

HP Business Service Management

Software Version: 10.00

BSM Connector User Guide

Document Release Date: January 2015
Software Release Date: January 2015

Legal Notices

Warranty

The only warranties for HP products and services are set forth in the express warranty statements accompanying such products and services. Nothing herein should be construed as constituting an additional warranty. HP shall not be liable for technical or editorial errors or omissions contained herein.

The information contained herein is subject to change without notice.

Restricted Rights Legend

Confidential computer software. Valid license from HP required for possession, use or copying. Consistent with FAR 12.211 and 12.212, Commercial Computer Software, Computer Software Documentation, and Technical Data for Commercial Items are licensed to the U.S. Government under vendor's standard commercial license.

Trademark Notices

Adobe® and Acrobat® are trademarks of Adobe Systems Incorporated.

AMD and the AMD Arrow symbol are trademarks of Advanced Micro Devices, Inc.

Citrix® and XenDesktop® are registered trademarks of Citrix Systems, Inc. and/or one more of its subsidiaries, and may be registered in the United States Patent and Trademark Office and in other countries.

Google™ and Google Maps™ are trademarks of Google Inc.

Intel®, Itanium®, Pentium®, Intel® Xeon®, and Lync® are trademarks of Intel Corporation in the U.S. and other countries.

Linux® is the registered trademark of Linus Torvalds in the U.S. and other countries.

Java is a registered trademark of Oracle and/or its affiliates.

Microsoft®, Windows®, Windows NT®, Windows® XP, and Windows Vista® are U.S. registered trademarks of Microsoft Corporation.

Oracle is a registered trademark of Oracle Corporation and/or its affiliates.

Red Hat® is a registered trademark of Red Hat, Inc. in the United States and other countries.

UNIX® is a registered trademark of The Open Group.

Documentation Updates

The title page of this document contains the following identifying information:

- Software Version number, which indicates the software version.
- Document Release Date, which changes each time the document is updated.
- Software Release Date, which indicates the release date of this version of the software.

To check for recent updates or to verify that you are using the most recent edition of a document, go to: <https://softwaresupport.hp.com/group/softwaresupport/search-result?keyword=>.

This site requires an HP Passport account. If you do not have one, click the **Create an account** button on the HP Passport Sign in page.

Support

Visit the HP Software Support web site at: <https://softwaresupport.hp.com>

This web site provides contact information and details about the products, services, and support that HP Software offers.

HP Software Support provides customer self-solve capabilities. It provides a fast and efficient way to access interactive technical support tools needed to manage your business. As a valued support customer, you can benefit by using the support web site to:

- Search for knowledge documents of interest
- Submit and track support cases and enhancement requests
- Download software patches
- Manage support contracts
- Look up HP support contacts

- Review information about available services
- Enter into discussions with other software customers
- Research and register for software training

Most of the support areas require that you register as an HP Passport user and sign in. Many also require a support contract. To register for an HP Passport ID, go to <https://softwaresupport.hp.com> and click **Register**.

To find more information about access levels, go to: <https://softwaresupport.hp.com/web/softwaresupport/access-levels>

HP Software Solutions & Integrations and Best Practices

Visit HP Software Solutions Now at <https://h20230.www2.hp.com/sc/solutions/index.jsp> to explore how the products in the HP Software catalog work together, exchange information, and solve business needs.

Visit the Cross Portfolio Best Practices Library at <https://hpln.hp.com/group/best-practices-hpsw> to access a wide variety of best practice documents and materials.

Contents

Part I: Setting Up and Configuring BSM Connector	9
Chapter 1: BSM Connector Overview	10
Key Features and Benefits	12
BSM Connector Deployment Scenarios	14
User Interface	14
User Authentication	15
Licensing	16
Chapter 2: Setup and Configuration	17
Getting Started	17
How to Log on to BSM Connector	19
How to Manage BSM Connector Processes	21
How to Configure BSM Connector to Communicate with OMi	22
How to Configure BSM Connector to Communicate with a Distributed OMi	23
How to Manage BSM Connector with HPOM	25
Configuring LW-SSO Authentication	29
Troubleshooting and Limitations	32
Chapter 3: Security	34
Hardening the BSM Connector Platform	34
Permissions and Credentials	35
Setting Up Smart Card Authentication	35
Chapter 4: Event Synchronization	39
How to Configure Policies for Event Synchronization	40
How to Write Perl Scripts for Event Synchronization	41
Chapter 5: UI Drilldown	43
How to Configure Drilldown into Third-Party Systems	45
Part II: Working with BSM Connector	48
Chapter 6: Policy Management	49
How to Edit Policies	52
How to Copy Policies	53
How to Delete Policies	54
How to Activate and Deactivate Policies	54
How to Export Policies	55
How to Import Policies	57

How to Configure Policy Management Options	59
Chapter 7: Collecting and Viewing Metrics Data	60
How to Collect Metrics	60
Example – Create a Metrics Policy	61
Collecting Metrics with HP Operations Agent	72
Verifying the Status of oacore Process	72
Starting or Stopping the oacore Process	73
Verifying Data Logging	74
Configuring Data Purging	74
Chapter 8: Collecting Topology Data	77
Topology Policies and Topology Synchronization	77
Send Topology Data Directly to RTSM	78
Use Topology Synchronization Rules to Map Data into RTSM CIs and Relationships	80
Topology Synchronization Rules	82
Mapping Syntax	86
Common Mapping File Format	87
Mapping File Syntax	87
Rules	88
Rule Conditions	88
Operator Elements	89
Operand Elements	92
Mapping Elements	99
Filtering	100
Type Mapping	101
Attribute Mapping	102
Relation Mapping	104
XPath Navigation	106
Data Structure	107
Example of an XPath-Navigated Data Structure	109
XPath Expressions and Example Values	110
Uploading the Sync Package to the OMi server	111
Topology Discovery Syntax	111
Troubleshooting	116
Part III: Integrating Data With BSM Connector	121
Chapter 9: Database Policies (Events and Metrics only)	122
How to Collect Event Data from Databases	122
How to Collect Metrics Data from Databases	123
Database Policy User Interface	124

Configuring Database Policy Properties	125
Configuring the Data Source in Database Policies	126
Configuring Mappings in Database Policies	131
Configuring Event Defaults in Database Policies	133
Configuring Metrics Defaults in Database Policies	136
Configuring Event Rules in Database Policies	139
Configuring Metrics Rules in Database Policies	143
Configuring Options in Database Policies	147
Troubleshooting Database Policies	148
Chapter 10: Open Message Interface Policies (Events only)	149
How to Collect Event Data from the Open Message Interface	149
opcmsg Command-Line Tool	150
opcmsg Java API	152
opcmsg C API	154
Open Message Interface Policy User Interface	154
Configuring Open Message Interface Policy Properties	155
Configuring Event Defaults in Open Message Interface Policies	155
Configuring Rules in Open Message Interface Policies	157
Configuring Options in Open Message Interface Policies	160
Chapter 11: REST Web Service Listener Policies	161
How to Collect Event Data Through the REST Web Service Listener	161
How to Collect Metrics Data Through the REST Web Service Listener	162
Configuring Topology Through the REST Web Service Listener	163
REST Web Service Listener Policy User Interface	164
Configuring REST Web Service Listener Policy Properties	165
Configuring the Data Source in REST Web Service Listener Policies	166
Configuring Mappings in REST Web Service Listener Policies	169
Configuring Event Defaults in REST Web Service Listener Policies	172
Configuring Metrics Defaults in REST Web Service Listener Policies	174
Configuring Event Rules in REST Web Service Listener Policies	178

Part I: Setting Up and Configuring BSM Connector

This section includes:

- ["BSM Connector Overview" on page 10](#)
- ["Setup and Configuration" on page 17](#)
- ["Security" on page 34](#)
- ["Event Synchronization" on page 39](#)
- ["UI Drilldown" on page 43](#)

Chapter 1: BSM Connector Overview

HP BSM Connector (BSM Connector) is a component of Operations Manager i (OMi) that enables you to integrate data from third-party systems (typically enterprise management systems) in OMi. You can integrate events, metrics, and topology data in OMi. Third-party systems are those not provided by HP. BSM Connector also works with some HP applications.

BSM Connector uses policies to access the data sources. If the data matches the conditions defined in the policies, the data is forwarded in the form of events or metrics to OMi. Policies can also report topology data to OMi in order to create CIs and CI relationships in OMi's Run-time Service Model (RTSM).

Integration Types

Depending on the third-party data source and what type of data you need to collect, you choose one of the following integration types:

- **Remote integration.** In remote integrations, installation of HP software on the third-party system is not required. BSM Connector can be installed on any system in your environment, provided the system meets the installation prerequisites.
- **Local integration.** You install BSM Connector directly on the third-party system.

Integration Data

BSM Connector can access the following data sources:

Data Source	Integration Type	Integration Data	Description
Structured log files	Local only	Events Metrics	Structured log file policies watch for specific entries added to a log file that is provided by a third-party system. These entries are then matched against the log file structure fields defined in policies by using the OM pattern-matching language . For details, see " Structured Log File Policies (Events and Metrics only) " on page 214.

Data Source	Integration Type	Integration Data	Description
Database tables	Local or remote	Events Metrics	<p>Database policies enable you to collect event and metric data from a database used by third-party systems by performing a query through a JDBC connection.</p> <p>For details, see "Database Policies (Events and Metrics only)" on page 122.</p>
Web service requests	Local or remote	Events Metrics Topology	<p>REST Web service listener policies process the data received by the BSM Connector REST Web service listener.</p> <p>For details, see "REST Web Service Listener Policies" on page 161.</p>
SNMP traps	Local or remote	Events	<p>SNMP trap policies process SNMP traps received by BSM Connector from third-party systems.</p> <p>For details, see "SNMP Interceptor Policies (Events only)" on page 206.</p>
XML files	Local only	Events Metrics Topology	<p>XML file policies watch for specific entries added to an XML file provided by a third-party system by trying to match against a regular expression. The log file must be a local file.</p> <p>For details, see "XML File Policies" on page 240.</p>
Open message interface messages	Local only	Events	<p>Open message interface policies process messages sent by the BSM Connector opcmsg command-line tool.</p> <p>For details, see "Open Message Interface Policies (Events only)" on page 149.</p>
Scheduled tasks	Local only	Events	<p>Scheduled task policies enable you to schedule commands to run on the BSM Connector system. Scheduled task policies send an event to BSM to indicate the start, success, or failure of the command.</p> <p>For details, see "Scheduled Task Policies (Events only)" on page 189.</p>

BSM Connector Data Consumers

The following applications consume the BSM Connector data:

- Operations Manager i (Events, Topology)
- Performance Graphing (Metrics)

Note: If you have a CI monitoring five minutes of data and there are multiple data points within the duration, the graph shows only the last data received within the duration.

- Run-time Service Model (Topology)

Available Out of the Box Integrations

You can use one of the out-of-the box integrations that are available for BSM Connector. Alternatively, if you do not find the integration that you are looking for, you can develop your own custom integration.

HP is continually updating the list of the integrations with third-party products. For details and for download information, see the HP Live Network site <https://hpln.hp.com/group/bsm-integrations>.

Key Features and Benefits

Key Features

- **Topology.** Discover and report topology from the product BSM Connector connects to (based on Web services or XML files). The discovered topology populates the RTSM. You can then manage and work with these discovered configuration items (CIs) and relationships in views.
- **Events.** Get events (from structured log files, database tables, Web services, XML files, SNMP traps, Open Message Interface messages, or scheduled tasks).
- **Metrics.** Get metrics (from structured log files, database tables, Web services, or XML files); metrics are stored on the BSM Connector system.
- **Web-based UI.** Define policies using Web-based UI.
- **Event synchronization.** After OMi receives an event, you can keep it up to date on the event source by configuring BSM and BSM Connector to synchronize event changes back to the third-party system that generated the original event.
- **OMi integration.** Manage BSM Connector from OMi.
- **Backward compatibility.** BSM Connector 9.2x configuration and most of the policies can be upgraded to BSM Connector 10.00. For more information, see the upgrade section in the BSM Connector *Installation and Upgrade Guide*.
- **Out-of-the-box connectors.** Supporting OMi's open integration strategy, providing out-of-the-box connectors to HP and third-party products. This enables expanding connectivity of OMi and related

products.

Customers can access connectors via HP Live Network (HPLN); HP is continually updating the list out-of-the box integrations with third-party products. For details and for download information, see the HP Live Network site <https://hpln.hp.com/group/bsm-integrations>.

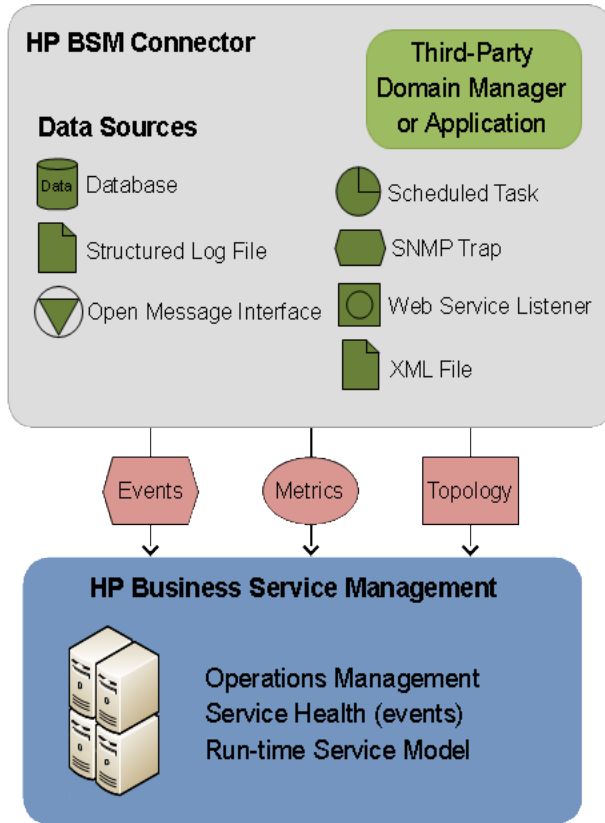

HP certified partners will also be able to build their own connectors and post them on HPLN. See the HP Live Network site <https://hpln.hp.com/group/bsm-integrations>.

Benefits

- **Run-time Service Model (RTSM).** BSM Connector can discover and report topology from the product BSM Connector connects to. You can then manage and work with these discovered configuration items (CIs) in views.
- **Performance Perspective.** You can view the BSM Connector metrics in the OMi Performance Perspective.
- **360 Degrees View.** You can view topology and events related data in the OMi360 Degrees View.
- **Topology-based Event Correlation** You can use topology-based event correlation to help you better understand, monitor, and manage the problems that can have an effect on the objects in your IT environment. The Correlation Rules manager enables you to define and deploy rules that use indicators to correlate the events occurring in the different domains throughout the managed IT environment.

BSM Connector Deployment Scenarios

The following figure shows a BSM Connector deployment.

You typically install BSM Connector on the third-party system that acts as data source. For example, to integrate NNMi data into BSM, you install BSM Connector on the NNMi management server. However, BSM Connector can also access data sources on remote systems without the need to install data collectors on these systems.

Where you install BSM Connector depends on the type of data you want to integrate in OMi. BSM Connector must be installed and run locally on the data host when integrating data originating from structured log files, XML files, the open message interface, or scheduled tasks. You can install BSM Connector on any system that meets the requirements if you want to integrate data originating from databases, or receive data through SNMP traps or the REST Web service listener. For details, see ["Integration Types"](#) on page 10 and ["Integration Data"](#) on page 10.

User Interface

The BSM Connector user interface is Web based; you can therefore access it from anywhere using a supported Web browser.

