

HP Database and Middleware Automation

For Linux, Solaris, AIX, and Windows®

Software Version: 10.21

WebSphere 8.0 and 8.5.x Patching User Guide

Document Release Date: July 2014

Software Release Date: July 2014

Legal Notices

Warranty

The only warranties for HP products and services are set forth in the express warranty statements accompanying such products and services. Nothing herein should be construed as constituting an additional warranty. HP shall not be liable for technical or editorial errors or omissions contained herein.

The information contained herein is subject to change without notice.

Restricted Rights Legend

Confidential computer software. Valid license from HP required for possession, use or copying. Consistent with FAR 12.211 and 12.212, Commercial Computer Software, Computer Software Documentation, and Technical Data for Commercial Items are licensed to the U.S. Government under vendor's standard commercial license.

Documentation Updates

The title page of this document contains the following identifying information:

- Software Version number, which indicates the software version.
- Document Release Date, which changes each time the document is updated.
- Software Release Date, which indicates the release date of this version of the software.

To check for recent updates or to verify that you are using the most recent edition of a document, go to: <http://h20230.www2.hp.com/selfsolve/manuals>

This site requires that you register for an HP Passport and sign in. To register for an HP Passport ID, go to: <http://h20229.www2.hp.com/passport-registration.html>

Or click the **New users - please register** link on the HP Passport login page.

You will also receive updated or new editions if you subscribe to the appropriate product support service. Contact your HP sales representative for details.

The following table indicates changes made to this document since the last released major edition.

Document Changes

Chapter	Version	Changes
Title Page Legal Notices	10.01	Updated version number, software release date, document release date, and copyright date range.
WebSphere 8 Patching Quick Start	10.01	Updated quick start section for 10.01.
Title Page Legal Notices	10.10	Updated version number, software release date, document release date, and copyright date range.
About HP DMA Solution Packs	10.10	Added overview topic: About HP DMA Solution Packs.
Audience Document Map Reference Information	10.10	Added sections that are in other HP DMA Solution Packs.
Title Page Legal Notices	10.20	Updated version number, software release date, document release date, and copyright date range.
WebSphere 8 Patching Quick Start Workflow Details	10.20	Removed Quick Start chapter. In the "How to Run this Workflow" topics, pointed to the <i>HP DMA Quick Start Tutorial</i> .
Entire guide	10.20	Added support for WebSphere 8.5 and 8.5.x.
Title Page Legal Notices Entire guide	10.21	Updated version number, software release date, document release date, and copyright date range. Updated document template.

Support

Visit the HP Software Support Online web site at: <http://www.hp.com/go/hpsoftwaresupport>

This web site provides contact information and details about the products, services, and support that HP Software offers.

HP Software online support provides customer self-solve capabilities. It provides a fast and efficient way to access interactive technical support tools needed to manage your business. As a valued support customer, you can benefit by using the support web site to:

- Search for knowledge documents of interest
- Submit and track support cases and enhancement requests
- Download software patches
- Manage support contracts
- Look up HP support contacts
- Review information about available services
- Enter into discussions with other software customers
- Research and register for software training

Most of the support areas require that you register as an HP Passport user and sign in. Many also require a support contract. To register for an HP Passport ID, go to:

<http://h20229.www2.hp.com/passport-registration.html>

To find more information about access levels, go to:

http://h20230.www2.hp.com/new_access_levels.jsp

HP Software Solutions Now accesses the HPSW Solution and Integration Portal Web site. This site enables you to explore HP Product Solutions to meet your business needs, includes a full list of Integrations between HP Products, as well as a listing of ITIL Processes. The URL for this Web site is

<http://h20230.www2.hp.com/sc/solutions/index.jsp>

About HP DMA Solution Packs

HP Database and Middleware Automation (HP DMA) software automates administrative tasks like provisioning and configuration, compliance, patching, and release management for databases and application servers. When performed manually, these day-to-day operations are error-prone, time consuming, and difficult to scale.

HP DMA automates these daily, mundane, and repetitive administration tasks that take up 60-70% of a database or application server administrator's day. Automating these tasks enables greater efficiency and faster change delivery with higher quality and better predictability.

HP DMA provides role-based access to automation content. This enables you to better utilize resources at every level:

- End-users can deliver routine, yet complex, DBA and middleware tasks.
- Operators can execute expert level tasks across multiple servers including provisioning, patching, configuration, and compliance checking.
- Subject matter experts can define, enforce, and audit full stack automation across network, storage, server, database, and middleware.

An HP DMA workflow performs a specific automated task—such as provisioning database or application servers, patching database or application servers, or checking a database or application server for compliance with a specific standard. You specify environment-specific information that the workflow requires by configuring its parameters.

Related HP DMA workflows are grouped together in solution packs. When you purchase or upgrade HP DMA content, you are granted access to download specific solution packs.

Audience

This solution is designed for IT architects and engineers who are responsible for planning, implementing, and maintaining application-serving environments that use IBM WebSphere Application Server Network Deployment versions 8.0 and 8.5.x (WebSphere 8.0 and 8.5.x).

To use this solution, you should be familiar with WebSphere 8.0 or 8.5.x and its requirements (see the [WebSphere 8.0 and 8.5.x Product Documentation](#) on page 39).

Document Map

The following table shows you how to navigate this guide:

Topic	Description
The WebSphere 8.0 and 8.5.x Patching Solution	General information about this solution, including what it contains and what it does
Workflow Details	Information about each of the two workflows included in this solution, including: prerequisites, how it works, how to run it, sample scenarios, and a list of input parameters
Reference Information	Links to current WebSphere 8.0 and 8.5.x product documentation and additional HP DMA documentation.
Tips and Best Practices	Simple procedures that you can use to accomplish a variety of common HP DMA tasks
Troubleshooting	Tips for solving common problems

Important Terms

Here are a few basic HP DMA terms that you will need to know:

- In HP DMA, a **workflow** executes a process —such as installing a software product or checking a database instance for compliance with a specific security benchmark.
- A workflow consists of a sequence of **steps**. Each step performs a very specific task. Steps can be shared among workflows.
- Steps can have input and output **parameters**, whose values will be unique to your environment.

If you provide correct values for the input parameters that each scenario requires, the workflow will be able to accomplish its objective. Output parameters from one step often serve as input parameters to another step.

- A **solution pack** contains a collection of related workflows and the steps, functions, and policies that implement each workflow.

More precisely, solution packs contain **workflow templates**. These are read-only versions of the workflows that cannot be deployed. To run a workflow included in a solution pack, you must first create a deployable copy of the workflow template and then customize that copy for your environment.

- A **deployment** associates a workflow with the targets (servers, instances, or databases) where the workflow will run. To run a workflow, you execute a specific deployment. A deployment is associated with one workflow; a workflow can have many deployments, each with its own targets and parameter settings.
- The umbrella term **automation items** is used to refer to those items to which role-based permissions can be assigned. Automation items include workflows, deployments, steps, and policies.

Organizations also have role-based permissions. Servers, instances, and databases inherit their role-based permissions from the organization in which the server resides.

- The **software repository** contains any files that a workflow might need to carry out its purpose (for example, software binaries or patch archives). If the files that a workflow requires are not in the software repository, they must be stored locally on each target server.

When you are using HP DMA with HP Server Automation (HP SA), the software repository is the HP SA Software Library.

- An **organization** is a logical grouping of servers. You can use organizations to separate development, staging, and production resources—or to separate logical business units. Because user security for running workflows is defined at the organization level, organizations should be composed with user security in mind.

Additional terms are defined in the [Glossary](#) on page 53.

Chapter 1: The WebSphere 8.0 and 8.5.x Patching Solution

The HP Database and Middleware Automation WebSphere 8.0 and 8.5.x patching solution automates the process of applying fixes and updates to one or more WebSphere 8.0 or 8.5.x application servers.

This solution contains the following workflows:

- Patch WebSphere 8 Standalone Profile
- Patch WebSphere 8 Network Deployment Cell

The WebSphere 8.0 and 8.5.x patching workflows perform extensive validation checks prior to performing their intended function. All parameter values are validated to ensure that they do not contain any prohibited characters. Additional validation checks are performed at the operating system level. These include file system space checks and RPM checks (on Red Hat Linux platforms). The workflows determine whether the pertinent files exist on the target machine; if they do not, the files are downloaded from the HP DMA server.

