <*node_grouptier_tag*> **service withkey** <*service_name*> **filtering** <*node_grouptier_tag*> **withkey** <*group_name_value*>	`service withkey MyService filtering groups`

Click here for example PQL queries:

Example PQL Queries Filtered by Scope

PQL Query	Results
`oracle performance withkey *enterprise.com`	Display all metrics associated with the tags **oracle** and **performance** for all host names in the ***.enterprise.com** domain.
`cpu_util withkey *enterprise.com`	Display the values for the **cpu_util** metric for all host names in the ***enterprise.com** domain.
`opsa withkey *enterprise.com,instance1`	Display the metrics associated with the tag **opsa** for the local host and for all hosts in the enterprise.com domain.
`service withkey MyService filtering groups withkey groupName1`	Used to filter the collection of database metrics for MyService. Displays only results for the database metrics for the group named **groupName1**.

Phrased Query Examples

Note: To access the PQL described in this topic, select **Start typing:** from the Search Query field options and type a word or phrase that begins to describe the type of problem you want to

resolve or the area you want to investigate. Use the list of suggestions provided by Operations Analytics for guidance to continue typing or select from the list of suggestions.

This help topic includes examples of phrased queries that you might use for basic troubleshooting tasks. See "Elements in a Phrased Query (for Metrics)" on page 138 for more information about the words and phrases to include in a Phrased Query as well as additional examples.

Note the following:

- For the purposes of this example, the example host name is `myhost.enterprise.com` and the Los Angeles office domain is `la.enterprise.com`
- The metrics displayed are filtered according to the time range you specify.
- The actual words and phrases available in your environment depend on the tags and phrases configured by your Operations Analytics administrator.

  Operations Analytics includes this information under the **Metadata** suggestions category. See "About Phrased Query Suggestions" on page 134 for more information.

  You can also view meta data information for your **collections**[1] from the **SystemMetaInfo** dashboard. See "View Collection Information" on page 73 for more information.

Example PQL Queries (by Task)

Task	Example Query
View the overall status metrics for myhost.enterprise.com	`status withkey myhost.enterprise.com`
View the overall status for all systems in the Los Angeles office	`status withkey *la.enterprise.com`
View the cpu speed metrics for myhost.enterprise.com	`cpu speed withkey myhost.enterprise.com`
View the cpu utilization for all systems in the IT environment	`cpu_util`
View the cpu utilization for all systems in the Los Angeles office	`cpu_util withkey *la.enterprise.com`
View memory metrics for all databases in the IT environment	`memory database`
View CPU bottlenecks for all systems in the Los Angeles office.	`cpu queue withkey *la.enterprise.com`

[1]Operations Analytics stores metrics, topology, inventory, log file, and event information in the form of collection tables. Each collection is associated with a database table in which an Operations Analytics Collector stores the data collected.

Example PQL Queries (by Task), continued

Task	Example Query
View the metrics for all servers in the IT environment that are associated with both performance and configuration tags.	`performance configuration`
View the location for the applications in your IT environment	`application location`
View the events for the applications in your IT environment	`application events`
View only results for database metrics for OracleService	`service withkey MyService filtering database`

For more examples, see:

"Elements in a Phrased Query (for Metrics)" on page 138

"Elements in a Phrased Query (for Log Files)" on page 145

"Filter the Scope of a Phrased Query Language (PQL) Query " on page 146

Searching for a Service Defined in Topology Manager

After you have defined a service, it can be referenced in searches and resulting dashboards. For details on defining services, see "Define a Service Using Topology Manager" on page 281.

For example, suppose you have defined a service called MyService, as follows:

- This service is made up of the groups **MyWebServers**, **MyAppServers**, and **MyDBServers**.
- These groups are made up of **WebHost1-3**, **AppHost1-3**, and **DBHost1-3** respectively.

You can now execute the following searches:

- `Service: “MyService”`. This search returns a dashboard with information regarding the different hosts in all the groups that are part of the **MyService** service, with their events and logs.
- `Service: “MyService” Drill To: “MyWebServers”` - This search returns a dashboard with data on all the hosts that belong to the **MyWebServers** group in the service, including metrics, events and logs.

Note: You can also use a host-based search (for example `Host: "WebHost1"`) to then focus on a specific host that seems to have issues.

These different searches provide you with a drill-down capability. When you look at the service, you can pinpoint the group or in some cases the specific host that may be causing the issue. When you

look at a group you can quickly focus on a specific host that exhibits problems. The final drill-down to a specific host helps you pinpoint the root cause of the problem.

To learn more about searching in Operations Analytics, see "Use a Search Query to Define the Context of a Problem or Area to Investigate" on page 109.

To learn more about interpreting dashboard information, see "Using an Operations Analytics Dashboard" on page 76.

Refine Your Search Query

Note: To access the PQL described in this topic, select **Start typing:**from the Search Query field options and type a word or phrase that begins to describe the type of problem you want to resolve or the area you want to investigate. Use the list of suggestions provided by Operations Analytics for guidance to continue typing or select from the list of suggestions.

Each time you enter a Phrased Query Language (PQL) query, Operations Analytics displays the default visualizations for the metrics, topology, inventory, event, and log file information available in response to your search query. See "Dashboards Provided by Operations Analytics" on page 102 for more information about dashboards that Operations Analytics provides. To change the dashboard results, see "Customize a Dashboard" on page 255.

If a search query results in too many instances to display, Operations Analytics uses the query to return only the log file messages matching any phrases in the search query. This is because it is not able to display the metrics results due to potential performance issues.

To refine your search query:

1. Return to your search query, review the list of suggestions, and select a suggestion from the list that continues to refine your query. You can also refine your query manually by filtering the query scope using the methods described in "Filter the Scope of a Phrased Query Language (PQL) Query " on page 146.

   Tip: To begin with a new search query, review the help topics described in Additional Topics that Might be of Interest. Filter the scope of your PQL query to reduce the number of entities, such as hosts, or the number of metrics returned.

2. Select an existing Dashboard from the **Dashboard** menu. See "Using an Operations Analytics Dashboard" on page 76 for more information.

For more information about Operations Analytics search queries, see the topics described in Additional Topics that Might be of Interest.

Additional Topics that Might be of Interest

Information	Topic
Basic steps for providing an Operations Analytics search query.	"Use a Search Query to Define the Context of a Problem or Area to Investigate" on page 109
An overview of the requirements for Phrased Query Language as well as of the suggestions provided by Operations Analytics	"About the Phrased Query Language (PQL)" on page 131
More detailed information about Phrased Query Language Query (PQL) suggestions provided by Operations Analytics.	"About Phrased Query Suggestions" on page 134
Elements to include in a Phrased Query Language Query (PQL) to filter the query by scope, such as host name.	"Filter the Scope of a Phrased Query Language (PQL) Query " on page 146

About the Analytics Query Language (AQL)

Use the Analytics Query Language (AQL) when the Phrased Query Language (PQL) syntax is not specific enough to return the data you need. When using AQL you can be more specific about the data collected. You can also filter, group, and order the collected data in a single query.

AQL queries use a syntax similar to the ANSI Standard SQL. When using AQL, it is helpful if you have minimal knowledge of databases as well as scripting or programming skills. However, it is not mandatory to have this knowledge to get started using AQL queries.

Tip: Before you begin writing AQL queries, view the collection information that is stored in Operations Analytics to determine the kinds of data available in your environment. You will use this information as part of your AQL syntax.

Note the following:

- When building AQL queries, you can also define AQL functions or expressions.
- AQL functions are a convenient way of defining and naming frequently used AQL queries for reuse. When you define the function, you define the associated AQL query as well as the argument values to pass to that AQL query. See "About Analytics Query Language (AQL) Functions" on page 228 for more information.

  Click here for more information about AQL functions.

  Operations Analytics provides a set of AQL functions for your use. You can browse them in Operations Analytics dashboard when adding or editing a query pane. See "Select an AQL Function for a New Query Pane" on page 101 for more information.

You can define your AQL functions using a text editor and then import them in Operations Analytics. See "Define Analytic Query Language (AQL) Functions" on page 283 and "Import Analytic Query Language (AQL) Functions" on page 284 for more information

You can specify an AQL query, an AQL function or an AQL expression when adding or editing a dashboard query pane. See "Using an Operations Analytics Dashboard" on page 76 for more information.

- AQL expressions include one or more AQL functions. Use AQL expressions when you want the results of multiple queries to be combined in to a single query pane in a Operations Analytics dashboard. See "About Analytics Query Language (AQL) Expressions" on page 231 for more information.

  Click here for more information about using AQL functions in AQL expressions.

  You can use AQL functions in an AQL expression in any of the following ways:

  - Use a single AQL function.
  - Concatenate the results of multiple AQL functions.
  - Use the results of one AQL function as an input filter for another AQL function.

- Operations Analytics provides a number of analytic functions that encapsulate more complex SQL expressions and notations. You can include these analytic functions in AQL queries without requiring SQL and database expertise. See "Analytic Functions Provided by Operations Analytics" on page 181 for more information.

Note: Operations Analytics also generates AQL in response to a Phrased Query Language (PQL) query. See "About the Phrased Query Language (PQL)" on page 131 for more information.

About the Analytics Query Language (AQL) Syntax and Structure

The basic structure of an AQL query is a series of clauses. The clauses you include depend on the type, organization, and order of the information you want Operations Analytics to return. It also depends on the time range and type of analysis, if any, you want Operations Analytics to apply to the data.

When positioning the clauses in an AQL query, note the following

- The **from i in…** clause must be the first clause
- The **select** clause must be the last clause.
- You can include all other clauses in any order within the **from i in …** and **select** clauses.

Click each of the choices listed for the associated clause and its required syntax.

Note: You can also specify additional optional parameters using let clauses. See **"About Parameters Used in an Analytics Query Language (AQL) let clause" on page 165** for more information.

Identify the collection of metrics and their attributes

Use the **from i in …** clause to identify the collection of metrics and the associated attributes to be queried.

The **from** clause supports the syntax described in The from clause syntax.

The from clause syntax

Syntax	Parameter	Examples
from i in (<collection_unique_id>)	<collection_unique_id> represents the unique identifier for a collection of metrics and associated attributes.	**oa_sysperf_global** is the unique identifier for the system performance metrics collected by the HP Operations Agents. To query this collection, use the following from clause: **from i in (oa_sysperf_global)**
from i in tags (<comma_separated_list_of_tags>)	<comma_separated_list_of_tags> represents the set of tags used to identify the metrics in one collection or across multiple collections	The tag **cpu** is applied to a subset of metrics in the **oa_sysperf_global** collection, which measures cpu related system behavior. Attributes such as host_name also receive this tag. **performance** is another tag applied to multiple metrics and their associated attributes in multiple collections. This tag identifies the metrics related to performance. To query these metrics with their associated attributes, use the following from clause: **from i in tags(cpu,performance)**

You can also append the **let** clause to the **from** clause to indicate either of the following

- Return metrics and attributes which are tagged with **both** tag values (for example, **cpu** and **performance**) (intersection)
- Return metrics and attributes which are tagged with **either** tag values (for example, **cpu** or **performance**) (union)

When used with the from clause, the let clause supports the syntax described in the let clause syntax to specify tag intersection or union in a from clause.

The let clause syntax to specify tag intersection or union in a from clause

Syntax	Parameter	Examples
`let tags_intersect=Y|N`	Y - intersection N - union	from i in tags(cpu, performance) let tags_intersect=Y from i in tags(cpu,performance) let tags_intersect=N

Note: If you do not include `let tags_intersect` in the from clause, Operations Analytics returns the union.

Specify a time filter

Use the **let** clause to specify the window of time or time range filter to use.

Note: The time filter is mandatory for any query that returns metrics or includes an analytic function. The time filter is not required for queries that return only attribute values.

When used to specify a time window or time range filter, the let clause supports the syntax described in The let clause syntax to specify a time filter.

The let clause syntax to specify a time filter

Syntax	Description	Examples
`let analytic_interval=since(<time_period_in_seconds>)`	Specify a time filter that goes back a specified time period from the current time	To specify a time filter that goes back by 24 hours from the current time, use the following let clause: `let analytic_interval=since(86400)`

The let clause syntax to specify a time filter, continued

Syntax	Description	Examples
`let analytic_interval=between (<starttime_as_seconds_since_epoch>, <endtime_as_seconds_since_epoch>)`	Specify a time filter that has an absolute start and end time To use the time range or time line specified in the Operations Analytics console, use $starttime, $endtime, or both as shown in the following example: `let analytic_interval=between ($starttime,$endtime)` See "Using an Operations Analytics Dashboard" on page 76 for more information.	To specify 1375197291 seconds since epoch to be the start time and 1375370091 seconds since epoch to be the end time, use the following let clause: `let analytic_interval=between (1375197291,1375370091)`

Specify a set of other data filters

Use the **where** clause to apply a set of data filters.

The where clause supports the syntax described in The where clause syntax.

The where clause syntax

Syntax	Parameter	Examples
`where (filter_expression)`	filter_expression is ([left_operand] relation_operator right_operand) left_operand or right_operand can be any of the following: • any attribute or metric • an analytic function applied on a metric • an analytic function applied on an attribute or a constant • filter_expression in which the relation_operator is on the logical operators !, ||, &&. relation_operator can be one of the comparison predicates: !=, ==, >, >=, <, <=, like, ilike **Tip:** Use ilike to indicate the filter is case insensitive.	**/*Attribute filters combined*/** from i in (omi_events_omievents) let analytic_interval = between ($starttime, $endtime) let interval = $interval **where ((i.hostinfo_dnsname like "*mydomain.com") && ((i.severity == "CRITICAL") \|\| (i.severity ilike "WARN*")))** group by i.host_name, i.severity select moving_count(i) **/*Attribute filters, metric filters combined*/** from i in (oa_sysperf_global) let analytic_interval = between ($starttime, $endtime) let interval = $interval **where ((i.host_name like "*.mydomain.com") && (i.cpu_util >= 0.80))** select i.host_name, i.timestamp, i.cpu_util **/*Attribute filters, metric analytic filter combined*/** from i in (oa_oraperf_graph) let analytic_interval = between ($starttime, $endtime) let interval = $interval **where (((i.host_name like "*.mydomain.com") && (i.db_instance_name like "*")) &&** **(moving_max(i.max_num_sessions) > 10))** group by i.host_name, i.db_instance_name

The where clause syntax, continued

Syntax	Parameter	Examples
		select moving_avg(i.max_num_ sessions)

Choose a set of attributes to group query results

Use the **group by** clause to group the query results

Note the following:

- When querying raw metrics or attributes,Operations Analytics ignores any group by clause.
- Specify group by attributes list only when your query includes an analytic function.
- Operations Analytics ignores the following group by fields:
  - Any field defined as a metric in the meta data.
  - The mandatory **timestamp** field defined in the meta data.
- Operations Analytics automatically selects any attribute specified in the group by clause and includes those attribute values in the query results.

The group by clause supports the syntax described in group by clause syntax.

The group by clause syntax

Syntax	Parameter	Examples
`group by i.attribute1uniqueid, i.attribute2uniqueid, …`	Group the results by the attributes whose unique identifiers (for example atribute1uniqueid) are specified. See "About Meta Data" on page 267 for more information.	**/*group by one attribute in queried collection*/** from i in (oa_sysperf_global) let analytic_interval = between ($starttime, $endtime) let interval = $interval where (i.host_name like “*.mydomain.com”) **group by i.host_name** select moving_avg(i.cpu_run_queue) **/*group by multiple attributes in queried collection*/** from i in (oa_sysperf_global) let analytic_interval = between ($starttime, $endtime) let interval = $interval where (i.host_name like “*.mydomain.com”)

The group by clause syntax, continued

Syntax	Parameter	Examples
		group by i.host_name , i.source select moving_ avg(i.cpu_run_ queue)
group by i	Group the results by all attributes in the collection identified in the **from i in..** clause	**/*group by all attributes in the queried collection*/** from i in (oa_ sysperf_global) let analytic_ interval = between ($starttime, $endtime) let interval = $interval where (i.host_ name like “*.mydomain.co m”) **group by i** select moving_ avg(i.cpu_run_ queue)

Select a set of attributes, metrics, or both to be queried

Use the select clause to specify the attributes and metrics to be selected

Note the following:

- If the select clause contains only attributes, Operations Analytics returns the distinct values of the specified attributes.

  When using this type of query, the **let analytic_interval …** clause is optional.

- If the select clause contains a set of metrics, Operations Analytics returns the raw time series of metric values. If attributes are also included in the select clause, Operations Analytics also returns the values of those attributes.

- Do not specify group by to select a set of attributes or metrics that do not have an analytic function applied to them.

The select clause supports the syntax described in select clause syntax.

The select clause syntax

Syntax	Parameter	Examples
`select i.property1uniqueid, i.property2uniqueid`	The property1uniqueid, property2uniqueid… are the unique meta data identifiers of the attributes or metrics in the collection identified in the **from i in…** clause.	**/*selecting attributes only to get distinct values of attributes from a topology collection and without time filter*/** from i in (opsa_topology) let limit = $limit where (i.service_name like "*opsaservice") **select i.opsa_server_name, i.vertica_node, i.collector_server_name, i.logger_server_name** **/*selecting attributes only to get distinct values of attributes from an events collection and with time filter*/** from i in (omi_events_omievents) let limit =$limit let analytic_interval=between ($starttime, $endtime) where ((i.hostinfo_dnsname like "*mydomain.com") && (i.severity=="CRITICAL")) **select i.hostinfo_dnsname, i.timestamp, i.state, i.category, i.title**

Select a set of analytic functions to apply to the metrics

Also use the select clause to specify one or more analytic functions to apply to the **metrics**[1] and the **attributes**[2] specified in your AQL search query. See "Analytic Functions Provided by Operations Analytics" on page 181 for more information about analytic functions.

See Guidelines for using the select clause with analytic functions for requirements when using the select clause with one or more analytic functions.

Guidelines for using the select clause with analytic functions

Guideline	Examples
Do not mix overall aggregate analytic functions, moving aggregates analytic functions, or **raw metrics**[3] in the same select clause.	**Note:** The following examples are **invalid** AQL select clauses. select **moving_avg**(i.cpu_run_queue), **aggregate_avg**(i.cpu_run_queue), **moving_total**(i.active_processes) select **moving_avg**(i.cpu_run_queue), **aggregate_avg**(i.cpu_run_queue), **moving_total**(i.active_processes), **i.disk_io_rate**

[1]Typically, measurements stored in a collection. For example, CPU utilization.
[2]Descriptors stored in a collection for an entity, such as host_name.
[3]Metrics to which an overall aggregate or moving aggregate analytic function is applied.

Guidelines for using the select clause with analytic functions, continued

Guideline	Examples
When using the analytic functions that are applied to overall aggregate analytic functions, moving aggregate analytic functions, or raw metrics, note the following: • If you apply an analytic function to one or more overall aggregate analytic functions, do not also apply the analytic function to moving aggregate analytic functions or raw metrics • If you apply an analytic function to one or more moving aggregate analytic functions, do not also apply the analytic function to overall aggregate analytic functions or raw metrics. • If you apply an analytic function to raw metrics, do not also apply the analytic function to overall aggregate or moving aggregate analytic functions.	**Note:** The following examples are **invalid** AQL select clauses. select **moving_avg**(i.cpu_run_queue)**, topN**(i.cpu_run-queue) select **aggregate_avg**(i.cpu_run_queue), **topN(moving_avg(i.cpu_run-queue)**) select i.cpu_run_que, **topN(aggregate_avg**(i.cpu_run-queue))
You can combine multiple moving aggregate analytic functions in a single select clause. Similarly, you can combine multiple overall aggregate analytic functions in a single select clause.	**Note:** The following examples are **valid** AQL select clauses: select **moving_avg**(i.cpu_run_queue), **moving_max**(i.cpu_run_queue), **moving_avg**(i.cpu_util), **moving_min**(i.cpu_util), moving_total(i.active_processes) select **aggregate_avg**(i.cpu_run_queue), **aggregate_max**(i.cpu_run_queue), **aggregate_avg**(i.cpu_util), **aggregate_min**(i.cpu_util), **aggregate_total**(i.active_processes)

Guidelines for using the select clause with analytic functions, continued

Guideline	Examples
Do not mix the following analytic functions with any other type of overall aggregate analytic functions, moving aggregate analytic functions, or raw metrics: • aggregate_count • moving_count • aggregate_distinct_count • moving_distinct_count	
When using the analytic functions that are applied to overall aggregate and moving aggregate analytic functions, apply the analytic function to only one of the following in the same select clause: • aggregate_count • moving_count • aggregate_distinct_count • moving_distinct_count	For example, if you use topN(aggregate_ distinct_count(…)) in a select clause, do not include any of the following moving count or aggregate count analytic functions in the same clause: • topN(aggregate_count(i)) • topN(moving_count(i)) • topN(moving_distinct_count(…))
Use only one of the following analytic functions in a single select clause: • aggregate_count • moving_count • aggregate_distinct_count • moving_distinct_count	

Guidelines for using the select clause with analytic functions, continued

Guideline	Examples
When using moving aggregates, specify the time interval parameter using the following **let interval = … clause** syntax: let interval=<*interval_size_in_seconds*> **Tip:** When you specify the time interval in an AQL query, make sure that the interval size is less than the number in seconds in the overall window of time specified using the **let analytic_interval=…** clause. Operations Analytics computes moving aggregates for each of the intervals.	To specify a fixed moving interval sizes of 1 hour, use the following **let** clause: let interval = 3600 To use the time interval selected in the Operations Analytics console, use the following let clause: let interval = $interval See "About the Operations Analytics Console" on page 8 for more information about specifying the time interval in the Operations Analytics console.

About Parameters Used in an Analytics Query Language (AQL) let clause

Operations Analytics enables you to specify parameters in the let clause of an AQL query. These parameters are used to set limits on data returned as well as to shift or change start times, end times, or both.

Note: Operations Analytics uses default values for each of these optional parameters unless you specify a value.

Optional parameters used in the let clause describes the parameters you can choose to include in a let clause. See "About the Analytics Query Language (AQL) Syntax and Structure" on page 153 for more information about the let clause syntax as well as additional parameters used in AQL queries.

Tip: You can precede any parameter with $ (dollar sign) to specify that you want Operations Analytics to use the parameter value specified when a user adds or edits a dashboard query pane. See "Using an Operations Analytics Dashboard" on page 76 for more information.

Optional parameters used in the let clause

Parameter	Syntax	Description	Examples
limit	`let limit=<limit>`	Limits the number of rows returned in response to an AQL query. Note the following: • Use the limit parameter only in AQL queries that return distinct attribute values from events, topology, structured log, or inventory collections. • The limit parameter has no effect on all other types of queries. • The number specified as <limit> restricts the number of rows returned.	The following example query returns the 100 most recent distinct combinations of the following OMi event attributes matching the filter condition: • hostinfo_dnsname • timestamp • state • category • title attributes These attributes are stored in the omi_events_omievents collection. **from i in (omi_events_ omievents) let limit =100** let analytic_interval=between ($starttime, $endtime) where ((i.hostinfo_dnsname like “*mydomain.com”) && (i.severity==”CRITICAL”)) select i.hostinfo_dnsname, i.timestamp, i.state, i.category, i.title

Optional parameters used in the let clause, continued

Parameter	Syntax	Description	Examples
offset	`let offset=<offset>`	Determines the row at which to begin returning query results. Note the following: • Use the offset parameter only in AQL queries that return distinct attribute values from events, topology, structured log, or inventory collections. • The offset parameter has no effect on all other types of queries. • The number specified as <offset> determines the row at which to begin returning query results.	The following example query returns the 100 most recent distinct combinations of the following OMi event attributes matching the filter condition: • hostinfo_dnsname • timestamp • state • category • title These attributes are stored in the omi_events_omievents collection. The offset value specifies that Operations Analytics should start at the first row of the distinct combinations when returned the first 100 values. **from i in (omi_events_ omievents) let limit =100 let offset=0** let analytic_interval=between ($starttime, $endtime) where ((i.hostinfo_dnsname like “*mydomain.com”) && (i.severity==”CRITICAL”)) select i.hostinfo_dnsname, i.timestamp, i.state, i.category, i.title As a next step you could request for the next set of 100 distinct attribute values combinations, using this example query:

Optional parameters used in the let clause, continued

Parameter	Syntax	Description	Examples
			from i in (omi_events_ omievents) let limit =100 let offset=100 let analytic_interval=between ($starttime, $endtime) where ((i.hostinfo_dnsname like “*mydomain.com”) && (i.severity==”CRITICAL”)) select i.hostinfo_dnsname, i.timestamp, i.state, i.category, i.title

Optional parameters used in the let clause, continued

Parameter	Syntax	Description	Examples
time_offset	`let time_offset=` `<time_offset_in_seconds>`	Specifies the offset to apply to the window of time specified using the **let analytic_interval=…** clause. This parameter is useful when you want to compare metrics or their trends across a pair of time periods. **Tip:** To compare metrics or other trends, use the same AQL query for each dashboard query pane, changing only the time_offset value in each AQL query. Note the following: • A positive value of time_offset_in_seconds moves the start and end time specified in the associated let	This example query moves the time window to a week back then what is specified in **let analytic_interval=…** clause: from i in (oa_sysperf_global) **let time_offset=-604800** let analytic_interval = between($starttime, $endtime) let interval = $interval where (i.host_name like “*.mydomain.com”) group by i.host_name select moving_max(i.cpu_run_queue), moving_max(i.cpu_util), moving_total(i.active_processes) .