When you connect to BSM Connector, the policy management list opens as shown below.

Policy Type	Integration Type	Name	Description	Activation State	Edited By
Database	Event	EventsSQLServer	Collect events from SQL Server database	Deactivated	
Database	Metric	Database server growth	Collect and store metrics from the database	Deactivated	
REST Web Service Li...	Event	HP BSM Connector for HP OneView - Ev...	OneView - events	Deactivated	
Structured Log File	Event	ThirdPartySystem-Events	Capture and forward events from a third-party s...	Deactivated	
XML File	Topology	Topology - servers and clients	Retrive topology from the environment	Deactivated	

For more information about the toolbar buttons and columns, as well as policy management in general, see ["Policy Management"](#) on page 49.

User Authentication

BSM Connector supports the following user authentication strategies:

- Single Sign-On (SSO) for OMi (recommended)

The default single sign-on authentication strategy for OMi is Lightweight Single Sign-On (LW-SSO). LW-SSO is embedded in OMi and does not require an external computer for authentication.

LW-SSO enables a user to log into OMi once and gain access to all applications without being prompted to log in again. The applications inside OMi trust the authentication, and you do not need further authentication when moving from one application to another. For example, if you configure BSM Connector to use LW-SSO, OMi users can launch the BSM Connector user interface without having to provide additional credentials.

Tip: OMi enables you to group users to make managing user permissions more efficient. For example, you could add all BSM Connector users to a dedicated group (BSMC_ADMINS, for example) and assign permissions to access BSM Connector to the group.

For more information about LW-SSO, see the *OMi Administration* guide.

- Smart card authentication

BSM Connector supports user authentication using smart cards. BSM Connector can be configured to use the certificates stored on the smart card in place of the standard model of each user manually entering a user name and password.

- Local user authentication

Each BSM Connector instance maintains a local user store. These users can access the local BSM Connector instance only and cannot gain access to other applications. When OMi users launch the BSM Connector user interface, they have to provide the credentials of a local BSM Connector user.

For more information about accessing BSM Connector, see ["How to Log on to BSM Connector" on page 19](#).

Licensing

BSM Connector does not require a separate license from the Operations Manager i license. For OMi licensing information, please refer to the license management chapter in the *the OMi Administration Guide*.

Chapter 2: Setup and Configuration

This chapter contains information about setting up and configuring BSM Connector.

Getting Started

1. Plan your integration strategy.

Consider the type of information you want to view in OMi from your third-party system: events, metrics, or topology.

Consider the data source: structured log files, databases, Web services data, SNMP traps, XML files, open message interface messages, or scheduled tasks.

2. Install BSM Connector.

You install BSM Connector locally on the third-party system that provides the integration data. Alternatively, install BSM Connector on any system that meets the installation requirements if you want to access remote data sources such as databases or receive SNMP traps or Web service data. For details on installing BSM Connector, see the interactive HP BSM Connector *Installation and Upgrade Guide*.

Alternatively, upgrade from a previous version of BSM Connector as described in the BSM Connector *Installation and Upgrade Guide*.

3. Run the `bsmc-conf` [bat | sh] configuration script that is located in `%ovdatadir%\installation\HP0prBSMC` on Windows, and `/var/opt/OV/installation/HP0prBSMC` on Linux.
4. Grant the BSMC certificate request on OMi side.
5. Configure the BSM Connector instance as a BSM Connector connected server in OMi:

Administration > Setup and Maintenance > Connected Servers

For details on configuring a BSM Connector integration server in OMi, see ["How to Configure BSM Connector to Communicate with OMi" on page 22](#).

6. Log on to BSM Connector.

To access BSM Connector from a Web browser or from within OMi, see ["How to Log on to BSM Connector" on page 19](#).

7. Create or import policies that collect the integration data from the third-party system.

For details on obtaining out-of-the box integrations, see ["Available Out of the Box Integrations"](#) on page 12.

For more information about importing policies developed on other servers (for example, HP Operations Manager, HP Network Node Manager *i*, or other BSM Connector servers), see ["How to Import Policies"](#) on page 57

You can also develop your own policies to collect data from different sources. Table: Policy Development Tasks provides links to the tasks you need to complete for the different data and policy types.

Table: Policy Development Tasks

Data Source	To Integrate Events	To Integrate Metrics	To Integrate Topology
Structured log files	"How to Collect Event Data from Structured Log Files" on page 214	"How to Collect Metrics Data from Structured Log Files" on page 215	Not available.
Databases	"How to Collect Event Data from Databases" on page 122	"How to Collect Metrics Data from Databases" on page 123	Not available.
Web service requests	"How to Collect Event Data Through the REST Web Service Listener" on page 161	"How to Collect Metrics Data Through the REST Web Service Listener" on page 162	"Configuring Topology Through the REST Web Service Listener" on page 163
SNMP traps	"How to Collect Event Data from SNMP Traps" on page 207	Not available.	Not available.
XML files	"How to Collect Event Data from XML Files" on page 240	"How to Collect Metric Data from XML Files" on page 241	"How to Collect Topology Data from XML Files" on page 242
Open message interface messages	"How to Collect Event Data from the Open Message Interface" on page 149	Not available.	Not available.
Scheduled tasks	"How to Schedule Tasks" on page 189	Not available.	Not available.

8. Activate the policies.

When you create a new policy or import a policy, the policy exists in the BSM Connector policy repository but does not function yet. You must first activate the policy for it to start accessing the corresponding data source.

For details on activating policies, see ["How to Activate and Deactivate Policies" on page 54](#).

9. View the data in OMi.

In OMi, open the applications that consume the integrated data and make sure OMi receives the expected data. For details on the applications that consume BSM Connector integration data, see ["BSM Connector Data Consumers" on page 11](#).

For example, to view events in OMi, access OMi and open the Event Browser.

How to Log on to BSM Connector

You access BSM Connector using a supported Web browser, from any computer with a network connection to a BSM Connector server.

The BSM Connector user interface opens without prompting for user authentication if single sign-on (SSO) is configured and the user is already logged on to OMi. In this case an LW-SSO session cookie stored in the Web browser contains the BSM authentication information. OMi users can access BSM Connector only if they have the necessary permissions (for example, if they are members of the BSMC_ADMIN group).

If BSM Connector is configured for smart card authentication, you are prompted to insert your smart card and enter the PIN.

This section includes:

- ["Log On to BSM Connector" below](#)
- ["Log Out of BSM Connector" on page 21](#)
- ["Troubleshooting" on page 21](#)

Log On to BSM Connector

You can start the BSM Connector user interface in the following ways:

- Start the BSM Connector user interface from a Web browser
 - a. To start the BSM Connector user interface, open a Web browser at the following URL:

```
https://<BSM Connector system>:30000/bsmconnector/
```

<BSM Connector system> is localhost or the hostname of the BSM Connector server. If OVTomcat is configured to use a different port, use this port instead.

- b. Depending on the security settings in your environment, you may have to log on or provide your smart card PIN. If asked for log-on credentials, type the user name and password of a local user account. The user name and password of the default local user account is:

User name: admin
Password: admin

Note: BSM Connector locks the user account for 60 seconds after five failed logon attempts. Each subsequent failed logon attempt restarts the lockout period.

- Start the BSM Connector user interface in OMi

OMi enables you to start the user interface of BSM Connector or of the third-party system directly from within OMi. The following integrations are available:

BSM Connector UI integrations

- **Connected Servers manager.** Navigate to **Administration > Setup and Maintenance > Connected Servers**. In the Connected Servers pane, locate the BSM Connector you want to launch and open it for editing.

In the Edit Server Connection window, navigate to the Policy Management tab, and click the **Launch Policy Management** link.

The following illustration shows the **Launch Policy Management** link in the Connected Servers manager.

- **Event context.** In the OMi Event Browser, right-click an event that has been forwarded from a BSM Connector server, and then select **Configure > Integration Policies**.

Depending on the security settings in your environment, you may have to log on or provide a smart card PIN. If you are prompted for login information, type the user name and password of a local user account. BSM Connector does not require you to log on if single sign-on is configured.

Third-party system UI integration

In the OMi Event Browser, right-click an event that has been forwarded from a BSM Connector server, and then select **Show > Event in Source Manager**.

UI integrations with third-party systems are not available out of the box. For information how to configure a UI integration, see ["How to Configure Drilldown into Third-Party Systems" on page 45](#).

Log Out of BSM Connector

To log out of BSM Connector, click **Logout** at the top of the page.

If a user ends a BSM Connector user interface session by closing the Web browser window or tab (for example by clicking the Close button in the window's title bar or using a menu option), BSM Connector automatically logs the user off after 60 seconds.

Troubleshooting

- **Problem:** The login page appears although a valid smart card exists.

Solution: The user is not set up as a local user in BSM Connector. Look for the value of the User Principal Name (UPN) in the Subject Alternative Name (SAN) field in the certificate and add a user with that name to BSM Connector. For details, see ["Setting Up Smart Card Authentication" on page 35](#).

How to Manage BSM Connector Processes

BSM Connector has multiple processes that are required to be running to allow users to access BSM Connector. The processes run continuously as background processes without affecting other applications.

HP Operations Agent processes

The HP Operations Agent processes start automatically. However you can manually start and stop HP Operations Agent using the ovc command:

Windows: %ovinstalldir%\bin*<windows_platform>*\ovc

Linux: /opt/OV/bin/ovc

For more information about ovc, type `ovc -help`.

How to Configure BSM Connector to Communicate with OMi

To enable the connection between BSM Connector and OMi, the BSMC certificate must be approved on the OMi side, and the BSM Connector instance must be configured as a BSM Connector connected server in OMi.

When you add a BSM Connector integration to OMi, the BSM Connector instance must be accessible to OMi.

1. *Prerequisite.* Install and configure BSM Connector.

For details, see the interactive BSM Connector Installation and Upgrade Guide.

Note: On the BSM Connector server, close any running instances of the command `ovconfchg -edit`.

2. *Prerequisite.* In a distributed OMi environment with a load balancer or reverse proxy, configure HP Operations Agent manually.

In a distributed OMi environment with a reverse proxy or a load balancer, the OMi Data Processing server and the BSM Connector server may not be able to communicate with each other in order to request and install a certificate. To provide the agent with a certificate, you must issue the certificate manually on the OMi certificate server and then import it manually on the BSM Connector system. In addition, you must manually set the `MANAGER_ID` configuration variable. The `MANAGER_ID` defines who is allowed to access the agent from outside. For details, see ["How to Configure BSM Connector to Communicate with a Distributed OMi" on the next page](#).

3. *Prerequisite.* Make sure the BSMC certificate request is granted on OMi side.
4. In OMi, open the Connected Servers manager from Administration, select:

Administration > Setup and Maintenance > Connected Servers

In the Connected Servers pane, click  **New** and select **BSM Connector**. The Create New Server Connection - BSM Connector dialog box opens.

The information you need to enter depends on the type of integration data you want to collect with this BSM Connector:

■ General

Complete the mandatory **Display Name** and **Name** fields. Additionally complete also the **Description** field. To activate BSM Connector server after creation, enable the appropriate box provided at the bottom of the page.

■ Server Properties

Enter the Fully Qualified DNS name of the server. Optionally, set the Advanced Delivery Options.

■ Policy Management

Set the communication port. To restore the port to the default value (30000), click Set default port. You can launch the BSM Connector by clicking the Launch Policy Management  icon, in case this is configured on the BSM Connector.

■ Event Drilldown

Event drilldown enables OMi users to launch the user interface of the third-party system in the context of an event collected through BSM Connector.

5. Click **Finish** to save the new BSM Connector integration.

After the wizard is successfully completed, a new connected server is created.

6. *Results.* You can view the collected data in OMi, depending on the type of integration data that you collect. For example, you can view data in RTSM or Service Health.

Note: You must first configure and activate policies in BSM Connector to start the data collection. To stop data collection, deactivate the policies.

For full details about how to configure a BSM Connector connected server, see the OMi online help or the OMi Administration Guide.

How to Configure BSM Connector to Communicate with a Distributed OMi

In a distributed OMi environment with a reverse proxy or a load balancer, the OMi data processing server and the BSM Connector server may not be able to communicate with each other in order to request and install a certificate. To provide the agent with a certificate, you must issue the certificate manually on the OMi certificate server and then import it manually on the BSM Connector system. In addition, you must manually set the `MANAGER_ID` configuration variable. The `MANAGER_ID` defines who is allowed to access the agent from outside.

1. On the BSM Connector system, use `ovcoreid` to show the core ID of the system:

```
ovcoreid
```

2. On the OMi certificate server (usually the data processing server), use `ovcert` to export the trusted certificate, type:

```
ovcert -exporttrusted -file omi.cer
```

3. On the OMi certificate server (usually the data processing server), use `ovcm` to generate a certificate, type:

```
ovcm -issue -file cert.cer -name <FQDN of BSM Connector> -coreid <OvCoreId of BSM Connector> -pass <password>
```

4. Securely transfer the generated files to the BSM Connector system.
5. Use `ovcert` to import the certificates from the generated files, type:

```
ovcert -importtrusted -file omi.cer
```

```
ovcert -importcert -file cert.cer
```

The command prompts you for the password that you specified when you generated the certificates. Type the password and press **Enter**.

6. On any of the gateway server systems, use `ovcoreid` to show the core ID of the system:

```
ovcoreid -ovrg server
```

7. On the BSM Connector system, set the manager and certificate server manually, type:

```
ovconfchg -ns sec.cm.client -set CERTIFICATE_SERVER <FQDN of reverse proxy or Load balancer>
```

```
ovconfchg -ns sec.core.auth -set MANAGER <FQDN of reverse proxy or Load balancer>
```

```
ovconfchg -ns sec.core.auth -set MANAGER_ID <OvCoreId of any gateway server>
```

8. Run `oainstall` to complete the HP Operations Agent setup, type:

```
Windows 32-bit: cscript "%OvInstallDir%\bin\OpC\install\oainstall.vbs" -a -c
```

```
Windows 64-bit: cscript "%OvInstallDir%\bin\win64\OpC\install\oainstall.vbs" -a -c
```

```
Linux: /opt/OV/bin/OpC/install/oainstall.sh -a -c
```

9. Review the agent installation log file:

```
Windows: %OvDataDir%\log\oainstall.log
```

```
Linux: /var/opt/OV/log/oainstall.log
```

If the log file contains errors relating to the OvControl service failing to start or restart, complete the following steps:

- a. Manually reinstall ovcd as a Windows service, type:

```
ovcd -install
```
 - b. Rerun oainstall.
10. Securely delete any copies of the files that contain the certificates. Depending on how you generate and transfer the files, you may, for example, have copies in the following locations:
 - on the OMi data processing server
 - on the BSM Connector system
 - on a USB flash drive, CD, or other portable media
 11. Add the BSM Connector system to the Connected server list in OMi. For details, see ["How to Configure BSM Connector to Communicate with OMi" on page 22](#).

How to Manage BSM Connector with HPOM

To manage a BSM Connector system with HPOM, you need to configure an agent-based flexible management policy. The policy configures the OMi server as the primary manager of BSM Connector, and the HPOM management server as a secondary and action-allowed management server. This enables the HPOM management server to start actions, and deploy policies and packages.

The policy also configures HP Operations Agent to send the collected data as follows:

- The OMi server receives all events generated by BSM Connector policies that have the **Type** attribute set to **BSMC_Message**.

The HPOM management server receives all events that do not have the **Type** attribute set to **BSMC_Message**.

BSM Connector sets the event type attribute automatically to **BSMC_Message**. You can delete the value in a policy but BSM Connector inserts it again when you save the policy. The type attribute is available in the Advanced attributes tab of the policy editors.