Although minimal HP DMA Application Server Patching Solution Pack knowledge is required to run this workflow using its default settings, the workflow is highly customizable and can support complex environment-specific deployment scenarios.

The remaining topics in this chapter provide the following contextual information about these workflows:

- [Supported Products and Platforms](#) on the next page
- [Prerequisites](#) on the next page

Supported Products and Platforms

WebSphere 8.0 and 8.5.x patching workflows are supported on AIX, Solaris, Red Hat Enterprise Linux, and Windows platforms.

Product Platform

The WebSphere provisioning workflows documented in this guide support the following versions of WebSphere: 8.0, 8.5, and 8.5.5. These versions will be referred to as WebSphere 8.0 and 8.5.x (or simply WebSphere 8) throughout.

Operating Systems

For specific target operating system versions supported by each workflow, see the *HP Database and Middleware Automation Support Matrix* available on the HP Software Product Manuals web site:

<http://h20230.www2.hp.com/selfsolve/manuals>

Hardware Requirements

For HP DMA server hardware requirements, see the *HP DMA Installation Guide* and the *HP DMA Release Notes*.

HP Software Requirements

This solution requires HP DMA version 10.20 (or later).

Prerequisites

The following prerequisites must be satisfied before you can run the WebSphere 8.0 and 8.5.x patching workflows in this solution pack.

1. You have installed the HP DMA Application Server Patching Solution Pack.
2. You have an HP Software support contract
3. IBM Installation Manager software exists on each target machine.

Chapter 2: Workflow Details

The HP DMA Application Server Patching solution pack includes the following WebSphere 8.0 and 8.5.x patching workflows:

- [Patch WebSphere 8 StandAlone Profile](#) on the next page
- [Patch WebSphere 8 Network Deployment Cell](#) on page 26

Each workflow included in this solution pack has a set of input parameters whose values will be unique to your environment. If you provide correct values for the parameters that each scenario requires, the workflow will be able to accomplish its objective.

There are two steps required to customize this solution. First, ensure that all required parameters are visible. You do this by using the workflow editor. Then, specify the values for those parameters. You do this when you create a deployment.

Note: For detailed instructions, see the "How to Use this Workflow" topic associated with each workflow.

The information presented here assumes the following:

- HP DMA is installed and operational.
- At least one suitable target server is available.
- You are logged in to the HP DMA web interface.
- You have permission to create, edit, and deploy copies of the workflows included in this solution pack.

Note: For information about the input parameters used by each workflow, see the "Parameters" topic associated with each workflow.

Patch WebSphere 8 StandAlone Profile

This workflow installs cumulative fixes and updates for WebSphere 8.0 or 8.5.x. The workflow patches a single WebSphere 8.0 or 8.5.x application server instance.

Fixes and updates are installed by the workflow using the IBM Installation Manager software, which must exist on the target machine.

To use this workflow in your environment, see the following information:

Topic	Information Included
Prerequisites for this Workflow	List of prerequisites that must be satisfied before you can run this workflow
How this Workflow Works	Information about what the workflow does, including validation checks performed, steps executed, and a high-level process flow
How to Run this Workflow	Instructions for running this workflow in your environment
Sample Scenario	Examples of typical parameter values for this workflow
Parameters	List of input parameters for this workflow

Prerequisites for this Workflow

Be sure that the following prerequisites are satisfied before you run this workflow:

1. You have installed the HP DMA Application Server Patching solution pack.
2. You have a valid HP Software support contract for this solution pack.
3. You have downloaded and installed all available HP DMA patches and hot fixes.
4. IBM Installation Manager software exists on each target machine.

For specific target operating system versions supported by each workflow, see the *HP Database and Middleware Automation Support Matrix* available on the HP Software Product Manuals web site:

<http://h20230.www2.hp.com/selfsolve/manuals>

Dependency: This workflow runs as root.

For information about prerequisites for WebSphere 8.0 and 8.5.x patching, refer to the [WebSphere 8.0 and 8.5.x Product Documentation](#) on page 39.

How this Workflow Works

The following information describes how the [Patch WebSphere 8 StandAlone Profile](#) workflow works.

Overview

This workflow installs cumulative fixes and updates for WebSphere 8.0 or 8.5.x. The workflow patches a single WebSphere 8.0 or 8.5.x application server instance.

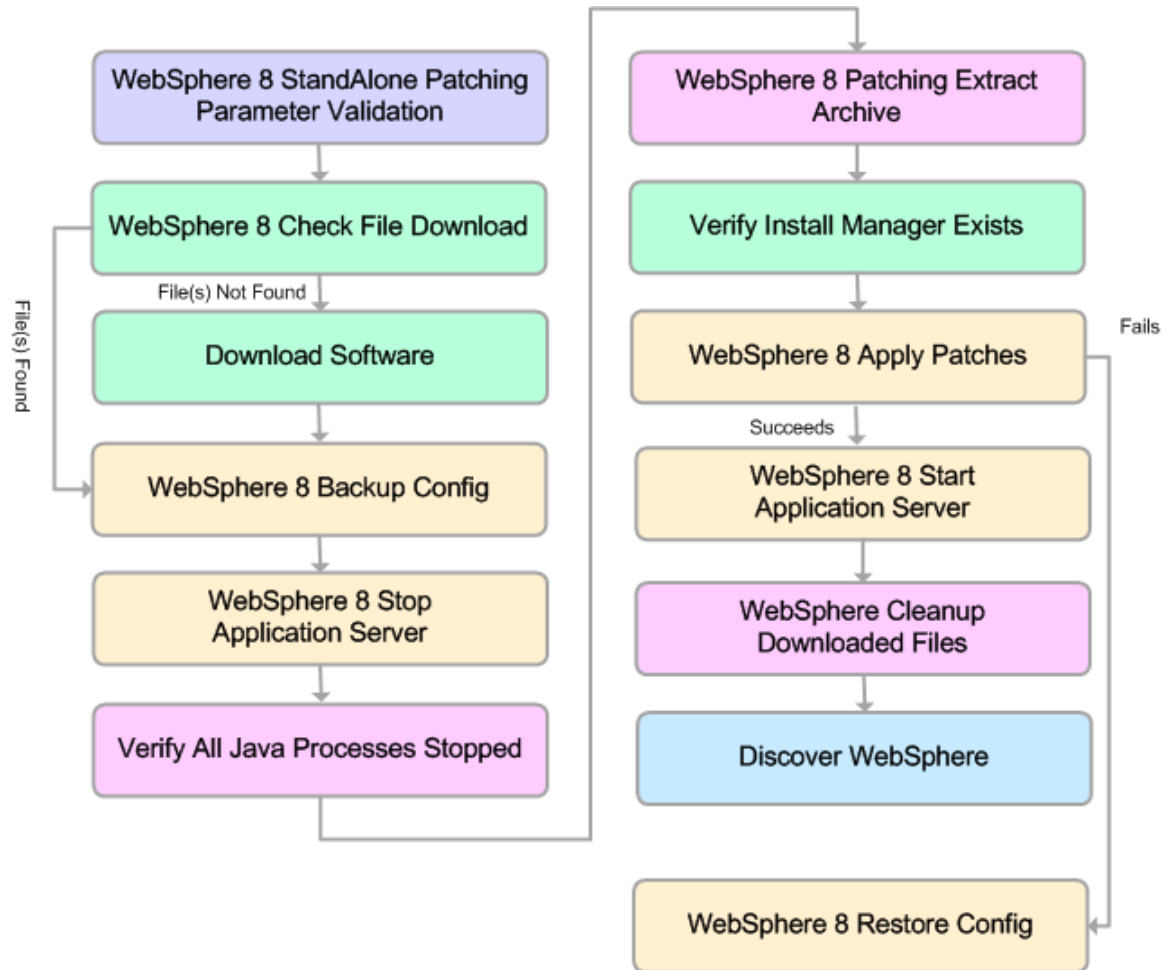

Validation Checks Performed

The validation centers on the input parameters:

- The input parameters have the proper syntax (no special characters or spaces).
- Specified files exist and have valid permissions.

Steps Executed

The Patch WebSphere 8 StandAlone Profile workflow includes the following steps. Each step must complete successfully before the next step can start. If a step fails, the workflow restores the configuration, cleans up files as necessary, reports a failure, and skips all subsequent steps.