Optional parameters used in the let clause, continued

Parameter	Syntax	Description	Examples
		analytic_interval=… clause forward by the number of seconds used in time_offset_in_seconds. • A negative value in time_offset_in_seconds moves the times back. • The time_offset parameter is applied to both the start and end time of the time window if the absolute time filter is specified using the following let analytic_interval… clause syntax: let analytic_interval=between(<start_time_in_seconds_since_epoch>, <end_time_in_seconds_since_epoch>) • The time_offset parameter is	

Optional parameters used in the let clause, continued

Parameter	Syntax	Description	Examples
		applied only to the start time of a time window if a relative time filter is specified using the following let clause: let analytic_interval = since (<relative_time_in_seconds>)	
start_time_offset	`let start_time_offset = <start_time_offset_in_seconds>`	Moves (offsets) only the start time of the time window. **Note:** If let time_offset = <time_offset_in_seconds> is used in the same AQL query, the end time of the time window continues to be offset by the time_offset and is not affected by the start_time_offset parameter.	This example query specifies that start time should begin one week earlier than what is specified in the **let analytic_interval=…** clause. from i in (oa_sysperf_global) where (i.host_name like "*.mydomain.com") **let start_time_offset=-604800** **let analytic_interval = between($starttime, $endtime) let interval = $interval** where (i.host_name like "*.mydomain.com") group by i.host_name select moving_max(i.cpu_run_queue), moving_max(i.cpu_util), moving_total(i.active_processes)

Optional parameters used in the let clause, continued

Parameter	Syntax	Description	Examples
end_time_offset	`let end_time_offset =` `<end_time_offset_in_seconds>`	Moves (offsets) only the end time of the time window. Note the following: • If the let time_offset = <time_offset_in_seconds> is used in the same AQL query, the start time of the time window continues to be offset by the time_offset and is not affected by the end_time_offset parameter. • The end_time_offset parameter has no effect if the relative time filter is specified using the following let clause: let analytic_interval = since (<relative_time_in_seconds>)	In this example query, end time is shifted to one week later than what is specified in the **let analytic_interval=…** clause. from i in (oa_sysperf_global) **let end_time_offset=604800** **let analytic_interval = between($starttime, $endtime) let interval = $interval** where (i.host_name like “*.mydomain.com”) group by i.host_name select moving_max(i.cpu_run_queue), moving_max(i.cpu_util), moving_total(i.active_processes)

About Log File Queries Using Analytics Query Language (AQL)

Examples in this topic use Analytics Query Language (AQL) to return the information collected by log files configured using HP ArcSight Logger.

Note: These queries do not apply to **structured log files**[1].

You can use three types of AQL functions to search log file information. Click each type for more information.

Search for text strings. Use aqlrawlog.

Use the aqlrawlog function to search the log file entries stored in HP ArcSight Logger servers.

The aqlrawlog query returns the following attributes for each matching log file message entry: timestamp, message text, host name, and source host name.

Syntax: aqlrawlog(<aqllit><text_to_search></aqllit>, <starttime_as_seconds_since_epoch>, <end_time_as_seconds_since_epoch>, “”|”<comma_separated_list_of_logger_host_names>” [,<limit>])

Click here for a description of the **aqlrawlog** arguments.

[let timeout=<timeout_in_seconds>]

[let limit=<limit>]

<text_to_search> is the text string that must match in the log file entries.

Note: The <text_to_search> argument must be enclosed by the <aqllit> keyword, for example **<aqllit>severity</aqllit>**.

<starttime_as_seconds_since_epoch> is the start time of the time window within which to look for matching log file entries.

Note: To use the value selected in the Operations Analytics console, enter $starttime as the value for this argument.

<endtime_as_seconds_since_epoch> is the end time of the time window within which to look for log file entries.

Note: To use the value selected in the Operations Analytics console, enter $endtime as the value for this argument.

[1]Fragments of log file data that are stored as collections in HP Operations Analytics. Structured logs are log files that are configured as collections. These collections are created so that users can perform analytics on the log file contents. For example, you might want to query for all outliers by host name and application for a particular time range.

<comma_separated_list_of_logger_host_names> is a comma separated list of host names that identify the HP ArcSight Logger servers to query.

Tip: To query all of the HP ArcSight Logger servers configured for the current tenant, specify “” as this parameter value.

<limit> is an optional parameter that overrides the default maximum number of log file entries to return.

Note: If you do not use this parameter or the optional let limit=<limit> clause, Operations Analytics returns up to a maximum of 2000 log file messages matching the search text. You can also specify $limit for this value.

<timeout_in_seconds> is the timeout for the search operation. This parameter is specified when using the optional let timeout=… clause.

Note: If you do not specify this parameter, Operations Analytics uses the default timeout value.

Click here for examples.

/* Returns a maximum of 500 log file entries that include "error" */

aqlrawlog(<aqllit>error</aqllit>, $starttime, $endtime, “”, 500)

/*Returns the default maximum number of log file entries that include "error". This query searches log file entries only on the following servers: mylogger1.mydomain.com and mylogger2.mydomain.com logger servers*/

aqlrawlog(<aqllit>error</aqllit>, $starttime, $endtime, “mylogger1.mydomain.com,mylogger2.mydomain.com”)

/* Returns the default maximum number of log file entries that include "error" . It uses the timeout value of 5 minutes */

aqlrawlog(<aqllit>error</aqllit>, $starttime, $endtime, “”) let timeout=300

/* Returns a maximum number of 500 log file entries that include "error". It uses the timeout value of 5 minutes */

aqlrawlog(<aqllit>error</aqllit>, $starttime, $endtime, “”) let timeout=300 let limit=500

Count the number of log file entries. Use aqlrawlogcount.

Use the aqlrawlogcount function to count the log file entries stored in HP ArcSight Logger servers that contain the search text string.

Syntax: aqlrawlogcount(<aqllit><text_to_search></aqllit>, <starttime_as_seconds_since_epoch>, <end_time_as_seconds_since_epoch>, “” | ”<comma_separated_list_of_logger_host_names>”,”” | ”<comma_separated_list_of_group_by_fields>” [,<granularity_in_seconds>])

Click here for a description of each of the **aqlrawlogcount** arguments.

[let timeout=<timeout_in_seconds>]

[let limit=<limit>]

<text_to_search> is the text string that must match in each log file entry returned.

Note: The <text_to_search> argument must be enclosed by the <aqllit> keyword, for example **<aqllit>severity</aqllit>**.

<starttime_as_seconds_since_epoch> is the start time of the time window within which to look for matching log file entries.

Note: To use the value selected in the Operations Analytics console, enter $starttime as the value for this argument.

<endtime_as_seconds_since_epoch> is the end time of the time window within which to look for matching log file entries.

Note: To use the value selected in the Operations Analytics console, enter $endtime as the value for this argument.

<comma_separated_list_of_logger_host_names> is a comma separated list of host names that identify the HP ArcSight Logger servers to query.

Tip: To query all of the HP ArcSight Logger servers configured for the current tenant, specify “” as this parameter value.

<limit> is an optional parameter that overrides the default maximum number of log file entries to return.

Note: If you do not use this parameter or the optional let limit=<limit> clause, Operations Analytics returns up to a maximum of 2000 log file messages matching the search text. You can also specify $limit as the value.

<timeout_in_seconds> is the timeout for the search operation specified using the optional let timeout=… clause.

Note: If you do not specify this parameter, Operations Analytics uses the default timeout value.

The aqlrawlog query returns the following attributes for each matching log file entry: timestamp, message text, host name, and source host name.

<comma_separated_list_of_group_by_fields> is a comma separated list of the HP ArcSight Logger attributes in which to group the results.

Tip: If you do not want Operations Analytics to group the results, specify “” as the parameter value.

Note: If you specify “” as this parameter and do not specify <granularity_in_seconds>, Operations Analytics computes the moving counts without any group by criteria.

The window of time between <starttime_as_seconds_since_epoch> and <endtime_as_seconds_since_epoch> is divided into multiple intervals. Operations Analytics calculates counts at each of these intervals. Operations Analytics automatically computes the optimal length of time for each interval.

<time_interval_in_seconds> specifies the value Operations Analytics should use to subdivide the window of time between <starttime_as_seconds_since_epoch> and <endtime_as_seconds_since_epoch>. Operations Analytics computes the moving counts at each of these intervals.

Note: To use the value selected in the Operations Analytics console, enter $interval as the value for this argument. See "Using an Operations Analytics Dashboard" on page 76 for more information about how to specify the $interval parameter value in the Operations Analytics console.

<limit> is an optional parameter that overrides the default maximum number of log file entries to return.

Note: If you do not use this parameter or the optional let limit=<limit> clause, Operations Analytics returns up to a maximum of 2000 log file messages matching the search text. You can also specify $limit as the value.

<timeout_in_seconds> is the timeout for the search operation specified using the optional let timeout=… clause.

Note: If you do not specify this parameter, Operations Analytics uses the default timeout value.

Click here for examples.

/* Returns the time series counts of log file entries that contain "error" at 5 minute intervals*/

aqlrawlogcount(<aqllit>error</aqllit>, $starttime, $endtime, “”, “”, 300)

/*Returns the time series counts of log file entries that contain "error" for each combination of deviceHostName and agentSeverity at 5 minute intervals. The function queries only the mylogger1.mydomain.com server*/

aqlrawlogcount(<aqllit>error</aqllit>, $starttime, $endtime, “mylogger1.mydomain.com”, ”deviceHostName,agentSeverity”, 300)

/*Returns overall aggregate counts of log file entries that contain "error" for each combination of deviceHostName and agentSeverity. This AQL function queries only the mylogger1.mydomain.com server*/

aqlrawlogcount(<aqllit>error</aqllit>, $starttime, $endtime, “mylogger1.mydomain.com”, ”deviceHostName,agentSeverity”)

/*Returns the time series of counts of log file entries that contain "error" for each combination of deviceHostName and agentSeverity at 5 minute intervals. This AQL function queries only mylogger1.mydomain.com, uses the timeout value of 10 minutes, and queries a maximum of 1000 entries */

aqlrawlogcount(<aqllit>error</aqllit>, $starttime, $endtime, “mylogger1.mydomain.com”, ”deviceHostName,agentSeverity”, 300) let timeout=600 let limit=1000

Enter a query supported by HP ArcSight Logger. Use aqlrawlogarbitrary.

Note: A supported query is any query that is configured for use on an HP ArcSight Logger server.

Use aqlrawlogarbitrary function to run any other query supported by your HP ArcSight Logger server.

Operations Analytics displays aqlrawlogarbitrary results table format.

Syntax: aqlrawlogarbitrary(<aqllit><query_string></aqllit>, <starttime_as_seconds_since_epoch>, <end_time_as_seconds_since_epoch>, “”|”<comma_separated_list_of_logger_host_names>” [,<limit>])

Click here for a description of each of the **aqlrawlogarbitrary** function arguments.

[let timeout=<timeout_in_seconds>]

[let limit=<limit>]

<query_string> is the query string that is supported by your HP ArcSight Logger server.

Note: The <query_string> argument must be enclosed by the <aqllit> keyword, for example **<aqllit>severity</aqllit>**.

<starttime_as_seconds_since_epoch> is the start time of the time window within which to look for matching log file entries.

Note: To use the value selected in the Operations Analytics console, enter $starttime as the value for this argument.

<endtime_as_seconds_since_epoch> is the end time of the time window within which to look for matching log file entriess.

Note: To use the value selected in the Operations Analytics console, enter $endtime as the value for this argument.

<comma_separated_list_of_logger_host_names> is a comma separated list of host names of the HP ArcSight Logger servers to query.

Tip: To query all of the HP ArcSight Logger servers configured for the current tenant, specify “” as this parameter value.

<limit> is optional parameter and if specified it overrides the default maximum rows of information returned by logger to consider for returning back to Operations Analytics console.

Note: If you do not use this parameter or the optional let limit=<limit> clause, Operations Analytics returns up to a maximum of 2000 log file messages matching the search text. You can also specify $limit for this value.

<timeout_in_seconds> is the timeout for the search operation specified using the optional let timeout=… clause.

Note: If you do not specify this parameter, Operations Analytics uses the default timeout value.

Click here for examples.

/* Returns a maximum of 500 log file entries that contain the text string "error" */

aqlrawlogarbitrary(<aqllit>error</aqllit>, $starttime, $endtime, “”, 500)

/*Returns up to the default maximum number of log file entries that contain the text string "error". This AQL function queries only the mylogger1.mydomain.com and mylogger2.mydomain.com logger servers*/

aqlrawlogarbitrary(<aqllit>error</aqllit>, $starttime, $endtime, “mylogger1.mydomain.com,mylogger2.mydomain.com”)

/* Returns the default maximum number of log file entries that contain "error". This AQL function uses a timeout value of 5 minutes */

aqlrawlogarbitrary(<aqllit>error</aqllit>, $starttime, $endtime, “”) let timeout=300

/* Returns a maximum of 500 log file entries that contain "error". This AQL function uses a timeout value of 5 minutes */

aqlrawlogarbitrary(<aqllit>error</aqllit>, $starttime, $endtime, “”) let timeout=300 let limit=500

You can add a **let** clause to your aqlrawlog, aqlrawlogcount or aqlrawlogarbitrary query to define a variable that contains a list of entities returned from an AQL function. The variable can then be used in the <aqllit><*text_to_search*></aqllit> string. This feature is useful when you want to search for a set of entities, such as hosts, applications, Business Service Management transactions, or database instances without needing to enter the entire list of values. Click here for more information:

- To add a let clause to your aqlrawlog, aqlrawlogcount or aqlrawlogarbitrary query, use the following syntax:

let <*variable_name*>=<*AQL_function*>

For example, you could define the variable $myhosts to contain the list of servers returned from the AQL function named oaSysperfHosts. The oaSysperfHosts AQL function uses the following arguments to return hosts that have performance metrics collected:

oaSysperfHosts (hostFilter, numHostsLimit)

To define a variable to store the results returned from the oaSysperfHosts AQL function, use the following syntax:

let <*variable_name*>=oaSysperfHosts (hostFilter, numHostsLimit)

For example, to pass the first 50 hosts that have performance metrics collected in the enterprise.com domain to the myhosts variable, add the following let clause to your aqlrawlog, aqlrawlogcount, or aqlrawlogarbitrary query:

let myhosts=oaSysperfHosts ("*enterprise.com", 50)

- The variable you define using the let clause can be used in a text search or with a Common Event Field (CEF) field that was configured using the Operations Analytics Log File Connector for ArcSight Logger. See "Installing and Configuring the Operations Analytics Log File Connector for ArcSight Logger " in the HP Operations Analytics Installation and Configuration Guide for more information.
- To use the variable in a text search, use the following syntax:

  <aqllit><$variable></aqllit>

  For example:

  <aqllit><$myhosts></aqllit>

- To use the variable with a CEF, use the following syntax in place of <aqllit><$variable></aqllit>:

  <aqllit><CEF> in [$<variable_name>]</aqllit>

  For example:

  sourcehostName in [$myhosts]

  The previous example searches for all log file messages that contain any of the host names stored in the $myhosts variable. These host names would be the first 50 hosts that have performance metrics collected in the enterprise.com domain.

About Analytic Functions

Operations Analytics provides a set of analytic functions to analyze the metrics, topology, inventory, event, and log file data that is collected.

These analytic functions are divided into the types described in Types of Analytic Functions Provided by Operations Analytics .

Types of Analytic Functions Provided by Operations Analytics

Analytic Function Types	Description	Valid Visualizations
Overall Aggregate (Summary)	Computes a single aggregate value for a set of raw data over a specified window of time.	Table, pie chart or bar chart
Moving Aggregate (Time Series)	Computes one aggregate value at each time interval within the selected window of time. *Pie charts only*. Each moving aggregate value displayed represents a re-computed value using each data points per interval within the specified time segment. For example, the moving_avg analytic function calculates the average of all average values returned for the specified time frame and metric or attribute. Operations Analytics displays each of these re-calculated values, one per pie chart segment.	Line chart, bar chart, heat map, and pie chart
Analytic Functions applied to Overall Aggregate and Moving Aggregate Analytic Functions	Use analytic functions in AQL queries to apply analysis to the following sets of data: • Overall aggregate values for **metrics**[1] or **attributes**[2] • Moving aggregate values for metrics or attributes **Note:** These analytic functions can also be applied to **raw metrics**[3].	**Tip:** When using the topN or bottomN analytic function, Operations Analytics displays a table by default. Bar charts and pie charts can also be used to visualize topN and bottomN results.

See "Analytic Functions Provided by Operations Analytics" on the next page for more information.

Also see "Interpret Dashboard Results" on page 235 for more information about interpreting dashboard results.

[1]Typically, measurements stored in a collection. For example, CPU utilization.
[2]Descriptors stored in a collection for an entity, such as host_name.
[3]Metrics to which an overall aggregate or moving aggregate analytic function is applied.

Analytic Functions Provided by Operations Analytics

Operations Analytics provides a set of analytic functions described in the Types of Analytic Functions Provided by HP Operations Analytics table.

Tip: These functions are used in an AQL query or AQL function. See "About the Analytics Query Language (AQL) Syntax and Structure" on page 153 for more information about the required AQL syntax. See "Examples of Using Analytic Functions in AQL Queries" on page 202 for examples of using these functions in AQL queries.

Types of Analytic Functions Provided by Operations Analytics

Analytic Function Type	Description	Valid Visualizations
Overall Aggregate (Summary)	Computes a single aggregate value for a set of raw data over a specified window of time.	Table, bar chart, and pie chart
Moving Aggregates (Time Series)	Computes one aggregate value at each time interval within the selected window of time.	Line charts, heat maps, bar charts, and pie charts

Types of Analytic Functions Provided by Operations Analytics, continued

Analytic Function Type	Description	Valid Visualizations
Analytic Functions applied to Overall Aggregate and Moving Aggregate Functions	Use analytic functions in AQL queries to apply analysis to the following sets of data: • Overall aggregate values for **metrics**[1] or **attributes**[2] • Moving aggregate values for metrics or attributes **Note:** These analytic functions can also be applied to **raw metrics**[3].	**Tip:** When using the topN or bottomN analytic function, Operations Analytics displays a table by default. Bar charts and pie charts can also be used to visualize topN and bottomN results.

[1]Typically, measurements stored in a collection. For example, CPU utilization.
[2]Descriptors stored in a collection for an entity, such as host_name.
[3]Metrics to which an overall aggregate or moving aggregate analytic function is applied.

Click here for a description of the overall aggregate (summary) analytic functions provided.

Overall Aggregate (Summary) Functions Provided by HP Operational Analytics

Function	Syntax	Description
aggregate_avg	aggregate_avg(i.<metric_unique_id>|i) <metric_unique_id> is the unique meta data identifier for the chosen metric Use aggregate_avg(i.<metric_unique_id>) to select a specific metric. **Note:** If this analytic function is applied to an attribute, Operations Analytics ignores the analytic function. Use aggregate_avg(i) to select all metrics in the collections identified in **from i in …** clause. When using the (i) notation, note the following: • Operations Analytics returns the aggregate_avg of only metrics. Attributes, such as host_name, are ignored. • If no matching metrics are found, Operations Analytics ignores the analytic function.	Identifies the average value for the metric or metrics selected.

Overall Aggregate (Summary) Functions Provided by HP Operational Analytics, continued

Function	Syntax	Description
aggregate_min	aggregate_min(i.<metric_unique_id>|i) <metric_unique_id> is the unique meta data identifier for the chosen metric Use aggregate_min(i.<metric_unique_id>) to select a specific metric use syntax. **Note:** If this analytic function is applied to an attribute, Operations Analytics ignores the analytic function. Use aggregate_min(i) to select all metrics in the collections identified in **from i in …** clause. When using the (i) notation, note the following: • Operations Analytics returns the aggregate_min of only metrics. Attributes, such as host_name, are ignored. • If no matching metrics are found, Operations Analytics ignores the analytic function.	Identifies the minimum value for the metric or metrics selected.

Overall Aggregate (Summary) Functions Provided by HP Operational Analytics, continued

Function	Syntax	Description
aggregate_max	aggregate_max(i.<metric_unique_id>|i) <metric_unique_id> is the unique meta data identifier for the chosen metric Use aggregate_max(i.<metric_unique_id>) to select a specific metric **Note:** If this analytic function is applied to an attribute, Operations Analytics ignores the analytic function. Use aggregate_max(i) to select all metrics in the collections identified in **from i in …** clause. When using the (i) notation, note the following: • Operations Analytics returns the aggregate_max of only metrics. Attributes, such as host_name, are ignored. • If no matching metrics are found, Operations Analytics ignores the analytic function.	Identifies the maximum value for the metric or metrics selected.

Overall Aggregate (Summary) Functions Provided by HP Operational Analytics, continued

Function	Syntax	Description
aggregate_total	aggregate_total(i.<metric_unique_id>|i) <metric_unique_id> is the unique meta data identifier for the chosen metric Use aggregate_total(i.<metric_unique_id>) to select a specific metric **Note:** If this analytic function is applied to an attribute, Operations Analytics ignores the analytic function. Use aggregate_total(i) to select all metrics in the collections identified in **from i in …** clause. When using the (i) notation, note the following: • Operations Analytics returns the aggregate_total of only metrics. Attributes, such as host_name, are ignored. • If no matching metrics are found, Operations Analytics ignores the analytic function.	Identifies the total value or cumulative sum for the metric or metrics selected.
aggregate_count	aggregate_count(i.<attribute_unique_id>|i) <attribute_unique_id> is the unique meta data identifier for the chosen attribute **Note:** If this analytic function is applied to a metric, Operations Analytics ignores the analytic function. Use aggregate_count(i.<attribute_unique_id>) to count only the rows with values of a specified attribute. Use aggregate_count(i) for counting all rows in a collection.	Computes the total count of rows with values of an attribute or total count of all rows in a collection table.

Overall Aggregate (Summary) Functions Provided by HP Operational Analytics, continued

Function	Syntax	Description
aggregate_distinct_count	aggregate_distinct_count(i.<attribute_unique_id>) **Note:** The (i) notation is not permitted. <attribute_unique_id> is the unique meta data identifier of the attribute for which a count of distinct values is to be calculated. **Note:** If this analytic function is applied to a metric, Operations Analytics ignores the analytic function.	Computes the total count of distinct values of an attribute.

See the topics described in Example AQL Queries that use Overall Aggregate Functions for example AQL queries that use overall aggregate (summary) functions.

Example AQL Queries that use Overall Aggregate Functions

Topic	Description
"Return Summary Information on Metrics (Example AQL Queries)" on page 202	Use these examples to view summary information for metrics.
"Return Summary Information on Events (Example AQL Queries) " on page 204	Use these examples to view summary information for event collections.
"Return Inventory Information Using Overall Aggregate Analytic Functions (Example AQL Queries)" on page 206	Use these examples to view a summary of inventory information for a collection.

Click here for a description of the moving aggregate (time series) functions provided.