- The BSM Connector server stores all metrics data.
- The OMi server receives all topology data (both HP Operations Agent and DFM-discovered data).

Note:

- The flexible management policy cannot be edited in the BSM Connector user interface.
- In the procedures below, use the `ovcoreid` command-line tool to find out the required core ID of the system.

To manage BSM Connector with HPOM for Windows:

1. Exchange certificates between the OMi and HPOM systems. For information about exchanging certificates, see ["To configure trusted certificates:" on page 28.](#)
2. On the HPOM management server, use the **Configure Managed Nodes** dialog box to add the BSM Connector system as a managed node. In the node's properties, manually add the core ID and set the certificate state to Installed.
3. On the BSM Connector system, create and activate an agent-based flexible management policy:
 - a. Make a copy of the flexible management policy template.

BSM Connector on Windows

Open a command prompt and type:

```
copy "%OvDataDir%\conf\HP0prBSMC\f6b8aff0-f467-4851-8407-5b60395648b4_
data.template" "%OvDataDir%\conf\HP0prBSMC\f6b8aff0-f467-4851-8407-
5b60395648b4_data"
```

```
copy "%OvDataDir%\conf\HP0prBSMC\f6b8aff0-f467-4851-8407-5b60395648b4_
header.xml.template" "%OvDataDir%\conf\HP0prBSMC\f6b8aff0-f467-4851-8407-
5b60395648b4_header.xml"
```

BSM Connector on Linux

Open a shell and type:

```
cp /var/opt/OV/conf/HP0prBSMC/f6b8aff0-f467-4851-8407-5b60395648b4_
data.template /var/opt/OV/conf/HP0prBSMC/f6b8aff0-f467-4851-8407-
5b60395648b4_data
```

```
cp /var/opt/OV/conf/HP0prBSMC/f6b8aff0-f467-4851-8407-5b60395648b4_
header.xml.template /var/opt/OV/conf/HP0prBSMC/f6b8aff0-f467-4851-8407-
5b60395648b4_header.xml
```

- b. Edit the policy data file f6b8aff0-f467-4851-8407-5b60395648b4_data.
- c. Locate the string `${OM_MGR_SRV}` and replace all occurrences with the FQDN of the HPOM management server.

Locate the string `${OM_MGR_SRV_ID}` and replace all occurrences with the core ID of the HPOM management server.

- d. Locate the string `${OMi_MGR_SRV}` and replace all occurrences with the FQDN of the OMi gateway server.

Locate the string `${OMi_MGR_SRV_ID}` and replace all occurrences with the core ID of the OMi data processing server.

- e. Save the policy data file. Import the policy in BSM Connector and activate it.
4. In the HPOM console, right-click the node that represents the BSM Connector system and select **All Tasks > Synchronize inventory > Packages**.
5. On the HPOM management server, check that you can manage the BSM Connector system, type:

```
opcragt -status <BSM Connector hostname>
```

The output should indicate that the agent is running.

For more information about HPOM for Windows, see the HPOM for Windows online help.

To manage BSM Connector with HPOM for UNIX or Linux:

1. Exchange certificates between the OMi and HPOM systems. For information about exchanging certificates, see ["To configure trusted certificates:" on the next page](#).
2. On the HPOM management server, add the BSM Connector system as a managed node, type:

```
opcnode -add_node <BSM Connector hostname>
```

3. On the HPOM management server, specify the core ID of the BSM Connector server, type:

```
opcnode -chg_id node_name=<BSM Connector hostname> id=<core ID of BSM Connector system>
```

4. On the BSM Connector system, create and activate an agent-based flexible management policy:
 - a. Make a copy of the flexible management policy template.

BSM Connector on Windows

Open a command prompt and type:

```
copy "%OvDataDir%\conf\HP0prBSMC\f6b8aff0-f467-4851-8407-5b60395648b4_data.template" "%OvDataDir%\conf\HP0prBSMC\f6b8aff0-f467-4851-8407-5b60395648b4_data"
```

```
copy "%OvDataDir%\conf\HP0prBSMC\f6b8aff0-f467-4851-8407-5b60395648b4_header.xml.template" "%OvDataDir%\conf\HP0prBSMC\f6b8aff0-f467-4851-8407-5b60395648b4_header.xml"
```

BSM Connector on Linux

Open a shell and type:

```
cp /var/opt/OV/conf/HP0prBSMC/f6b8aff0-f467-4851-8407-5b60395648b4_
data.template /var/opt/OV/conf/HP0prBSMC/f6b8aff0-f467-4851-8407-
5b60395648b4_data
```

```
cp /var/opt/OV/conf/HP0prBSMC/f6b8aff0-f467-4851-8407-5b60395648b4_
header.xml.template /var/opt/OV/conf/HP0prBSMC/f6b8aff0-f467-4851-8407-
5b60395648b4_header.xml
```

- b. Edit the policy data file `f6b8aff0-f467-4851-8407-5b60395648b4_data`.
- c. Locate the string `${OM_MGR_SRV}` and replace all occurrences with the FQDN of the HPOM management server.

Locate the string `${OM_MGR_SRV_ID}` and replace all occurrences with the core ID of the HPOM management server.

- d. Locate the string `${OMi_MGR_SRV}` and replace all occurrences with the FQDN of the OMi gateway server.

Locate the string `${OMi_MGR_SRV_ID}` and replace all occurrences with the core ID of the OMi data processing server.

- e. Save the policy data file. Import the policy in BSM Connector and activate it.
5. On the HPOM management server, check that you can manage the BSM Connector system, type:

```
opcragt -status <BSM Connector hostname>
```

The output should indicate that the agent is running.

For more information about HPOM for UNIX or Linux, see the documentation that HPOM for UNIX or Linux provides.

To configure trusted certificates:

In an environment with multiple servers, you must configure each server to trust certificates that the other servers issued. This task involves exporting every server's trusted certificate, and then importing this trusted certificate to every other server. You must also update the agent's trusted certificates, so that the agent also trusts the BSM servers.

Configure trusted certificates for every server (OMi gateway and data processing servers, HPOM management server):

1. On *every* BSM server, export the trusted certificate to a file using the following command:

```
ovcert -exporttrusted -file <file>
```

The command generates a file with the name that you specify.

2. Copy each file to *every other* server, and then import the trusted certificate using the following commands:

```
ovcert -importtrusted -file <file>
```

```
ovcert -importtrusted -ovrg server -file <file>
```

3. On the BSM Connector system, update the trusted certificates using the following command:

```
ovcert -updatetrusted
```

Configuring LW-SSO Authentication

BSM Connector can use lightweight single sign-on (LW-SSO) for the user authentication strategy, which allows the BSM Connector users to be managed in the same way as the OMi users and groups. LW-SSO is the recommended strategy for OMi. The BSM Connector installation program enables LW-SSO authentication by default.

You can configure LW-SSO authentication either when you configure BSM Connector using the `bsmc-conf` command or later on using the command `lwssso-conf`. For details on how to use `bsmc-conf`, see *BSM Connector Installation and Upgrade Guide*.

This section describes how to configure LW-SSO authentication for an existing BSM Connector installation using `lwssso-conf`:

- ["How to configure LW-SSO authentication for an existing BSM Connector installation" below](#)
- ["LW-SSO security warnings" on page 31](#)

How to configure LW-SSO authentication for an existing BSM Connector installation

1. *Prerequisite:* Obtain the following information from OMi:
 - **OMi domain name.** You need to know the domain name of the OMi gateway server to which BSM Connector sends data (for example, `example.com`).

If the OMi gateway servers and the BSM Connector run in different subdomains, for example, `deu.example.com` and `ind.example.com`, specify only the name of the parent domain, which is `example.com` in this example.

BSM Connector and the OMi gateway server to which it is reporting must run in the same top-level domain.

- **LW-SSO token key.** Obtain the token key defined in OMi as follows:
 - i. In the OMi user interface, navigate to the Users and Permissions manager:
Administration > Users > Authentication Management
 - ii. In the Single Sign-On Configuration group, view the value of the Token Creation Key (initString) setting.
 - iii. Record the value so it will be available to you later in this procedure.

If the setting is not defined, work with an OMi administrator to define it :

- A. Click **Configure** to open the Authentication Wizard.
 - B. Click **Single Sign-On** to view the Single Sign-On panel, and select **Lightweight** for the Single Sign-On Authentication mode.
 - C. Generate the **Token Creation Key (initString)**. Record the value so it will be available to you later in this procedure.
 - D. Define the domain or subdomains that are participating in the LW-SSO configuration:
 - If OMi and the BSM Connector instances are running in different subdomains type the name of the parent domain in the **HP Operations Manager i** field.
 - If OMi and the BSM Connector instances are running in the same domain, select **Parse automatically** and add the domain to the **Trusted Hosts/Domains** list.
 - E. Click **Finish** to save your changes and close the wizard.
- **BSM Connector groups and roles.** Define the groups and roles that are allowed to log into the BSM Connector:
 - i. In the OMi user interface, navigate to the Infrastructure Settings manager:
Administration > Setup and Maintenance > Infrastructure Settings
 - ii. Click **Foundations** and select **Single Sign-On** in the drop-down list.
 - iii. Set **Add user groups information to LW-SSO token** to true.

The default group for BSM Connector is BSMC_ADMINs.
 - iv. Set **Add user roles information to LW-SSO token** to true.
2. Use the `lwsso-conf` command to configure LW-SSO:

```
lwsso-conf.[bat|sh] -lwsso_key <LwssoKey> [-lwsso_domain <LwssoDomainName>] [-  
lwsso_groups <group0> [<group1> ...]]
```

where:

- -lwsso_key <LwssoKey> is the token key (init string) generated in the OMi.

Note: Single-sign on can only work if the token key that you type here is exactly the same as the token key on the OMi server.

- -lwsso_domain <LwssoDomainName> specifies the domain of the associated OMi gateway server.
- -lwsso_groups <group0> [<group1> ...] specifies the OMi users and roles that will have access to BSM Connector. Separate individual groups with spaces (for example, -lwsso_groups BSMC_ADMINS SUPERUSER).

3. Restart ovc:

```
ovc -restart
```

LW-SSO security warnings

This section describes security warnings relevant to LW-SSO configuration. For more information about LW-SSO, see the Platform Administration Guide.

- Confidential initString parameter in LW-SSO security.

LW-SSO uses symmetric encryption to validate an LW-SSO token. The initString parameter within the configuration is used for initialization of the secret key. An application creates a token, and each application that uses the same initString parameter validates the token.

Caution:

- It is not possible to use LW-SSO without setting the initString parameter.
- The initString parameter is confidential information and should be treated as such in terms of publishing, transporting, and persistency.
- The initString should be shared only between applications integrating with each other using LW-SSO.
- The minimum length of the initString is 12 characters.

- LW-SSO should be disabled unless it is specifically required.

- Symmetric encryption implication.

LW-SSO uses symmetric cryptography for issuing and validating LW-SSO tokens. Therefore, any application using LW-SSO can issue a token to be trusted by all other applications sharing the same `initString`. This potential risk is relevant when an application sharing the `initString` either resides or is accessible in an untrusted location.

Troubleshooting and Limitations

This section provides help in troubleshooting problems relating to BSM Connector in general.

This section includes:

- ["Tomcat Logging" below](#)
- ["Verify That BSM Connector Can Send Events to OMi" below](#)
- ["Debug Trace Logging for Events" below](#)

Tomcat Logging

Tomcat log output is written to the `<OvDataDir>/log/Tomcat/stderr.log` file.

Verify That BSM Connector Can Send Events to OMi

You can use the following procedure to verify that BSM Connector events actually arrive in the Event Browser.

1. Create an open message interface policy. For details, see ["Open Message Interface Policies \(Events only\)" on page 149](#).
2. In the Options page of the policy, under **Unmatched Events**, select **are forwarded to OMi Server**. For details, see ["Configuring Options in Open Message Interface Policies" on page 160](#).
3. Save the policy and activate it. The activation starts the `opcmsgi` process on the BSM Connector server.
4. Use the `opcmsg` command-line tool to submit messages to the open message interface policy. For details, see ["opcmsg Command-Line Tool" on page 150](#).
5. In OMi, navigate to the Event Browser and verify that the events you submitted using `opcmsg` have arrived.

Debug Trace Logging for Events

To enable debug trace logging for an event, add the custom attribute `__TRACE__` and set it to any value. The attribute creates flow trace logs at the `INFO` level for this event.

The attribute can be set in the Custom Attributes tab of the policy that sends the event. Whenever this custom attribute is set on an event, trace output for this event appears in the trace logs:

- OMi Data Processing Server: `log/opr-backend/opr-flowtrace-backend.log`
- OMi Gateway Server: `log/wde/opr-gateway-flowtrace.log`

By default, only events with the custom attribute `__TRACE__` set are logged to the flow trace log files. To enable flow tracing for all events, set the flow trace log level to `DEBUG`.

Chapter 3: Security

This section includes:

- ["Hardening the BSM Connector Platform" below](#)
- ["Permissions and Credentials" on the next page](#)
- ["Setting Up Smart Card Authentication" on the next page](#)

Hardening the BSM Connector Platform

This section describes several configuration and setup options that can be used to harden the BSM Connector platform.

Network and system security has become increasingly important. As a third-party data integration tool, BSM Connector might have access to some system information which could be used to compromise system security if steps are not taken to secure it. You should use the configuration and setup options in this section to protect the BSM Connector platform.

This section includes:

- ["BSM Connector Users" below](#)
- ["Hardening the BSM Connector Platform" above](#)

BSM Connector Users

Administrator user. The administrator account configured with the `bsmc-conf` tool. This account is required when adding a BSM Connector integration to OMi. The administrator user can access only the BSM Connector user interface and does not have access to OMi.

Local users. You can add additional users to BSM Connector with the command-line tool `user`. The tool creates local user accounts in the BSM Connector local user store. These users can access BSM Connector only; they cannot access OMi or other OMi applications. For more information about the `user` tool, see ["Local User Configuration Tool" on page 279](#).

Single sign-on. BSM Connector also supports Single Sign-On (SSO) authentication. The default single sign-on authentication strategy for BSM is Lightweight Single Sign-On (LW-SSO). LW-SSO is embedded in BSM and does not require an external computer for authentication.

LW-SSO enables a user to log into BSM once and gain access to all BSM applications without being prompted to log in again. The applications inside BSM trust the authentication, and you do not need further authentication when moving from one application to another. For example, if you configure BSM Connector to use LW-SSO, BSM users can launch the BSM Connector user interface without having to provide additional credentials.

For more information about LW-SSO, see the OMi Platform Administration Guide.

Permissions and Credentials

The following table provides you with basic information about the permissions needed to secure access to remote servers to collect data from databases.

Data Source	Protocol / Technology	User Permissions and Credentials	Notes
Database	JDBC	User credentials are needed to authenticate access to the particular database. Each database has a particular method for providing access control to the particular tables that need to be accessed.	The user needs sufficient permission to execute any specified SQL statements.

Setting Up Smart Card Authentication

BSM Connector supports user authentication using smart cards. If smart card authentication is configured, you cannot log in without a valid smart card.

Learn More

Smart Card Authentication

Smart cards are physical devices used to identify users in secure systems. These cards can be used to store certificates both verifying the user's identity and allowing access to secure environments.

BSM Connector can be configured to use these certificates in place of the standard model of each user manually entering a user name and password. When using smart cards with BSM Connector, users can only log in using the smart card.

Tasks

This section includes:

- ["Enable Smart Card Authentication in BSM Connector" below](#)
- ["Disable Smart Card Authentication in BSM Connector" on page 37](#)

Enable Smart Card Authentication in BSM Connector

To configure smart card authentication in BSM Connector, complete the following tasks:

1. Import the certificate of your certificate authority to a truststore. You can use an existing one, or create a new one.