KEY:

- Workflow preparation
- OS or file system operation
- WebSphere Specific Operation
- Pre/post validation
- Parameter gathering and validation

Steps for Patch WebSphere 8 StandAlone Profile

Workflow Step	Description
WebSphere 8 StandAlone Patching Parameter Validation	Prepares the parameters needed to patch WebSphere 8.0 or 8.5.x.
WebSphere 8 Check File Download	Checks for the existence of a file on the target machine before downloading that file from the HP DMA server. For each file in the list: <ol style="list-style-type: none"> 1. The step determines whether the file is in the expected location on the target machine. 2. If the file is not in the expected location, the step adds that file to a list of files that need to be downloaded.
Download Software	Automates the transfer of files from the software repository to individual managed servers for use in downstream workflow steps.
WebSphere 8 Backup Config	Uses the <code>backupConfig</code> utility to backup the WebSphere configurations for the specified WebSphere 8.0 or 8.5.x installation.
WebSphere 8 Stop Application Server	Stops the specified application server before patching the WebSphere 8.0 or 8.5.x installation.
Verify All Java Processes Stopped	Verifies that all Java processes relevant to the WebSphere services on the specified target have been stopped.
WebSphere 8 Patching Extract Archive	First checks to ensure that the archive file exists. Then, based on the archive extension, extracts the archive to the specified directory.
Verify Install Manager Exists	Verifies that an IBM Installation Manager instance exists on the specified target machine.
WebSphere 8 Apply Patches	Uses the IBM Installation Manager to apply the cumulative patches to the specified WebSphere 8.0 or 8.5.x installation.
WebSphere 8 Start Server	Starts the stand-alone application server.
WebSphere 8 Cleanup Downloaded Files	Removes all temporary downloaded files and archives.

Steps for Patch WebSphere 8 StandAlone Profile, continued

Workflow Step	Description
Discover WebSphere	<p>Examines the target server's physical environment to discover information about WebSphere 8.0 and 8.5.x cells, clusters, and managed servers.</p> <p>Note: Discovery is ONLY additive. It will not remove instances or databases currently in your environment. It is your HP DMA administrator's responsibility to delete content that is no longer in use.</p>
WebSphere 8 Restore Config	<p>If the patching process fails, this step is called to restore the configuration via the restoreConfig utility.</p>

How to Run this Workflow

The following instructions show you how to customize and run the [Patch WebSphere 8 StandAlone Profile](#) workflow in your environment.

Tip: For detailed instructions to run HP DMA workflows—using the Run Oracle Compliance Audit workflow as an example—see *HP DMA Quick Start Tutorial*.

Note: Before following this procedure, review the [Prerequisites for this Workflow](#), and ensure that all requirements are satisfied.

To use the Patch WebSphere 8 StandAlone Profile workflow:

1. Create a deployable copy of the workflow (see "Create a Deployable Workflow" in *HP DMA Quick Start Tutorial*).
2. Determine the values that you will specify for the following parameters:

Parameter Name	Default Value	Required	Description
Config Backup File	no default	required	Fully qualified file path where the WebSphere BackupConfig utility will write the backup file. For example: /opt/IBM/WebSphere/newbackup/backup.zip
Install Manager Location	no default	required	Fully qualified file path where the WebSphere Install Manager is located. For example: /usr/IBM/installManager or /opt/IBM/InstallManager
Trust SSL Certificates	True	optional	If this parameter is set to True, the workflow will trust any Secure Sockets Layer (SSL) certificate used to connect to the HP DMA web service.
WAS Admin Password	no default	optional	If global security is enabled, this is the password for a user who belongs to a group that has permission to change the state of a specific application server.
WAS Admin User	no default	optional	If global security is enabled, this is the user account for a user who belongs to a group that has permission to change the state of a specific application server.

Parameter Name	Default Value	Required	Description
Web Service Password	no default	required	Password for the HP DMA Discovery web service API.
Web Service URL	no default	required	URL for the HP DMA Discovery web service API. For example: <code>https://example.com/8443/dma</code>
Web Service User	required	required	User who is capable of modifying the HP DMA managed environment by using the HP DMA Discovery web service API.
WebSphere Patch Extract Location	no default	required	Fully qualified path to the directory where the Update Installer package will be uncompressed. For example: <code>/opt/IBM/WebSphere/WebSphere_Upgrader</code>
WebSphere Patch File List	no default	required	Comma-separated list of fully qualified paths to the compressed WebSphere cumulative patch files on the target machine. For example: <code>/usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part1.zip,</code> <code>/usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part2.zip</code>
WebSphere Server Name	no default	required	Name of the application server that will be stopped before the patching process proceeds (for example: server1).

Tip: To avoid having to re-enter passwords whenever they change, you can create a policy to provide them to the workflow (see [How to Use a Policy to Specify Parameter Values](#) on page 46).

Note: See [Parameters for Patch WebSphere 8 StandAlone Profile](#) on page 24 for detailed descriptions of all input parameters for this workflow, including default values.

3. Create a new deployment (see "Create a Deployment" in *HP DMA Quick Start Tutorial* for instructions).
4. On the Targets tab, specify one or more targets for this deployment.
5. Save the deployment (click **Save** in the lower right corner).

6. Run the workflow using this deployment (see "Run Your Workflow" in *HP DMA Quick Start Tutorial* for instructions).

To verify the results:

The workflow will complete and report SUCCESS on the Console if it has run successfully. If an error occurs during workflow execution, the error is logged, and the workflow terminates in the FAILURE state.

Sample Scenario

It is very straightforward to run the [Patch WebSphere 8 StandAlone Profile](#) workflow. This topic shows you typical parameter values to use.

For the sample use case scenario below, global security is not enabled, and the workflow will trust any Secure Sockets Layer (SSL) certificates.

Parameter Name	Example Value	Description
Config Backup File	see description	Fully qualified file path where the WebSphere BackupConfig utility will write the backup file. For example: <code>/opt/IBM/WebSphere/newbackup/backup.zip</code>
Install Manager Location	see description	Fully qualified file path where the WebSphere Install Manager is located. For example: <code>/usr/IBM/installManager</code> or <code>/opt/IBM/InstallManager</code>
Trust SSL Certificates	True	If this parameter is set to True, the workflow will trust any Secure Sockets Layer (SSL) certificate used to connect to the HP DMA web service.
WAS Admin Password	myPwd	If global security is enabled, this is the password for a user who belongs to a group that has permission to change the state of a specific application server.
WAS Admin User	myUsername	If global security is enabled, this is the user account for a user who belongs to a group that has permission to change the state of a specific application server.
Web Service Password	myWebSvcPwd	Password for the HP DMA Discovery web service API.
Web Service URL	see description	URL for the HP DMA Discovery web service API. For example: <code>https://example.com/8443/dma</code>
Web Service User	JohnDoe	User who is capable of modifying the HP DMA managed environment by using the HP DMA Discovery web service API.
WebSphere Patch Extract Location	see description	Fully qualified path to the directory where the Update Installer package will be uncompressed. For example: <code>/opt/IBM/WebSphere/WebSphere_Upgrader</code>

Parameter Name	Example Value	Description
WebSphere Patch File List	see description	Comma-separated list of fully qualified paths to the compressed WebSphere cumulative patch files on the target machine. For example: /usr/IBM/patches/8.0.0-WAS-WAS-FP0000003-part1.zip, /usr/IBM/patches/8.0.0-WAS-WAS-FP0000003-part2.zip
WebSphere Server Name	see description	Name of the application server that will be stopped before the patching process proceeds (for example: server1).

Parameters for Patch WebSphere 8 StandAlone Profile

The following tables describe the required and optional input parameters for this workflow.