Moving Aggregate (Time Series) Functions Provided by HP Operations Analytics

Function	Syntax	Description
moving_avg	moving_avg(i.<metric_unique_id>|i) <metric_unique_id> is the unique meta data identifier for the chosen metric Use moving_avg(i.<metric_unique_id>) to select a specific metric. **Note:** If this analytic function is applied to an attribute, Operations Analytics ignores the analytic function. Use moving_avg(i) to select all metrics in the collections identified in **from i in …** clause. When using the (i) notation, note the following: • Operations Analytics returns the moving_avg of only metrics. Attributes, such as host_name, are ignored. • If no matching metrics are found, Operations Analytics ignores the function.	Computes the average values at each time interval within the specified time window for one or more metrics. **Note:** The time interval is specified using the **let interval= …** clause.

Moving Aggregate (Time Series) Functions Provided by HP Operations Analytics, continued

Function	Syntax	Description
moving_min	moving_min(i.<metric_unique_id>|i) <metric_unique_id> is the unique meta data identifier for the chosen metric Use moving_min(i.<metric_unique_id>) to select a specific metric. **Note:** If this analytic function is applied to an attribute, Operations Analytics ignores the analytic function. Use moving_min(i) to select all metrics in the collections identified in **from i in …** clause. When using the (i) notation, note the following: • Operations Analytics returns the moving_min of only metrics. Attributes, such as host_name, are ignored. • If no matching metrics are found, Operations Analytics ignores the function.	Computes the minimum values at each time interval within the specified time window for one or more metrics. **Note:** The time interval is specified using the **let interval= …** clause.

Moving Aggregate (Time Series) Functions Provided by HP Operations Analytics, continued

Function	Syntax	Description
moving_max	moving_max(i.<metric_unique_id>|i) <metric_unique_id> is the unique meta data identifier for the chosen metric. Use moving_max(i.<metric_unique_id>) to select a specific metric. **Note:** If this analytic function is applied to an attribute, Operations Analytics ignores the analytic function. Use moving_max(i) to select all metrics in the collections identified in **from i in …** clause. When using the (i) notation, note the following: • Operations Analytics returns the moving_max of only metrics. Attributes, such as host_name, are ignored. • If no matching metrics are found, Operations Analytics ignores the function.	Computes the maximum values at each time interval within the specified time window for one or more metrics. **Note:** The time interval is specified using the **let interval= …** clause.

Moving Aggregate (Time Series) Functions Provided by HP Operations Analytics, continued

Function	Syntax	Description
moving_total	moving_total(i.<metric_unique_id>|i) <metric_unique_id> is the unique meta data identifier for the chosen metric. Use moving_total(i.<metric_unique_id>) to select a specific metric. **Note:** If this analytic function is applied to an attribute, Operations Analytics ignores the analytic function. Use moving_total(i) to select all metrics in the collections identified in **from i in …** clause. When using the (i) notation, note the following: • Operations Analytics returns the moving_total of only metrics. Attributes, such as host_name, are ignored. • If no matching metrics are found, Operations Analytics ignores the function.	Computes the totals at each time interval within the specified time window for one or more metrics. **Note:** The time interval is specified using the **let interval= …** clause.

Moving Aggregate (Time Series) Functions Provided by HP Operations Analytics, continued

Function	Syntax	Description
moving_ count	moving_count(i.<attribute_unique_id>|i) <attribute_unique_id> is the unique meta data identifier for the chosen attribute Use moving_count(i.<attribute_ unique_id>) to count only the rows with values of the specified attribute. **Note:** If this analytic function is applied to a metric, Operations Analytics ignores the analytic function. Use moving_count(i) for counting all rows in a collection.	Computes the total counts of rows with values of an attribute or total count of all rows within a collection table at each time interval within the specified time window. **Note:** The time interval is specified using the **let interval= ...** clause.
moving_ distinct_ count	moving_distinct_count(i.<attribute_ unique_id>) **Note:** The (i) notation is not permitted. <attribute_unique_id> is the unique meta data identifier of the attribute for which a count of distinct values is to be calculated. **Note:** If this analytic function is applied to a metric, Operations Analytics ignores the analytic function.	Computes the total counts of distinct values of an attribute at each time interval within the specified time window. **Note:** The time interval is specified using the **let interval= ...** clause.

Click here for a description of the analytic functions provided.

Analytic Functions provided by Operations Analytics

Function	Syntax	Description
bottomN	bottomN(<inner_analytic_expression>|i.<metric_unique_id> [,<N>]) <inner_analytic_expression>is the use of an overall aggregate or moving aggregate function executed on an attribute or metric in a collection. <metric_unique_id> is the unique meta data identifier of a metric in the queried collection. <N> is an optional parameter that determines the number of values returned. **Note:** Use the $N variable in a bottomN analytic function when you want Operations Analytics to use the $N value specified when you add or edit a dashboard query pane. For example: bottomN(aggregate_disntinct_count (i.ciid),$N). See "Using an Operations Analytics Dashboard" on page 76 for more information about providing parameter values when creating a dashboard.	Uses the rank (ascending order) analytic function to identify the lowest N values. Operations Analytics returns the bottom N values with their associated rank. Note the following: • If you do not specify an N value in the AQL query, Operations Analytics displays the bottom five values. • The bottomN analytic function is not permitted in the **where** clause.

Analytic Functions provided by Operations Analytics, continued

Function	Syntax	Description
inverse_ pctile	inverse_pctile(<inner_analytic_ expression>|i.<metric_unique_id>, <pctile>) <inner_analytic_expression> is the use of an overall aggregate or moving aggregate function executed on an attribute or metric in a collection. <metric_unique_id> is unique meta data identifier of a metric property in a queried collection. <pctile> is the nth percentile parameter. Valid values are 1 to 100. **Note:** Use the $pctile variable when you want Operations Analytics to use the $pctile value specified when you add or edit a dashboard query pane. For example: inverse_pctile (moving_max(i.cpu_util),$pctile). See "Using an Operations Analytics Dashboard" on page 76 for more information about providing parameter values when creating a dashboard.	Calculates the inverse percentile distribution values for the set of raw metric, overall aggregate or moving aggregate values. Each inverse percentile distribution value is the nth percentile value among the set of values. For example, if you specify 50 as the <pctile> value, inverse_pctile finds the 50th percentile value (or median value) for the data set of raw metric, overall aggregate or moving aggregate values. **Note:** While identifying the nth percentile value,Operations Analytics uses an ascending ranking order. Use this analytic function to filter the underlying data set of values above or below a specified percentile value. Click here for more information. When applied to raw metrics, the nth percentile value is determined for the entire set of raw metric values without any grouping. When applied to overall aggregate values, the nth percentile value is calculated for the entire set of overall aggregate values. Because the overall aggregates data is already

Analytic Functions provided by Operations Analytics, continued

Function	Syntax	Description
		computed in groups using the group by clause, Operations Analytics does not apply any additional grouping of this data set before identifying the single nth percentile value for the entire data set of overall aggregates. When applied to moving aggregate values, the inverse_pctile value is calculated once for each time series of moving aggregate values.

Analytic Functions provided by Operations Analytics, continued

Function	Syntax	Description
pctile	pctile(<inner_analytic_expression>|i.<metric_ unique_id>)) <inner_analytic_expression> is the use of an overall aggregate or moving aggregate function executed on an attribute or metric in a collection. <metric_unique_id> is unique meta data identifier of a metric property in a queried collection.	Calculates the percentile rank value expressed as a fraction for the data set of raw metric, overall aggregate or moving aggregate values. Use this analytic function on a data set of raw metrics, overall aggregate values or moving aggregate values to view the relative distribution score for each value along with the value itself. **Note:** The ranking order is ascending while calculating percentile or relative distribution values. Click here for more information. When applied to raw metrics, the percentile ranking is calculated for each of the raw metric values within the data set. Each metric value receives a percentile rank. When applied to overall aggregate values,Operations Analytics calculates the percentile ranking for each of the overall aggregate values in the data set. Each overall aggregate value receives a percentile rank. Because the overall aggregates data is already computed in groups using the group by clause, Operations Analytics does not apply any additional grouping of this data set before identifying the

Analytic Functions provided by Operations Analytics, continued

Function	Syntax	Description
		percentile ranks of values within the data set of overall aggregates. When applied to moving aggregate values, each moving aggregate value is assigned a percentile rank score relative to other intervals in the same time series. If the query includes multiple moving aggregate time series (trends), Operations Analytics calculates a percentile for each moving aggregate time series.

Analytic Functions provided by Operations Analytics, continued

Function	Syntax	Description
outlier	outlier(<inner_analytic_expression>|i.<metric_ unique_id> [, <upper_pctile_limit>, <lower_pctile_ limit>]) <inner_analytic_expression> is the use of an overall aggregate or moving aggregate function executed on an attribute or metric in a collection. <metric_unique_id> is unique meta data identifier of a metric property in a queried collection. <upper_pctile_limit> and <lower_pctile_limit> indicate the upper and lower boundaries of the normal range. Valid values are 1 to 100. Note the following: • The <lower_pctile_limit> must be lower than <upper_pctile_limit>. • Use the $upper_pctile_limit and $lower_pctile_ limit variables in an outlier function when you want Operations Analytics to use the $upper_ pctile_limit and $lower_pctile_limit values specified when you add or edit a dashboard query pane. For example: outlier(moving_count (i), $upper_pctile_limit, $lower_pctile_limit)). See "Using an Operations Analytics Dashboard" on page 76 for more information about providing parameter values when creating a dashboard.	Highlights the data that is outside of the normal range identified using the <upper_ pctile_limit> and <lower_ pctile_limit>. **Note:** The outlier analytic function is not permitted in the **where** clause. The outlier analytic function uses the inverse_pctile analytic to filter and identify the values above the high percentile value and below the low percentile value. By default, if you do not specify the upper and lower pctile limits, Operations Analytics uses the 1st and 95th percentile range. Any value outside of this range is an outlier. Click here for more information. When the outlier analytic function is applied to a set of moving aggregate values representing multiple time-series (trends), Operations Analytics returns only the outlier time intervals within each time series. The returned set of time series (trend) data is sorted in descending order based on the number of outlier time intervals for each time series. Click here for more information. When the outlier analytic is

Analytic Functions provided by Operations Analytics, continued

Function	Syntax	Description
		applied to raw metric values returned as a time series, the outlier analytic function is applied on each raw metric time series without any grouping. When the outlier analytic is applied to overall aggregate values, only the overall aggregate values that are considered to be outliers are returned. Because the overall aggregates data is already computed in groups using the group by clause, Operations Analytics does not apply any additional grouping of this data set before identifying the outlier values within the data set of overall aggregates.

Analytic Functions provided by Operations Analytics, continued

Function	Syntax	Description
rank	rank(<inner_analytic_expression>|i.<metric_ unique_id>)[,<order>]) <inner_analytic_expression> is the use of an overall aggregate or moving aggregate function executed on an attribute or metric in a collection. <metric_unique_id> is unique meta data identifier of a metric property in a queried collection. <order> is optional. Valid values are **asc** or **desc** .	Use this analytic on a data set of raw metrics values, overall aggregate values or moving aggregate values to view the relative rank expressed as an integer for each value along with the value itself. Use the <order> parameter to specify either ascending or descending ranking. **Note:** If you do not specify an <order>, the default order is descending. Click here for more information. When the rank analytic is applied to raw metrics, Operations Analytics assigns a rank to each metric value. When the rank analytic is applied to overall aggregate values, Operations Analytics assigns a rank to each overall aggregate value. When the rank analytic is applied to moving aggregate values that return multiple time series (trend) results, Operations Analytics assigns a rank to each interval within each time series. Each interval receives a rank score relative to the other intervals in the same time series.

Analytic Functions provided by Operations Analytics, continued

Function	Syntax	Description
topN	topN(<inner_analytic_expression>|i.<metric_unique_id> [,<N>]) <inner_analytic_expression>is the use of an overall aggregate or moving aggregate function executed on an attribute or metric in a collection. <metric_unique_id> is the unique meta data identifier of a metric in the queried collection. <N> is optional parameter that determines the number of values returned. **Note:** Use the $N variable in a topN analytic function when you want Operations Analytics to use the $N value specified when you add or edit a dashboard query pane. For example: topN(aggregate_distinct_count(i.ciid), $N). See "Using an Operations Analytics Dashboard" on page 76 for more information about providing parameter values when creating a dashboard.	Uses the rank (descending order) analytic function to identify the highest N values. Operations Analytics returns the top N values with their associated rank. Note the following: • If you do not specify an N value in the AQL query, Operations Analytics displays the top five values. • The topN analytic function is not permitted in the **where** clause.

See the topics described in Example AQL Queries that Apply Analytic Functions for example AQL queries that use these analytic functions.

Return Summary Information on Metrics (Example AQL Queries)

Operations Analytics provides a set of analytic functions that return overall aggregate (summary) information.

Click here to view the description for each overall aggregate analytic function provided.

Overall Aggregate (Summary) Analytic Functions Provided by HP Operational Analytics

Function	Syntax	Description
aggregate_avg	aggregate_avg (i.<metric_unique_id>|i) <metric_unique_id> is the unique meta data identifier for the chosen metric	Identifies the average value for the metric or metrics selected.
aggregate_min	aggregate_min (i.<metric_unique_id>|i)	Identifies the minimum value for the metric or metrics selected.

Overall Aggregate (Summary) Analytic Functions Provided by HP Operational Analytics, continued

Function	Syntax	Description
aggregate_max	aggregate_max (i.<metric_unique_id>|i)	Identifies the maximum value for the metric or metrics selected.
aggregate_total		Identifies the total value for the metric or metrics selected.
aggregate_count	aggregate_countl (i.<attribute_unique_ id>|i) <attribut_unique_id> is the unique meta data identifier for the chosen attribute	Identifies the total count of rows with values of an attribute or total count of all rows in a collection table.
aggregate_distinct_count	aggregate_distinct_ countl(i.<attribute_ unique_id>) <attribute_unique_id> is the unique meta data identifier of the attribute for which a count of distinct values is to be calculated	Identifies the total count of distinct values of an attribute.

Click each query of interest from the following list to view the example AQL query.

Note: Each of the examples queries data from the oa_sysperf_global collection. This collection uses HP Performance Agent to collect system metrics. Each example queries data for only the hosts in the **mydomain.com** domain.

Return the average CPU utilization and CPU run queue size.

The following AQL query returns the average CPU utilization and CPU run queue size for each host matching the filter criteria.

from i in (oa_sysperf_global)

let analytic_interval= between($starttime,$endtime)

where (i.host_name like “*.mydomain.com”) group by i.host_name

select aggregate_avg(i.cpu_util), aggregate_avg(i.cpu_run_queue)

Return the average for each of the metrics collected by the oa_sysperf_global collection.

The following AQL query returns the average for each of the metrics collected by oa_sysperf_global for each host matching the filter criteria:

```
from i in (oa_sysperf_global)

let analytic_interval= between($starttime,$endtime)

where (i.host_name like "*.mydomain.com") group by i.host_name

select aggregate_avg(i)
```

Return the maximum, minimum, and average values for CPU utilization and CPU run queue size.

The following AQL query returns the maximum, minimum, average for CPU utilization and CPU run queue size for each host matching the filter criteria:

```
from i in (oa_sysperf_global)

let analytic_interval= between($starttime,$endtime)

where (i.host_name like "*.mydomain.com") group by i.host_name

select aggregate_min(i.cpu_util), aggregate_max(i.cpu_util), aggregate_max(i.cpu_util),
aggregate_min(i.cpu_run_queue), aggregate_max(i.cpu_run_queue), aggregate_avg(i.cpu_run_
queue)
```

Return the minimum, maximum, and average for each of the metrics collected by the oa_sysperf_global collection.

The following AQL query returns the minimum, maximum and average for each of the metrics collected by oa_sysperf_global for each host matching the filter criteria:

```
from i in (oa_sysperf_global)

let analytic_interval= between($starttime,$endtime)

where (i.host_name like "*.mydomain.com") group by i.host_name

select aggregate_min(i), aggregate_max(i), aggregate_avg(i)
```

Return Summary Information on Events (Example AQL Queries)

Operations Analytics provides a set of analytic functions that return overall aggregate (summary) information.

Click here to view the description for each overall aggregate analytic function provided.

Overall Aggregate (Summary) Analytic Functions Provided by HP Operational Analytics

Function	Syntax	Description
aggregate_avg	aggregate_avg (i.<metric_unique_id>|i) <metric_unique_id> is the unique meta data identifier for the chosen metric	Identifies the average value for the metric or metrics selected.
aggregate_min	aggregate_min (i.<metric_unique_id>|i)	Identifies the minimum value for the metric or metrics selected.
aggregate_max	aggregate_max (i.<metric_unique_id>|i)	Identifies the maximum value for the metric or metrics selected.
aggregate_total		Identifies the total value for the metric or metrics selected.
aggregate_count	aggregate_countl (i.<attribute_unique_ id>|i) <attribut_unique_id> is the unique meta data identifier for the chosen attribute	Identifies the total count of rows with values of an attribute or total count of all rows in a collection table.
aggregate_distinct_count	aggregate_distinct_ countl(i.<attribute_ unique_id>) <attribute_unique_id> is the unique meta data identifier of the attribute for which a count of distinct values is to be calculated	Identifies the total count of distinct values of an attribute.

Note: Each of the examples queries data from the omi_events_omievents collection. This collection uses HP Operations Manager i (OMi) to collect OMi events. Each example queries data for only the hosts in the **mydomain.com** domain.

Return the total count of OMi events for a specified host and severity combination.

The following AQL query calculates the total count of OMi events for each host and severity combinations matching the filter criteria:

```
from i in (omi_events_omievents)

let analytic_interval= between($starttime, $endtime)

where ( ( i.hostinfo_dnsname like “*mydomain.com”” ) && ( ( i.severity ilike ”CRITI*” ) || (i.severity ilike “WARN*”) ))

group by i.hostinfo_dnsname, i.severity select aggregate_count(i)
```

Return the total count of OMi events for a specified host and severity combination and for which the event count exceeds 100

The following AQL query does the same as the previous AQL query, but returns the counts for only those host name and severity combinations for which the event count exceeds 100:

```
from i in (omi_events_omievents)

let analytic_interval= between($starttime, $endtime)

where (( i.hostinfo_dnsname like “*mydomain.com”” ) && ( ( i.severity ilike ”CRITI*” ) || (i.severity ilike “WARN*”) ) && ( aggregate_count(i) > 100 ))

group by i.hostinfo_dnsname, i.severity select aggregate_count(i)
```

Return Inventory Information Using Overall Aggregate Analytic Functions (Example AQL Queries)

Operations Analytics provides a set of analytic functions that return overall aggregate (summary) information.

Click here to view the description for each overall aggregate analytic function provided.

Overall Aggregate (Summary) Analytic Functions Provided by HP Operational Analytics

Function	Syntax	Description
aggregate_avg	aggregate_avg (i.<metric_unique_id>|i) <metric_unique_id> is the unique meta data identifier for the chosen metric	Identifies the average value for the metric or metrics selected.
aggregate_min	aggregate_min (i.<metric_unique_id>|i)	Identifies the minimum value for the metric or metrics selected.

Overall Aggregate (Summary) Analytic Functions Provided by HP Operational Analytics, continued

Function	Syntax	Description
aggregate_max	aggregate_max (i.<metric_unique_id>|i)	Identifies the maximum value for the metric or metrics selected.
aggregate_total		Identifies the total value for the metric or metrics selected.
aggregate_count	aggregate_countl (i.<attribute_unique_ id>|i) <attribut_unique_id> is the unique meta data identifier for the chosen attribute	Identifies the total count of rows with values of an attribute or total count of all rows in a collection table.
aggregate_distinct_count	aggregate_distinct_ countl(i.<attribute_ unique_id>) <attribute_unique_id> is the unique meta data identifier of the attribute for which a count of distinct values is to be calculated	Identifies the total count of distinct values of an attribute.

Return the number of distinct applications monitored by HP Business Process Monitor (BPM) per location.

Note: The following AQL query uses the bpm_application_performance collection. This collection uses HP Business Process Monitor (BPM) to gather application performance information.

The following AQL query calculates the number of distinct applications monitored by BPM on a location by location basis.

from i in (bpm_application_performance)

let analytic_interval = between($starttime, $endtime)

group by i.location

select aggregate_distinct_count(i.application)

Return the total count of distinct database instances reporting oracle metrics.

> **Note:** The following AQL query uses the oa_oraperf_graph collection. The oa_oraperf_graph collection uses HP Operations Smart Plug-in for Oracle to gather Oracle performance information.

The following AQL query returns a distinct counts of database instances reporting oracle metrics:

```
from i in (oa_oraperf_graph)
let analytic_interval= between($starttime,$endtime)
where ( i.host_name like "*mydomain.com" )
group by i.host_name select aggregate_distinct_count(i.db_instance_name)
```

Return Time Series (Trend) Information on Metrics (Example AQL Queries)

Operations Analytics provides a set of analytic functions that return moving aggregate (time series) information.

Click here to view the description for each moving aggregate analytic function provided.

Moving Aggregate (Time Series) Analytic Functions Provided by HP Operational Analytics

Function	Synax	Description
moving_ avg	moving_avg (i.<metric_ unique_id>|i)	Computes the average values at the specified time interval and within the specified time window for one or more metrics.
moving_ min	moving_min (i.<metric_ unique_id>|i)	Computes the minimum values at the specified time interval and within the specified time window for one or more metrics.
moving_ max	moving_max (i.<metric_ unique_id>|i)	Computes the maximum values at the specified time interval and within the specified time window for one or more metrics.
moving_ total	moving_total (i.<metric_ unique_id>|i)	Computes the totals at the specified time interval and within the specified time window for one or more metrics.
moving_ count	moving_countl (i.<attribute_ unique_id>|i)	Computes the total number of rows with values of an attribute or total count of all rows within a collection table at the specified time interval and within the specified time window.
moving_ distinct_ count	moving_ distinct_count (i.<attribute_ unique_id>)	Computes the total count of distinct values of an attribute at the specified time interval and within the specified time window.

Click each query of interest from the following list to view the example AQL query.

Note: Each of the examples queries data from the oa_sysperf_global collection. This collection uses HP Performance Agent to collect system metrics. Each example queries data for only the hosts in the **mydomain.com** domain.

Return the moving average CPU utilization and CPU run queue size.

The following AQL query returns the moving average CPU utilization and CPU run queue size for each host matching the filter criteria.

from i in (oa_sysperf_global)

let analytic_interval= between($starttime,$endtime) let interval=$interval

where (i.host_name like “*.mydomain.com”) group by i.host_name

select moving_avg(i.cpu_util), moving_avg(i.cpu_run_queue)

Return the moving average for each of the metrics collected by the oa_sysperf_global collection.

The following AQL query returns the moving average for each of the metrics collected by oa_ sysperf_global for each host matching the filter criteria:

from i in (oa_sysperf_global)

let analytic_interval= between($starttime,$endtime) let interval=$interval

where (i.host_name like “*.mydomain.com”) group by i.host_name

select moving_avg(i)

Return the moving maximum, minimum, and average values for CPU utilization and CPU run queue size.

The following AQL query returns the moving maximum, minimum, average for CPU utilization and CPU run queue size for each host matching the filter criteria:

from i in (oa_sysperf_global)

let analytic_interval= between($starttime,$endtime) let interval=$interval

where (i.host_name like “*.mydomain.com”) group by i.host_name

select moving_min(i.cpu_util), moving_max(i.cpu_util), moving_max(i.cpu_util), moving_min (i.cpu_run_queue), moving_max(i.cpu_run_queue), moving_avg(i.cpu_run_queue)

Return the moving minimum, maximum, and average for each of the metrics collected by the oa_sysperf_global collection.

The following AQL query returns the moving minimum, maximum and average for each of the metrics collected by oa_sysperf_global for each host matching the filter criteria:

from i in (oa_sysperf_global)

let analytic_interval= between($starttime,$endtime) let interval=$interval

where (i.host_name like “*.mydomain.com”) group by i.host_name

select moving_min(i), moving_max(i), moving_avg(i)

Return Time Series (Trend) Information on Events (Example AQL Queries)

Operations Analytics provides a set of analytic functions that return moving aggregate (time series or trends) information.

Click here to view the description for each moving aggregate analytic function provided.