Go to the folder `C:\Program Files\HP\HP BTO Software\nonOV\jre\b\bin` (Windows) or `/opt/OV/nonOV/jre/b/bin` (Linux) and run the following command:

```
keytool -import -trustcacerts -alias <your alias> -keystore <path to the truststore file> -file <root CA certificate file>
```

For example, on Linux, to add the certificate "hpca2ssG2_ns.cer" to the truststore "newTrustStore.jks", run:

```
./keytool -import -trustcacerts -alias TSTORE1 -keystore /tmp/newTrustStore.jks -file /tmp/hpca2ssG2_ns.cer
```

You need to define a password and agree to add the certificate to the truststore.

2. Configure the BSM Connector OVTomcat server to require a client certificate for mutual authentication and to use the truststore to which you imported the certificate.

The file `server.xml` used by OV Tomcat is recreated on each `ovc` start, with XPL values replacing the values from templates. Therefore run the Operations Agent tool `ovconfchg` to change the settings in the XPL configuration:

Run `ovconfchg -edit` to open the default system editor (Notepad on Windows, `vi` on Linux) and load the current XPL configuration.

The Tomcat related XPL settings are in the XPL namespace `NONOV.TomcatB`. Configure the Tomcat server to request a client certificate by locating the following section. Locate the following section:

```
<Connector port="30000" maxThreads="150"
  minSpareThreads="25" maxSpareThreads="75"
  enableLookups="true" disableUploadTimeout="true"
  acceptCount="100" debug="0"
  scheme="https" secure="true" clientAuth="false"
  sslProtocol="TLS"
  keystoreFile="../../groups/serverKeystore"
  keystoreType="JKS"
  keystorePass="changeit"/>
```

Change `clientAuth` to "true", and add the following attributes:

Add the following attributes:

```
  truststoreFile="<path to the truststore file>"
  truststorePass="<password>"
  truststoreType="JKS"
/>
```

Alternatively, change the settings directly, using the `-set` option:

```
ovconfchg -ns <namespace> -set <parameter> <value>
```

For example:

```
ovconfchg -ns NONOV.TomcatB -set clientAuth "true" -set truststoreFile "<path  
to the truststore file>" -set truststorePass "<password>" -set truststoreType  
"JKS"
```

3. Start OVTomcat:

```
ovc -start ovtomcatB
```

4. Add users to BSM Connector using the BSM Connector **user** command line tool:

- a. In the Subject Alternative Name (SAN) field of the certificate, look for the value of the User Principal Name (UPN) in Other Name (OID: 1.3.6.1.4.1.311.20.2.3).
- b. Use the **user** command-line tool to add a user to BSM Connector:

```
user -add <value of UPN> <password>
```

Note: The user tool requires a password for each user. However, the password is not used when logging into OMi connector using a smart card. Users must enter their smart card PIN instead.

For more information on the **user** command-line tool, see ["Local User Configuration Tool" on page 279](#).

Disable Smart Card Authentication in BSM Connector

1. The file `server.xml` used by OV Tomcat is recreated on each `ovc` start, with XPL values replacing the values from templates. Therefore run the Operations Agent tool `ovconfchg` to change the settings in the XPL configuration:
 - Run `ovconfchg -edit` to open the default system editor (Notepad on Windows, vi on Linux) and load the current XPL configuration.

The Tomcat related XPL settings are in the XPL namespace `NONOV.TomcatB`. Configure the Tomcat server to not request a client certificate by locating the following section:

```
<Connector port="30000" maxThreads="150"  
    minSpareThreads="25" maxSpareThreads="75"  
    enableLookups="true" disableUploadTimeout="true"  
    acceptCount="100" debug="0"  
    scheme="https" secure="true" clientAuth="true"  
    sslProtocol="TLS"  
    keystoreFile="../groups/serverKeystore"
```

```
        keystoreType="JKS"  
        keystorePass="changeit"  
        truststoreFile="../templates.certificates/truststore.jks"  
        truststorePass="<password>"  
        truststoreType="JKS"  
    />
```

Change `clientAuth` to "false".

- Alternatively, change the settings directly, using the `-set` option:

```
ovconfchg -ns <namespace> -set <parameter> <value>
```

For example:

```
ovconfchg -ns NONOV.TomcatB -set clientAuth "false"
```

2. Restart ovc:

```
ovc -restart ovtomcatB
```

Chapter 4: Event Synchronization

BSM Connector enables you to access event sources, and, if certain conditions apply, to forward the detected events as Operations Manager i (OMi) events to OMi. After OMi receives an event, you can keep it up to date on the event source by configuring OMi and BSM Connector to synchronize event changes back to the third-party system that generated the original event. For example, if an OMi operator closes an event originating from NNMi, a notification can be automatically sent to NNMi.

Note: Event changes that are synchronized back only include lifecycle changes to the state closed (that is, the state is only updated when it changes to closed).

Synchronized events have additional runtime parameters that can be inserted in URL tools. For more information about URL tools, see the OMi online help.

To configure event synchronization:

1. Configure the BSM Connector server as a connected server in OMi:

Administration > Setup and Maintenance > Connected Servers

For full details about how to configure a BSM Connector as a connected server, see "[How to Configure BSM Connector to Communicate with OMi](#)" on page 22.

2. On the BSM Connector **Event Drilldown** tab, you can set the default event drilldown in OMi by specifying the port and URL path of the third-party system for which the drilldown is configured, if these settings are not already defined in BSM Connector. For more information on how to configure event drilldown in OMi, see "[How to Configure Drilldown into Third-Party Systems](#)" on page 45.

However, any event drilldown settings defined in BSM Connector for the respective policies will override the default settings made during the BSM Connector configuration in OMi.

3. Configure policies to include the source event ID in the generated event.

For more information, see "[How to Configure Policies for Event Synchronization](#)" on the next page.

4. Write a Perl script that receives the event changes from OMi and forwards them to the third-party system .

For more information, see "[How to Write Perl Scripts for Event Synchronization](#)" on page 41.

How to Configure Policies for Event Synchronization

The event that BSM Connector forwards to OMi must include the original ID of the event in the third-party system. Otherwise OMi and BSM Connector do not know which event to update in the third-party system.

To configure policies for event synchronization:

1. Create or edit an event integration policy.
2. Set the **Source Event ID** attribute in the **Event Attributes** tab.

The source event ID attribute may not be available in all event attributes tabs. For example, the default event attributes of SNMP trap and open message interface policy editors do not include this attribute.

3. Click **Save and Close** to save the policy and close the editor.
4. *Optional.* Activate the policy for your changes to take effect.

The next step in configuring event synchronization is to create a Perl script that receives the event changes and forwards them to the corresponding third-party system. See ["How to Write Perl Scripts for Event Synchronization" on the next page.](#)

How to Write Perl Scripts for Event Synchronization

The `ombacksync` process on the BSM Connector server receives event updates from the OMi data processing server. To forward these changes to the third-party system, you must provide the `OMBackSync.pl` Perl script that closes the event in the third-party system.

The Perl script must call the subroutine `OMBackSync`, which supports the following parameters:

- Operation (`Init` or `Close`)
- ID (`Close` only)

When the `ombacksync` process starts, it processes the Perl script and calls the subroutine `OMBackSync` with the parameter `Init`. When the process receives an event with the status `closed`, `ombacksync` calls the subroutine `OMBackSync` with the parameters `Close` and `ID`.

The script must be named `OMBackSync.pl`. Only one instance of the script can exist in BSM Connector. If multiple integrations are hosted on BSM Connector, all integrations must merge their event synchronization code into a single `OMBackSync.pl` file. When uninstalling an integration, the integration must remove its event synchronization code from the file.

BSM Connector provides an example Perl script (`OMBackSync.pl`) that writes the time, date, operation, and ID to the file `OMBSOutput.txt`.

The `OMBackSync.pl` file is located at:

Windows: "%OvDataDir%\conf\backsync\OMBackSync.pl"

Linux: `/var/opt/OV/conf/backsync/OMBackSync.pl`

The `OMBSOutput.txt` file is located at:

Windows: "%OvDataDir%\tmp\OMBSOutput.txt"

Linux: `/var/opt/OV/tmp/OMBSOutput.txt`

Caution: The `OMBackSync.pl` script does *not* encrypt user credentials. If you need to add user credentials to the script, for example for connecting to an external management tool, use file system permissions to restrict access to the script.

To forward event changes to the third-party system:

1. Write a Perl script that calls the subroutine `OMBackSync` with the parameters `Operation` and `ID`.
2. Name your Perl script `OMBackSync.pl` and place it in the following folder on the BSM Connector server:

Windows: "%OvDataDir%\conf\backsync\OMBackSync.pl"

Linux: `/var/opt/OV/conf/backsync/OMBackSync.pl`

3. Restart the `ombacksync` process on the BSM Connector server:

```
ovc -restart ombacksync
```

Troubleshooting:

If the `ombacksync` process encounters syntax errors in the Perl script, it generates an event describing the problem and stops. Correct the syntax and restart the `ombacksync` process.

Chapter 5: UI Drilldown

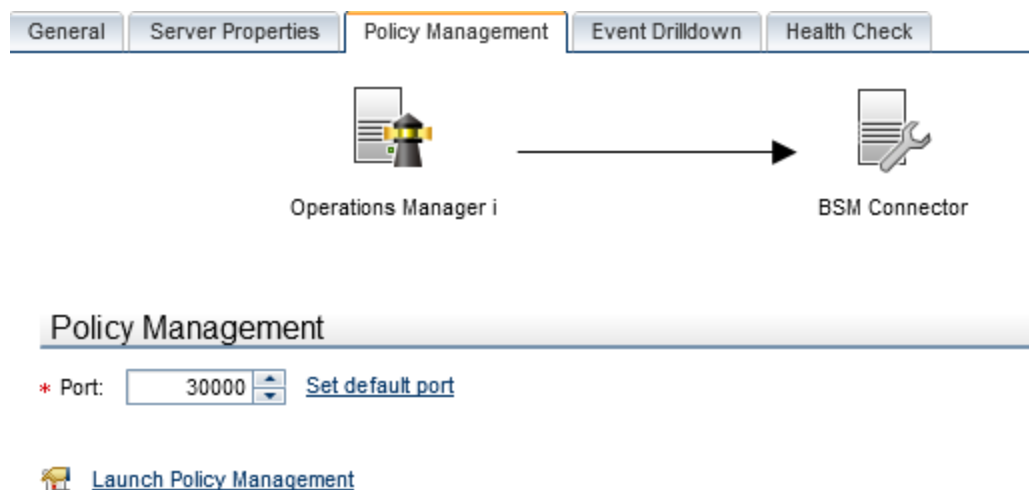

OMi enables you to start the user interface of BSM Connector or of the third-party system directly from within OMi. The following integrations are available:

BSM Connector UI integrations

- **Connected Servers manager.** Navigate to **Administration > Setup and Maintenance > Connected Servers**. In the Connected Servers pane, locate the BSM Connector you want to launch and open it for editing.

In the Edit Server Connection window, navigate to the Policy Management tab, and click the **Launch Policy Management** link.

The following illustration shows the **Launch Policy Management** link in the Connected Servers manager.

- **Event context.** In the OMi Event Browser, right-click an event that has been forwarded from a BSM Connector server, and then select **Configure > Integration Policies**.

Depending on the security settings in your environment, you may have to log on or provide a smart card PIN. If you are prompted for login information, type the user name and password of a local user account. BSM Connector does not require you to log on if single sign-on is configured.

Third-party system UI integration

In the OMi Event Browser, right-click an event that has been forwarded from a BSM Connector server, and then select **Show > Event in Source Manager**.

UI integrations with third-party systems are not available out of the box. For information how to configure a UI integration, see ["How to Configure Drilldown into Third-Party Systems"](#) on the next page.

How to Configure Drilldown into Third-Party Systems

OMi enables operators to start the user interface of third-party systems in the context of an event in the Event Browser. To launch the third-party system's user interface, right-click the event in the Event Browser and select **Show > Event in Source Manager**.

You can configure drilldown in the following ways:

- Add the third-party system to the BSM Connector integration server configuration in OMi.
- Specify source information in the policies that forward the source events to OMi.

If a policy and a BSM Connector server configuration both contain information about the third-party system, the information in the policy takes precedence.

Tip: Specify the third-party system in the BSM Connector Connected Servers configuration if you want to centrally configure drilldown to the third-party system, as opposed to adding this information to individual policies.

This section includes:

- ["To specify the third-party system in the BSM Connector Event Drilldown Settings:"](#) below
- ["To configure policies for event drilldown:"](#) on the next page

To specify the third-party system in the BSM Connector Event Drilldown Settings:

1. Configure the BSM Connector server as a connected server in OMi:

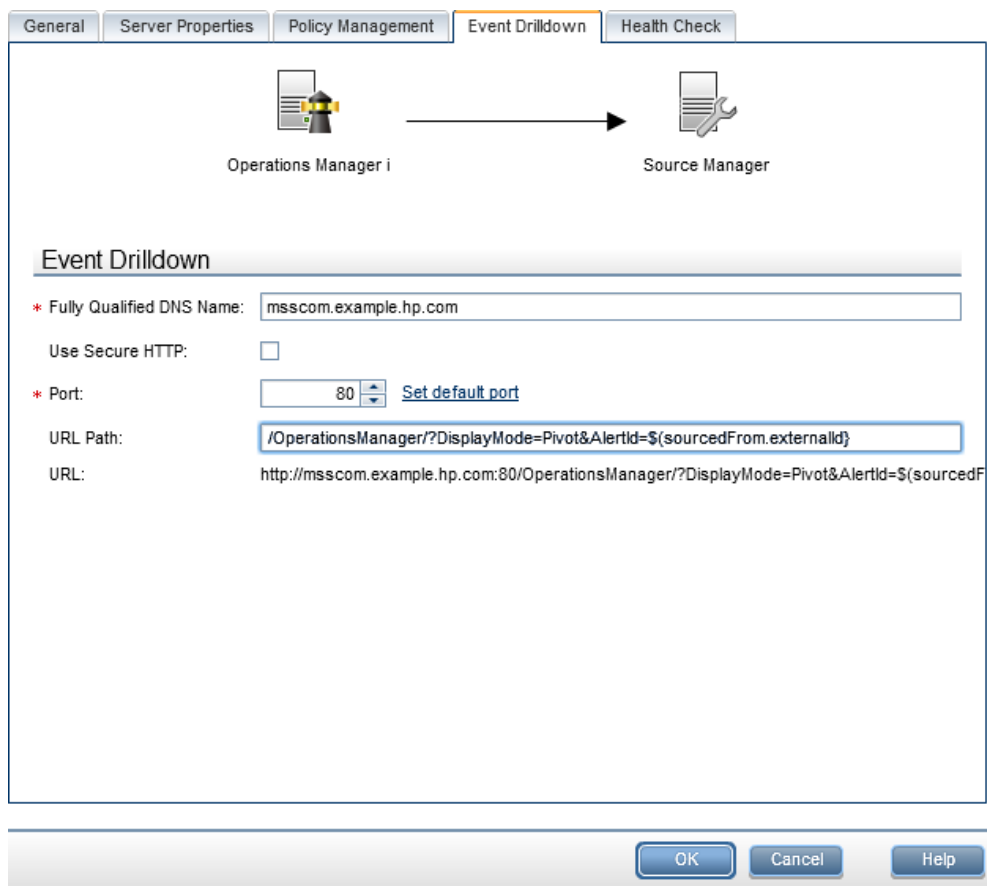

Administration > Setup and Maintenance > Connected Servers

2. On the **Event Drilldown** tab, complete the following information:

Fully Qualified DNS Name. Enter the fully qualified DNS name of the computer that hosts the third-party system for which the drilldown is configured (for example, `SCOM.mgmt2.example.com`). For a secure connection, enable the Use Secure HTTP checkbox.