Parameters Defined in this Step: WebSphere 8 StandAlone Patching Parameter Validation

Parameter Name	Default Value	Required	Description
Config Backup File	no default	required	Fully qualified file path where the WebSphere BackupConfig utility will write the backup file. For example: /opt/IBM/WebSphere/newbackup/backup.zip
Install Manager Location	no default	required	Fully qualified file path where the WebSphere Install Manager is located. For example: /usr/IBM/installManager or /opt/IBM/InstallManager
Trust SSL Certificates	True	optional	If this parameter is set to True, the workflow will trust any Secure Sockets Layer (SSL) certificate used to connect to the HP DMA web service.
WAS Admin Password	no default	optional	If global security is enabled, this is the password for a user who belongs to a group that has permission to change the state of a specific application server.
WAS Admin User	no default	optional	If global security is enabled, this is the user account for a user who belongs to a group that has permission to change the state of a specific application server.
Web Service Password	no default	required	Password for the HP DMA Discovery web service API.
Web Service URL	no default	required	URL for the HP DMA Discovery web service API. For example: https://example.com/8443/dma
Web Service User	no default	required	User who is capable of modifying the HP DMA managed environment by using the HP DMA Discovery web service API.
WebSphere Patch Extract Location	no default	required	Fully qualified path to the directory where the Update Installer package will be uncompressed. For example: /opt/IBM/WebSphere/WebSphere_Upgrader

Parameters Defined in this Step: WebSphere 8 StandAlone Patching Parameter Validation, continued

Parameter Name	Default Value	Required	Description
WebSphere Patch File List	no default	required	Comma-separated list of fully qualified paths to the compressed WebSphere cumulative patch files on the target machine. For example: /usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part1.zip, /usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part2.zip
WebSphere Server Name	no default	required	Name of the application server that will be stopped before the patching process proceeds (for example: server1).

Patch WebSphere 8 Network Deployment Cell

This workflow installs cumulative fixes and updates for a WebSphere 8.0 or 8.5.x application server.

The workflow supports the patching of WebSphere 8.0 or 8.5.x running in a Network Deployment topology.

Fixes and updates are installed by the workflow using an existing instance of the IBM Installation Manager software, which must exist on each target machine.

This workflow takes into account the multiple components related to a Network Deployment implementation and makes sure that all components (dmgr, nodeagent, and application servers) are stopped before proceeding with the patching.

To use this workflow in your environment, see the following information:

Topic	Information Included
Prerequisites for this Workflow	List of prerequisites that must be satisfied before you can run this workflow
How this Workflow Works	Information about what the workflow does, including validation checks performed, steps executed, and a high-level process flow
How to Run this Workflow	Instructions for running this workflow in your environment
Sample Scenario	Examples of typical parameter values for this workflow
Parameters	List of input parameters for this workflow

Prerequisites for this Workflow

Be sure that the following prerequisites are satisfied before you run this workflow:

1. You have installed the HP DMA Application Server Patching solution pack.
2. You have a valid HP Software support contract for this solution pack.
3. You have downloaded and installed all available HP DMA patches and hot fixes.
4. IBM Installation Manager software exists on each target machine.

For specific target operating system versions supported by each workflow, see the *HP Database and Middleware Automation Support Matrix* available on the HP Software Product Manuals web site:

<http://h20230.www2.hp.com/selfsolve/manuals>

Dependencies:

- This workflow runs as root.
- The workflow supports the patching of WebSphere 8.0 or 8.5.x running in a Network Deployment topology.
- When patching a Network Deployment Cell, the workflow must be set up to first patch the server that runs the Deployment Manager process and then patch the other nodes in the cell.
- The workflow requires that an instance of IBM Installation Manager be installed on each of the target servers.

For information about prerequisites for WebSphere 8.0 and 8.5.x patching, refer to the [WebSphere 8.0 and 8.5.x Product Documentation](#) on page 39.

How this Workflow Works

The following information describes how the [Patch WebSphere 8 Network Deployment Cell](#) workflow works:

Overview

This workflow installs cumulative fixes and updates for a WebSphere 8.0 or 8.5.x application server.

The workflow supports the patching of WebSphere 8.0 or 8.5.x running in a Network Deployment topology.

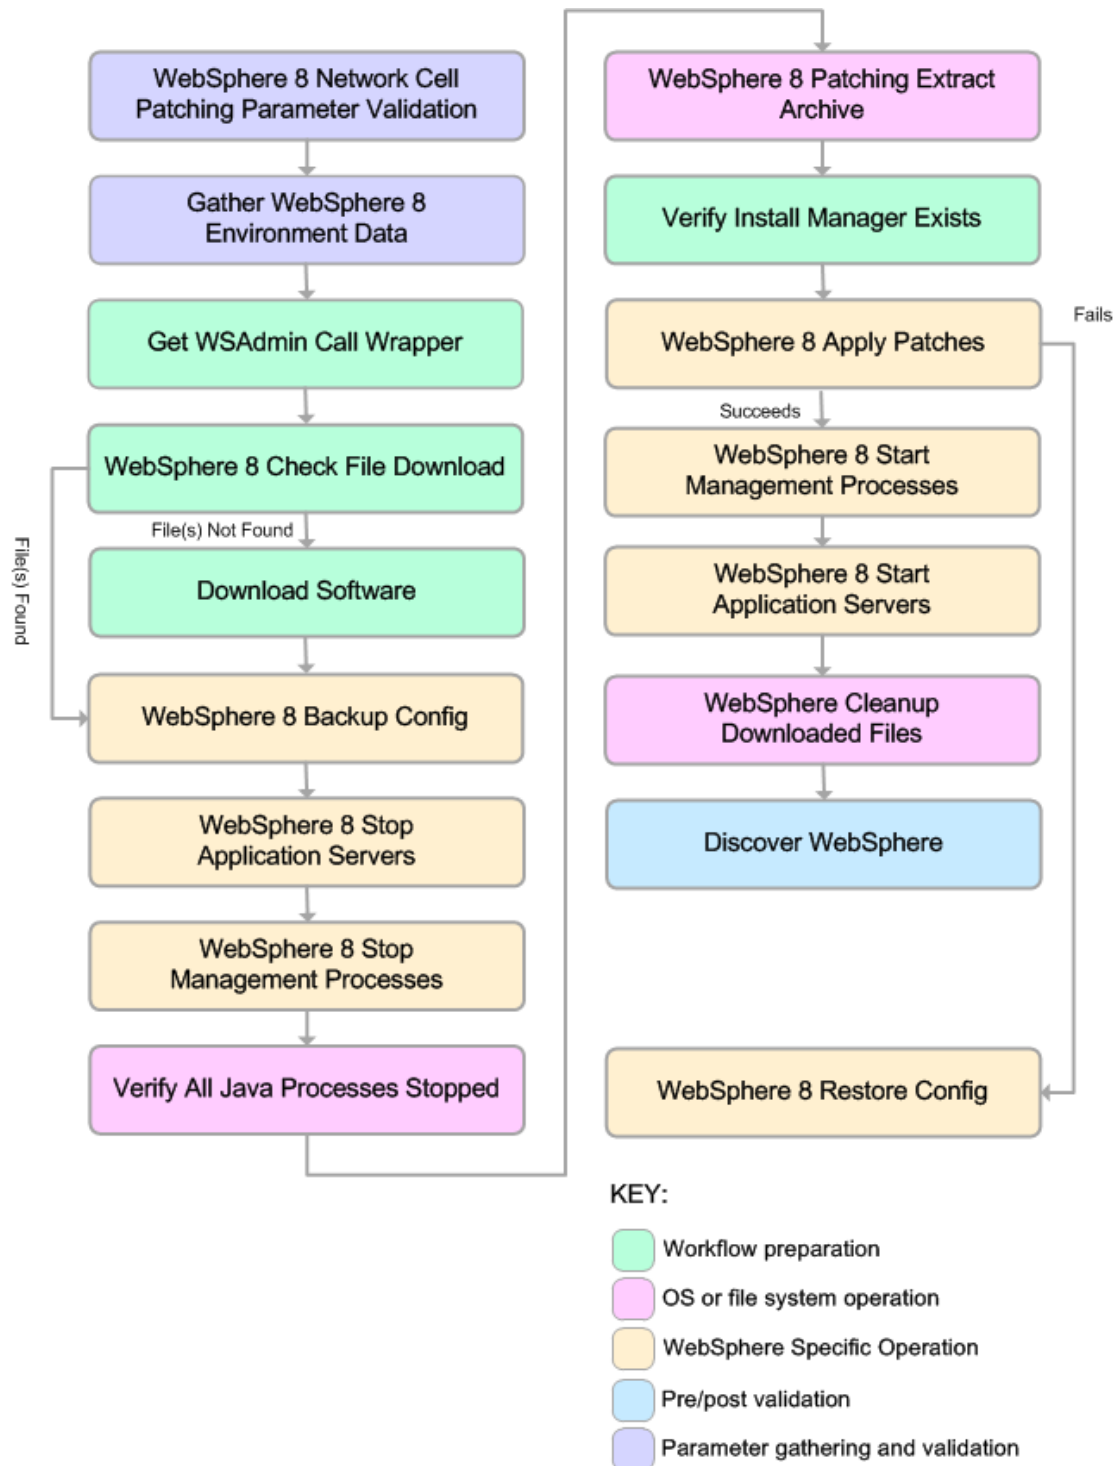

Validation Checks Performed

The validation centers on the input parameters:

- The input parameters have the proper syntax (no special characters or spaces).
- Specified files exist and have valid permissions.