Moving Aggregate (Time Series) Analytic Functions Provided by HP Operational Analytics

Function	Synax	Description
moving_ avg	moving_avg (i.<metric_ unique_id>|i)	Computes the average values at the specified time interval and within the specified time window for one or more metrics.
moving_ min	moving_min (i.<metric_ unique_id>|i)	Computes the minimum values at the specified time interval and within the specified time window for one or more metrics.
moving_ max	moving_max (i.<metric_ unique_id>|i)	Computes the maximum values at the specified time interval and within the specified time window for one or more metrics.
moving_ total	moving_total (i.<metric_ unique_id>|i)	Computes the totals at the specified time interval and within the specified time window for one or more metrics.
moving_ count	moving_countl (i.<attribute_ unique_id>|i)	Computes the total number of rows with values of an attribute or total count of all rows within a collection table at the specified time interval and within the specified time window.
moving_ distinct_ count	moving_ distinct_count (i.<attribute_ unique_id>)	Computes the total count of distinct values of an attribute at the specified time interval and within the specified time window.

Note: Each of the examples queries data from the omi_events_omievents collection. This collection uses HP Operations Manager i (OMi) to collect OMi events. Each example queries data for only the hosts in the **mydomain.com** domain.

Return the moving total count of OMi events for a specified host and severity combination.

The following AQL query calculates the moving total count of OMi events for each host and severity combinations matching the filter criteria:

from i in (omi_events_omievents)

let analytic_interval=between($starttime,$endtime) let interval=$interval

where ((i.hostinfo_dnsname like “*mydomain.com””) && ((i.severity ilike ”CRITI*”) || (i.severity ilike “WARN*”)))

group by i.hostinfo_dnsname, i.severity select moving_count(i)

Return the moving total count of OMi events for a specified host and severity combination and for which the event count exceeds 100

The following AQL query does the same as the previous AQL query, but returns the moving counts for only those host name and severity combinations at only those intervals at which the event count exceeds 100:

from i in (omi_events_omievents)

let analytic_interval=between($starttime,$endtime) let interval=$interval

where ((i.hostinfo_dnsname like “*mydomain.com””) && ((i.severity ilike ”CRITI*”) || (i.severity ilike “WARN*”)) && (moving_count(i) > 100))

group by i.hostinfo_dnsname, i.severity select moving_count(i)

Return Inventory Information Using Moving Aggregate (Time Series) Analytic Functions (Example AQL Queries)

Operations Analytics provides a set of analytic functions that return moving aggregate (time series or trend) information.

Click here to view the description for each moving aggregate analytic function provided.

Moving Aggregate (Time Series) Analytic Functions Provided by HP Operational Analytics

Function	Synax	Description
moving_ avg	moving_avg (i.<metric_ unique_id>|i)	Computes the average values at the specified time interval and within the specified time window for one or more metrics.
moving_ min	moving_min (i.<metric_ unique_id>|i)	Computes the minimum values at the specified time interval and within the specified time window for one or more metrics.
moving_ max	moving_max (i.<metric_ unique_id>|i)	Computes the maximum values at the specified time interval and within the specified time window for one or more metrics.
moving_ total	moving_total (i.<metric_ unique_id>|i)	Computes the totals at the specified time interval and within the specified time window for one or more metrics.
moving_ count	moving_countl (i.<attribute_ unique_id>|i)	Computes the total number of rows with values of an attribute or total count of all rows within a collection table at the specified time interval and within the specified time window.
moving_ distinct_ count	moving_ distinct_count (i.<attribute_ unique_id>)	Computes the total count of distinct values of an attribute at the specified time interval and within the specified time window.

Note: The following two examples query data from the collection rtsm_ci_inventory. This collection uses HP Run-Time Service Model (RTSM) to collect inventory information on topology.

Return the moving number of distinct applications monitored by HP Business Process Monitor (BPM) per location.

Note: The following AQL query uses the bpm_application_performance collection. This collection uses HP Business Process Monitor (BPM) to gather application performance information.

The following AQL query calculates the moving number of distinct applications monitored by BPM on a location by location basis.

from i in (bpm_application_performance)

let analytic_interval = between($starttime, $endtime) let interval = $interval

group by i.location

select moving_distinct_count(i.application)

Return the moving total count of distinct database instances reporting oracle metrics.

Note: The following AQL query uses the oa_oraperf_graph collection. The oa_oraperf_graph collection uses HP Operations Smart Plug-in for Oracle to gather Oracle performance information.

The following AQL query returns moving total counts of the distinct database instances reporting oracle metrics:

from i in (oa_oraperf_graph)

let analytic_interval= between($starttime,$endtime) let interval = $interval where (i.host_name like “*mydomain.com”)

group by i.host_name

select moving_distinct_count(i.db_instance_name)

Apply Additional Analytic Functions to Overall Aggregates, Moving Aggregates and Raw Metrics

Operations Analytics provides a set of analytic functions that can be applied to overall aggregate and moving aggregate analytic functions.

Click here to view the description for each of these analytic functions provided.

Analytic Functions provided by Operations Analytics

Function	Syntax	Description
bottomN	bottomN(<inner_analytic_expression>|i.<metric_unique_id> [,<N>]) <inner_analytic_expression>is the use of an overall aggregate or moving aggregate function executed on an attribute or metric in a collection. <metric_unique_id> is the unique meta data identifier of a metric in the queried collection. <N> is an optional parameter that determines the number of values returned. **Note:** Use the $N variable in a bottomN analytic function when you want Operations Analytics to use the $N value specified when you add or edit a dashboard query pane. For example: bottomN(aggregate_disntinct_count (i.ciid),$N). See "Using an Operations Analytics Dashboard" on page 76 for more information about providing parameter values when creating a dashboard.	Uses the rank (ascending order) analytic function to identify the lowest N values. Operations Analytics returns the bottom N values with their associated rank. Note the following: • If you do not specify an N value in the AQL query, Operations Analytics displays the bottom five values. • The bottomN analytic function is not permitted in the **where** clause.

Analytic Functions provided by Operations Analytics, continued

Function	Syntax	Description
inverse_ pctile	inverse_pctile(<inner_analytic_ expression>|i.<metric_unique_id>, <pctile>) <inner_analytic_expression> is the use of an overall aggregate or moving aggregate function executed on an attribute or metric in a collection. <metric_unique_id> is unique meta data identifier of a metric property in a queried collection. <pctile> is the nth percentile parameter. Valid values are 1 to 100. **Note:** Use the $pctile variable when you want Operations Analytics to use the $pctile value specified when you add or edit a dashboard query pane. For example: inverse_pctile (moving_max(i.cpu_util),$pctile). See "Using an Operations Analytics Dashboard" on page 76 for more information about providing parameter values when creating a dashboard.	Calculates the inverse percentile distribution values for the set of raw metric, overall aggregate or moving aggregate values. Each inverse percentile distribution value is the nth percentile value among the set of values. For example, if you specify 50 as the <pctile> value, inverse_pctile finds the 50th percentile value (or median value) for the data set of raw metric, overall aggregate or moving aggregate values. **Note:** While identifying the nth percentile value,Operations Analytics uses an ascending ranking order. Use this analytic function to filter the underlying data set of values above or below a specified percentile value. Click here for more information. When applied to raw metrics, the nth percentile value is determined for the entire set of raw metric values without any grouping. When applied to overall aggregate values, the nth percentile value is calculated for the entire set of overall aggregate values. Because the overall aggregates data is already

Analytic Functions provided by Operations Analytics, continued

Function	Syntax	Description
		computed in groups using the group by clause, Operations Analytics does not apply any additional grouping of this data set before identifying the single nth percentile value for the entire data set of overall aggregates. When applied to moving aggregate values, the inverse_pctile value is calculated once for each time series of moving aggregate values.

Analytic Functions provided by Operations Analytics, continued

Function	Syntax	Description
pctile	pctile(<inner_analytic_expression>|i.<metric_ unique_id>)) <inner_analytic_expression> is the use of an overall aggregate or moving aggregate function executed on an attribute or metric in a collection. <metric_unique_id> is unique meta data identifier of a metric property in a queried collection.	Calculates the percentile rank value expressed as a fraction for the data set of raw metric, overall aggregate or moving aggregate values. Use this analytic function on a data set of raw metrics, overall aggregate values or moving aggregate values to view the relative distribution score for each value along with the value itself. **Note:** The ranking order is ascending while calculating percentile or relative distribution values. Click here for more information. When applied to raw metrics, the percentile ranking is calculated for each of the raw metric values within the data set. Each metric value receives a percentile rank. When applied to overall aggregate values,Operations Analytics calculates the percentile ranking for each of the overall aggregate values in the data set. Each overall aggregate value receives a percentile rank. Because the overall aggregates data is already computed in groups using the group by clause, Operations Analytics does not apply any additional grouping of this data set before identifying the

Analytic Functions provided by Operations Analytics, continued

Function	Syntax	Description
		percentile ranks of values within the data set of overall aggregates. When applied to moving aggregate values, each moving aggregate value is assigned a percentile rank score relative to other intervals in the same time series. If the query includes multiple moving aggregate time series (trends), Operations Analytics calculates a percentile for each moving aggregate time series.

Analytic Functions provided by Operations Analytics, continued

Function	Syntax	Description
outlier	outlier(<inner_analytic_expression>|i.<metric_ unique_id> [, <upper_pctile_limit>, <lower_pctile_ limit>]) <inner_analytic_expression> is the use of an overall aggregate or moving aggregate function executed on an attribute or metric in a collection. <metric_unique_id> is unique meta data identifier of a metric property in a queried collection. <upper_pctile_limit> and <lower_pctile_limit> indicate the upper and lower boundaries of the normal range. Valid values are 1 to 100. Note the following: • The <lower_pctile_limit> must be lower than <upper_pctile_limit>. • Use the $upper_pctile_limit and $lower_pctile_ limit variables in an outlier function when you want Operations Analytics to use the $upper_ pctile_limit and $lower_pctile_limit values specified when you add or edit a dashboard query pane. For example: outlier(moving_count (i), $upper_pctile_limit, $lower_pctile_limit)). See "Using an Operations Analytics Dashboard" on page 76 for more information about providing parameter values when creating a dashboard.	Highlights the data that is outside of the normal range identified using the <upper_ pctile_limit> and <lower_ pctile_limit>. **Note:** The outlier analytic function is not permitted in the **where** clause. The outlier analytic function uses the inverse_pctile analytic to filter and identify the values above the high percentile value and below the low percentile value. By default, if you do not specify the upper and lower pctile limits, Operations Analytics uses the 1st and 95th percentile range. Any value outside of this range is an outlier. Click here for more information. When the outlier analytic function is applied to a set of moving aggregate values representing multiple time-series (trends), Operations Analytics returns only the outlier time intervals within each time series. The returned set of time series (trend) data is sorted in descending order based on the number of outlier time intervals for each time series. Click here for more information. When the outlier analytic is

Analytic Functions provided by Operations Analytics, continued

Function	Syntax	Description
		applied to raw metric values returned as a time series, the outlier analytic function is applied on each raw metric time series without any grouping. When the outlier analytic is applied to overall aggregate values, only the overall aggregate values that are considered to be outliers are returned. Because the overall aggregates data is already computed in groups using the group by clause, Operations Analytics does not apply any additional grouping of this data set before identifying the outlier values within the data set of overall aggregates.

Analytic Functions provided by Operations Analytics, continued

Function	Syntax	Description
rank	rank(<inner_analytic_expression>|i.<metric_ unique_id>)[,<order>]) <inner_analytic_expression> is the use of an overall aggregate or moving aggregate function executed on an attribute or metric in a collection. <metric_unique_id> is unique meta data identifier of a metric property in a queried collection. <order> is optional. Valid values are **asc** or **desc** .	Use this analytic on a data set of raw metrics values, overall aggregate values or moving aggregate values to view the relative rank expressed as an integer for each value along with the value itself. Use the <order> parameter to specify either ascending or descending ranking. **Note:** If you do not specify an <order>, the default order is descending. Click here for more information. When the rank analytic is applied to raw metrics, Operations Analytics assigns a rank to each metric value. When the rank analytic is applied to overall aggregate values, Operations Analytics assigns a rank to each overall aggregate value. When the rank analytic is applied to moving aggregate values that return multiple time series (trend) results, Operations Analytics assigns a rank to each interval within each time series. Each interval receives a rank score relative to the other intervals in the same time series.

Analytic Functions provided by Operations Analytics, continued

Function	Syntax	Description
topN	topN(<inner_analytic_expression>|i.<metric_unique_id> [,<N>]) <inner_analytic_expression>is the use of an overall aggregate or moving aggregate function executed on an attribute or metric in a collection. <metric_unique_id> is the unique meta data identifier of a metric in the queried collection. <N> is optional parameter that determines the number of values returned. **Note:** Use the $N variable in a topN analytic function when you want Operations Analytics to use the $N value specified when you add or edit a dashboard query pane. For example: topN(aggregate_distinct_count(i.ciid), $N). See "Using an Operations Analytics Dashboard" on page 76 for more information about providing parameter values when creating a dashboard.	Uses the rank (descending order) analytic function to identify the highest N values. Operations Analytics returns the top N values with their associated rank. Note the following: • If you do not specify an N value in the AQL query, Operations Analytics displays the top five values. • The topN analytic function is not permitted in the **where** clause.

See the following topics for examples that use these analytic functions and the expected results.

"Return Inverse Percentile Values (Example AQL Queries)" below

"Return Percentile Values (Example AQL Queries)" on the next page

"Return Outlier Values (Example AQL Queries)" on page 224

"Return Values by Rank (Example AQL Queries)" on page 225

"Return the Top N Values (Example AQL Queries)" on page 226

Return Inverse Percentile Values (Example AQL Queries)

Operations Analytics provides a set of analytic functions that can be applied to overall aggregate (summary) or moving aggregate (time series or trend) information. See"Analytic Functions Provided by Operations Analytics" on page 181 for more information.

The following examples use the inverse_pctile analytic function to return inverse percentile values for sets of data returned by the overall aggregate and moving aggregate analytic functions.

Note: The following two examples query data from the oa_sysperf_global collection. This collection uses HP Operations Agent to collect system metrics. Each example queries data for only the hosts in the **mydomain.com** domain.

Return the hosts and their overall aggregate average values of CPU utilization that are greater than the 95th percentile.

The following AQL query determines the hosts and their overall aggregate average values of CPU utilization which are greater than 95th percentile value amongst the overall aggregate average values for all hosts matching the filter criteria:

```
from i in (oa_sysperf_global)

let analytic_interval= between($starttime,$endtime)

where(( i.host_name like “*.mydomain.com” ) && ( aggregate_avg(i.cpu_util) > inverse_pctile (aggregate_avg(i.cpu_util), 95) ))

group by i.host_name select aggregate_avg(i.cpu_util)
```

Return the raw CPU utilization values that are greater than the 95th percentile value.

The following AQL query returns the raw CPU utilization values that are greater than the 95th percentile value:

```
from i in (oa_sysperf_global)

let analytic_interval= between($starttime,$endtime)

where(( i.host_name like “*.mydomain.com” )&& (i.cpu_util > inverse_pctile(i.cpu_util, 95) ))

select i.host_name, i.timestamp, i.cpu_util
```

Note: The following two examples query data from the omi_events_omievents collection. This collection uses HP Operations Manager i (OMi) to collect OMi events. Each example queries data for only the hosts in the **mydomain.com** domain.

Return the hosts and their overall aggregate count of events that are greater than the 95th percentile.

The following AQL query determines the hosts and their overall aggregate count of events that are greater than 95th percentile among the overall aggregate event count values for all hosts matching the filter criteria:

```
from i in (omi_events_omievents) let analytic_interval= between($starttime,$endtime)

where(( i.hostinfo_dnsname like “*.mydomain.com” )&& ( aggregate_count(i) > inverse_pctile (aggregate_count(i), 95) ))

group by i.hostinfo_dnsname select aggregate_count(i)
```

Return Percentile Values (Example AQL Queries)

Operations Analytics provides a set of analytic functions that can be applied to overall aggregate (summary) or moving aggregate (time series or trend) information. See "Analytic Functions Provided by Operations Analytics" on page 181 for more information.

The following examples use the pctile analytic function to return percentile values for sets of data returned by the overall aggregate and moving aggregate analytic functions.

Note: The following example queries data from the oa_sysperf_global collection. This collection uses HP Operations Agent to collect system metrics. Each example queries data for only the hosts in the **mydomain.com** domain.

Return the hosts and their overall aggregate average values of CPU utilization along with the percentile rank

The following AQL query determines the hosts and their overall aggregate average values of CPU utilization along with the percentile rank for the value among the overall aggregate average values for all hosts matching the filter criteria:

from i in (oa_sysperf_global)

let analytic_interval= between($starttime,$endtime)

where(i.host_name like “*.mydomain.com”)

group by i.host_name select pctile(aggregate_avg(i.cpu_util))

Note: The following example queries data from the omi_events_omievents collection. This collection uses HP Operations Manager i (OMi) to collect OMi events. Each example queries data for only the hosts in the **mydomain.com** domain.

Return the hosts and their overall aggregate count of events with the percentile rank of the overall aggregate event count.

The following AQL query determines the hosts and their overall aggregate count of events along with percentile ranks of the overall aggregate event count values for all hosts matching the filter criteria:

from i in (omi_events_omievents)

let analytic_interval= between($starttime,$endtime)

where(i.hostinfo_dnsname like “*.mydomain.com”)

group by i.hostinfo_dnsname

select pctile(aggregate_count(i))

Note: The following example queries data from the bpm_application_performance collection. This collection uses HP Business Process Monitor (BPM) to gather application performance information.

Return application locations and their overall aggregate distinct counts of applications monitored by BPM with the percentile rank for each.

The following AQL query determine the locations and their overall aggregate distinct count of applications monitored by BPM. The query also returns their percentile ranks within the overall aggregate distinct application counts for all locations matching the filter criteria:

from i in (bpm_application_performance)

let analytic_interval= between($starttime,$endtime)

where(i.location like “*”)

group by i.location

select pctile(aggregate_distinct_count(i.application))

Return Outlier Values (Example AQL Queries)

Operations Analytics provides a set of analytic functions that can be applied to overall aggregate (summary) or moving aggregate (time series or trend) information. See "Analytic Functions Provided by Operations Analytics" on page 181 for more information.

The following examples use the outlier analytic function to return outlier values for sets of data returned by the overall aggregate and moving aggregate analytic functions.

Note: The following set of examples query data from the oa_sysperf_global collection. This collection uses HP Operations Agent to collect system metrics. Each example queries data for only the hosts in the **mydomain.com** domain.

Return the outlier values for the hosts that have an overall aggregate average value of CPU utilization outside the specified high and low range.

The following AQL query determines only the hosts and their overall aggregate average values of CPU utilization that are outside the specified high and low range among the overall aggregate average values for all hosts matching the filter criteria:

from i in (oa_sysperf_global)

let analytic_interval= between($starttime,$endtime)

where(i.host_name like “*.mydomain.com”)

group by i.host_name

select outlier(aggregate_avg(i.cpu_util))

Return only the outlier moving average values of CPU utilization and their intervals.

The following AQL query returns per host only moving average values of CPU utilization that are outside the specified high and low range and the interval for each:

from i in (oa_sysperf_global)

let analytic_interval= between($starttime,$endtime) let interval=$interval

where(i.host_name like “*.mydomain.com”)

group by i.host_name

select outlier(moving_avg(i.cpu_util))

Note: The following example queries data from the omi_events_omievents collection. This collection uses HP Operations Manager i (OMi) to collect OMi events. Each example queries data for only the hosts in the **mydomain.com** domain.

Return the hosts and their overall aggregate count of events that are outside the specified high and low range.

The following AQL query determines the hosts and their overall aggregate count of events that are outside the specified high and low range among all hosts matching the filter criteria:

```
from i in (omi_events_omievents)

let analytic_interval= between($starttime,$endtime)

where( i.hostinfo_dnsname like “*.mydomain.com” )

group by i.hostinfo_dnsname

select outlier(aggregate_count(i))
```

Note: The following example queries data from the bpm_application_performance collection. This collection uses HP Business Process Monitor (BPM) to gather application performance information.

Return the locations and their overall aggregate distinct count of applications monitored by BPM for those counts that are outside the specified high and low range.

The following AQL query determines the locations of the outlier overall aggregate distinct count of applications monitored by BPM, among all locations matching the filter criteria:

```
from i in (bpm_application_performance)

let analytic_interval= between($starttime,$endtime)

where(i.location like “*” )

group by i.location

select outlier(aggregate_distinct_count(i.application))
```

Return Values by Rank (Example AQL Queries)

Operations Analytics provides a set of analytic functions that can be applied to overall aggregate (summary) or moving aggregate (time series or trend) information. See "Analytic Functions Provided by Operations Analytics" on page 181 for more information.

The following examples use the rank analytic function to return the calculated rank and associated values for sets of data returned by the overall aggregate and moving aggregate analytic functions.

Note: The following example queries data from the oa_sysperf_global collection. This collection uses HP Operations Agent to collect system metrics. Each example queries data for only the hosts in the **mydomain.com** domain.

Return the hosts that have the 10 lowest values for overall aggregate average CPU utilization along with the rank of each value.

The following AQL query determines the hosts that have the 10 lowest values for overall aggregate average CPU utilization. This AQL query also returns the rank associated with each value.

from i in (oa_sysperf_global)

let analytic_interval= between($starttime,$endtime)

where((i.host_name like “*.mydomain.com”)&& (rank(aggregate_avg(i.cpu_util), asc) <= 10))

group by i.host_name

select aggregate_avg(i.cpu_util)

Note: The following two examples query data from the omi_events_omievents collection. This collection uses HP Operations Manager i (OMi) to collect OMi events. Each example queries data for only the hosts in the **mydomain.com** domain.

Return the hosts that have the highest 10 values for the overall aggregate count of events.

The following AQL query determines the hosts and their overall aggregate count of events that are the highest 10 values. This AQL query also returns the rank associated with each value.

from i in (omi_events_omievents) let analytic_interval= between($starttime,$endtime) where((i.hostinfo_dnsname like “*.mydomain.com”)&& (rank(aggregate_count(i)) <=10))

group by i.hostinfo_dnsname

select aggregate_count(i)

Return the Top N Values (Example AQL Queries)

Operations Analytics provides a set of analytic functions that can be applied to overall aggregate (summary) or moving aggregate (time series or trend) information. See "Analytic Functions Provided by Operations Analytics" on page 181 for more information.

Tip: Also use these examples to assist you in constructing AQL queries that use the bottomN analytic function.

The following examples use the topN analytic function to return the top *n* values for sets of data returned by the overall aggregate and moving aggregate analytic functions.

Note: The following examples query data from the oa_sysperf_global collection. This collection uses HP Operations Agent to collect system metrics. Each example queries data for only the hosts in the **mydomain.com** domain.

Return the top five hosts and their overall aggregate average values of CPU utilization. This query also returns the associated relative ranks.

The following AQL query determines the top five hosts and their overall aggregate average values of CPU utilization among the overall aggregate average values and relative ranks for all hosts matching the filter criteria:

from i in (oa_sysperf_global)

let analytic_interval= between($starttime,$endtime)

where (i.host_name like “*.mydomain.com”)

group by i.host_name

select topN(aggregate_avg(i.cpu_util))

Return the top five raw CPU utilization values.

The following AQL query returns the top five raw CPU utilization values:

from i in (oa_sysperf_global)

let analytic_interval= between($starttime,$endtime)

where (i.host_name like “*.mydomain.com”)

select i.host_name, i.timestamp, topN(i.cpu_util)

Note: The following example queries data from the omi_events_omievents collection. This collection uses HP Operations Manager i (OMi) to collect OMi events. Each example queries data for only the hosts in the **mydomain.com** domain.

Return the top 10 hosts with the highest overall aggregate count of events.

The following AQL query determines the top 10 hosts with the highest overall aggregate count of events among the overall aggregate event count values for all hosts matching the filter criteria:

from i in (omi_events_omievents)

let analytic_interval= between($starttime,$endtime)

where (i.hostinfo_dnsname like “*.mydomain.com”)

group by i.hostinfo_dnsname

select topN(aggregate_count(i), 10)

Note: The following example queries data from the bpm_application_performance collection. This collection uses HP Business Process Monitor (BPM) to gather application performance information.

Return the top five locations with the highest overall aggregate distinct count of applications monitored by BPM.