Port. Specify the communication port on the third-party system.

URL Path. Specify the root URL of the event in the third-party system. This is the base path of the URL, and does not include FQDN or port.

To drill down to a specific event in the third-party system, append the variable `${sourcedFrom.externalId}` to the URL. OMI replaces the variable at runtime if the event contains the source event ID.

For more information about adding the source event ID to a policy, see ["How to Configure Policies for Event Synchronization" on page 40](#).

For full details about how to configure a BSM Connector as a connected server, see ["How to Configure BSM Connector to Communicate with OMI" on page 22](#).

To configure policies for event drilldown:

1. Create or edit an event integration policy.
2. Find the **Event Drilldown URL** attribute in the **Advanced** tab.

The event drilldown URL attribute may not be available in all advanced attributes tabs. For example, the default advanced attributes of SNMP trap and open message interface policy editors do not include this attribute.

3. In the **Event Drilldown URL** field, type the URL of the event in the third-party system. This is the complete path of the URL, and includes the FQDN (Fully Qualified Domain Name) of the computer that hosts the third-party system, the communication port, and the root URL path. Example:
`http://nnmi.example.com:8004/nnm/launch?cmd=showForm
&objtype=Incident&objuuid=$OPC_CUSTOM[nnm.incident.uuid]
&menus=true`

This event attribute can also be set by BSM based on connected server configuration. If a policy and a connected server configuration both contain event drilldown information, the information in the policy takes precedence.

4. Click **Save and Close** to save the policy and close the editor.
5. Activate the policy for your changes to take effect.

Part II: Working with BSM Connector

This section includes:

- ["Policy Management" on page 49](#)
- ["Collecting and Viewing Metrics Data" on page 60](#)
- ["Collecting Topology Data" on page 77](#)

Chapter 6: Policy Management

Policies are collections of configuration information used to configure HP Operations Agent on the BSM Connector server to process integration data. When you develop policies, you decide what kinds of data to process, how often to process, what to look for in the data, and what to do if certain conditions apply.

BSM Connector provides policy editors for different policy types (for example, for XML file policies). You can import policies developed and exported on other servers, for example, HP Operations Manager (HPOM) management servers, HP Network Node Manager i (NNMi) management servers, or other BSM Connector servers.

When you create a new policy or import a policy, the policy exists in the BSM Connector policy repository but does not function yet. You must first activate the policy for it to start accessing the corresponding event source or discovering topology data.

Tip: You can sort the information that appears in the columns in the BSM Connector policy list so that data appears in either ascending or descending order, indicated by either an up or down arrow at the top of the column. In addition, you can change the order of columns by dragging columns to other positions.

To access

To start the BSM Connector user interface, open a Web browser at the following URL:

`https://<BSM Connector system>:30000/bsmconnector/`

<BSM Connector system> is localhost or the hostname of the BSM Connector server. If Apache Tomcat is configured to use a different port, use this port instead.

Learn More

This section includes:

- ["Drag and drop" below](#)
- ["Policies in cluster environments" on the next page](#)

Drag and drop

Most BSM Connector policy editors offer drag-and-drop to quickly insert sample data, mappings, policy variables, and so on in text boxes.

The following illustration shows the default event attributes page of structured log file policies. You can select data in the Sample Data, Mappings, Indicators, and Policy Variables tabs on the right and drag it to the Event Attributes, Event Correlation, Custom Attributes, and Advanced tabs on the left. BSM Connector inserts the data at the current cursor position.

Default Event Attributes

Event Attributes | Event Correlati... | Custom Attribu... | Advanced | Sample Data | Mappings | Indicators | Policy Variables

Title: <\$DATA:host>

Description:

Severity: <\$MAP(maphost)>

maphost

Policies in cluster environments

Import and activate the same set of policies on all nodes in the cluster.

Make sure that you do not access data stored on the shared disk with the same policies activated on multiple cluster nodes. This may result in duplicate events in OMi after a failover. For example, do not activate the same XML file policies on more than one cluster node if the policies read an XML file on a shared disk.

If the IP address of the resource group (also known as virtual IP address) sends SNMP events that you plan to capture, make sure that the IP address is set up as a CI (configuration item) with the attribute "host is virtual" in OMi. Otherwise the events display as unmapped events in OMi.

UI Descriptions

Policy Management

UI Element	Description
	Refresh. Reloads the policy list.
	Create. Opens a policy editor to create a new policy.
	Edit. Opens the selected policy in a policy editor for editing.
	Copy. Opens the Copy Policy dialog box.
	Delete. Deletes the currently selected policy.
	Activate. Activates the currently selected policy so that it starts functioning.
	Deactivate. Deactivates the currently selected policy. The policy stops on the BSM Connector server.
	Break Edit Lock. Removes the edit lock from the currently selected policy.
	Import. Opens a file selection dialog box for you to select the policy files to import.
	Options. Opens the Options dialog box
Policy Type	The policy type indicates the data source of the policy (for example, structured log file, database, or open message interface).
Integration Type	The integration type indicates the type of data that the policy integrates (for example, event, metrics, or topology).
Policy ID	<i>Optional:</i> GUID (globally unique identifier) of the policy.
Name	Name of the policy.
Description	Description of the policy.
Activation State	The activation state indicates if a policy is activated, deactivated, or needs reactivation after modification.
Edited by	The lock icon  and the name of the editing user indicate that a policy is being edited and by whom.

How to Edit Policies

BSM Connector enables multiple users to connect to the same server at the same time. However, only one user at a time can edit a policy to prevent changes from other users overwriting each other.

When you edit a policy, BSM Connector locks the policy for you so that only you can save the policy. Note that if you open a policy more than once, only the first editor instance receives the lock and can save the policy.

Locked policies display with a lock icon  and the name of the editing user in the list of policies in the BSM Connector user interface. (The tooltip explains who locked the policy and when.)

BSM Connector releases the lock when the policy is closed or when a user forcefully breaks the lock. It is recommended that you only break the edit lock when you have reason to believe that the locked policy editor was abandoned or stopped working. Policy editors that have been forcefully unlocked by another user change to read-only mode and you can no longer save any changes made.

Tip: When you open a locked policy for viewing, reload the policy from time to time to ensure that you are viewing the most recently saved version.

This section includes:

- ["To edit unlocked policies:"](#) below
- ["To break the edit lock on locked policies:"](#) below

To edit unlocked policies:

1. In the list of policies in the BSM Connector user interface, select the policy that you want to edit.
2. Click  in the toolbar. The policy editor opens. The policy is marked with the lock icon  and the name of the editing user in the list of policies in the BSM Connector user interface.
3. Modify the policy.
4. Click **Save and Close** to save the policy and close the editor.

Alternatively, right-click the policy that you want to edit and click **Edit** in the context menu. Modify the policy and click **OK** to save your changes.

To break the edit lock on locked policies:

1. In the list of policies in the BSM Connector user interface, select the locked policy that you want to edit.

2. Click  in the toolbar. A dialog box opens and lists the name of the editing user, the hostname of the BSM Connector server, and the date and time the policy was locked.

The date and time displays using the current time zone of the computer on which the BSM Connector user interface runs. The language setting of the Web browser determines the date and time format (for example, 09/14/2010 8:16:38 AM for English (United States)). If the Web browser and the computer on which the BSM Connector server run have different language settings, the language setting of the Web browser takes precedence. However, English is the default language if the Web browser is configured to use a language that is not available on the server.

3. Click **OK** to break the edit lock. The lock icon  and the name of the editing user disappear from the list of policies in the BSM Connector user interface..
4. Open the policy for editing and modify it.
5. Click **Save and Close** to save the policy and close the editor.

Alternatively, right-click the locked policy that you want to edit and click **Unlock** in the context menu. Modify the policy and click **OK** to save your changes.

Tip: You can unlock a policy at any time, even while editing.

How to Copy Policies

Instead of creating a new policy from scratch, you can copy an existing policy and change the copy to meet your needs. Copied policies are by default deactivated.

Note: You can copy only one policy at a time.

How to copy a policy

1. In the list of policies in the BSM Connector user interface, select a policy.
2. Click  in the toolbar. The **Copy Policy** dialog box opens.
3. Change the policy name and optionally the description.
4. Click **OK**. The copied policy appears in the list of policies in the BSM Connector user interface and is by default deactivated.

UI description

UI Element	Description
Name	Name of the policy. You can use spaces in the name. The equal sign (=) is not allowed.
Description	Description of what the policy does. You might also add other notes (for example, data sources that are used).

How to Delete Policies

You can only delete deactivated policies and policies that are not being edited by other users. When you delete a policy the policy files are deleted from the file system. To temporarily stop a policy from functioning, deactivate the policy instead.

To delete policies:

1. In the list of policies in the BSM Connector user interface, select the policies that you want to delete.
2. Make sure that the policies are deactivated and not being edited.
3. Click  in the toolbar. A message box opens.
4. Confirm that you want to delete the policies.

How to Activate and Deactivate Policies

When you create a new policy or import a policy, the policy exists in the BSM Connector policy repository but does not function yet. You must first activate the policy for it to start accessing the corresponding data source.

When you edit an existing, active policy, the previous version of the policy remains active on the BSM Connector server and you must reactivate the policy for your changes to take effect.

When you deactivate a policy, the policy remains in the BSM Connector policy repository but does not function until it is activated again.

This section includes:

To activate policies:

1. In the list of policies in the BSM Connector user interface, select the policies that you want to activate. The activation state of at least one of the selected policies must be deactivated or

activated (reactivate for new version). (If you include an already activated policy in your selection, the policy is ignored and not activated again.)

2. Click  in the toolbar. The activation state changes to activated.

Alternatively, right-click the policies that you want to activate and click **Activate** in the context menu. The activation state changes to activated.

To deactivate policies:

1. In the list of policies in the BSM Connector user interface, select the policies that you want to deactivate. (If you include an already deactivated policy in your selection, the policy is ignored and not deactivated again.)
2. Click  in the toolbar. The activation state changes to deactivated.

Alternatively, right-click the policies that you want to deactivate and click **Deactivate** in the context menu. The activation state changes to deactivated.

How to Export Policies

BSM Connector enables you to import policies developed on other servers, for example, HP Operations Manager (HPOM) management servers, HP Network Node Manager i (NNMi) management servers, or other BSM Connector servers. Most policies can simply be copied from the source BSM Connector server and imported in the target server. However, some policies may contain information that does not apply to the target BSM Connector server. Policies may also contain sensitive information such as user names and passwords that must be secured before the distribution.

Policy content that should be modified or removed before distribution

The following table describes policy content that should be modified or removed before the distribution. In addition to the items listed, you may need to adapt other content to prepare your policies for distribution, for example policy conditions.

Policy Type	Policy Field	Recommended Action
Database policies	Connect string	If necessary, enter placeholders for the database server name and port, for example enter: <code>jdbc:sqlserver://<hostname>:<dbport>;Database=<name>;</code>
	Username	Enter a placeholder for the database user name, for example: <db user name>.
	Password	Remove the password from the policy.
Structured log file policies	Log File Path / Name	If necessary, change the path or file name.
Scheduled task policies	Password	Remove the password from the policy.
	Username	Remove the user name from the policy.
	Password in commands, Perl, or VBScript	Remove the password from the policy. Alternatively, use the ExecuteCommand method password with an encrypted password. For details, see ExecuteCommand: password .
REST Web Service listener policies	Path	Part of the Effective URL for the REST Web Service Topology policy
XML file policies	Log File Path / Name	If necessary, change the path or file name. <div style="background-color: #f0f0f0; padding: 5px;"> <p>Tip: You can use Windows environment variables or call a command or script that returns the log file name and path. For details, see "Configuring the Data Source in XML File Policies" on page 244</p> </div>
	Topology XML File	Path to the source file for the XML Topology policy.

To export policies:

1. Prepare the policies for distribution:
 - a. Create copies of the policies. For details, see ["How to Copy Policies" on page 53](#).
 - b. Edit the copied policies and modify them as suggested in ["Policy content that should be modified or removed before distribution" on the previous page](#).
2. Identify the policy ID of each policy you want to export:
 - a. In the toolbar, click  to open the Options dialog box.
 - b. In the Options dialog box, select **Policy ID** and click **OK**.

The policy list now shows the ID of each policy in an additional column.

3. On the BSM Connector server, navigate to the policy store:
 - Windows: "%OvDataDir%\datafiles\policymanagement\store"
 - Linux: /var/opt/OV/datafiles/policymanagement/store
4. Copy the header (<policyID>_header.xml) and the data (<policyID>_data) files to a temporary location on the target BSM Connector server and import them. For more information about importing policies, see ["How to Import Policies" below](#).

How to Import Policies

BSM Connector provides policy editors for different policy types (for example, for XML file policies). You can import policies developed and exported on other servers, for example, HP Operations Manager (HPOM) management servers, HP Network Node Manager i (NNMi) management servers, or other BSM Connector servers.

Policies Exported from HPOM

When you download policies on an HPOM management server, make sure the resulting policy files support the XML-based policy exchange format:

- HP Operations Manager for Windows: use the `ovpmutil` command-line tool.
- HP Operations Manager for UNIX or Linux: use the `opccfgdwn` command-line tool.

Policies Exported from NNMi

NNMi provides the `nnmopcexport.ovp1` command-line tool, which exports an SNMP trap policy for

use with BSM Connector. For more information about running this tool and the NNMI integration in general, see the *NNMI Deployment Reference*.

Policies Exported from Other BSM Connector Servers

You can also import policies developed on other BSM Connector systems, for example, to ensure that the same set of policies is available on multiple BSM Connector systems. This is necessary, for example, when running BSM Connector in a cluster environment.

BSM Connector stores policies in the following folders:

- Windows: %OvDataDir%\datafiles\policymanagement\store
- Linux: /var/opt/OV/datafiles/policymanagement/store

To import policies by using the BSMC Policy Management UI:

1. In the BSM Connector user interface, click  in the toolbar. A file selection dialog box opens.
2. Navigate to the policy files and, for each policy, select both the header (*_header.xml) and the data (*_data) files.
3. Click **Open** to start the import process.

If the policies with the same policy ID already exist in BSM Connector, you are asked whether you would like to replace them with the newly imported policies.

The imported policies appear in the list of policies in the BSM Connector user interface. They are by default deactivated.

4. If necessary, edit the imported policies and adapt their contents to the new BSM Connector server.
5. *Optional:* Activate the policies.

To import policies by using the command-line interface:

You can import policies by using the `bsmc_policy.[bat|sh]` script. The script is located at:

Windows:

```
%ovdatadir%installation\HP0prBSMC\bsmc-policy.bat
```

Linux:

```
/var/opt/OV/installation/HP0prBSMC/bsmc-policy.sh
```

Import a policy by using the following command:

```
bsmc-policy.[bat|sh] -import -header <full path to policy header file> -data <full path to policy data file>
```

How to Configure Policy Management Options

You can choose to show any combination of columns in the BSM Connector policy list

Tip: Click **Default** to restore the default selections.

How to change the column display

1. Click  in the toolbar. The **Options** dialog box opens.
2. Select or clear the check box beside the column you want to show or hide.
3. Click **OK** to save your changes.