Steps Executed

The Patch WebSphere 8 Network Deployment Cell workflow includes the following steps. Each step must complete successfully before the next step can start. If a step fails, the workflow restores the configuration, cleans up files as necessary, reports a failure, and skips all subsequent steps.

Steps for Patch WebSphere 8 Network Deployment Cell

Workflow Step	Description
WebSphere 8 Network Cell Patching Parameter Validation	Prepares the parameters needed to patch WebSphere 8.0 or 8.5.x.
Gather WebSphere 8 Environment Data	Determines what the Network Deployment cell looks like.
Get WSAAdmin Call Wrapper	Creates the necessary call wrapper to call <code>wsadmin</code> to execute certain operations within the WebSphere 8.0 or 8.5.x environment.
WebSphere 8 Check File Download	Checks for the existence of a file on the target machine before downloading that file from the HP DMA server. For each file in the list: <ol style="list-style-type: none"> 1. The step determines whether the file is in the expected location on the target machine. 2. If the file is not in the expected location, the step adds that file to a list of files that need to be downloaded.
Download Software	Automates the transfer of files from the software repository to individual managed servers for use in downstream workflow steps.
WebSphere 8 Backup Config	Uses the <code>backupConfig</code> utility to backup the WebSphere configurations for the specified WebSphere 8.0 or 8.5.x installation.
WebSphere 8 Stop Application Servers	Stops all application servers first before patching the installation of WebSphere.
WebSphere 8 Stop Management Processes	First stops <code>nodeagents</code> . If there is a <code>dmgr</code> process running, the step will then stop that process before patching the WebSphere 8.0 or 8.5.x installation.
Verify All Java Processes Stopped	Verifies that all Java processes relevant to the WebSphere services on the specified target have been stopped.
WebSphere 8 Patching Extract Archive	First checks to ensure that the archive file exists. Then, based on the archive extension, extracts the archive to the specified directory.
Verify Install Manager Exists	Verifies that an IBM Installation Manager instance exists on each of the specified target machines.
WebSphere 8 Apply Patches	Uses the IBM Installation Manager to apply the cumulative patches to the specified WebSphere 8.0 or 8.5.x installation.
WebSphere 8 Start Management Processes	First starts the <code>dmgr</code> process first if one exists. Then, starts the <code>nodeagent</code> process.

Steps for Patch WebSphere 8 Network Deployment Cell, continued

Workflow Step	Description
WebSphere 8 Start Application Servers	Starts all application servers.
WebSphere 8 Cleanup Downloaded Files	Removes all temporary downloaded files and archives.
Discover WebSphere	<p>Examines the target server's physical environment to discover information about WebSphere 8.0 and 8.5.x cells, clusters, and managed servers.</p> <p>Note: Discovery is ONLY additive. It will not remove instances or databases currently in your environment. It is your HP DMA administrator's responsibility to delete content that is no longer in use.</p>
WebSphere 8 Restore Config	If the patching process fails, this step is called to restore the configuration via the <code>restoreConfig</code> utility.

For parameter descriptions and defaults, see [Parameters for Patch WebSphere 8 Network Deployment Cell](#).

How to Run this Workflow

The following instructions show you how to customize and run the [Patch WebSphere 8 Network Deployment Cell](#) workflow in your environment.

Tip: For detailed instructions to run HP DMA workflows—using the Run Oracle Compliance Audit workflow as an example—see *HP DMA Quick Start Tutorial*.

Note: Before following this procedure, review the [Prerequisites for this Workflow](#) on page 27, and ensure that all requirements are satisfied.

To use the Patch WebSphere 8 Network Deployment Cell workflow:

1. Create a deployable copy of the workflow (see "Create a Deployable Workflow" in *HP DMA Quick Start Tutorial*).
2. Determine the values that you will specify for the following parameters:

Parameter Name	Default Value	Required	Description
Config Backup File	no default	required	Fully qualified file path where the WebSphere BackupConfig utility will write the backup file. For example: /opt/IBM/WebSphere/newbackup/backup.zip
Enable Security	false	required	Enables administrative security. Must be set to either true or false. If Enable Security is true, the WAS Admin User and WAS Admin Password parameters must have values.
Install Manager Location	no default	required	Fully qualified file path where the WebSphere Install Manager is located. For example: /usr/IBM/installManager or /opt/IBM/InstallManager
Trust SSL Certificates	True	optional	If this parameter is set to True, the workflow will trust any Secure Sockets Layer (SSL) certificate used to connect to the HP DMA web service.
WAS Admin Password	no default	optional	If global security is enabled, this is the password for a user who belongs to a group that has permission to change the state of a specific application server.

Parameter Name	Default Value	Required	Description
WAS Admin User	no default	optional	If global security is enabled, this is the user account for a user who belongs to a group that has permission to change the state of a specific application server.
Web Service Password	no default	required	Password for the HP DMA Discovery web service API.
Web Service URL	no default	required	URL for the HP DMA Discovery web service API. For example: <code>https://example.com/8443/dma</code>
Web Service User	required	required	User who is capable of modifying the HP DMA managed environment by using the HP DMA Discovery web service API.
WebSphere Patch Extract Location	no default	required	Fully qualified path to the directory where the Update Installer package will be uncompressed. For example: <code>/opt/IBM/WebSphere/WebSphere_Upgrader</code>
WebSphere Patch File List	no default	required	Comma-separated list of fully qualified paths to the compressed WebSphere cumulative patch files on the target machine. For example: <code>/usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part1.zip,</code> <code>/usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part2.zip</code>

Tip: To avoid having to re-enter passwords whenever they change, you can create a policy to provide them to the workflow (see [How to Use a Policy to Specify Parameter Values](#) on page 46).

Note: See [Parameters for Patch WebSphere 8 Network Deployment Cell](#) on page 37 for detailed descriptions of all input parameters for this workflow, including default values.

3. Create a new deployment (see "Create a Deployment" in *HP DMA Quick Start Tutorial* for instructions).
4. On the Targets tab, specify one or more targets for this deployment.

5. Save the deployment (click **Save** in the lower right corner).
6. Run the workflow using this deployment (see "Run Your Workflow" in *HP DMA Quick Start Tutorial* for instructions).

To verify the results:

The workflow will complete and report SUCCESS on the Console if it has run successfully. If an error occurs during workflow execution, the error is logged, and the workflow terminates in the FAILURE state.

Sample Scenario

It is very straightforward to run the [Patch WebSphere 8 Network Deployment Cell](#) workflow. This topic shows you typical parameter values to use.

For the sample use case scenario below, security is enabled, and the workflow will trust any Secure Sockets Layer certificates.

Parameter Name	Example Value	Description
Config Backup File	see description	Fully qualified file path where the WebSphere BackupConfig utility will write the backup file. For example: <code>/opt/IBM/WebSphere/newbackup/backup.zip</code>
Enable Security	true	Enables administrative security. Must be set to either true or false. If Enable Security is true, the WAS Admin User and WAS Admin Password parameters must have values.
Install Manager Location	see description	Fully qualified file path where the WebSphere Install Manager is located. For example: <code>/usr/IBM/installManager</code> or <code>/opt/IBM/InstallManager</code>
Trust SSL Certificates	True	If this parameter is set to True, the workflow will trust any Secure Sockets Layer (SSL) certificate used to connect to the HP DMA web service.
WAS Admin Password	myPwd	If global security is enabled, this is the password for a user who belongs to a group that has permission to change the state of a specific application server.
WAS Admin User	myUsername	If global security is enabled, this is the user account for a user who belongs to a group that has permission to change the state of a specific application server.
Web Service Password	myWebSvcPwd	Password for the HP DMA Discovery web service API.
Web Service URL	see description	URL for the HP DMA Discovery web service API. For example: <code>https://example.com/8443/dma</code>
Web Service User	JohnDoe	User who is capable of modifying the HP DMA managed environment by using the HP DMA Discovery web service API.