The following AQL query determines the top five locations with the highest overall aggregate distinct count of applications monitored by BPM among the overall aggregate distinct application counts for all locations matching the filter criteria:

from i in (bpm_application_performance)

let analytic_interval= between($starttime,$endtime)

where(i.location like “*”)

group by i.location

select topN(aggregate_distinct_count(i.application))

About Analytics Query Language (AQL) Functions

Analytic Query Language (AQL) functions are functions that can be used in place of an associated AQL query. When you define an AQL function, you name the AQL function, define its arguments and the associated AQL query.

Note: To select an AQL Function provided by Operations Analytics, use the Add a Query Pane feature from an Operations Analytics dashboard. See "Using an Operations Analytics Dashboard" on page 76 for more information.

To create an AQL function use the following syntax:

`define` <*AQL function name*>(*argument_1*, *argument_2,...argument_n*)=<*AQL query syntax*>

Note: Arguments are those values that are passed to the associated AQL function. Any value that is used in the AQL query is known as a parameter. For example, the name of a host might be a valid parameter for an AQL query.

To use an AQL function use the following syntax:

[<*AQL function name*>(*value for argument_1*, *value for argument_2,...value for argument_n*)]

Note: The brackets ([]) are mandatory.

See AQL Function Syntax for a description of the AQL function syntax.

Note the following:

- You create AQL functions using a text editor. See"Define Analytic Query Language (AQL) Functions" on page 283 for more information.
- To make the AQL functions available to your user community, import the AQL functions using the opsa-aql-import.sh. See "Import Analytic Query Language (AQL) Functions" on page 284 for more information.
- The arguments that can be passed to an AQL function include any parameter included in an AQL query. See "About Parameters Used in an Analytics Query Language (AQL) let clause" on page 165 for more information about the parameters that can be included in a let clause. See "About the Analytics Query Language (AQL) Syntax and Structure" on page 153 for more information about additional parameters that can be defined in an AQL query.

AQL Function Syntax

Syntax	Description	Example
AQ_function_name	Name of the AQL function. **Tip:** Use a name that will help you to remember the AQL function purpose. Alphanumeric characters and underscore (_) are permitted. Spaces and other special characters (~ ! @ # $ % ^ &; * ( ) + -) are not permitted.	cpu_threshold
argument_n	The nth argument to be passed to the associated AQL query. You can enter any number of arguments. **Note:** In this example, **percent** is used to identify the cpu utilization percent threshold.	percent
AQL_query_syntax	Syntax for the AQL query to which the AQL function is associated. **Note:** When the AQL function is used, each argument value provided is passed.to the associated AQL query. See the **bold** text in the Example.	from i in (oa_sysperf_global) let analytic_interval=between ($starttime,$endtime) where (aggregate_avg(i.cpu_util > **percent**) group by i.host_name select i.host_name, aggregate_avg (i.cpu_util)

Click here for the complete example.

`define cpu_threshold(percent) =`	from i in (oa_sysperf_global) let analytic_interval=between($starttime,$endtime) where (aggregate_avg(i.cpu_util) > percent) group by i.host_name select i.host_name, aggregate_avg(i.cpu_util)

To use the cpu_threshold AQL function to return a list of all the hosts where the average CPU utilization exceeds 80 percent, include the following parameter values:

```
[cpu_threshold(0.8)]
```

Click here for another example.

The following AQL function selects the host name that matches the value of argument **name**. The query returns the following information for the most recent **number** of OMi events that originated from the host selected:

- host name (hostinfo_dsname)
- timestamp
- message title
- severity

define `host_events (name,number)` =	from i in (omi_events_omievents) where (i.hostinfo_dnsname like **name**) let analytic_interval = between($starttime,$endtime) let offset = 0 let limit = **number** select i.hostinfo_dnsname, i.timestamp, i.title, i.severity

To use the host_events AQL function to return a list of the most recent 50 events for all hosts in the "enterprise.com" domain, include the following argument values:

```
[host_events("enterprise.com", 50)]
```

Operations Analytics provides a set of AQL functions for your use. See "Analytic Query Language (AQL) Functions Provided by Operations Analytics" below for more information.

Analytic Query Language (AQL) Functions Provided by Operations Analytics

By default, Operations Analytics provides several AQL functions to assist you with creating AQL queries and associated dashboards.

To view the AQL functions provided by Operations Analytics, use either of the following methods:

- If you are an Operations Analytics administrator, look at the .aql files in $OPSA_HOME/inventory/lib/hp/aql.
- Use the Add a Query Pane feature from an Operations Analytics dashboard. See "Using an Operations Analytics Dashboard" on page 76 for more information.

Operations Analytics also provides a set of analytic functions that you might commonly use in your AQL queries when creating AQL functions. See "Analytic Functions Provided by Operations Analytics" on page 181 for more information.

When using AQL functions, note the following:

- Your Operations Analytics administrator can specify which AQL functions to make available for your use.
- If you are an Operations Analytics administrator, you can create your own AQL functions using a text editor and then import those functions in to Operations Analytics. See "Import Analytic Query Language (AQL) Functions" on page 284 for more information.

About Analytics Query Language (AQL) Expressions

Analytic Query Language (AQL) expressions include multiple AQL functions. Use AQL expressions when you want the results of multiple queries to be combined into a single query pane in a dashboard.

You can use AQL functions in an AQL expression in any of the following ways:

Use a single AQL function.

Syntax: [<aql_function_invocation>]

See "About Analytics Query Language (AQL) Functions" on page 228 for more information.

Concatenate multiple AQL functions.

Concatenating multiple AQL functions enables you to concatenate the results from each AQL function as if they were run individually.

Syntax: [<aql_function1>,<aql_function2>, ….<aql_function*n*>]

Click here for an example:

The following AQL function returns the concatenation of the results from the following:

- moving averages of CPU utilization
- outlier values for the data set of moving averages of CPU utilization

[oaSysperfMovingMetric(“*.mydomain.com”, cpu_util, moving_avg),
oaSysperfOutlierMovingMetric(“*.mydomain.com”, cpu_util, moving_avg)]

Click here for the definition of each AQL function used in the example expression.

/* Returns the moving aggregation analytic function results for the specified metric. Input parameters are host filter, metric and analytic function. */

define oaSysperfMovingMetric(hostFilter, metric, moving_analytic) =

from i in (oa_sysperf_global)

let analytic_interval = between($starttime, $endtime) let interval = $interval

where i.host_name like hostFilter

group by i.host_name

select moving_analytic(i.metric);

/* Returns the outlier values for the results from a moving aggregate analytic function on a metric. Input parameters are host filter, metric & analytic. */

define oaSysperfOutlierMovingMetric(hostFilter, metric, moving_analytic) =

from i in (oa_sysperf_global)

let analytic_interval = between($starttime, $endtime)

let interval = $interval where i.host_name like hostFilter group by i.host_name

select outlier(moving_analytic(i.metric));

Use multiple AQL functions so that the results from one AQL function is an input filter for another AQL function.

This type of AQL expression is known as an AQL composition.

Syntax: [do <target_function> filter by <filter_function> with <filter_criteria>]

Click here for more syntax information.

<target_function> is the AQL function to execute.

<filter_function> is the AQL function used to filter the results.

<filter_criteria> is the criteria to use for filtering the results of target function. The syntax of <filter_criteria> is:

(<filter_criteria_element1>, <filter_criteria_element2>, ….)

Each <filter_criteria_element> specifies a metric or attribute column name with its associated collection. Values for the column name specified must be returned in the target_function and filter_function results.

Note: All of the filter criteria elements must be met to successfully filter the target function results.

The syntax for any filter criteria element is:

<target_function_name>.<target_function_resultcolumn> == <filter_function_name>.<filter_function_resultcolumn>

The <target_function_resultcolumn> can be any of the expected result columns from the results of <target_function>.

<target_function_name> is the name of the target function

Similarly, <filter_function_resultcolumn> can be any of the expected result columns from the results of <filter_function> . The <filter_function_name> is the name of the filter function.

Click here for an example.

The following example AQL expression returns the moving_avg, moving_max and moving min of CPU utilization for the top five hosts with the highest aggregate_avg cpu_util values.

[do oaSysperfMovingMetricAvgMaxMin("*", cpu_util) filter by oaSysperfTopNAggregateMetric ("*.mydomain.com",cpu_util,aggregate_avg,5) with (oaSysperfMovingMetricAvgMaxMin.host_ name== oaSysperfTopNAggregateMetric.host_name)]

Click here for the definition of each AQL function used in the example expression.

/* Returns the moving average, maximum, and minimum values of a specific metric by host. Input parameters are the host filter and the metric. */

define oaSysperfMovingMetricAvgMaxMin(hostFilter, metric) =

from i in (oa_sysperf_global)

let analytic_interval = between($starttime,$endtime) let interval = $interval

where i.host_name like hostFilter

group by i.host_name

select moving_avg(i.metric), moving_max(i.metric), moving_min(i.metric);

/* Returns the topN of a moving aggregate analytic function on a metric. Input parameters are the host filter, metric, moving aggregate analytic function, and N. */

define oaSysperfTopNMovingMetric(hostFilter, metric, moving_analytic, N) =

from i in (oa_sysperf_global)

let analytic_interval = between($starttime, $endtime) let interval = $interval

where i.host_name like hostFilter group by i.host_name

select topN(moving_analytic(i.metric), N);

Click here for another example.

The following AQL expression returns the aggregate_avg CPU utilization for all server nodes in the Operations Analytics topology. These servers include the database server nodes. This example uses topology data to filter and return metric analysis for important entities in your topology:

[do oaSysperfAggregateMetric("*",cpu_util,aggregate_avg) filter by opsaNodes()

with (

oaSysperfAggregateMetric.host_name== opsaNodes.opsa_server_name,
oaSysperfAggregateMetric.host_name== opsaNodes.collector_server_name,
oaSysperfAggregateMetric.host_name== opsaNodes.logger_server_name,
oaSysperfAggregateMetric.host_name== opsaNodes.vertica_node

)]

Click here for the definition of each AQL function used in the example expression.

/* Returns the results of the overall aggregate analytic function applied to the specified metric. Input parameters are host filter, metric and overall aggregate analytic function. */

define oaSysperfAggregateMetric(hostFilter,metric,aggregate_analytic) =

from i in (oa_sysperf_global) let analytic_interval = between($starttime, $endtime)

where i.host_name like hostFilter

group by i.host_name

select aggregate_analytic(i.metric);

/* Returns the host names of Operations Analytics application servers, logger servers, collector servers and vertica nodes in an Operations Analyticsdeployment */

define opsaNodes() = from i in (opsa_topology) select i.opsa_server_name, i.logger_server_name, i.collector_server_name, i.vertica_node;

Operations Analytics provides a set of AQL functions for your use. See "About Analytics Query Language (AQL) Functions" on page 228 and "Analytic Query Language (AQL) Functions Provided by Operations Analytics" on page 230 for more information.

Chapter 7: Interpret Dashboard Results

Operations Analytics returns data in the formats described in the following **Operations Analytics Visualizations** table.

Operations Analytics Visualizations

Format	Description
Line Charts, Heat Maps	Operations Analytics presents moving aggregate (time series) data as line charts, heat maps, bar charts and pie charts. Moving aggregate (time series) data is data that is displayed according to a time interval within a specified time range. This data might include the total, average, minimum, or maximum values calculated at each interval over the specified time range. It might also include the count of unique instances or values. For example, you might want to view CPU utilization for each unique hosts in a specified domain at 1 hour intervals for the last 24 hours. Operations Analytics displays time series (moving aggregate) data as a line chart by default. See "Analytic Functions Provided by Operations Analytics" on page 181 for more information about functions that calculate data values for a time interval.
Bar Charts, Pie Charts, and Tables	Operations Analytics presents overall aggregate data as bar charts, pie charts, or tables. Overall aggregate data is data that is grouped by total, average, minimum, or maximum values within a specified time range. Operations Analytics displays overall aggregate (summary of totals, counts, averages, maximum values, or minimum values) data in table format by default. See "Analytic Functions Provided by Operations Analytics" on page 181 for more information about functions that calculate overall aggregate values.
Sunburst Charts	Sunburst charts display the topology relationship among data items. For example, a sunburst chart might show the relationship among servers, the applications that reside on those servers and the nodes that access those applications.

If you select a visualization that is not supported by your Analytics Query Language (AQL) search query, Operations Analytics uses the default visualizations described in the following **Default Visualizations** tables. See "Using an Operations Analytics Dashboard" on page 76 for more information about selecting a visualization in a dashboard query pane. See "About the Analytics Query Language (AQL) " on page 152for more information about AQL search queries.

Default Visualizations by Types of Analytic Functions

AQL Query	Default Visualization	Valid Visualizations
Includes a Moving Aggregate (Time Series) Analytic Function	Line Chart	Line chart, heat map, bar chart, and pie chart

Default Visualizations by Types of Analytic Functions, continued

AQL Query	Default Visualization	Valid Visualizations
Includes an Overall Aggregate (Summary) Analytic Function	Table	Table, bar chart and pie chart

Tip: When using the topN or bottomN analytic function, Operations Analytics displays a bar chart by default. You can also use topN and bottomN analytic functions to visualize pie charts and tables.

About Bar Charts

You can use both moving aggregate (time series) and overall aggregate (summary) analytic functions to display your results as a bar chart.

Moving aggregate (time series) analytic functions display results according to a time interval within a specified time range. This data might include the total, average, minimum, or maximum values calculated at each interval over the specified time range. It might also include the count of unique instances or values. For example, you might want to view CPU utilization for each unique hosts in a specified domain at 1 hour intervals for the last 24 hours.

Overall aggregate (summary) data is data that is grouped by total, average, minimum, or maximum values within a specified time range. For example, you might want to view the total number of log messages generated by each host within a specified domain within the last hour.

See "Analytic Functions Provided by Operations Analytics" on page 181 for more information about analytic functions that can be used in your Analytic Query Language (AQL) search queries.

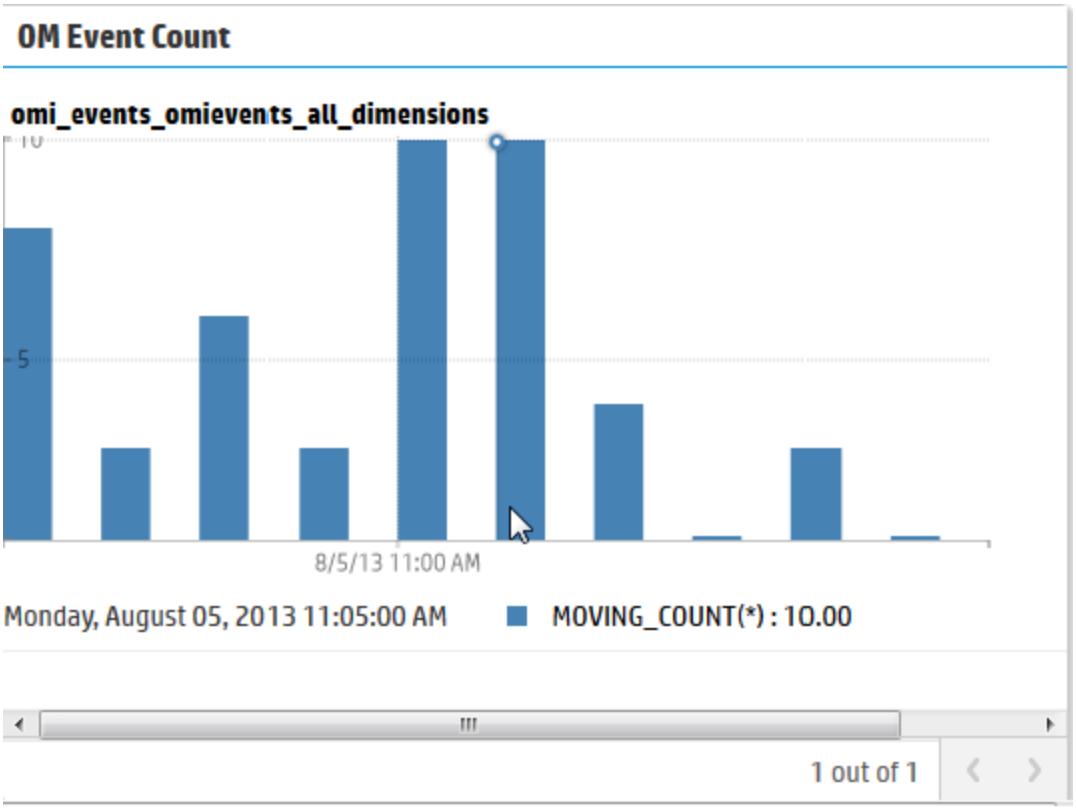
You can perform the following operations on bar chart aggregate data:

Access more details for a bar in the chart

To access more details for a bar in the chart:

Mouse over the bar of interest.

Operations Analytics displays the value for the selected point in time as shown in the following example:



Group the results by metric

When you group charts by metrics (for example, transaction rate), note the following:

- You can select a maximum of 10 metrics.
- Operations Analytics displays one metric per page.
- All hosts related to that metric are included in the same results page in your dashboard pane.

> **Tip:** To move to the page for a specific metric, navigate to the **Go To Metric:** menu and select the metric of interest.

- Each host is represented by a single bar chart.
- The metric name appears as the chart title.
- The legend describes the entities displayed for the metric results.

To group results by metrics:

1. In the **Group by** menu, select **Metric**.
2. In the **Select Entities** menu,select each entity you want to view on the current page.

Group the results by entity

When you group charts by entity (for example, host), note the following:

- You can select a maximum of 10 entities.
- Operations Analytics displays all metrics available for the selected entity.
- Each page displays the entity and all metrics of the same measurement unit (for example, rate or utilization) for the selected entity.

  Tip: To move to the page for a specific entity, navigate to the **Go To Entity:** menu and select the entity of interest.

- When using the **Select Metrics** option In each results page, you can select only metrics of the same measurement unit.
- The entity name appears as the chart title.
- The legend describes the metrics displayed for the entity.

To group results by entity:

1. In the **Group by** menu, select **Entity**.
2. In the **Select Metrics** menu,select each metric you want to view on the current page.

View additional bar charts in a **query pane**[1]

Operations Analytics enables you to navigate through a series of bar charts.

To view additional bar charts:

Tip: You can also use the **Go To Entity:** to move to the page for the entity you selected. Use the **Go To Metric:** menu to move to the page for the selected metric.

Click ›.

To return to previous bar charts:

Click ‹.

About Heat Maps

You can use moving aggregate (time series) analytic functions to display your results as a heat map.

[1]Displays the results of an Analytic Query Language (AQL) query, AQL function, or AQL expression. If you use the Phrased Query Language (PQL) in your search, HP Operations Analytics converts the PQL query to one or more AQL queries and subsequent query panes.

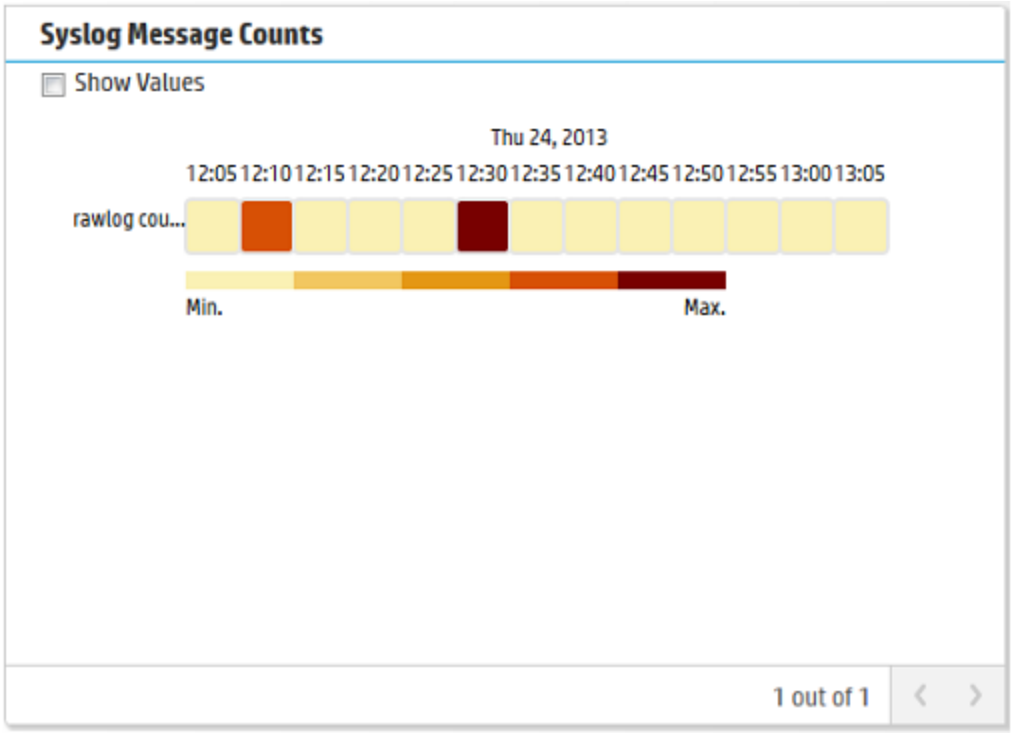
Moving aggregate (time series) analytic functions display results according to a time interval within a specified time range. This data might include actual metric values or total, average, minimum, or maximum values calculated at each interval over the specified time range. For example, you might want to view CPU utilization for each unique host in a specified domain at 1 hour intervals for the last 24 hours.

See "Analytic Functions Provided by Operations Analytics" on page 181 for more information about analytic functions that can be used in your Analytic Query Language (AQL) search queries.

Heat maps use a series of color-coded rectangles to map returned values to a scale based on the minimum and maximum values. Each cell color is determined as follows:

- Operations Analytics identifies the minimum and maximum value per the group by entity for the selected metric. The minimum and maximum values are identified in the available results for the selected duration.
- Operations Analytics calculates the percentage of each cell value in relation to the minimum and maximum value.
- The calculated percentage value is associated with a pre-determined color shade. For example, a value of 50 percent might be associated with a medium shade of orange.

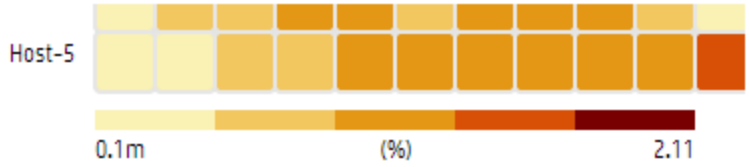
The following heat map example displays the number of syslog log file messages generated over a specified time period:



When using the heat map legend, note the following:

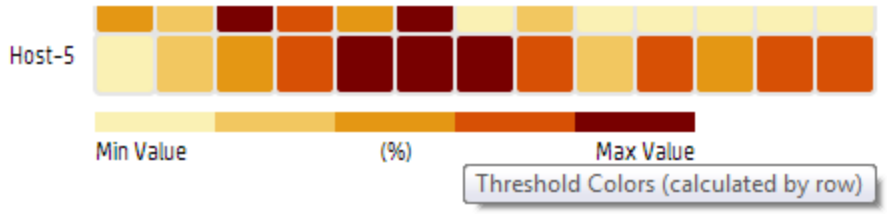
- The legend describes the minimum to maximum value ranges represented by each color used in the map.
- A clear rectangle indicates no data is available.
- When Operations Analytics calculates heat map values based on the entire matrix, the legend displays the actual minimum and maximum values. See the following example:

  Note: The middle of the scale displays the unit of measurement, such as percentage or milliseconds. If the value are measuring whole number, such as count, no unit is displayed.