UI description

UI Element	Description
Policy Type	The policy type indicates the data source of the policy (for example, structured log file, database, or open message interface).
Integration Type	The integration type indicates the type of data that the policy integrates (for example, event, metrics, or topology).
Policy ID	GUID (globally unique identifier) of the policy.
Name	Name of the policy.
Description	Description of the policy.
Activation State	The activation state indicates if a policy is activated, deactivated, or needs reactivation after modification.
Edited by	The lock icon  and the name of the editing user indicate that a policy is being edited and by whom.
Default	Click to restore the default selection.

Chapter 7: Collecting and Viewing Metrics Data

You enable capturing metrics data from third-party systems by configuring metrics policies.

Metrics policies depend on the default attributes and rules you define within the policies. The rules define the processing of incoming data and in combination with the defaults define the metrics forwarded to OMi.

How to Collect Metrics

The following tasks describe how to collect metrics.

This task includes the following steps:

- ["Check the existing topology in OMi" below](#)
- ["Create a policy" below](#)
- ["View Integration Results" on the next page](#)

1. Check the existing topology in OMi

When collecting metrics, you need to consider the following:

■ **CIs available in OMi**

You probably already have CIs in the RTSM for which you want to report data by using BSM Connector policies, but you can create new CIs in BSM Connector integrations.

■ **Data that you want to be reported for these CIs**

Consider what data you have for these CIs and how it can be attached to the CIs. For more information, see ["Example – Create a Metrics Policy" on the next page](#).

2. Create a policy

When creating a policy, you need to associate performance data or metrics with CIs that exist in RTSM. Make sure that the values in the BSM Connector data store (`Related CI`) correspond to the values in the RTSM model (`External ID`). If this is not the case, either create mappings or define the rules in the BSM Connector appropriately, so that they match the values in the RTSM model. For more information on how to check the values in the RTSM model, see ["Example – Create a Metrics Policy" on the next page](#).

Note: The `External ID` values can consist from more than one property, for example,

hostname1;diskC;vol1. In such a case, make sure that the corresponding policy sets the attribute Related CI for this particular metric to hostname1;diskC;vol1.

3. View Integration Results

After activating the policy in BSM Connector, you can view the results in OMi, by using the **Performance Perspective** view. For more details, see ["View the integration results" on page 71](#).

Example – Create a Metrics Policy

This example describes how to create a metrics integration policy to capture and forward metrics from a third-party system to OMi.

For a task related to this example, see ["How to Collect Metrics" on the previous page](#).

This example includes the following steps:

- ["Design stage" below](#)
- ["Create a structured log file policy for metrics integration" on page 64](#)
- ["View the integration results" on page 71](#)

1. Design stage

You have an application named My Oracle Monitoring. This application writes various metrics from Oracle databases running on different computers to a log file.

Note: Each data entry represents a line in a log file.

Log File Line Number	Data
1	1418724468 ORAPROD03;tungsten.elementary.com tablespace_free_space [%] 39.3631591796875 tablespace_skew [%] 1.3631591796875 buffer_pool_hit_ratio [%] 98.3631591796875 in_memory_sort_ratio [%] 93.3631591796875 parse_to_execute_ratio [%] 999.363159179688 latch_hit_ratio [%] 89.3631591796875

Log File Line Number	Data
2	1418724468 ORAPROD02;silver.elementary.com tablespace_free_space [%] 39.4726257324219 tablespace_skew [%] 1.47262573242188 buffer_pool_hit_ratio [%] 98.4726257324219 in_memory_sort_ratio [%] 93.4726257324219 parse_to_execute_ratio [%] 999.472625732422 latch_hit_ratio [%] 89.4726257324219
3	1418724468 ORADEV;carbon.elementary.com tablespace_free_space [%] 40.2490844726563 tablespace_skew [%] 2.24908447265625 buffer_pool_hit_ratio [%] 99.2490844726563 in_memory_sort_ratio [%] 94.2490844726563 parse_to_execute_ratio [%] 1000.24908447266 latch_hit_ratio [%] 90.2490844726563
4	1418724468 ORAPROD04;platinum.elementary.com tablespace_free_space [%] 40.1240844726563 tablespace_skew [%] 2.12408447265625 buffer_pool_hit_ratio [%] 99.1240844726563 in_memory_sort_ratio [%] 94.1240844726563 parse_to_execute_ratio [%] 1000.12408447266 latch_hit_ratio [%] 90.1240844726563
5	1418724468 ORAPROD01;palladium.elementary.com tablespace_free_space [%] 40.2179565429688 tablespace_skew [%] 2.21795654296875 buffer_pool_hit_ratio [%] 99.2179565429688 in_memory_sort_ratio [%] 94.2179565429688 parse_to_execute_ratio [%] 1000.21795654297 latch_hit_ratio [%] 90.2179565429688

Entries in the log file have the following logical structure:

(timestamp,entity_id,(performance_counter,counter_value){6}).

Each line consists of two unique fields: timestamp and entity_id, followed by six repeating field pairs: performance_counter and counter_value.

2. Check the RTSM model

To check the RTSM model for matching of the associated CIs, follow these steps:

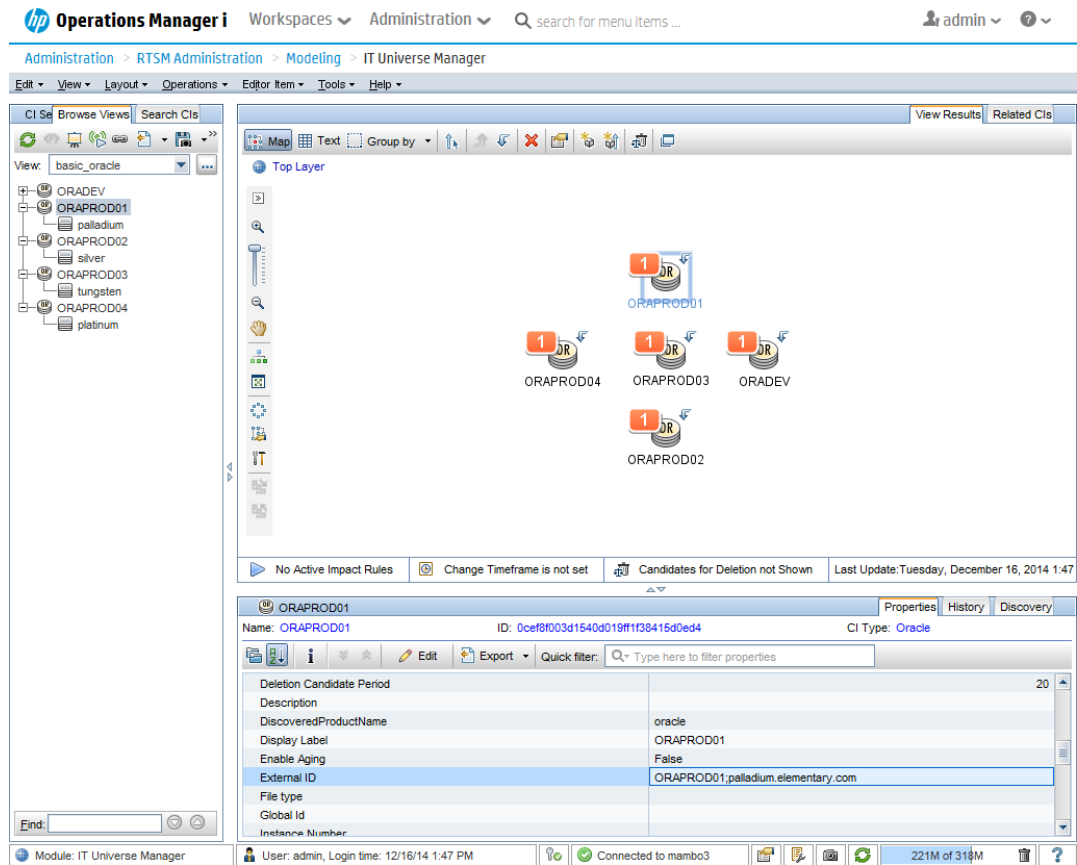

- a. In OMi, select **Administration > RTSM Administration > Modeling > IT Universe Manager**. In the IT Universe Manager, select a view from the drop-down list provided on the Browse Views tab, and choose the one that you want to do the mapping for.
- b. On Properties tab, Select External ID and check its value because it is a link between the

RTSM model and metrics stored in the BSMC data store.

Note: Because `External Id` is not visible in the list of attributes by default, set it to be visible as follows:

- i. In OMi, select **Administration > Setup and Maintenance > Infrastructure Settings**.
- ii. In the Infrastructure Settings, select the Foundations context and choose RTSM from the provided drop-down list.
- iii. In the **RTSM - General Settings** list, scroll down to the `Object Root` item.
Click the  button on the right side to open the editor and set the value of the object root to `data`.
- iv. Select **Administration > RTSM Administration > Modeling > CI Type Manager**.
- v. Select the CI Type data. On the Attributes tab, double click `External ID` and enable the `Visible` checkbox from the Advanced tab. Click **OK**.

The value of `External ID` must match the value of BSMC metric attribute `Related CI` in the OA datastore. To achieve this, either create mappings or define the rules in the BSM Connector appropriately, so that they match the values in the RTSM model. In this example, topology in RTMS is also created by the `My Oracle Monitoring` application, therefore `External ID` matches `Related CI`.

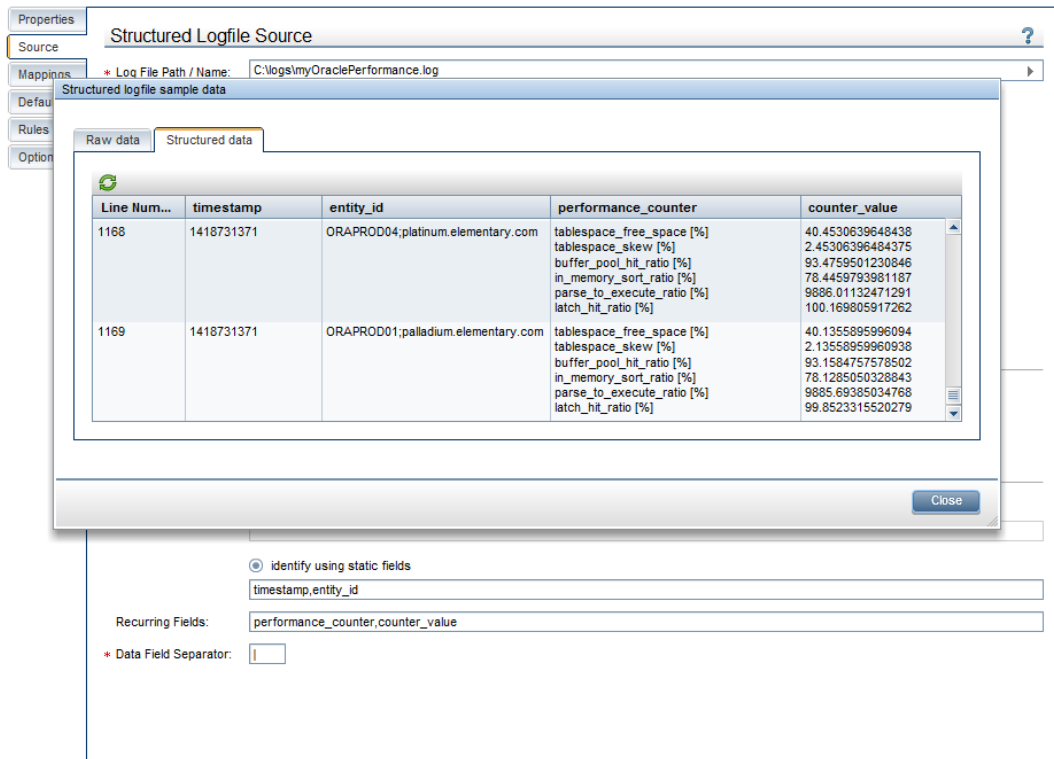

3. Create a structured log file policy for metrics integration

To create a structured log file policy for metrics integration, follow these steps:

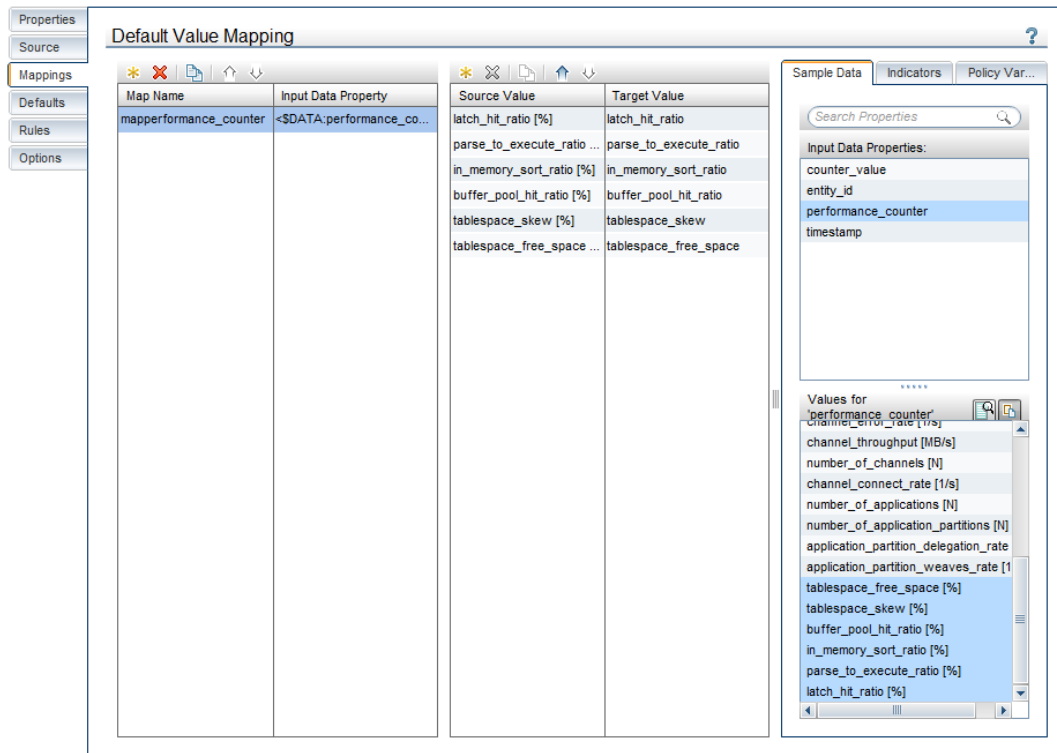

Note: For details about structured log file data, "[Structured Log File Policies \(Events and Metrics only\)](#)" on page 214.

- a. In the **Source** page, specify the full path to the log file on the BSM Connector system or a command that returns a path, and also define static and recurring fields according to the logical structure.