Parameter Name	Example Value	Description
WebSphere Patch Extract Location	see description	Fully qualified path to the directory where the Update Installer package will be uncompressed. For example: /opt/IBM/WebSphere/WebSphere_Upgrader
WebSphere Patch File List	see description	Comma-separated list of fully qualified paths to the compressed WebSphere cumulative patch files on the target machine. For example: /usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part1.zip, /usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part2.zip

Parameters for Patch WebSphere 8 Network Deployment Cell

The following tables describe the required and optional input parameters for this workflow.

Parameters Defined in this Step: WebSphere 8 Network Cell Patching Parameter Validation

Parameter Name	Default Value	Required	Description
Config Backup File	no default	required	Fully qualified file path where the WebSphere BackupConfig utility will write the backup file. For example: /opt/IBM/WebSphere/newbackup/backup.zip
Enable Security	false	required	Enables administrative security. Must be set to either true or false. If Enable Security is true, the WAS Admin User and WAS Admin Password parameters must have values.
Install Manager Location	no default	required	Fully qualified file path where the WebSphere Install Manager is located. For example: /usr/IBM/installManager or /opt/IBM/InstallManager
Trust SSL Certificates	True	optional	If this parameter is set to True, the workflow will trust any Secure Sockets Layer (SSL) certificate used to connect to the HP DMA web service.
WAS Admin Password	no default	optional	If global security is enabled, this is the password for a user who belongs to a group that has permission to change the state of a specific application server.
WAS Admin User	no default	optional	If global security is enabled, this is the user account for a user who belongs to a group that has permission to change the state of a specific application server.
Web Service Password	no default	required	Password for the HP DMA Discovery web service API.
Web Service URL	no default	required	URL for the HP DMA Discovery web service API. For example: https://example.com/8443/dma
Web Service User	no default	required	User who is capable of modifying the HP DMA managed environment by using the HP DMA Discovery web service API.

Parameters Defined in this Step: WebSphere 8 Network Cell Patching Parameter Validation, continued

Parameter Name	Default Value	Required	Description
WebSphere Patch Extract Location	no default	required	Fully qualified path to the directory where the Update Installer package will be uncompressed. For example: /opt/IBM/WebSphere/WebSphere_Upgrader
WebSphere Patch File List	no default	required	Comma-separated list of fully qualified paths to the compressed WebSphere cumulative patch files on the target machine. For example: /usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part1.zip, /usr/IBM/patches/8.0.0-WS-WAS-FP0000003-part2.zip

Chapter 3: Reference Information

This chapter contains the following information:

Topic	Description
WebSphere 8.0 and 8.5.x Product Documentation	This topic contains links to general information about WebSphere 8.0 and 8.5.x
HP DMA Documentation	Links to additional HP DMA documentation

WebSphere 8.0 and 8.5.x Product Documentation

For the current list of hardware requirements, software requirements, and supported platforms for WebSphere 8.0 and 8.5.x, see:

Note: The links to the documents listed here were correct as of the publication of this guide.

HP DMA Documentation

For information about using the HP DMA web interface, see the *HP DMA User Guide*, the *HP DMA Administrator Guide*, and the *HP DMA Quick Start Tutorial*.

These documents are part of the HP DMA documentation library, which is available on the HP Software Product Manuals web site:

<http://h20230.www2.hp.com/selfsolve/manuals>

Chapter 4: Tips and Best Practices

This portion of the document contains a collection of tips and best practices that will enable you to use HP DMA more effectively. It contains the following topics:

- [How a Solution Pack is Organized](#) on the next page
- [How to Expose Additional Workflow Parameters](#) on page 45
- [How to Use a Policy to Specify Parameter Values](#) on page 46
- [How to Import a File into the Software Repository](#) on page 49

How a Solution Pack is Organized

Note: This topic uses the Run Oracle Compliance Audit workflow in the Database Compliance solution pack as an example. The information provided here, however, pertains to any solution pack.

In HP DMA, a **workflow** executes a process —such as installing a software product or checking a database instance for compliance with a specific security benchmark.

A **solution pack** contains one or more related **workflow templates**.

Each workflow template has a Documentation tab that provides detailed information about that workflow.

The screenshot displays the HP Database & Middleware Automation console. The top navigation bar includes links for Home, Automation, Reports, Environment, Solutions, and Setup. Below this, a secondary navigation bar lists Workflows, Steps, Functions, Policies, Deployments, Run, Console, and History. The main content area is titled 'My Copy of Run Oracle Compliance Audit' and features tabs for Documentation, Workflow, History, Deployments, and Roles. The 'Documentation' tab is active, showing fields for Name (My Copy of Run Oracle Compliance Audit), Tags, Type (Oracle), and Target level (Instance). The 'Documentation' section contains three expandable sections: Purpose, Description, and Parameters. The 'Purpose' section describes auditing an Oracle Database instance against CIS benchmarks and PCI/SOX requirements. The 'Description' section details the workflow's process, including CIS Level 1 and 2 auditing and report generation. The 'Parameters' section is currently collapsed. At the bottom of the console, there is a toolbar with buttons for DELETE, EXPORT, EXTRACT POLICY, and DEPLOY, along with a 'Copy' button and a 'Save or CANCEL' prompt.

Name: My Copy of Run Oracle Compliance Audit

Tags:

Type: Oracle

Target level: Instance

Documentation:

Purpose

Audit an Oracle Database instance for compliance with the following Center for Internet Security (CIS) benchmarks and, optionally, compare the audit results to the related PCI and SOX requirements:

- CIS Security Configuration Benchmark for Oracle Database Server 11g, version 1.1.0, December 2011
- CIS Security Benchmark for Oracle 9i/10g, version 2.01, April 2005
- Payment Card Industry (PCI) Data Security Standard Version 2.0, October 2010
- Sarbanes-Oxley (SOX) Sarbanes-Oxley Act of 2002 Section 302

Description

This workflow will audit an Oracle Database instance using CIS Level 1 and Level 2 auditing. It will then compare the results to the pertinent PCI and SOX requirements, where applicable. This audit, which runs in conjunction with the HP DMA reporting tool, can identify more than 175 compliance related problems with an Oracle database. You can view information about the audit on the Console while the audit is running. After the audit has finished, the workflow sends a summary report to each specified email address. You can also view a compliance report on the Reports page.

Parameters

DELETE EXPORT EXTRACT POLICY DEPLOY Copy Save or CANCEL

A workflow consists of a sequence of **steps**. Each step performs a very specific task. Each step includes a documentation panel that briefly describes its function.

The screenshot displays the HP Database & Middleware Automation web interface. The top navigation bar includes links for Home, Automation, Reports, Environment, Solutions, and Setup. Below this, a secondary navigation bar shows Workflows, Steps, Functions, Policies, Deployments, Run, Console, and History. The main content area is titled 'Get Oracle Home' and features several tabs: General, Action, Parameters, History, Workflows, Solutions, and Roles. The 'General' tab is active, showing two panels: 'Properties' and 'Documentation'. The 'Properties' panel lists details for the 'Get Oracle Home' step, including its name, tags, type (Oracle), category (Script), and a 'Targetable' checkbox. The 'Documentation' panel provides a detailed description of the step's purpose and the sources for ORACLE_HOME, along with dependencies, input/output parameters, and the return code. At the bottom of the interface, there is a 'Copy' button and a lock icon with the text 'THIS STEP IS READ ONLY'.

Properties

Name: Get Oracle Home

Tags:

Type: Oracle

Category: Script

Targetable: ☐

Documentation

Description:

Get the value of ORACLE_HOME from the appropriate source:

- The /etc/oratab or /var/opt/oracle/oratab file on UNIX
- The registry on Windows

Dependencies: None

Input Parameters: None

Output Parameters:

- Oracle Home = The fully qualified name of the ORACLE_HOME
- Oracle SID = The Oracle server (instance) ID

Return Code:

0 = Step was successful

Copy

THIS STEP IS READ ONLY

Steps can have input and output **parameters**. Output parameters from one step often serve as input parameters to another step. Steps can be shared among workflows.