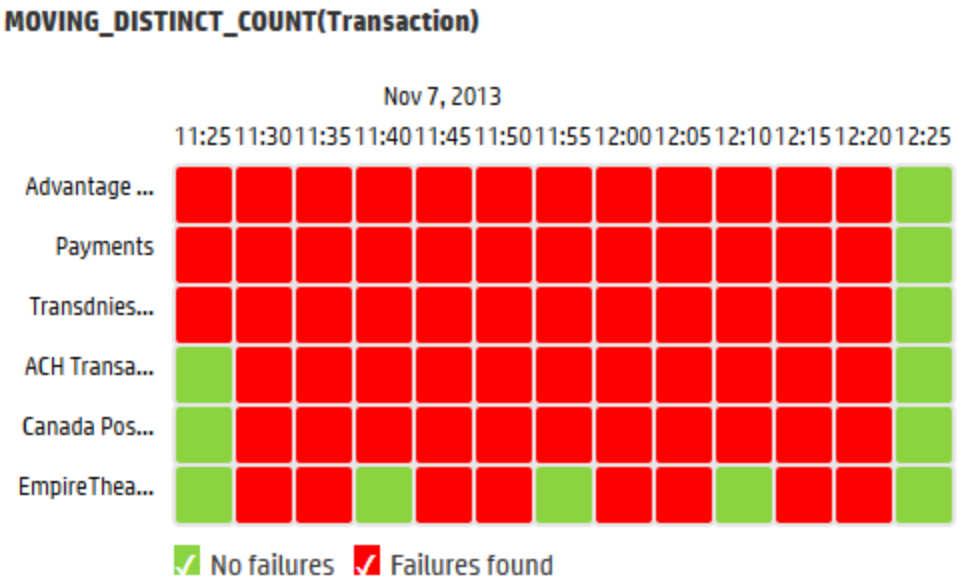
- When Operations Analytics calculates heat map values per row or per column, the legend displays **Min Value** and **Max Value**. See the following example:

  Tip: To determine whether the values are calculated by row or by column, mouse over the legend.



- Some dashboards provided by Operations Analytics use heat maps to display metrics that indicate some type of failure. Operations Analytics uses green to indicate **No failures** and red to indicate **Failures found**.

  See the following example:



You can perform the following operations on heat maps:

Display the value within each heat map cell

You can display the value that is represented within each heat map cell using the **Show Values** option.

To display the value the value represented in each heat map cell:

Click ✔ **Show Values**.

Operations Analytics displays the first few characters of the value represented within each heat map cell.

View a data value at a particular point in time in a heat map

To view a data value at a particular point in time in a heat map:

Mouse over the data point of interest.

Operations Analytics displays the value for the point in time you select.

Calculate the percentage values using the minimum and maximum values for the entire matrix, per row, or per column

To re-calculate percentage values in a heat map:

1. Mouse over the query pane toolbar for the query pane you want to change.
2. Click to edit the query pane.
3. Navigate to the **Visualization** tab.
4. Select **Heat**.

5. Do either of the following:
   a. Select **Matrix** to calculate the heat percentages using the minimum and maximum values of the entire data set (matrix).

   b. Select **Row** to calculate the heat percentages using the minimum and maximum values per row.

   c. Select **Column** to calculate the heat percentages using the minimum and maximum values per column.

6. Click **OK**.

Operations Analytics recalculates the heat colors based on the new minimum and maximum values.

View additional heat maps in a **query pane**[1]

Operations Analytics enables you to navigate through a series of heat maps.

To view additional heat maps:

Click ›.

To return to previous heat maps:

Click ‹.

About Line Charts

You can use moving aggregate (time series) analytic functions to display your results as a line chart.

Moving aggregate (time series) analytic functions display results according to a time interval within a specified time range. This data might include the total, average, minimum, or maximum values calculated at each interval over the specified time range. It might also include the count of unique instances or values. For example, you might want to view CPU utilization for each unique host in a specified domain at 1 hour intervals for the last 24 hours.

See "Analytic Functions Provided by Operations Analytics" on page 181 for more information about moving aggregate analytic functions that can be used in your AQL queries.

When using line charts, note the following:

- Operations Analytics displays multiple line charts in a single query pane when the Analytic Query Language (AQL) search query requests in multiple line charts.

- Operations Analytics displays time series information in line chart format by default.

[1] Displays the results of an Analytic Query Language (AQL) query, AQL function, or AQL expression. If you use the Phrased Query Language (PQL) in your search, HP Operations Analytics converts the PQL query to one or more AQL queries and subsequent query panes.

- When creating BPM line charts, if you want to see data gaps (for when an application status was unavailable), add `i.status` to the AQL query.

  Example: In the following example, add the bold text to the AQL Query.

  from i in (bpm_application_performance) let analytic_interval=between($starttime, $endtime) let interval=$interval select i.application, moving_avg(i.transaction_response_ time), **i.status**

You can perform the following operations on line charts:

Group the results by metric

When you group line charts by metrics (for example, transaction rate), note the following:

- You can select a maximum of 10 metrics.
- Operations Analytics displays one metric per page.
- All hosts related to that metric are included in the same results page in your dashboard pane.

  Tip: To move to the page for a specific metric, navigate to the **Go To Metric:** menu and select the metric of interest.

- Each host is represented by a single line.
- The metric name appears as the line chart title.
- The legend describes the entities displayed for the metric results.

To group results by metrics:

1. In the **Group by** menu, select **Metric**.
2. In the **Select Entities** menu,select each entity you want to view on the current page.

Group the results by entity

When you group line charts by entity (for example, host), note the following:

- You can select a maximum of 10 entities.
- Operations Analytics displays all metrics available for the selected entity.
- Each page displays the entity and all metrics of the same measurement unit (for example, rate or utilization) for the selected entity.

  Tip: To move to the page for a specific entity, navigate to the Go To Entity: menu and

select the entity of interest.

- When using the **Select Metrics** option In each results page, you can select only metrics of the same measurement unit.
- The entity name appears as the line chart title.
- The legend describes the metrics displayed for the entity.

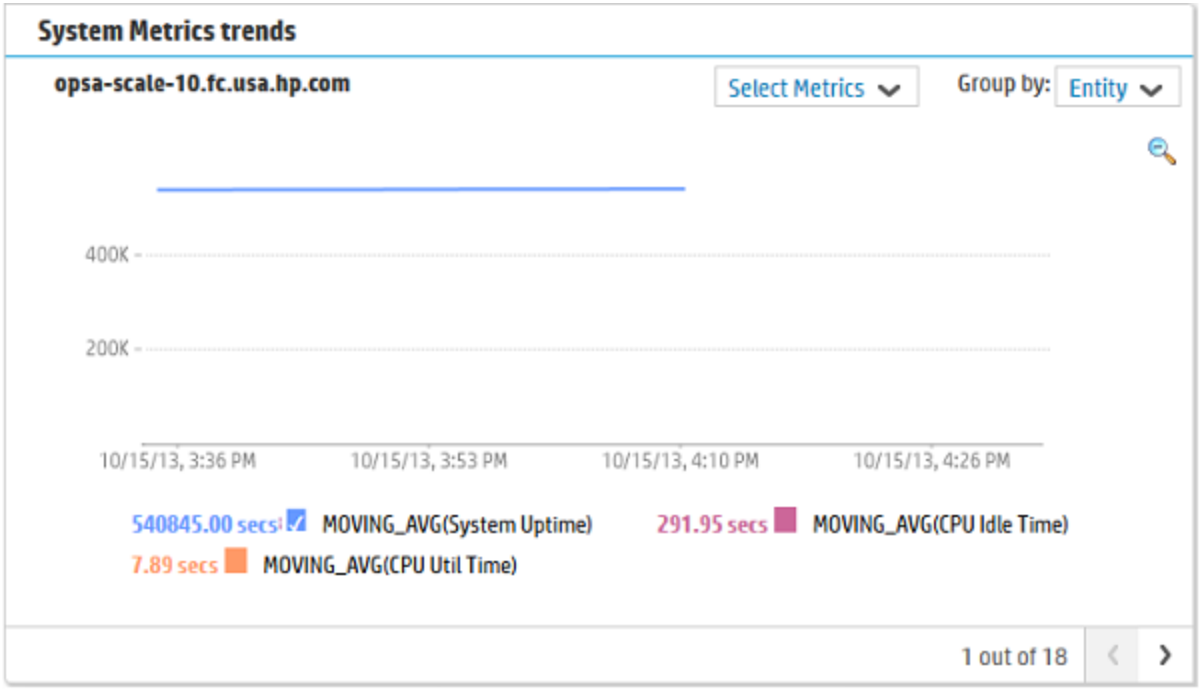
To group results by entity:

1. In the **Group by** menu, select **Entity**.
2. In the **Select Metrics** menu,select each metric you want to view on the current page.

Focus on one or more lines

To focus on a line or lines:

Click the legend item to select the line chart or line charts that you want to view. All other lines on the current page are hidden.

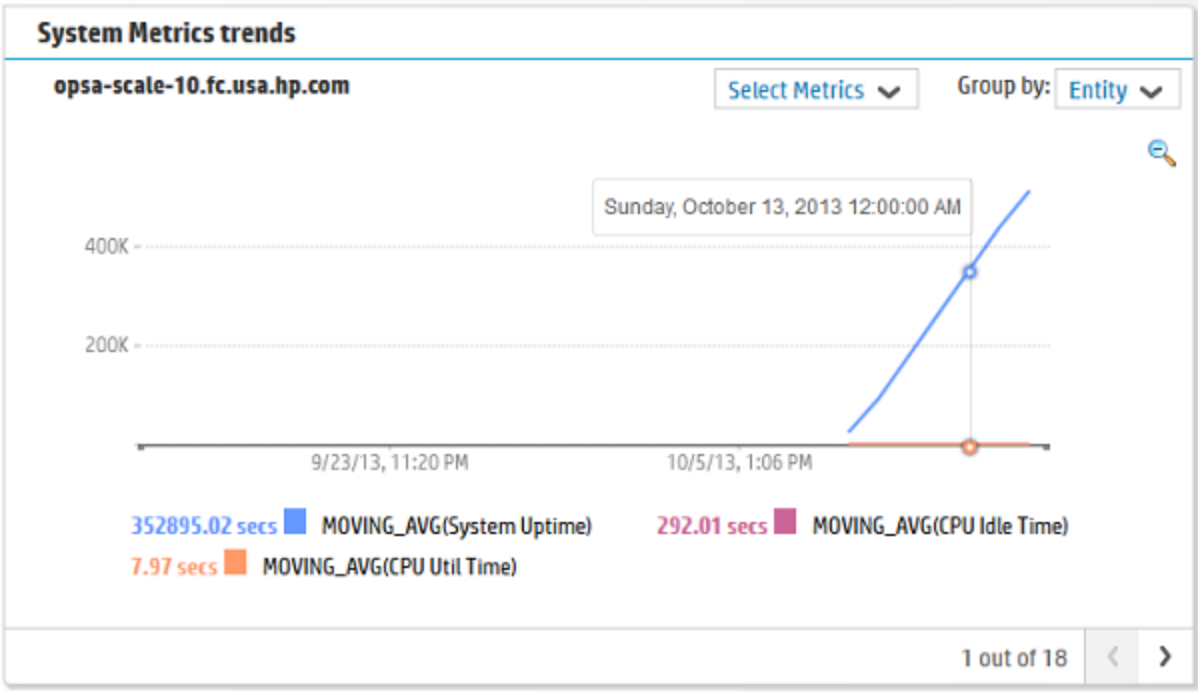


View data values at a particular point in time

To view data values in a line chart:

Mouse over the data point of interest.

Operations Analytics displays each value in the legend for the selected points in time as shown in the following example:



View additional line charts in a **query pane**[1]

Operations Analytics enables you to navigate through a series of line charts.

To view additional line charts:

> **Tip:** You can also use the **Go To Entity:** to move to the page for the entity you selected. Use the **Go To Metric:** menu to move to the page for the selected metric.

Click ›.

To return to previous line charts:

Click ‹.

About Pie Charts

You can use both moving aggregate (time series) and overall aggregate (summary) analytic functions to display your results as a pie chart.

Moving aggregate (time series) analytic functions display results according to a time interval within a specified time range. This data might include the total, average, minimum, or maximum values calculated at each interval over the specified time range. For example, you might want to view CPU utilization for each unique hosts in a specified domain at 1 hour intervals for the last 24 hours.

[1]Displays the results of an Analytic Query Language (AQL) query, AQL function, or AQL expression. If you use the Phrased Query Language (PQL) in your search, HP Operations Analytics converts the PQL query to one or more AQL queries and subsequent query panes.

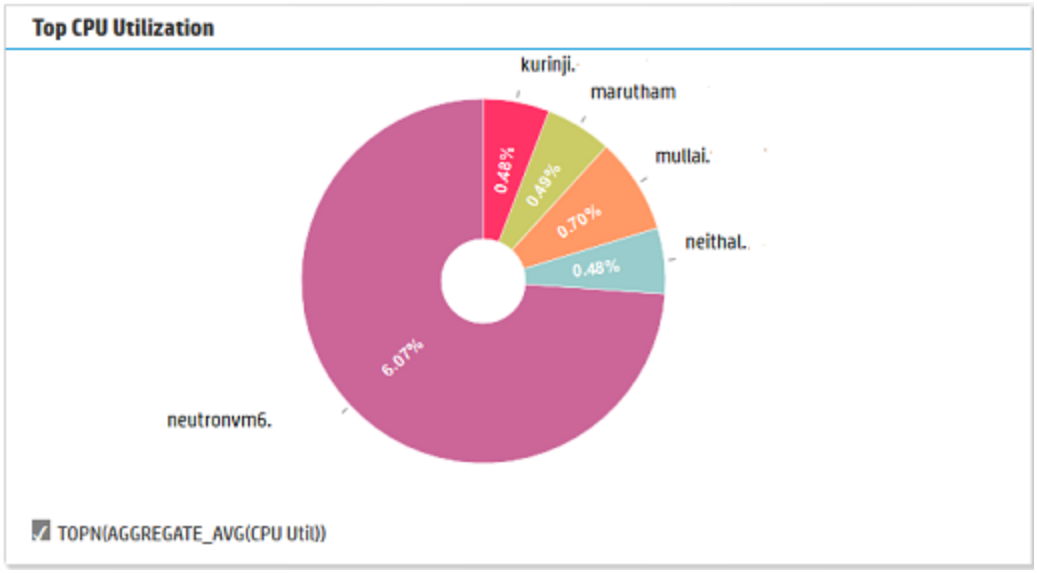
Each moving aggregate value displayed represents a re-computed value using each data points per interval within the specified time segment. For example, the moving_avg analytic function calculates the average of all average values returned for the specified time frame and metric or attribute. Operations Analytics displays each of these re-calculated values, one per pie chart segment.

Overall aggregate (summary) data is data that is grouped by total, average, minimum, or maximum values within a specified time range. For example, you might want to view the total number of log messages generated by each host within a specified domain within the last hour.

See "Analytic Functions Provided by Operations Analytics" on page 181 for more information about aggregate analytic functions that can be used in your Analytic Query Language (AQL) search queries..

Note: Operations Analytics groups all values that are too small to display in a pie chart segment as an **Other** category.

Operations Analytics displays the values for each pie segment as shown in the following example:



You can perform the following operations on pie chart aggregate data:

Access more details for a pie segment

To access more details for a pie segment:

Mouse over the pie segment of interest.

Operations Analytics displays the value for the selected point in time.

About Sunburst revuewCharts

Sunburst charts display the relationship among topology data items. For example, a sunburst chart might show the relationship among servers for an application, including the servers on which the application reside and metrics for each of those servers. To show these relationships, a sunburst

chart is organized using a tree relationship, starting with the center, which is the root, moving out to include children and leaf nodes.

Tip: If you want to use the **Playback** feature to play back the data returned, use a moving aggregate (time series) analytic function to create a sunburst chart. See "Analytic Functions Provided by Operations Analytics" on page 181 for more information.

To interpret the data in a sunburst chart, note the following:

- The root or center of a sunburst chart does not represent an object.
- Sunburst charts use color ranges to show the relative weight of a metric among the set of objects rather than to show status. Operations Analytics uses a darker color to indicate there is more of a particular value and a lighter shade of the same color to indicate there is less of a value.
- Gray indicates no values are available.
- Operations Analytics calculates the color fill for each parent node using the average color of all child nodes. When determining the average, It ignores any node with a fill color of gray.

  Tip: Mouse over the chart segment of interest to see the name, value, and any additional information available for the selected segment.

- When using the ▶ Play Back feature for the sunburst chart, Operations Analytics displays the mid-range value for each time segment displayed.
- When you click ⏸ Pause in the ▶ Play Back feature, click the chart segment of interest to view the point in time (**Review Time**) for which the data is displayed.

You can perform the following operations on a sunburst chart:

Access more details

To access more details for a segment of the sunburst chart:

Mouse over the sunburst segment of interest.

Operations Analytics displays the value for the selected point in time.

Select a different metric to display in the sunburst chart

To select a different metric to display in the sunburst chart:

Click on the Select Metric menu and select the required metric.

The sunburst chart only displays a single metric. The default metric is OM Events.

Zoom in on a section of the sunburst chart

To zoom in on a section in the sunburst chart:

Click the sunburst chart segment of interest until you are viewing only the segment or segments of interest.

Return the chart to its original detail level

To return the sunburst chart to its original detail level:

Click the center of the sunburst chart until it returns to its initial image.

About Table Data

Operations Analytics presents overall aggregate data as bar charts, pie charts, or tables. Overall aggregate data is data that is grouped by total, average, minimum, or maximum values within a specified time range. See "Analytic Functions Provided by Operations Analytics" on page 181 for more information about functions that calculate aggregations.

Operations Analytics displays overall aggregate (summary of totals, counts or averages) data in table format by default.

Note: Operations Analytics also displays log file information in table format by default.

When viewing table data, note the following:

- You can use an AQL query to specify the column names to be displayed. Operations Analytics displays each column name in the order in which it appears in the AQL query.
- If you do not specify column names in your query, Operations Analytics initially displays a maximum of eight columns.
- If more than eight columns are returned from the search, Operations Analytics displays the set of columns that are determined to be of the most value. Examples of these "preferred" columns include **raw**, **message**, **title**, **severity** and **host**.
- Operations Analytics does not display identification columns that are for internal use only.
- Use the Columns feature to add or remove table columns.

You can perform the following operations on table data:

Filter table data

Use the **Filter** option to filter the results by words or phrases.

To filter table data:

1. Navigate to the table column of interest.
2. In the filter field for that column, enter the value or values for which you want to filter the results.

   When entering column filters, note the following

- You can use the AND, OR, NOT operators in your filter to include multiple filter values
- When using NOT, include the associated value in parenthesis; for example NOT(Normal)
- The NOT operator returns values only for fields that contain values. To search for empty fields, use NOT (NULL).
- The AND, OR, NOT operators can be either all upper case or all lower case (AND, and, OR, or, NOT, not)
- Operations Analytics finds any record that contains the text string or strings you enter.
- Do not use the wildcard character (*). Any text that appears after the wildcard character (*) until the next operator is ignored

3. Enter the word or phrase on which you want to filter the data results.

> **Note:** The word or phrase you enter must be an exact match.

Restore column settings

To restore column settings:

1. Click **Columns**.
2. Select **Restore original**.

   The columns are restored to the original settings.

Sort table data

To sort table data:

1. Navigate to the column on which you want to sort.
2. To sort the column in ascending order,click the up arrow ( ).
3. To sort the column in descending order, click the down arrow ( ).

Access more details for a table row

To access more details for a table row:

Click to expand the table row.

Operations Analytics expands the row of information by displaying each column and value in its own row.

Collapse the details for a table row.

To collapse a table row that has been expanded:

Click to collapse the table row details.

Show and hide columns

To show or hide columns:

To show columns, click **Columns** and click the selection box that precedes each column you want to show.

To hide columns,click **Columns** to clear the selection box that precedes each column you want to hide.

Chapter 8: Filter Search Query Results

Operations Analytics enables you to filter your search query results using the following methods:

Tables only. Use the **Filter** option to filter the results by words or phrases.

The **Filter** option enables you to filter the results according to a word or phrase.

Note: The word or phrase you enter must be an exact match in the results displayed.

Use the Time Line to fine tune the Time Range selected.

Operations Analytics enables you to focus on a specified time segment using the slide bar that appears above the metrics, log file and event data displayed. For example, you might want to focus on a particular day or a particular peak period.

Note: The time range attribute that appears next to the search query initially defines the x-axis for the bar, line or plot diagram displayed as well as the time frame for the log file and event information that is displayed.

Changing the Time Line segment, changes the information displayed in visualizations and tables for all metric and log file and event data.

To filter your analysis by time segment:

Slide each end of the time line to the beginning and end point of the time you want to use:

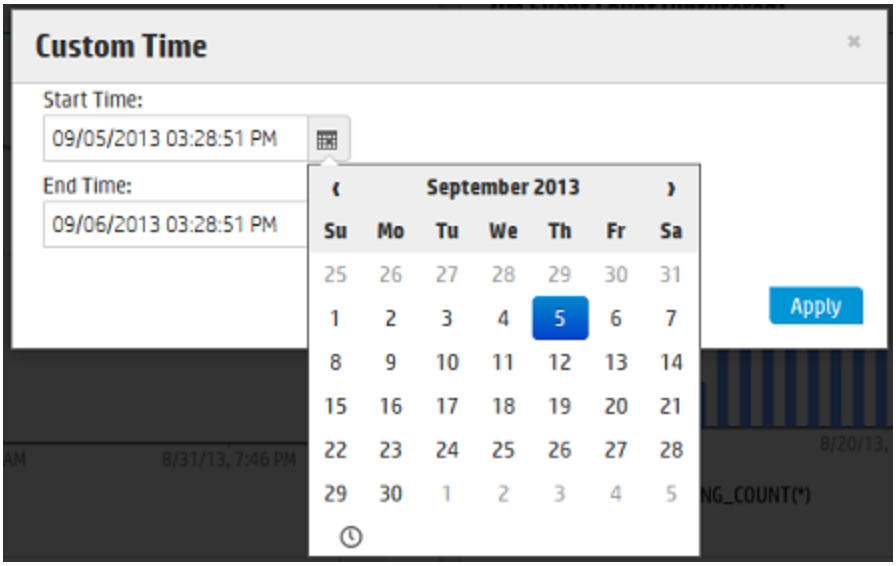
Operations Analytics filters the information available to focus only on the time segment you selected in each of the metric visualizations displayed. The log file and event information is also filtered based on the time segment you specify.

Use the Time Range option to filter the results by a specified time period.

To change the time range for the data displayed, by doing either of the following:

- Refine your search query to narrow the information presented.
- Change the time range value from the Time Range drop-down menu to narrow or broaden the time range for which the data is displayed:

Use the **Custom Time** option when you want to specify a start and end date using the Operations Analytics calendar:



See "Use a Search Query to Define the Context of a Problem or Area to Investigate" on page 109 for more information.

You can also specify a filter in your Phrased Query search using collection attribute values stored in a collection. See "Filter the Scope of a Phrased Query Language (PQL) Query " on page 146 for more information.

Chapter 9: Play Back Search Query Results

Operations Analytics enables you to play back your search query results using the ▶ Play feature.

Use this feature when you want to view the most recent changes in data over time or when you want to note the point at which a problem began to occur.

When using this feature, note the following:

- Operations Analytics uses the start and end time specified in the time line.
- Operations Analytics selects the optimum time segment within the specified start and end time in which to display the results. For example, if the time line specifies 1 day, Operations Analytics might choose a time interval of 1 hour. If the time line specifies 1 hour, Operations Analytics might choose a time interval of 5 minutes.

> **Note:** If you provide an $interval parameter value in a **query pane**[1], Operations Analytics uses the $interval value you specify for the time segment for only that query pane . See "Using an Operations Analytics Dashboard" on page 76 for more information.

See "Play Back Search Query Results " abovefor more information.

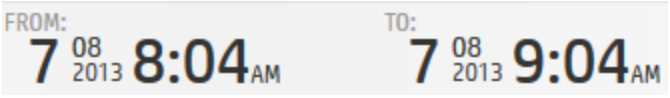
To play back your search query results:

1. Click « Playback.
2. Click ▶ (Play).
3. Do any of the following:
   - To pause the recording, click ❚❚ (Pause).
   - To fast forward to a new location, click ❚❚ (Pause), then ▶▶ (Fast Forward).
   - To rewind to a new location, click ❚❚ (Pause), then ◀◀ (Rewind).
   - To reverse play, click ◀ (Back).

> **Note:** If a query pane shows multiple pages of data, Operations Analytics replays only the results for the current query pane.

As Operations Analytics replays the results, it indicates each point in time for which data is displayed as shown in the following example:

[1]Displays the results of an Analytic Query Language (AQL) query, AQL function, or AQL expression. If you use the Phrased Query Language (PQL) in your search, HP Operations Analytics converts the PQL query to one or more AQL queries and subsequent query panes.



When you finish viewing the playback results, click (Pause).