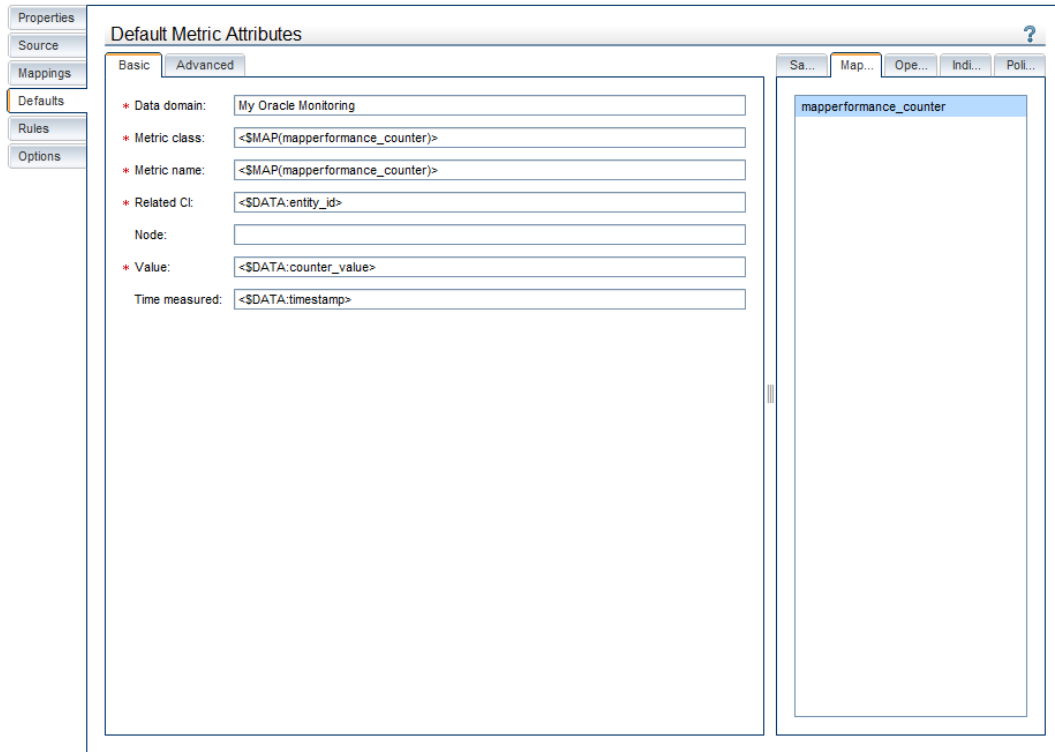

Check results with the view sample data feature () and apply the structure pattern definition by pressing the refresh button ()

- b. Define a mapping for the values of the field performance_counter to strip the values of unnecessary information. You can drag the field from the Input Data Properties and drop it on the Default Value Mapping list.

- c. On the **Defaults** page, define defaults for the BSMC metrics that are created from the policy configuration.
 - o Data Domain attribute is set to My Oracle Monitoring.
 - o Metric class and metric name are both set to the result of the value mapping (`<$MAP (mapperformance_counter)>`) that is created when defining the mapping. Whenever incoming values that are structured by the field definitions are processed by the policy, the actual value is replaced according to the mapping definition.
 - o Related CI is set to values of the field `entity_id` directly (`<$DATA:entity_id>`).
 - o Node is empty at this stage, it will be set when defining a rule.
 - o Value is set directly by using the defined input data field `counter_value` (`<$DATA:counter_value>`).
 - o The `timestamp` field values from the input data are in the epoch time format, therefore you can set directly the Time measured field (`<$DATA:timestamp>`).

d. Create a rule to set the Node attribute, as follows:

Note: Because the values of the incoming data field `entity_id` contain both Oracle SID and hostname, it is useful to create a policy rule for extracting the hostname. The rule condition uses OM Pattern Matching to perform the extraction to named OM Pattern Matching variables.

- i. In the **Policy Rules** section, click  and select the "Store on matched rule" type.
- ii. In the **Rule Content** section, click  to create a new condition. Click  to expand the new condition. Set the following:
 - A. In the **Property** field, specify `entity_id`, or drag and drop this input data reference from the Input Data Properties list on the Sample Data tab to the Property field.
 - B. Select the `matches` operator.
 - C. In the **Operand** field, type `<*.oracleSID>;<*.oracleHost>`.

The screenshot displays the 'Policy Rules' configuration window. On the left, a sidebar contains tabs for Properties, Source, Mappings, Defaults, Rules (selected), and Options. The main area is titled 'Policy Rules' and contains a table with the following data:

Seq.	Rule Description	Rule Type
1	Process Oracle counters	Store on matched rule

Below the table is the 'Rule Content "Process Oracle counters"' section. It has tabs for 'Condition', 'Basic', and 'Advanced'. The 'Condition' tab is active, showing a configuration for the property 'entity_id'. The configuration includes:

- Property: entity_id
- Operator: matches
- Operand: <*.oracleSID>;<*.oracleHost>

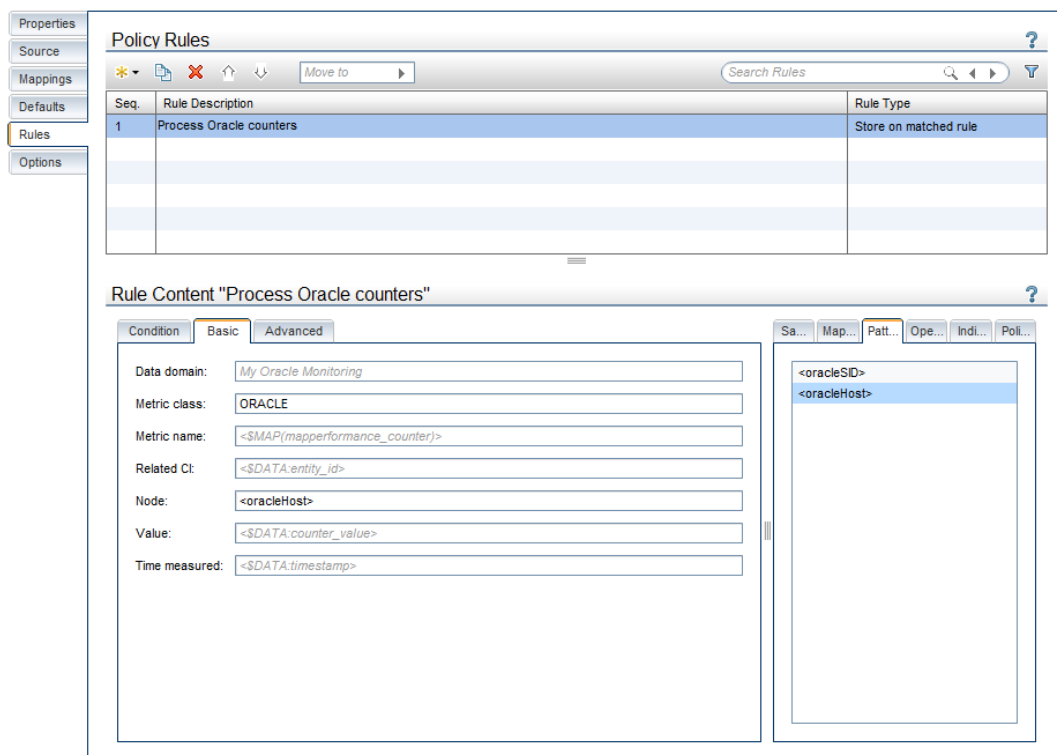

On the right side of the 'Rule Content' section, there is a 'Sample Data' panel. It includes a search box for properties and a list of 'Input Data Properties':

- counter_value
- entity_id
- performance_counter
- timestamp

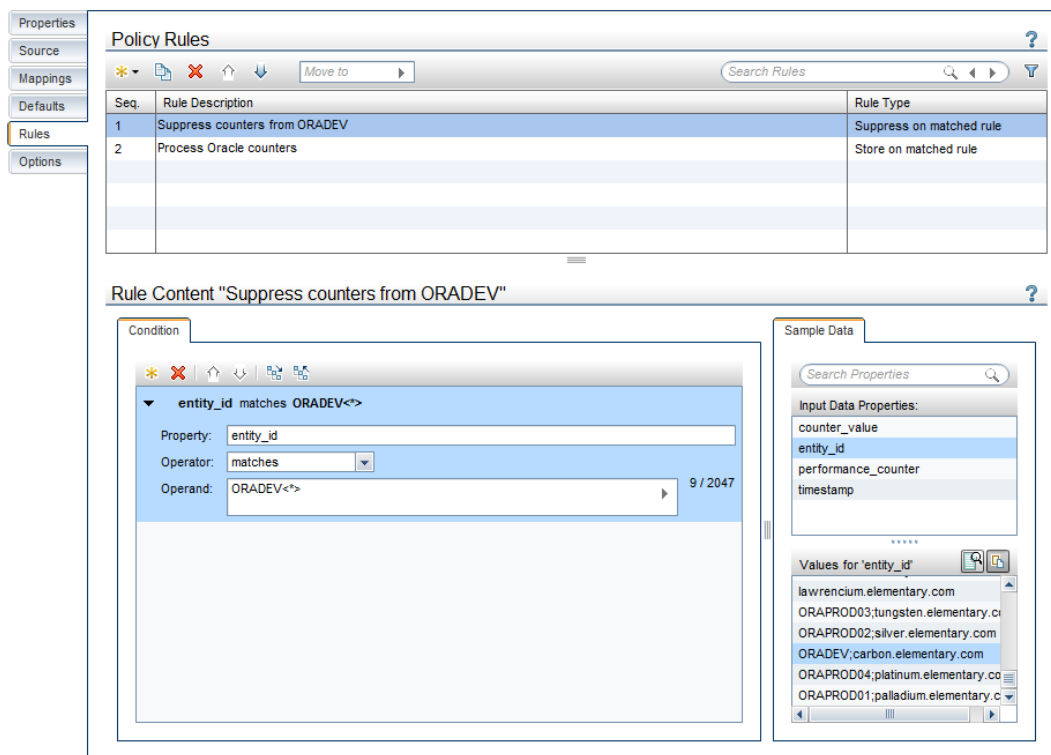

Below this, there is a section for 'Values for 'entity_id'' with a list of example values:

- lawrencium.elementary.com
- ORAPROD03;tungsten.elementary.c
- ORAPROD02;silver.elementary.com
- ORADEV;carbon.elementary.com
- ORAPROD04;platinum.elementary.co
- ORAPROD01;palladium.elementary.c

To set the Node attribute in this rule, override the default value. It might also be appropriate to set a common Metric class value specific for Oracle related counters in My Oracle Monitoring.

- e. (Optionally) The log file from My Oracle Monitoring contains entries for an Oracle development system which should not be integrated at all. This Oracle system is denoted by its SID ORADEV. Create a rule of the "Suppress on matched rule" type and place it at the top of the rule list so that the policy skips entries in the log file for that specific instance.

f. Save and activate the policy.

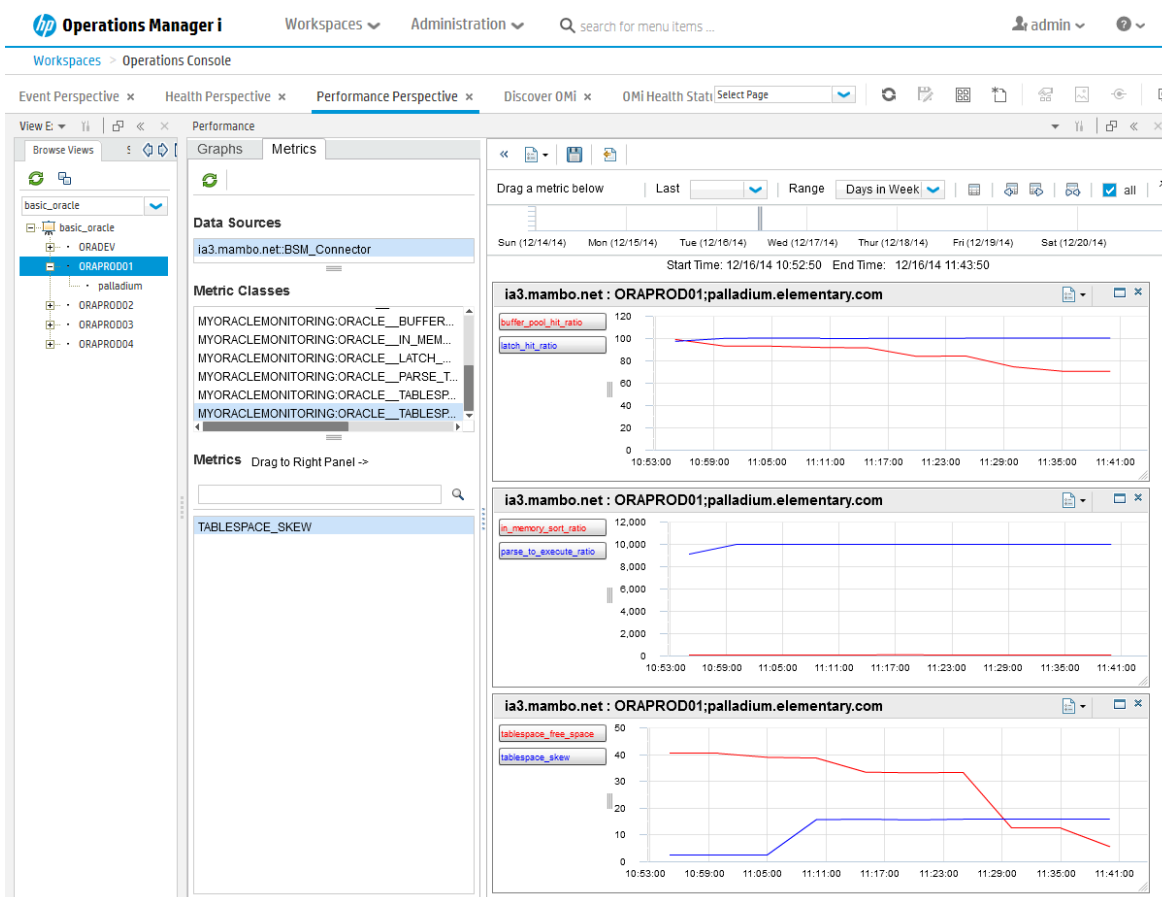

View the integration results

To view the contents of the performance data store in OMi, perform the following:

1. In OMi, select **Workspaces > Operations Console > Performance Perspective**.
2. In the **View Explorer** pane, select the desired view (that includes CI with metrics that you want to analyze) from the Browse Views tab, and then click the Metrics tab in the **Performance** pane.

Note: If there is no CI with the External Id field that is identical to the Related CI field of the BSM Connector metric policy attribute, Metric Class is mapped to the BSM Connector host.

3. Select the metric for which you want to check the performance and drag it to the subtab on the right to see the graph that shows the values for this metric.

Collecting Metrics with HP Operations Agent

The HP Operations Agent helps you to monitor a system by collecting metrics that indicate the health, performance, availability, and resource utilization of essential elements of the system.

When you use the HP Operations Agent in conjunction with Business Service Management Connector (BSMC), you can add the capability to monitor business applications running on monitored systems.

With its embedded data collector, the HP Operations Agent collects a rich set of system performance metrics from the monitored system to help you analyze the system health. Using minimal system resources, HP Operations Agent continuously collects and summarizes performance and health data across your system and stores the collected data into the metrics data store. The collected data is stored in a single Relational Database Management System (RDBMS) based data store.

Verifying the Status of oacore Process

The **oacore** process collects metrics data and records it in the metric data store. After installing the HP Operations Agent, follow the steps to check the status of the **oacore** process:

1. Log on to the HP Operations Agent node.
2. Run the command:

On Windows x64 system:

```
%ovinstalldir%bin\win64\ovc
```

On Windows x86 system:

```
%ovinstalldir%bin\win32\ovc
```

On AIX:

```
/usr/lpp/OV/bin/ovc
```

On UNIX/Linux/Solaris/HP-UX:

```
/opt/OV/bin/ovc
```

If the `oacore` process is running, the following message appears:

oacore	Operations Agent Core	AGENT,OA	(25357)	Running
--------	-----------------------	----------	---------	---------

Starting or Stopping the oacore Process

Follow the steps:

1. Log on to the HP Operations Agent node.
2. Go to the following directory:

On Windows x64 system:

```
%ovinstalldir%bin\win64\
```

On Windows x86 system:

```
%ovinstalldir%bin\win32\
```

On AIX:

```
/usr/lpp/OV/bin
```

On UNIX/Linux/Solaris/HP-UX:

```
/opt/OV/bin
```

3. Run the command:

- To start the oacore process: `ovc -start oacore`
- To stop the oacore process: `ovc -stop oacore`

Verifying Data Logging

Metrics data collected by the oacore process is logged in the data store.