Parameter descriptions are displayed on the Parameters tab for each step in the workflow.

X Parameter is in use and cannot be removed.

Parameter descriptions are also displayed on the Workflow tab for each workflow.

Get Listener Names / Oracle SIDs

Optional: Comma delimited list of ORACLE_SIDs, at least one of which a resulting listener must service. If blank, listeners are not limited to those servicing any specific ORACLE_SID.

To see the parameter description here

Step ID	Step Name	Duration	Order
7	Prepare Oracle Instance	0	3, 8
8	Get Listener Names	0	3, 9
9	Audit Unix or Linux OS Specific Settings	0	3, 10
10	Audit Installation and Patch	0	11, 12

Listener Homes: Prepare Oracle Instance.Oracle Home

Oracle SIDs: Get Oracle Home.Oracle SID **Click here**

Parameter descriptions are also displayed on the Parameters tab in the **deployment** (organized by step).

The screenshot displays the HP Database & Middleware Automation web interface. The top navigation bar includes links for Home, Automation, Reports, Environment, Solutions, and Setup. Below this, a secondary navigation bar shows Workflows, Steps, Functions, Policies, Deployments (highlighted), Run, Console, and History.

The main content area is titled 'Run Oracle Compliance CIS' and features three tabs: Targets, Parameters (selected), and Roles.

Under the 'Parameters' tab, the section 'Gather Parameters for Oracle Compliance' contains the following configuration fields:

- Compliance Type:** A text field with 'CIS' entered, a 'Fixed Value' dropdown, and a description: 'Compliance type that will be audited by the workflow. Compliance types supported: CIS, PCI, SOX. Will be defaulted to CIS.'
- Excluded Compliance Checks:** An empty text field, a 'Fixed Value' dropdown, and a description: 'Optional: Checks to exclude from of Compliance Checks'.
- Inventory Files:** A text field with '/etc/orainst.loc' entered, a 'Fixed Value' dropdown, and a description: 'Optional: Comma separated list of fully qualified Oracle inventory files. If not specified, default to /etc/orainst.loc, /var/opt/oracle/orainst.loc, or %ProgramFiles%\Oracle\Inventory.'

Below this, the 'Gather Advanced Parameters for Oracle Compliance' section includes:

- Email Addresses to Receive Report:** A text field with 'CISComplianceAuditor@mycompany.com' entered, a 'Fixed Value' dropdown, and a description: '*Optional. Provided an email address or multiple email addresses separated by commas without spaces that you would like to receive an email of the results of the compliance tests run against the target specified.'

At the bottom of the configuration area, there are two buttons: 'X DELETE' and '▶ RUN'. To the right of these are four buttons: 'Restore defaults', 'Copy', 'Save', and 'CANCEL'.

Note: The workflow templates included in this solution pack are read-only and cannot be deployed. To use a workflow template, you must first create a copy of the template and then customize that copy for your environment.

How to Expose Additional Workflow Parameters

Each workflow in this solution pack has a set of input parameters. Some are required and some are optional. To run a workflow in your environment, you must specify values for a subset of these parameters when you create a deployment.

By default, only a few of the input parameters for each workflow are visible on the Deployment page, and the rest are hidden. In order to specify a value for a parameter that is currently hidden, you must first expose that parameter by changing its mapping in the workflow editor.

To expose a hidden workflow parameter:

1. In the HP DMA web interface, go to Automation > Workflows.
2. From the list of workflows, select a deployable workflow.
3. Go to the Workflow tab.
4. In the list of steps below the workflow diagram, click the ► (blue arrow) to the immediate left of the pertinent step name. This expands the list of input parameters for this step.
5. For the parameter that you want to expose, select - User Selected - from the drop-down list.
For example:

Step	Name	Required Result	Next
▼ 1	Gather Parameters for Oracle Compliance		2
	Compliance Type: - User selected -		
	Excluded Compliance Checks: - User selected -		
	Inventory Files: - User selected -		

6. Repeat steps 4 and 5 for all the parameters that you would like to specify in the deployment.
7. Click **Save** in the lower right corner.

How to Use a Policy to Specify Parameter Values

It is sometimes advantageous to provide parameter values by using a policy rather than explicitly specifying the values in a deployment. This approach has the following advantages:

- The policy can be used in any deployment.
- It is faster and less error-prone than specifying parameter values manually.
- For parameter values that change frequently—for example, passwords that must be changed regularly—you only need to update them in one place.

To establish a policy, you can either [Create a Policy](#) or [Extract a Policy](#) from a workflow.

After you establish the policy, you must [Reference the Policy in the Deployment](#).

For more information, see the *HP DMA User Guide*. This document is available on the HP Software Product Manuals web site: <http://h20230.www2.hp.com/selfsolve/manuals>

Create a Policy

The first step in this approach is to create a policy that provides parameter values. There are two ways to do this: (1) create a new policy, and define all attributes manually (as shown here) or (2) extract a policy from a workflow (see [Extract a Policy](#) on the next page).

To create a policy that provides parameter values:

1. In the HP DMA web UI, go to Automation > Policies.
2. Click **New Policy**.
3. In the **Name** box, specify the name of the policy
4. For each parameter value that you want to provide using this policy, perform the following actions on the Attributes tab:
 - a. From the drop-down list, select the type of attribute:
 - A Text attribute contains simple text that users can view while deploying and running workflows.
 - A List attribute contains a comma-separated list of values (or a large amount of text not suitable for a Text attribute).
 - A Password attribute contains simple text, but the characters are masked so that users cannot see the text.

- b. In the text box to the left of the Add button, specify the name of the attribute.

For your convenience, this name should be similar to the parameter name used in the pertinent workflow (or workflows).

- c. Click **Add**.

- d. In the new text box to the right of the attribute's name, enter a value for this attribute.

To remove an attribute, click the **Remove** button.

5. On the Roles tab, grant Read and Write permission to any additional users and groups who will be using this policy. By default, any groups to which you belong have Read and Write permission.
6. Click the **Save** button (lower right corner).

Extract a Policy

An alternative to creating your own policy one attribute at a time is to extract the policy. This automatically creates a reusable policy that provides values for all input parameters associated with a workflow. This is a convenient way to create a policy.

To extract a policy:

1. Go to Automation > Workflows.
2. Select the Workflow that you want to work with.
3. Click the Extract Policy link at the bottom of the screen.
4. Specify values for each attribute listed.
5. *Optional:* Remove any attributes that you do not want to use.
6. *Optional:* Add any new attributes that you want to use.
7. *Optional:* On the Roles tab, select the Read box for any users or user groups that you want to be able to use this policy to provide parameter values in a Deployment. Select the Write box for any users or groups that you want to be able to modify this Policy (add or remove attributes).
8. Click **Save**.

Reference the Policy in the Deployment

After you create a policy, you can reference its attributes in a deployment.

To reference policy attributes in a deployment:

1. Create or access the deployment.

See “Deployments” in the *HP DMA User Guide* for details.

2. On the Parameters tab, perform the following steps for each parameter whose value you want to provide by referencing a policy attribute:
 - a. In the drop-down menu for that parameter, select **Policy Attribute**.
 - b. In the text box for that parameter, type any character. A drop-down list of policy attributes appears. For example:

Admin Password: Policy Attribute ▼

- Discovery.Web Service Password
- DTE - Policy.Password
- MyParameterValues.MyAdminPassword**
- MyParameterValues.MyAdminUser
- MyParameterValues.MyDBUser
- MyParameterValues.MyDBUserPassword
- oracle software.oracle software

- c. From the drop-down list, select the attribute that you want to reference. For example:

Admin Password: Policy Attribute ▼

3. Click **Save** to save your changes to the deployment.

How to Import a File into the Software Repository

Many HP DMA workflows are capable of downloading files from the software repository on the HP DMA server to the target server (or servers) where the workflow is running. The following procedure shows you how to import a file into the software repository so that it can be downloaded and deployed by a workflow.

HP DMA uses the HP Server Automation (HP SA) Software Library as its software repository.

Tip: Be sure to use unique file names for all files that you import into the software repository.

To import a file into the HP SA Software Library:

1. Launch the HP SA Client from the Windows Start Menu.

By default, the HP SA Client is located in Start → All Programs → HP Software → HP Server Automation Client

If the HP SA Client is not installed locally, follow the instructions under “Download and Install the HP SA Client Launcher” in the *HP Server Automation Single-Host Installation Guide*.