To restore the dashboard to its original state before using the play back feature, click « Playback.

Chapter 10: Customize a Dashboard

Operations Analytics returns query results in one or more query panes that comprise an Operations Analytics dashboard. Each query pane is the result of one or more Analytic Query Language (AQL) queries, AQL functions, or AQL expressions.

Note: If you use a Phrased Query Language Query (PQL) , Operations Analytics converts the PQL query to one ore more AQL queries. See "Use a Search Query to Define the Context of a Problem or Area to Investigate" on page 109 for more information about Operations Analytics query languages.

Operations Analytics enables you to customize your dashboard contents in the ways described in Ways to Customize a Dashboard.

To save your dashboard customizations, click  . See "Save a Dashboard " on page 262 for more information.

Tip: The query pane Edit Settings  option also enables you to view the AQL queries, AQL functions, or AQL expressions used to return query pane results.

You can customize a dashboard in the following ways:

Add one or more query panes

To add a new query pane, click  .

In the **NEW PANE** attribute, enter the name of the query pane.

Use the **Query** tab to provide the AQL query or AQL function you want to use:

1. Navigate to the **Query** tab.
2. Do one of the following:
   - Select an AQL function.

     Enter values for any of the AQL function arguments that apply.

     Note the following:

     - Your Operations Analytics administrator can provide descriptions for the arguments required for each AQL Function provided. See "Select an AQL Function for a New Query Pane" on page 101 for information about how to view these descriptions.
     - If descriptions are not provided, you can also view the collection information configured for your IT environment. This collection information might also assist you in providing values for the arguments required.

Click **Show Tags** to view a new query pane that displays the collections (property group uid), tags (tag name), and columns (property uid) available. Click **Show Properties** to view a new query pane that displays the collections (property group uid), columns (property uid), and whether the column contains **metric**[1] or **attribute**[2] values.

Also see "View Collection Information" on page 73 for more information about how to view the meta data stored for your collections.

Click here for a brief description of the possible AQL function argument types.

AQL Function Argument Types

Argument Type	Description
analytic	Specifies an analytic function that can be applied to overall aggregate analytic functions, moving aggregate analytic functions, or raw metrics. These analytic functions include: topN, bottomN, inverse_pctile, pctile, outlier, or rank. See "About Analytic Functions" on page 179 for more information.
collection	Specifies the name of the collection for which Operations Analytics should return search results.
custom	Indicates that Operations Analytics cannot identify the argument type. Check the description for the AQL function that appears in the Query tab when adding or editing a query pane. Also, check with your Operations Analytics administrator for assistance with providing values for these arguments.
entity	Specifies the type of entity attribute on which you want to filter; for example, host_name.
filter	Specifies the filter value to use in the `where` clause of the AQL function. For example, when used with host name, you might enter the following filter value to return data for only the servers in the co.usa.enterprise. com domain: `\"*\.co.usa.enterprise.com"`.
grouping	Specifies an argument required for the group by clause.
function	Specify the overall aggregate or moving aggregate analytic function you want Operations Analytics to use. See "Analytic Functions Provided by Operations Analytics" on page 181 for the list of analytic functions provided by Operations Analytics.

[1]Typically a measurement stored in a collection. For example, CPU utilization.
[2]A descriptor stored in a collection for an entity, such as host_name.

AQL Function Argument Types, continued

Argument Type	Description
metric	Either of the following: ○ Name of the metric column. ○ Tag that represents the metric column.
ordering	Specifies an argument required for the `order by` clause.

See "Select an AQL Function for a New Query Pane" on page 101 for more information about selecting AQL functions.

- In the **(NEW PANE)** attribute, enter the AQL query, AQL function name, or AQL expression for the new query pane.

3. Navigate to another tab or click **OK**.

Optional. Use the **Visualization** tab to change the visualization that is displayed.

Note: If you select a visualization that is not valid for the data displayed, Operations Analytics displays the default visualization for the AQL query.

1. Navigate to the **Visualizations** tab.
2. Navigate to the Visualizations options:

3. Select the visualization you want to use.
4. Navigate to another tab or click **OK**.

See "Interpret Dashboard Results" on page 235 for more information about visualizations.

Use the **Parameters** tab to provide the parameter values, if any, to the selected AQL function.

Note: Any parameter value you provide overrides the associated value selected using another method in the Operations Analytics console. For example, if you specify a time interval using the $interval parameter, Operations Analytics uses the value for $interval rather than the time line segment selected. See "Filter Search Query Results " on page 251for more information about time line segments.

1. Navigate to the **Parameters** tab.
2. Provide the parameter values you want to use.

> **Tip:** Mouse over the parameter of interest to view its description.

To restore the parameter values to their original default values, click **Defaults**.

3. Navigate to another tab or click **OK** to save your changes.

Edit a query pane

To edit a query pane:

Click the **Edit Settings** icon in the query pane you want to change.

Use the **Query** tab to provide the AQL query or AQL function you want to use:

1. Navigate to the **Query** tab.
2. Do one of the following:
   - Select an AQL function.

     Enter values for any of the following AQL function arguments that apply.

     Note the following:

     - Your Operations Analytics administrator can provide descriptions for the arguments required for each AQL Function provided. See "Select an AQL Function for a New Query Pane" on page 101 for information about how to view these descriptions.
     - If descriptions are not provided, you can also view the collection information configured for your IT environment. This collection information might also assist you in providing values for the arguments required.

       Click **Show Tags** to view a new query pane that displays the collections (property group uid), tags (tag name), and columns (property uid) available. Click **Show Properties** to view a new query pane that displays the collections (property group uid), columns (property uid), and whether the column contains **metric**[1] or **attribute**[2] values.

       Also see "View Collection Information" on page 73 for more information about how to view the meta data stored for your collections.

[1]Typically a measurement stored in a collection. For example, CPU utilization.
[2]A descriptor stored in a collection for an entity, such as host_name.

Click here for a brief description of the possible AQL function argument types.

AQL Function Argument Types

Argument Type	Description
analytic	Specifies an analytic function that can be applied to overall aggregate analytic functions, moving aggregate analytic functions, or raw metrics. These analytic functions include: topN, bottomN, inverse_pctile, pctile, outlier, or rank. See "About Analytic Functions" on page 179 for more information.
collection	Specifies the name of the collection for which Operations Analytics should return search results.
custom	Indicates that Operations Analytics cannot identify the argument type. Check the description for the AQL function that appears in the Query tab when adding or editing a query pane. Also, check with yourOperations Analyticsadministrator for assistance with providing values for these arguments.
entity	Specifies the type of entity on which you want to filter; for example, host_ name.
filter	Specifies the filter value to use in the `where` clause of the AQL function. For example, when used with host name, you might enter the following filter value to return data for only the servers in the co.usa.enterprise. com domain: `\"*\.co.usa.enterprise.com"`
grouping	Specifies an argument required for the group by clause.
function	Specify the overall aggregate or moving aggregate analytic function you want Operations Analytics to use. See "Analytic Functions Provided by Operations Analytics" on page 181 for the list of analytic functions provided by Operations Analytics.
metric	Either of the following: ○ Name of the metric column. ○ Tag that represents the metric column.
ordering	Specifies an argument required for the `order by` clause.

See "Select an AQL Function for a New Query Pane" on page 101 for more information about selecting AQL functions.

- In the **(NEW PANE)** attribute, enter the AQL query, AQL function name, or AQL expression for the new query pane.

3. Navigate to another tab or click **OK**.

Optional. Use the **Visualization** tab to change the visualization that is displayed.

1. Navigate to the **Visualizations** tab.
2. Navigate to the Visualizations options:

3. Select the visualization you want to use.
4. Navigate to another tab or click **OK**.

See "Interpret Dashboard Results" on page 235 for more information about visualizations.

Use the **Parameters** tab to provide the parameters, if any, to the selected AQL function.

Note: Any parameter value you provide overrides the associated value selected using another method in the Operations Analytics console. For example, if you specify a time interval using the $interval parameter, Operations Analytics uses the value for $interval rather than the time line segment selected. See "Filter Search Query Results " on page 251for more information about time line segments.

1. Navigate to the **Parameters** tab.
2. Provide the parameters you want to use.

   Tip: Mouse over the parameter of interest to view its description.

   To restore the parameter values to their original default values, click **Defaults**.
3. Navigate to another tab or click **OK** to save your changes.

Move the query pane to a new location

To move the query pane to a new location:

Drag the query pane to the new location.

Rearrange the query panes.

To rearrange the query panes:

Drag one or more panes to a new location.

Rename a query pane.

To rename a query pane:

1. Click the **Edit Settings** icon in the query pane you want to change
2. Enter the new name of the query pane by replacing the current name.

> **Tip:** Click **Save** to save your settings as part of the current dashboard.

Resize a query pane.

To resize a query pane:

Navigate to the query pane you want to change. Mouse over the upper right-hand corner of the query pane. Use the query pane toolbar to change the height and width of the query pane:

Operations Analytics increments the height and width settings as described in Resize a Query Pane Options.

Resize a Query Pane Options

Resize Option	Description
	Decreases the query pane height in predefined increments.
	Increases the query pane height in predefined increments.
	Decreases the query pane width in predefined increments.
	Increases the query pane width in predefined increments.

Delete a query pane from the dashboard

To delete a query pane:

Click **x** in the upper right-hand corner of the results pane to close the query pane and remove it from your dashboard.

See "Using an Operations Analytics Dashboard" on page 76 for more information about an Operations Analytics dashboard.

Chapter 11: Save a Dashboard

Operations Analytics enables you to save a dashboard and the associated search queries for later use, fine tuning, or both.

When saving a dashboard, note the following:

- When you Save a dashboard that you own, Operations Analytics overwrites the original dashboard with any changes.
- When you Save a shared dashboard that you do not own, Operations Analytics prompts you to save the dashboard using a new name.
- To Save (Save As..) a dashboard you own using a new name without overwriting your original dashboard, use the **Manage... Copy** option of the **Dashboard** menu before making any changes.

To save a dashboard:

1. Click **Save**.
2. In the **Save Dashboard** dialog, enter the name you want to appear in the suggestions list for this dashboard. Only alpha-numeric characters and periods (.), plus sign (+), and dashes (-) are permitted, Spaces and other special characters (~ ! @ # $ % ^ &; * ( ) -) are not permitted.

   Note: Do not begin or end a dashboard name with a space.

3. Click **OK**.

   The dashboard name appears in the **Dashboards** menu list as well as in the suggestions list.

   Shared dashboards that have been provided by other members of your user community are appended with the name of the user who provided the dashboard.

Chapter 12: Manage Your Dashboards

Operations Analytics enables you to copy, share, unshare, or delete a dashboard that you no longer need from the **Dashboards** menu.

> **Note:** You can delete only those dashboards you created.

When managing your dashboards, note the following:

- When you Save a dashboard that you own, Operations Analytics overwrites the original dashboard with any changes.
- When you Save a shared dashboard that you do not own, Operations Analytics prompts you to save the dashboard using a new name.
- To Save (Save As..) a dashboard you own using a new name without overwriting your original dashboard, use the **Manage... Copy** option of the **Dashboard** menu before making any changes.

You can manage your dashboards in the following ways:

Copy a dashboard

To copy a dashboard:

1. Navigate to the **Dashboards** menu.
2. Click **Manage**.
3. Click the check box for the dashboard you want to copy.
4. Click **Copy**.
5. In the **Do you wish to copy selected Dashboard?** dialog, click **OK**.
6. In the **Specify a new name** dialog, enter the name of the copied dashboard.
7. Click **OK**.

   The copied dashboard appears in the **Dashboards** menu.

Delete a dashboard

To delete a dashboard:

1. Navigate to the **Dashboards** menu.
2. Click **Manage**.
3. Click the check box for each dashboard you want to delete.

4. Click **Delete**.
5. Click **OK**.

   The dashboard name is removed from the **Dashboards** menu.

Share a dashboard with other users in your user community

To share a dashboard with other users in your user community (tenant):

1. Navigate to the **Dashboards** menu.
2. Click **Manage**.
3. Click the check box ☑ for each dashboard you want to share.
4. Click **Share**.

   Each dashboard you select is available to all users in the same tenant.

   Note: Shared dashboards that have been provided by other members of your user community are appended with the name of the user who provided the dashboard.

Stop sharing a dashboard with other users in your user community

To stop sharing a dashboard with other users in your user community (tenant):

1. Navigate to the **Dashboards** menu.
2. Click **Manage**.
3. Click the check box ☑ for each dashboard you want to unshare.
4. Click **Unshare**.

   Each dashboard you select is removed from the dashboard menu of other users in your user community (tenant).

Part 2: Help for Administrators

This is the online help for users of Operations Analytics 2.00.

Tip: If you are an Operations Analytics user, see **"Help for Users" on page 27**

To access more information about Operations Analytics, select any entry in the Table of Contents. Good starting points are:

- "Welcome to HP Operations Analytics" on page 6
- "About the Operations Analytics Console" on page 8
- "Using an Operations Analytics Dashboard" on page 76

To learn about Operations Analytics administrator tasks and concepts, see the following help topics:

- "Operations Analytics Administrator Tasks" on page 275
- "Operations Analytics Concepts" on page 266

To learn more about the help options available while using the console, see "Access Help and About Information" on page 23.

To use the online help Search feature, see "Search the Help Topics" on page 24.

Chapter 13: Operations Analytics Concepts

As an Operations Analytics administrator, you need to understand the following concepts.

Operations Analytics Concepts

Concept	Topic
Collection	"About Collections" below
Collector Appliances	"About Collectors" below
Meta data	"About Meta Data" on the next page
Tag	"About Tags" on the next page
Tenant	"About Tenants" on page 271
User Group	"About User Groups" on page 272
User Accounts	"About User Accounts" on page 272

About Collections

Operations Analytics stores metrics, topology, inventory, log file, and event information in the form of collections. Each collection is associated with a database table in which an Operations Analytics Collector stores the data collected.

Note: These collection tables are identified in the Operations Analytics database as **property_group_uid.** The columns that represent the metrics collected and that store values within these tables are stored in the database as **property_uid**. This is important to know when using the SystemMetaInfo dashboard to identify text strings to include in your search queries.

As the Operations Analytics administrator, you configure one or more data sources per Operations Analytics collection.

See "Collection Data Sources" on page 34 for more information about possible data sources.

See "Configure Collections" in the HP Operations Analytics Installation and Configuration Guide for information about how to configure collections.

About Collectors

A Collector is responsible for collecting data from one or more data sources. The data collected is organized by collections.

Each collector is configured to run in an Operations Analytics Collector Agent.

Each server that is running the Operations Analytics Collector agent is configured as a Collector Appliance.

See "Adding a New HP Operations Analytics Collection" the HP Operations Analytics Installation and Configuration Guide for more information.

About Meta Data

Operations Analytics stores collections information as meta data (descriptors). Example meta data information includes:

- Collection table names.

  Note: Operations Analytics stores metrics, topology, inventory, log file, and event information in the form of collection tables. These collection tables are also known as property groups. The columns that represent the metrics collected and that store values within these tables are also known as properties. A property can be either an **attribute**[1] or a **metric**[2].

- Metrics, attributes, and tags per collection.
- The length of time the data is retained per collection.
- Data type information per collection.

See "About Collections" on the previous page for more information.

About Tags

A tag is a word that is associated with a collection or with a metric or attribute that is stored as part of a collection.

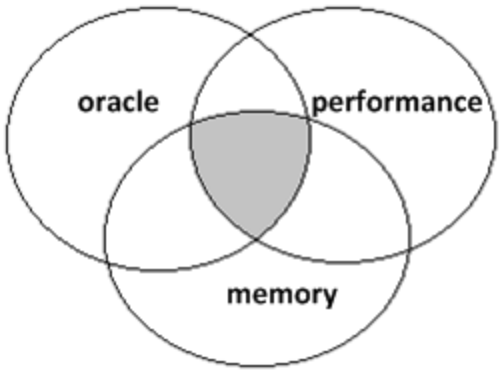
Tags are used in the Operations Analytics Phrased Query Language (PQL) to create an Operations Analytics dashboard. They help to define the following:

Note: Tags are not limited to these example uses.

- Entities for which you want information, such as **host**, **database**, and **application**
- Hardware and software components, such as **cpu**, **memory**, **disk**, **interface**, **tablespace**, **process**, and **threads**
- Metrics or problem areas, such as **utilization**, **availability**, **performance**, and **change**

Operations Analytics returns results based on an intersection of the tags used in the search query. For example, the query **oracle memory performance** returns only the metrics that are associated with all three tags (**oracle memory performance**) as represented in the following diagram:

[1]A descriptor stored in a collection for an entity, such as host_name.
[2]Typically a measurement stored in a collection. For example, CPU utilization.



Note: If you include a hostname in your query, Operations Analytics refines the search to include only those metrics associated with the host name you specify.

As an Operations Analytics administrator, you might want to add, edit, or remove tags after they are initially configured. See opsa-tag-manager.sh and "Configure Your Collections" in the HP Operations Analytics Installation and Configuration Guide for more information.

To view the tags available for a collection, see "View Collection Information" on page 73 or use the opsa-tag-manager.sh command.

See the Uses for Tags table for examples of how you as the Operations Analytics administrator might use tags.

Uses for Tags

Use	Example	Result
Represent the data for an entire collection	If you have configured an HP NNM iSPI Performance for Metrics collection, the tag **performance** might be used for that collection.	When you type **performance** in your phrased search query, the value for all attributes in the NNM iSPI Performance for Metrics collection are considered for use in the metrics displayed.
Provide one or more synonyms for an attribute stored in a collection	The tag **host** might be used as a synonym for the attribute **host_name**	When you type **host** in your search query, Operations Analytics uses the value stored for **host_name** in each collection table for which the tag is defined.

Uses for Tags, continued

Use	Example	Result
Group attributes that provide similar information	The tag **cpu utilization** might be used to represent the following CPU attributes: • cpu_idle_time • cpu_sys_mode • cpu_util_time • cpu_util • cpu_user_mode • cpu_context_switch_rate • cpu_run_queue	When you type **cpu utilization** in your search query, Operations Analytics uses the values stored for the CPU attributes in each collection in which the tag **cpu utilization** is defined.
Focus on attributes that are prototypical	The tag **primary** might be used to tag the most important metric attributes for a specific area, such as cpu). This means that when the user enters **cpu primary** in the search query, the results focus on only a few important metrics, which are tagged as **primary**.	When you type **<*hostname*>cpu** in your search query, Operations Analytics uses the following metrics in its results. • cpu_idle_time • cpu_sys_mode • cpu_util_time • cpu_util • cpu_user_mode • cpu_context_switch_rate • cpu_run_queue When you type <***hostname***>**cpu primary** in your search query, Operations Analytics might use only the following metrics in its results. • cpu_util • cpu_user_mode

Uses for Tags, continued

Use	Example	Result
Group attributes across collections	The tags **performance primary** could be used for the attributes that assist with identifying performance problems across collections. As another example, you might tag all metrics that are useful for identifying status or health information across collections.	When you type **performance primary**, Operations Analytics returns performance metrics from both the HP Operations Smart Plug-in for Oracle and HP Operations Agent collections.
Dynamically extend your collections	Use the same tag name for more than one collection. For example, you might use the tag name **event** and **events** for the following collections: • HP Operations Manager (OM) • HP Operations Manager i (OMi)	When you type <*host name*> **events** in your search query, both the Operations Manager i events and Operations Manager events data is used to return your results.

About Keys and Link Tags

Keys identify a column in a collection that you want Operations Analytics to use to do either of the following:

- Narrow a search within a single collection
- Match metrics for one entity (collection row) to the same or related entity (collection row) across collections

Typically, key columns uniquely identify an entity instance.

When using a key column to narrow a search within only one collection, Operations Analytics returns only those metrics for the specified key column value. For example, if the **host_name** column is defined as a key in a cpu metrics collection, the host_name key column enables you to search for cpu metrics for a specific host name.

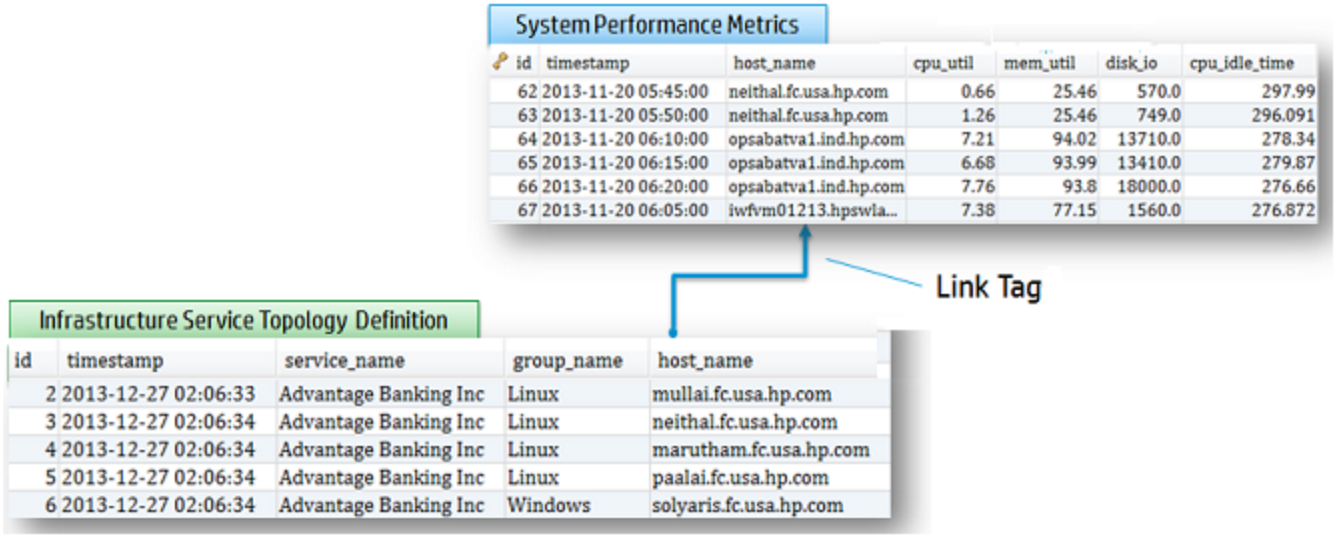
When using keys to identify a column in a collection that you want Operations Analytics to use to match metrics for a specific entity across collections make sure the required column is configured in each collection. For example, you might find that host_name is an attribute that identifies the host in most of your collections. However, perhaps in one or two collections, server_name is the attribute used to identify the host. In this scenario, you specify **host_name** as a key column in the collections that include the host_name attribute and **server_name** as a key column in the collections that include server_name. When a user enters a host_name value in a PQL search query, Operations Analytics looks for that value in all key columns across collections.

Keys also enable you to filter the scope of a search using link tags.

Link tags are special tags that associate two collections. The link between collections is based on one or more columns configured as keys . Values contained in a key column can then be used to filter one collection by the instances in another collection.

Note: You can link only two collections together in a single link tag.

The following diagram illustrates using the **host_name** key column to link an example Infrastructure **Service Topology Definition** collection with its associated system performance metrics stored in the **System Performance Metrics** collection.



Note the following:

- Operations Analytics includes link tags for the collections it provides. If you are an Operations Analytics administrator, see "Configuring Collections using Predefined Templates" in the HP Operations Analytics Installation and Configuration Guide for more information about these collections.
- When you define a service using the Topology Manager, Operations Analytics configures the link tags to establish the relationships between the collections for your service. You can then search for information using these relationships. See "Define a Service Using Topology Manager" on page 281 and "Searching for a Service Defined in Topology Manager" on page 150 for more information.

About Tenants

Operations Analytics supports multi-tenancy. This means one instance of Operations Analytics can serve multiple customers. Tenants ensure isolation of meta data and data across customers. The meta data includes the following:

- Collections
- **Database schema**[1]
- Tags
- Dashboards
- User Accounts

For example, if you are a Manage Service Provider or Software as a Service Provider with multiple customers, tenants enable you to ensure that each customer accesses only the data for its data center or network.

When you install Operations Analytics, by default Operations Analytics creates the **opsa_default** tenant.

To create one or more tenants, see opsa-tenant-manager.sh and "Configuring Tenants and Collections" in the HP Operations Analytics Installation and Configuration Guide.

About User Accounts

As an Operations Analytics administrator, you must configure a User Account for each user who needs to access the Operations Analytics graphical user interface.