2. In the navigation pane in the HP SA Client, select Library → By Folder.
3. Select (or create) the folder where you want to store the file.
4. From the Actions menu, select **Import Software**.
5. In the Import Software dialog, click the **Browse** button to the right of the File(s) box.
6. In the Open dialog:
 - a. Select the file (or files) to import.
 - b. Specify the character encoding to be used from the Encoding drop-down list. The default encoding is English ASCII.
 - c. Click **Open**. The Import Software dialog reappears.
7. From the Type drop-down list, select **Unknown**.
8. If the folder where you want to store the files does not appear in the Folder box, follow these steps:
 - a. Click the **Browse** button to the right of the Folder box.
 - b. In the Select Folder window, select the import destination location, and click **Select**. The Import Software dialog reappears.

9. From the Platform drop-down list, select all the operating systems listed.
10. Click **Import**.

If one of the files that you are importing already exists in the folder that you specified, you will be prompted regarding how to handle the duplicate file. Press F1 to view online help that explains the options.

11. Click **Close** after the import is completed.

Chapter 5: Troubleshooting

These topics can help you address problems that might occur when you install and run the workflows in this solution pack:

- [Target Type](#) below
- [User Permissions and Related Requirements](#) below
- [Discovery in HP DMA](#) on the next page

Target Type

In your deployment, make sure that you have specified the correct type of target. The workflow type and the target type must match. A workflow designed to run against an instance target, for example, cannot run against a server target.

User Permissions and Related Requirements

Roles define access permissions for organizations, workflows, steps, policies, and deployments. Users are assigned to roles, and they gain access to these automation items according to the permissions and capabilities defined for their roles.

Roles are assigned by the HP Server Automation administrator. They are then registered in HP DMA by your HP DMA administrator.

Your HP DMA administrator will ensure that the users in your environment are assigned roles that grant them the permissions and capabilities they need to accomplish their tasks. For example:

- To create a workflow, your role must have Workflow Creator capability.
- To view a workflow, your role must have Read permission for that workflow.
- To edit a workflow, your role must have Write permission for that workflow.
- To view a deployment, your role must have Read permission for that deployment.
- To modify a deployment, your role must have Write permission for that deployment.
- To run a deployment, your role must have Execute permission for that deployment and Deploy permission for the organization where it will run.

Capabilities determine what features and functions are available and active in the HP DMA UI for each user role.

For more information, see the *HP DMA Administrator Guide*. This document is available on the HP Software Product Manuals web site: <http://h20230.www2.hp.com/selfsolve/manuals>

Discovery in HP DMA

HP DMA uses a process called “discovery” to find information about the servers, networks, and database instances on target machines in your managed environment.

You must explicitly initiate the process of discovery—it is not automatic. See the *HP DMA User Guide* for instructions. This document is available on the HP Software Product Manuals web site: <http://h20230.www2.hp.com/selfsolve/manuals>

Glossary

A

automation items

The umbrella term automation items is used to refer to those items to which role-based permissions can be assigned. Automation items include workflows, deployments, steps, and policies.

B

bridged execution

A bridged execution workflow includes some steps that run on certain targets and other steps that run on different targets. An example of a bridged execution workflow is Extract and Refresh Oracle Database via RMAN (in the Database Refresh solution pack). This workflow extracts the contents of a database on one target (the Source) and creates a new database with the same contents on another target (the Destination). This workflow is useful when you want to clone a database - for example, to move it from a traditional IT infrastructure location into a private cloud. Bridged execution workflows are supported on HP DMA version 9.11 (and later).

C

capability

Capabilities are collections of related privileges. There are three capabilities defined in HP DMA. Login Access capability enables a user to log in to the web interface. This capability does not guarantee that this user can view any organizations or automation items—permissions are required to access those items. Workflow Creator capability

enables a user to create new workflows and make copies of other workflows. Administrator capability enables a user to perform any action and view all organizations. If you have Administrator capability, you do not need Workflow Creator capability. The Administrator can assign any of these capabilities to one or more roles registered roles.

connector

HP DMA includes a Connector component that enables it to communicate with HP Server Automation. You must configure the Connector before you can run an workflow against a target.

cross-platform

Cross-platform database refresh involves converting the data from one type of byte ordering to another. This is necessary, for example, if you want to load a database dump file on a little-endian Linux target that was created on a big-endian Solaris server.

custom field

Custom Fields are used to customize workflows or show information about the environment. Custom Fields can be used in workflow steps to automatically supply information that is specific to an organization, server, instance, or database.

D

deployment

Deployments associate a workflow with a target environment in which a workflow runs. You can customize a deployment by specifying values for any workflow parameters that are designated - User Selected - in the workflow. You must save a deployment before you can run the workflow. You can re-use a saved deployment as many times as you like.

F

function

Functions are reusable pieces of code that can be included in automation steps. Any common routine or operation that multiple steps perform is a good candidate for a function. Functions can be tagged with keywords indicating the language in which they are written and the operating system with which they work. Functions are "injected" into the step code just prior to step execution.

I

input parameters

A workflow has a set of required parameters for which you must specify a value. The required parameters are a subset of all the parameters associated with that workflow. The remaining parameters are considered optional. You can specify a value for an optional parameter by first exposing it using the workflow editor and then specifying the value when you create a deployment.

M

mapping

An input parameter is said to be "mapped" when its value is linked to an output parameter from a previous step in the workflow or to a metadata field. Mapped parameters are not visible on the Deployment page. You can "unmap" a parameter by specifying - User Selected - in the workflow editor. This parameter will then become visible on the Deployment page.

O

organization

An organization is a logical grouping of servers. You can use organizations to separate development, staging, and production resources - or to separate logical business units.

P

parameters

Parameters are pieces of information - such as a file system path or a user name - that a step requires to carry out its action. Values for parameters that are designated User Selected in the workflow can be specified in the deployment. Parameters that are marked Enter at Runtime in the deployment must be specified on the target system when the workflow runs.

policy

Policies are reusable sets of attributes that can be used as parameter values in deployments. Deployments can reference policy attributes to change the automation behavior. Policies provide values for input parameters. They can contain fixed values or reference Custom Fields. Policies enable HP DMA to manage groups of hundreds or thousands of servers at a time without the need to configure each individual server.

R

raw devices

In Sybase ASE version 15, you can create and mount database devices on raw bound devices. This enables Sybase ASE to use direct memory access from your address space to the physical sectors on the disk. This can improve performance by reducing memory copy

operations from the user address space to the operating system kernel buffers.

role

Each HP DMA user has one or more roles. Roles are used to grant users permission to log in to and to access specific automation items and organizations. Roles are defined in HP Server Automation. Before you can associate a role with an automation item or organization, however, you must register that role in HP DMA.

S

smart group

Smart Groups are dynamic groups of servers, instances, or databases defined by some criteria. They are used to specify targets for deployments. As information about an environment object changes, its membership in the groups is re-evaluated.

software repository

The software repository is where the workflow will look for any required files that are not found on the target server. If you are using HP DMA with HP Server Automation (SA), this repository is the SA Software Library.

solution pack

A solution pack contains one or more related workflow templates. These templates are read-only and cannot be deployed. To run one of the workflows included in a solution pack, you must first create a deployable copy of that template and then customize that copy for your environment. Solution packs are organized by function - for example: database patching or application server provisioning.

steps

Steps contains the actual code used to perform a unit of work detailed in a workflow.

T

target instance

In the context of MS SQL database refresh, the term "target instance" refers to the SQL Server instance where the database that will be restored resides.

W

workflow

A workflow automates the process followed for an operational procedure. Workflows contain steps, which are linked together to form business logic for a common task. Workflows connect existing tasks in order to perform a new business process by building on existing best practices and processes.

workflow editor

The workflow editor is the tool that you use to assemble steps into workflows. You can map each input parameter to output parameters of previous steps or built-in metadata (such as the server name, instance name, or database name). You can also specify User Selected to expose a parameter in the deployment; this enables the person who creates the deployment to specify a value for that parameter.

workflow templates

A workflow template is a read-only workflow that cannot be deployed. To run one of the workflows included in a solution pack, you must first create a deployable copy of the workflow template and then customize that copy for your environment.