Note the following:

- User Accounts must be unique across all Tenants.

  Tip: To ensure the user name is globally unique, enter a user's email address as the user name.

- Each User Account must be assigned to a User Group.

To create a user account, see "Manage Users" on page 279, opsa-user-manager.sh, and "Configuring Tenants and Collections" in the HP Operations Analytics Installation and Configuration Guide.

About User Groups

User Groups are pre-defined in Operations Analytics and determine which tasks each User Account that is assigned to the User Group can perform. See the following Pre-defined User Groups table for more information.

Note the following:

[1]Table, column, attribute, and data type information per collection.

- User Accounts must be unique across all tenants.
- All User Groups have access to the Operations Analytics graphical user interface.
- You cannot add a new User Group to Operations Analytics.
- A User Account was assigned to the **Super Admin** User Group when Operations Analytics was installed.
- See opsa-tenant-manager.sh and "Configuring Tenants and Collections" in the HP Operations Analytics Installation and Configuration Guide for information about assigning a user to a User Group.

Pre-defined User Groups

User Group	Description	Supported Tasks
Super Admin	**Note:** Operations Analytics permits only one Super Admin user. The user account assigned to this user group has access to the following information for each tenant defined: • User Accounts • User Groups	Add, modify, and delete tenants. Add, modify, and delete user accounts assigned to the Tenant Admin user group.
Tenant Admin	User accounts assigned to this User Group have access to the following information only for the tenant to which they are assigned: • Collectors • Collections • Meta Data • Tags • User Accounts • User Groups	Add, modify, and delete user accounts. Manage the collectors, collections, meta data, and tags for a specified tenant. See the following topics for more information: • "About Collectors" on page 266 • "About Collections" on page 266 • "About Meta Data" on page 267 • "About Tags" on page 267 • "About User Accounts" on the previous page

Pre-defined User Groups, continued

User Group	Description	Supported Tasks
User	User accounts assigned to this User Group have access to the Operations Analytics graphical user interface and to only the meta data and data for the tenant to which they are assigned.	Access and perform tasks using the Operations Analytics Dashboards. **Note:** Users assigned to this user group can also add and delete tags from a collection. See opsa-tag-manager.sh and "Configuring Tenants and Collections" in the *HP Operations Analytics Installation and Configuration Guide* for more information.

Chapter 14: Operations Analytics Administrator Tasks

As an Operations Analytics administrator, you perform the tasks described in the Administrator Tasks table to enable Operations Analytics users to proactively manage and troubleshoot IT operations problems.

For example, after you have initially installed and configured Operations Analytics, you might find that you want to use additional data sources and configure the associated collections.

Note: As an Operations Analytics administrator, you use a command line interface for most administrator tasks. See the *HP Operational Analytics Installation and Configuration Guide* for more information.

For more information about Operations Analytics, see "Welcome to HP Operations Analytics" on page 6.

For information about basic Operations Analytics concepts, see "Operations Analytics Concepts" on page 266.

Administrator Tasks

Category	Task	Sections or Help Topic	Command
Maintain Collections and Collectors	Plan for each new data source and subsequent collection configuration.	See "Planning Your Deployment" in the HP Operations Analytics Installation and Configuration Guide.	
	In multiple Operations Analytics server environments only. Designate the Operations Analytics server from which to configure all collections.	See "Configuring Tenants and Collections" in the HP Operations Analytics Installation and Configuration Guide.	
	Create the collection template for each additional collection.	See "Adding a New HP Operations Analytics Collection" in the *HP Operations Analytics Installation and Configuration Guide*.	opsa-collection-config.sh
	Configure your collection templates to match your IT environment.	See "Configuring Tenants and Collections" in the *HP Operations Analytics Installation and Configuration Guide*.	opsa-collection-config.sh
	Optional. Add one or more tenants	"Add a Tenant" on page 280 See "Creating a Tenant" in the HP Operations Analytics Installation and Configuration Guide.	opsa-tenant-manager.sh
	Optional. Delete one or more tenants. **Note:** Be sure to remove a collection registration for any tenant that will be removed.	See "Deleting a Tenant" and "Remove a Collection Registration for a Tenant" in the HP Operations Analytics Installation and Configuration Guide.	opsa-tenant-manager.sh
	Optional. Associate each collection with a tenant. **Note:** You must first create the tenant to which you want to associate a collection.	See "Configuring Tenants and Collections" and in the *HP Operations Analytics Installation and Configuration Guide*.	opsa-tenant-manager.sh

Administrator Tasks , continued

Category	Task	Sections or Help Topic	Command
	Optional. For each tenant, create a user account for the **Tenant Admin** and **User** User Groups.	"Manage Users" on page 279 See "Configuring Tenants and Collections" in the *HP Operations Analytics Installation and Configuration Guide*.	opsa-tenant-manager.sh
	Configure a collector for each new collection.	See "Configuring Tenants and Collections" in the *HP Operations Analytics Installation and Configuration Guide*.	opsa-collection-config.sh
	Configure additional collectors for one or more existing collections.	See "Installing and Configuring the Operations Analytics Collector Appliance using the VMware vSphere Client" and "Configuring Tenants and Collections" in the *HP Operations Analytics Installation and Configuration Guide*.	opsa-collection-config.sh
	Back up your collection configuration on the Operations Analytics server. The collection configuration directory is: `/opt/HP/opsa/conf/collection`	See "Configuring Tenants and Collections" in the HP Operations Analytics Installation and Configuration Guide.	
	Troubleshoot collection problems	See "Troubleshooting Operations Analytics Collections" in the HP Operations Analytics Installation and Configuration Guide.	
	Communicate collection names and meta data information to your users.	See "Communicate Collection Names and Meta Data Information to your Users" in the *HP Operations Analytics Installation and Configuration Guide*.	

Administrator Tasks , continued

Category	Task	Sections or Help Topic	Command
Define a Service	View the collection information stored in Operations Analytics.	"View Collection Information" on page 73	
	Topology Manager enables you to group together hosts that are of interest to you, and view them in Operations Analytics as a **service**. You can group hosts together based on their function, their location, or any other grouping that is meaningful to you when organizing your services.	"Define a Service Using Topology Manager" on page 281	
Create AQL Functions	*Optional*. Write Analytic Query Language (AQL) functions using a text editor.	"About Analytics Query Language (AQL) Functions" on page 228	
Import AQL Functions	*Optional.* Import your AQL functions.	"Import Analytic Query Language (AQL) Functions" on page 284	opsa-aql-module-manager.sh
Maintain User Accounts	Add, modify, or delete one or more user accounts.	"Manage Users" on the next page Also see "Maintaining User Accounts" in the *HP Operations Analytics Installation and Configuration Guide*.

Category	Task	Sections or Help Topic	Command
Maintain HP Operations Analytics	Check the system health of Operations Analytics.	"Check the Health of Operations Analytics" on page 285 Also see "Checking Operations Analytics System Health" in the *HP Operations Analytics Installation and Configuration Guide*.	
	Back up the Operations Analytics database.	See "Maintaining the HP Operations Analytics Database" in the *HP Operations Analytics Installation and Configuration Guide*.	
	View license information.	"Access Help and About Information" on page 23	

Manage Users

As an Operations Analytics administrator, you must configure a user account for each user who needs to access the Operations Analytics.

Note the following:

- User account names must be unique across all tenants.
- Each user account is automatically assigned to a User Group.

  User groups are pre-defined in Operations Analytics and determine which tasks each user account that is assigned to the user group can perform.

  The user group to which a new user is assigned depends on the user group to which you are assigned when adding a new user. See User Groups Assigned to New Users.

  User Groups Assigned to New Users

Your User Group	User Group Automatically Assigned to the New User
Super Admin	Tenant Admin
Tenant Admin	User

To add a user account:

1. Click **Settings** and select **User Management**.

   Operations Analytics displays the **User Management** form.

   Note: You must belong to either the Super Admin or Tenant Admin User Group to access the **User Management** option.

2. Click .

   Operations Analytics displays the **Add User** form.

3. If you belong to the Super Admin User Group, in the **Tenant** attribute, do one of the following:

   a. Select a tenant name to which you want to assign the user account.

   b. Enter the name of a tenant you want to create. Click **No matches found - Click to Add** . In the **Add Tenant** dialog, click **OK.**

      The new user is assigned to this tenant.

4. In the **User Name** attribute, enter the user account name of at least four characters.

   Tip: If you are using Public Key Infrastructure (PKI) authentication, the user name must be an email address.

5. In the **Password** attribute, enter a password that contains at least four characters.

6. In the **Confirm Password** attribute, re-enter the password for this user account.

7. Click **Save**.

   Operations Analytics lists the new user account in the **User Management** table with its associated user group and tenant.

See "About Table Data" on page 248 for more information about using tables.

Add a Tenant

As an Operations Analytics administrator, if you belong to the **Super Admin** User Group, you can add one or more tenants.

Tenants are used to separate the following information among User Groups:

- Collections

- **Database schema**[1]
- Meta data
- Tags
- Dashboards
- "About User Accounts" on page 272

Note the following:

- You can also use opsa-tenant-manager.sh to add tenants to Operations Analytics.
- If you do not configure one or more tenants, Operations Analytics stores all of the meta data, collection and query information in the **opsa_default** tenant.
- User account names must be unique across all tenants.

To add a tenant:

1. Click **Settings** and select **User Management**.

   Operations Analytics displays the **User Management** form.

   > **Note:** You must belong to either the Super Admin or Tenant Admin User Group to access the **User Management** option.

2. Click .

   Operations Analytics displays the **Add User** form.

3. If you belong to the Super Admin User Group, in the **Tenant** attribute, enter the name of a tenant you want to create.
4. Click **No matches found - Click to Add** .
5. In the **Add Tenant** dialog, click **OK.**

Define a Service Using Topology Manager

Topology Manager enables you to group together hosts that are of interest to you, and view them in Operations Analytics as a **service**. You can group hosts together based on their function, their location, or any other grouping that is meaningful to you when organizing your services.

[1]Table, column, attribute, and data type information per collection.

After you define a service, you can then search for it and view metrics, events and logs that are relevant to all the hosts in that service. For details, see "Searching for a Service Defined in Topology Manager" on page 150.

Topology Manager enables you to define your groups and their underlying hosts; first you create a service and provide a name for it, then you define the groups and specify their hosts.

For example, you might create a service that includes web servers, applications servers, and database servers. In order to easily reference all these hosts and get a holistic view of the service, you would create groups for web servers and so on. The groups will correspond to the groups you want to look at in Operations Analytics. A subsequent search for this service will return results for all the underlying hosts, providing a single pane of glass for all hosts that make up the service.

You can also edit or delete an existing service using Topology Manager.

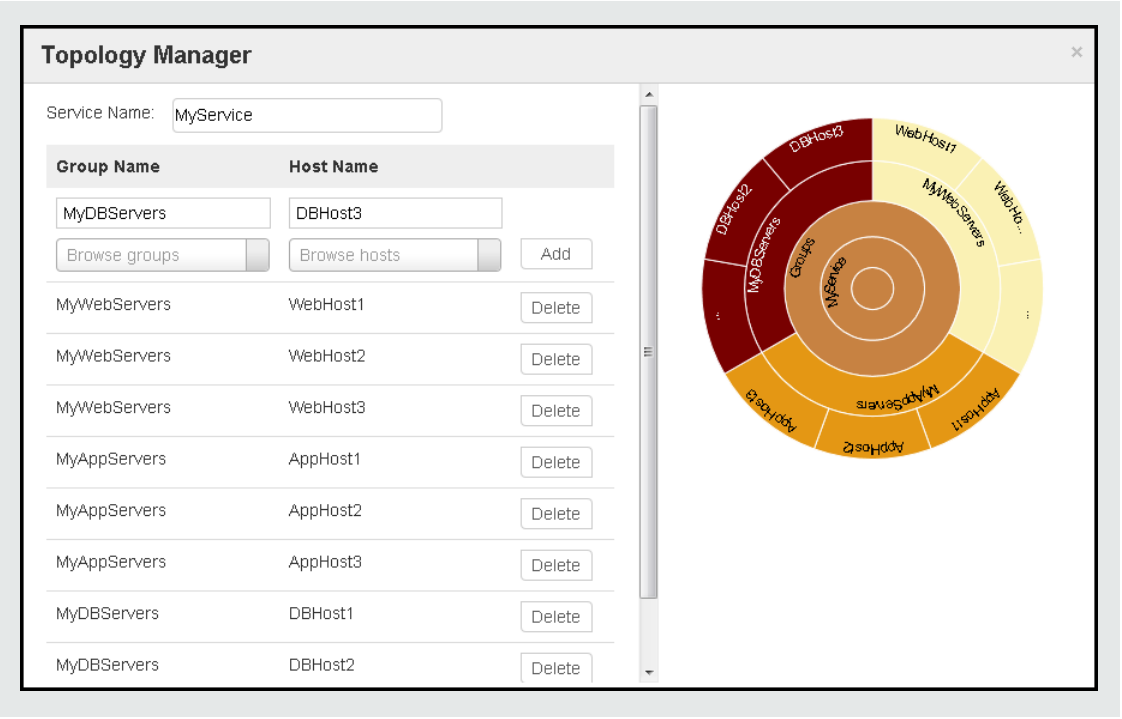
To define a service:

1. Click **Settings** and select **Topology Manager**.
2. Select **New**, and enter a name for your service.
3. Enter a group name and a host, then click **Add**.

   You can select the host from a list; as you type the first letters of the host, the list filters automatically. When adding a host, you can add it to an existing group or to a new one.
4. Continue defining groups and their hosts until you are done, and then click **Save**.

As a simple example, you can define a service called MyService, as follows:

- This service is made up of the groups **MyWebServers**, **MyAppServers**, and **MyDBServers**.
- These groups are made up of **WebHost1-3**, **AppHost1-3**, and **DBHost1-3** respectively.



Define Analytic Query Language (AQL) Functions

By default, Operations Analytics provides several Analytic Query Language (AQL) functions to assist you with creating AQL queries, AQL functions, and associated dashboards.

You can write your own AQL functions using a text editor and then import these functions into Operations Analytics. Each text file you create can contain any number of AQL functions. A set of AQL functions that reside in a single file are known as an AQL module.

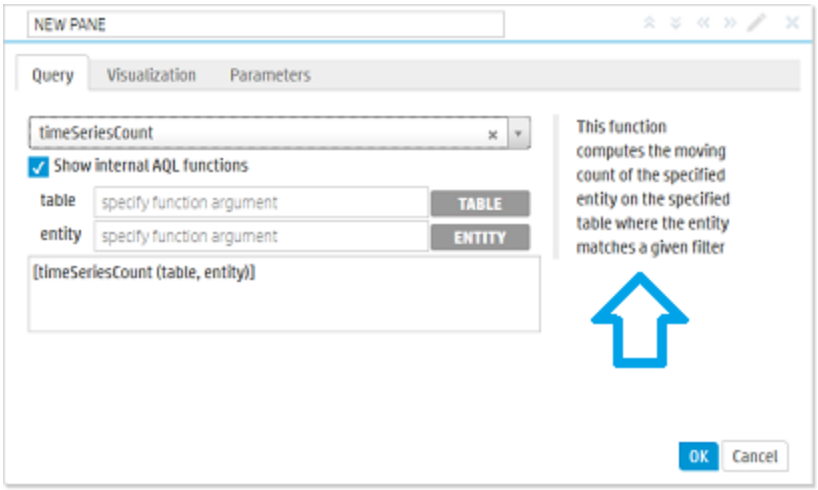
Tip: Use the bpm_functions.aql module as an example. This AQL module contains several AQL functions that can be used as a template for creating your own. They reside in the `$OPSA_HOME/inventory/lib/hp/aql` directory.

You can also view these AQL functions when you use the Add A Query Pane option from an Operations Analytics dashboard. See "Using an Operations Analytics Dashboard" on page 76 for more information.

Note: To view the AQL query associated with each AQL function provided by Operations Analytics, look at the .aql files in $OPSA_HOME/inventory/lib/hp/aql or use the opsa-aql-module-manager.sh command.

When creating AQL functions to be imported, note the following:

- The comment preceding each AQL function is displayed as the description for the AQL function selected as shown in the following example:



- As a best practice, name your file using a .aql extension.
- As a best practice, use the opsa-aql-module-manager.sh validate option to ensure your module will import.
- As a best practice, place your file in the `$OPSA_HOME/inventory/lib/user/aql` directory before it is imported. This helps to ensure that the file is not overwritten when upgrading to a new version of Operations Analytics.
- To make your AQL functions available to your user community, use the opsa-aql-module-manager.sh command. This command imports the AQL functions defined in your module into the Operations Analytics database and makes them available to your user community by default.

Also see "Import Analytic Query Language (AQL) Functions" below.

Import Analytic Query Language (AQL) Functions

By default, Operations Analytics provides several Analytic Query Language (AQL) functions to assist you with creating AQL queries, AQL functions, and associated dashboards. See "Define Analytic Query Language (AQL) Functions" on the previous page for more information about the AQL functions that Operations Analytics provides.

You can write your own AQL functions using a text editor and then import these functions into Operations Analytics. Each text file you create can contain any number of AQL functions. Each set of AQL functions contained in a single file is known as a **module**.

Use the opsa-aql-module-manager.sh command to manage the AQL functions. that you create.

When using the opsa-aql-module-manager.sh command, note the following:

- You must specify the tenant name for which the AQL functions should be available.
- Use file names that identify the types of AQL functions contained in each file.
- You define the <module_name> in the first line of each file; for example:

  module <module_name>;

- You validate, list, and delete modules using the module name.

Use the opsa-aql-module-manager.sh command to perform the following tasks:

Validate the AQL functions included in an module file

Enter the following command:

```
opsa-aql-module-manager.sh -t <tenant_name> -v <file_name>
```

Import an AQL module

Enter the following command:

```
opsa-aql-module-manager.sh -t <tenant_name> -i <file_name>
```

When importing AQL functions, note the following:

- After importing your AQL functions, all functions are available to the user community in the specified tenant.
- To replace or redefine AQL functions, you must make the appropriate changes to the .aql module and re-import the file.

List all AQL modules that have been imported into Operations Analytics

Enter the following command:

```
opsa-aql-module-manager.sh -t <tenant_name> -l modules
```

List the AQL functions contained in a module that has been imported into Operations Analytics

Enter the following command:

```
opsa-aql-module-manager.sh -t <tenant_name> -l <module_name>
```

See opsa-aql-module-manager.sh for more information.

Check the Health of Operations Analytics

Operations Analytics provides two methods for checking the health of servers running the Operations Analytics service:

Command Line Interface

Commands to Check Operations Analytics Status includes the commands available to check the status of Operations Analytics:

Commands to Check Operations Analytics Status

Command	Description
opsa-server status	Check the status of the Operations Analytics service **Note:** The opsa-server command must be run on the Operations Analytics server.
opsa-collector status	Checks the status of the collector service on the Collector Appliance. **Note:** The opsa-collector command must be run on the Operations Analytics Collector Appliance.
opsa-loader status	Checks the status of the loader service on the Collector Appliance. **Note:** The opsa-loader command must be run on the Operations Analytics Collector Appliance.

OpsaSystemHealth Dashboard

Use the OpsaSystemHealth dashboard to investigate the health of the Operations Analytics servers. OpsaSystemHealth Dashboard Query Panes describes the query panes available.

Note: If you view the message that no data is available, this might mean you do not have the required software to collect the expected data. See the **Required Software** column of OpsaSystemHealth Dashboard Query Panes. Also see "Checking Operations Analytics System Health" in the HP Operations Analytics Installation and Configuration Guide for the configuration steps required to display this dashboard information.

OpsaSystemHealth Dashboard Query Panes

Query Pane	Description	Required Software
System Metrics Trends	Use this visualization to determine server health for the Operations Analytics servers. Displays the average value over time for the following metrics for each server running the Operations Analytics service: • System up time • CPU utilization	HP Operations Agent

OpsaSystemHealth Dashboard Query Panes, continued

Query Pane	Description	Required Software
Service components with max CPU utilization of nodes	Use this visualization to determine the servers running Operations Analytics software. Displays topology information for the Operations Analytics service, including the following servers: • Operations Analytics server • Operations Analytics collector servers • HP logger servers • HP Vertica database servers Also displays the CPU utilization for each of the Operations Analytics servers.	Operations Analytics only
Recent Logs from OPSA service components	Use this visualization to troubleshoot any Operations Analytics log file error messages. Displays all log file messages for servers running the Operations Analytics service.	Operations Analytics only

Glossary

A

attribute

A descriptor stored in a collection for an entity, such as host_name.

attributes

Descriptors stored in a collection for an entity, such as host_name.

C

categories

Folders that are used to organize your AQL modules.

Category

A folder that is used to organize your AQL modules.

collections

Operations Analytics stores metrics, topology, inventory, log file, and event information in the form of collection tables. Each collection is associated with a database table in which an Operations Analytics Collector stores the data collected.

D

Database schema

Table, column, attribute, and data type information per collection.

K

Knowledge Content

An xml file that configures a predefined dashboard. Each Knowledge Context includes a name, the entities for which the dashboard displays information, phrases to help identify the Knowledge Context, as well as the queries that return the dashabord and any filters to use before the data is returned.

M

metric

Typically a measurement stored in a collection. For example, CPU utilization.

metrics

Typically, measurements stored in a collection. For example, CPU utilization.

O

outlier

A data point that is outside of the normal range based on the data collected to date.

outliers

Data that is outside of the normal range based on the data collected to date.

Q

query pane

Displays the results of an Analytic Query Language (AQL) query, AQL function, or AQL expression. If you use the Phrased Query Language (PQL) in your search, HP Operations Analytics converts the PQL query to one or more AQL queries and subsequent query panes.

query panes

Each query pane displays the results of an Analytic Query Language (AQL) query, AQL function, or AQL expression. If you use the Phrased Query Language (PQL) in your search, HP Operations Analytics converts the PQL query to one or more AQL queries and subsequent query panes.

R

raw logs

Log files that contain messages as they appear in the log source from which they are collected. These log files must be configured using the log file management software supported by HP Operations Analytics. See the HP Operations Analytics Support Matrix for more information.

Raw logs

Log files that contain messages as they appear in the log source from which they are collected. These log files must be configured using the log file management software supported by HP Operations Analytics. See the HP Operations Analytics Support Matrix for more information.

raw metrics

Metrics to which an overall aggregate or moving aggregate analytic function is applied.

S

structured log files

Fragments of log file data that are stored as collections in HP Operations Analytics. Structured logs are log files that are configured as collections. These collections are created so that users can perform analytics on the log file contents. For example, you might want to query for all outliers by host name and application for a particular time range.

structured logs

Fragments of log file data that are stored as collections in HP Operations Analytics. Structured logs are log files that are configured as collections. These collections are created so that users can perform analytics on the log file contents. For example, you might want to query for all outliers by host name and application for a particular time range.

Structured logs

Fragments of log file data that are stored as collections in HP Operations Analytics. Structured logs are log files that are configured as collections. These collections are created so that users can perform analytics on the log file contents. For example, you might want to query for all outliers by host name and application for a particular time range.

T

tag

A word or phrase that is associated with a metric, topology, event, or log file attribute that is stored as part of a collection in HP Operational Analytics. These tags can be used in the HP Operational Analtyics search query as synonyms for the attributes stored in HP Operational Analytics collection tables. They are also used to make metrics display names more meaningful. Tags are provided by HP Operational Analytics and can also be defined by the HP Operational Analytics administrator.

tags

Each tag is a word or phrase that is associated with a metric, topology, event, or log file attribute that is stored as part of a collection in HP Operational Analytics. These tags can be used in the HP Operational Analtyics search query as synonyms for the attributes stored in HP Operational Analytics collection tables. They can also be used to make metrics display names more meaningful. Tags are provided by HP Operational Analytics and can also be defined by the HP Operational Analytics administrator.

Tags

Each tag is a word or phrase that is associated with a metric, topology, event, or log file attribute that is stored as part of a collection in HP Operational Analytics. These tags can be used in the HP Operational Analtyics search query as synonyms for the attributes stored in HP Operational Analytics collection tables. They can also be used to make metrics display names more meaningful. Tags are provided by HP Operational Analytics and can also be defined by the HP Operational Analytics administrator.