Follow these steps:

1. Log on to the HP Operations Agent node.
2. Run the command:

On Windows x64 system:

```
%ovinstalldir%bin\win64\ovcodutil -obj
```

On Windows x86 system:

```
%ovinstalldir%bin\win32\ovcodutil -obj
```

On AIX:

```
/usr/lpp/OV/bin/ovcodutil -obj
```

On UNIX/Linux/Solaris/HP-UX:

```
/opt/OV/bin/ovcodutil -obj
```

A list of logged metrics appear.

Configuring Data Purging

Data collected by the HP Operations Agent is stored for 172800 seconds (two days) by default. To configure data purging from the command line, follow the steps:

1. Log on to the HP Operations Agent node.
2. Run the command to set the time interval to purge data:

Note: `AutoPurgeIntervalSecs` defines the schedule at which the purge task would get triggered. By default, the purge task is started at 6 AM.

On Windows x64 system:

```
%ovinstalldir%bin\win64\ovconfchg -ns oacore -set AutoPurgeIntervalSecs  
<interval>
```

In this instance, <interval> specifies the duration after which data is removed from the metrics data store. <interval> is always specified in seconds.

On Windows x86 system:

```
%ovinstalldir%bin\win32\ovconfchg -ns oacore -set AutoPurgeIntervalSecs  
<interval>
```

On AIX:

```
/usr/lpp/OV/bin/ovconfchg -ns oacore -set AutoPurgeIntervalSecs <interval>
```

On UNIX/Linux/Solaris/HP-UX:

```
/opt/OV/bin/ovconfchg -ns oacore -set AutoPurgeIntervalSecs <interval>
```

3. Run the following command to set the data retention period:

On Windows x64 system:

```
%ovinstalldir%bin\win64\ovconfchg -ns oacore -set KeepDataForSecs <retention_  
period>
```

In this instance, <retention_period> specifies the duration to store data in the metrics data store. <retention_period> is specified in seconds.

On Windows x86 system:

```
%ovinstalldir%bin\win32\ovconfchg -ns oacore -set KeepDataForSecs <retention_  
period>
```

On AIX:

```
/usr/lpp/OV/bin/ovconfchg -ns oacore -set KeepDataForSecs <retention_period>
```

On UNIX/Linux/Solaris/HP-UX:

```
/opt/OV/bin/ovconfchg -ns oacore -set KeepDataForSecs <retention_period>
```

4. Run the following command to start agent processes:

On Windows x64 system:

```
%ovinstalldir%bin\win64\ovc -start oacore
```

On Windows x86 system:

```
%ovinstalldir%bin\win32\ovc -start oacore
```

On AIX:

```
/usr/lpp/OV/bin/ovc -start oacore
```

On UNIX/Linux/Solaris/HP-UX:

```
/opt/OV/bin/ovc -start oacore
```

Note: To see the set data retention period and data purging interval, run the following command:

```
ovconfget oacore
```

Chapter 8: Collecting Topology Data

Topology discovery is the process of populating the Run-time Service Model database (RTSM) with CI and CI relationship data. Accurate CI topology information provided by discovery of the system infrastructure is essential for Operations Manager i components, for example, for Topology-based Event Correlation (TBEC) or context-specific tools.

Topology discovery and synchronization enables you to write your own discovery scripts and mapping rules. The discovery scripts discover topology data, the mapping rules map the discovered data to the CI and CI relation model used in the RTSM. The processed and transformed topology data is then stored in the RTSM.

The advantage of using topology discovery and synchronization is that you can separate the discovery technology from the RTSM data model. If the RTSM data model changes, you only need to update the mapping files, not the discovery scripts.

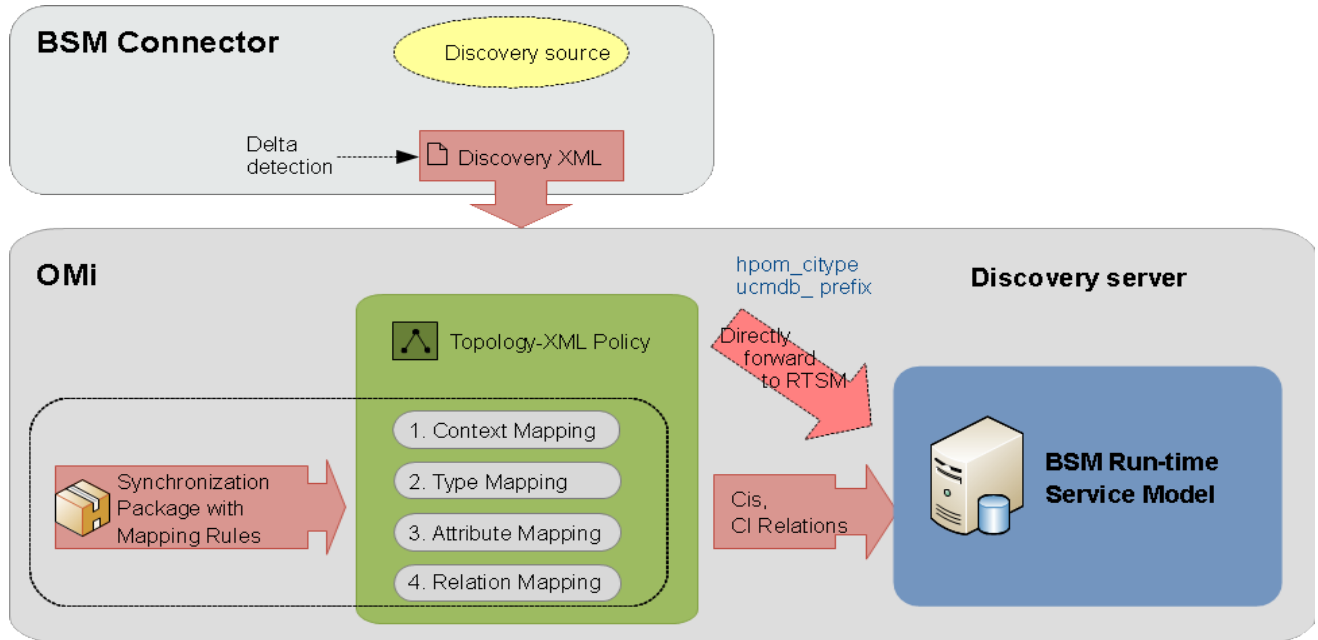

Topology Policies and Topology Synchronization

Topology synchronization enables you to filter the discovered data on the BSM Connector system before sending it to OMi for further processing and mapping on the discovery server.

The discovered data must be available in an XML format that conforms to the BSM Connector topology discovery syntax. To create the XML, write a discovery script or program (using your preferred scripting or programming language) that generates the XML file.

The XML file or REST Web Service topology policy then reads the XML data. Data from the discovery XML can be either *sent to RTSM directly* (if it complies to the RTSM data model and is marked correctly) or *transformed with mapping rules* to CIs and CI relations that comply with the RTSM data model.

To configure the transformation, create a topology synchronization package and include the necessary mapping rules. You then configure the XML or REST Web Service topology policy to apply the synchronization package to the discovery XML file.

Delta detection

A delta file is the difference between the input file and the data in the repository and includes only the minimum of information about the changes: new and changed instances and relations and instances and relations that need to be deleted. Instances are deleted only if they reach their aging limit.

If delta discovery is not enabled, no delta detection is done and the incoming topology file is directly sent to the topology server.

Aging of topology items

If an instance is not reported on several runs in a row, it will age, that is it will be marked with a counter. The counter goes up each time when the algorithm is running (this depends on the interval and the last time the file was written or sent via web service).

Once the *aging limit* (number of runs when it was not found) is reached, the instance will be deleted. You can configure the aging limit in the policy. See ["How to configure the XML source \(topology\)" on page 246](#).

Send Topology Data Directly to RTSM

For simple topologies, you can directly map data from the discovery XML to RTSM, without the need to provide a sync package.

1. Create a script (or program) that runs on the BSM Connector server and discovers configuration items (CIs) and CI relations. This discovery script must write details of each discovered CI in XML to a file on the BSM Connector system or send it through the REST Web Service. For details on

the XML syntax, see ["Topology Discovery Syntax" on page 111](#).

Setting Instance Attributes

To make sure that data is mapped directly to RTSM, you must set the following attributes for the instance you want to map:

- `hpom_citype`

Sets the CI type as stored in the RTSM.

- `hpom_discoTarget`

Set this attribute to the value "BSM".

- `ucmdb_<CI_attribute_name>`

Attribute names with the prefix `ucmdb_map` directly to CI attributes in RTSM. For example, `ucmdb_primary_dns_name` maps to the CI attribute `primary_dns_name`.

Syntax:

```
<Attributes>
  <attribute name="hpom_citype" value="<CIType>"
  <attribute name="hpom_discoTarget" value="BSM">
  <attribute name="ucmdb_<CI_attribute_name>" value="<CIValue>">
</Attributes>
```

Examples:

In the following example, the CI type set to "host_node" and the attributes "name" and "primary_dns_name" are mapped to the corresponding CI attributes in RTSM.

```
<NewInstance ref="HOST:server3.company.com">
  <Std>DiscoveredElement</Std>
  <Virtual/>
  <Key>HOST:server3.company.com</Key>
  <Attributes>
    <attribute name="hpom_citype" value="host_node">
    <attribute name="hpom_discoTarget" name="BSM">
    <attribute name="ucmdb_name" value="server3">
    <attribute name="ucmdb_primary_dns_name" value="server3.company.com">
    <attribute name="ucmdb_data_externalid" value="server3.company.com">
  </Attributes>
</NewInstance>
```

In the following example, the CI type set to "sqlserver" and the attributes "name", "database_dbsid", and "discovered_product_name" are mapped to the corresponding CI attributes in RTSM.

```
<NewInstance ref="SQLSERVER:MSSQLSERVER:server3.company.com">
  <Std>DiscoveredElement</Std>
  <Virtual />
  <Key>SQLSERVER:MSSQLSERVER:server3.company.com</Key>
  <Attributes>
    <Attribute name="hpom_citype" value="sqlserver" />
    <Attribute name="hpom_discoTarget" value="BSM" />
    <Attribute name="ucmdb_name" value="MSSQLSERVER" />
    <Attribute name="ucmdb_database_dbsid" value="MSSQLSERVER" />
    <Attribute name="ucmdb_discovered_product_name" value="mssqlserver" />
    <Attribute name="ucmdb_data_externalid"
value="server3.company.com/MSSQLSERVER" />
  </Attributes>
</NewInstance>
```

Setting the Relations Type

Make sure the relations type does *not* have the prefix omrel_.

For example, the relation type "composition" should be set like:

```
<NewRelationship>
  <Parent>
    <Instance ref="HOST:server3.company.com"/>
  </Parent>
  <GenericRelations>
    <Relations type="composition">
      <Instance ref="SQLSERVER:MSSQLSERVER:server3.company.com"/>
    </Relations>
  </GenericRelations>
</NewRelationship>
```

2. Create a topology XML or Rest Web Service policy. For details on topology policies, see ["Configuring Topology Through the REST Web Service Listener" on page 163](#) and ["How to Collect Topology Data from XML Files" on page 242](#).

Use Topology Synchronization Rules to Map Data into RTSM CIs and Relationships

For complex topologies, you need to create a topology synchronization package that contains mapping rules that map data in to RTSM CIs and relationships.

1. Create a script (or program) that runs on the BSM Connector server and discovers configuration items (CIs) and CI relations. This discovery script must write details of each discovered CI in XML to a file on the BSM Connector system or send it through the REST Web Service. For details on the XML syntax, see ["Topology Discovery Syntax" on page 111](#).

2. Create the sync package:

- a. In a temporary location, create a directory with a name that matches the synchronization package name (for example, `/temp/mysyncpkg`).
- b. Create the package descriptor file and save it in the synchronization package directory (for example, `/temp/mysyncpkg/package.xml`).

For details on the package descriptor file, see ["Package Descriptor File: package.xml" on page 83](#).

- c. Configure the context mapping file to tag which elements included in discovered data you want to include in the topology synchronization for mapping. The mapping rules contained in the XML mapping files are applied to the tagged elements.

Save the context mapping file in the synchronization package directory (for example, `/temp/mysyncpkg/contextmapping.xml`).

For details on the context mapping file, see ["Context Mapping \(Filtering\): contextmapping.xml" on page 83](#).

- d. Configure the type mapping file to define the mapping between the discovered CIs to the type of a CI in the RTSM.

Save the type mapping file in the synchronization package directory (for example, `/temp/mysyncpkg/typemapping.xml`).

For details on the type mapping file, see ["Type Mapping File: typemapping.xml" on page 84](#).

- e. Configure the attribute mapping file to map the attributes of a discovered CI to the attributes of a CI in the RTSM.

Save the attribute mapping file in the synchronization package directory (for example, `/temp/mysyncpkg/attributemapping.xml`).

For details on the attribute mapping file, see ["Attribute Mapping File: attributemapping.xml" on page 84](#).

- f. Configure the relation mapping file to define the CI relationships created in the RTSM between specified discovered CIs.

Save the relation mapping file in the synchronization package directory (for example, `/temp/mysyncpkg/relationmapping.xml`).

For details on the relation mapping file, see ["Relation Mapping File: relationmapping.xml" on page 85](#).

- g. *Optional*: Use the supplied XML schema definitions to validate the correctness of the XML mapping files. The definitions are located the OMi server:

```
%topaz_home%/conf/opr/topology-sync/schemas
```

3. Upload the sync package to the OMi server. See ["Uploading the Sync Package to the OMi server" on page 111](#).
4. Create a topology XML or Rest Web Service policy. For details on topology policies, see ["Configuring Topology Through the REST Web Service Listener" on page 163](#) and ["How to Collect Topology Data from XML Files" on page 242](#).

Topology Synchronization Rules

The filter and mapping rules that process the discovered data are gathered in a synchronization package. You can apply multiple synchronization packages to the topology data discovered by a topology policy.

Topology Synchronization Packages

A synchronization package consists of the following files:

- **package.xml**. The package descriptor file defines the name of the synchronization package and contains a description and the priority level. The priority level determines the order in which synchronization packages are applied.
- **contextmapping.xml**. The context mapping file defines the filter that is applied to the discovered data. Filtering involves assigning a context to those CIs you want to process and send to OMi. Configuring the context enables you to apply mapping rules selectively to CIs of the same context.
- **typemapping.xml**. The type mapping file defines the mapping from the type of a discovered CI to the type of a CI in OMi.
- **attributemapping.xml**. The attribute mapping file defines the mapping between the attributes of a discovered CI and the attributes of a CI in OMi.

Attribute mapping enables you to change CI attributes and add new attributes to better describe a CI and create a more detailed view of the environment.

- **relationmapping.xml**. Using the relation mapping file, you can define the CI relationships created in OMi between specified discovered CIs.

Make sure that the specified discovered CIs are created as CIs in the RTSM. Otherwise it is not possible for topology synchronization to create a relationship in the RTSM.

Synchronization packages must be uploaded to the OMi system. See ["Uploading the Sync Package to the OMi server" on page 111](#).

Package Descriptor File: package.xml

A topology synchronization package must include the package descriptor file (package.xml). The package.xml file defines a topology synchronization package and includes:

- <Name> The name of the package must be the same as the name of the subdirectory in which you place the synchronization package:

```
%topaz_home%\conf\opr\topology-sync\sync-packages\
```

- <Description> Description of the package.
- <Priority> Priority level of the package.

The highest priority is represented by 1. The default synchronization package is assigned the lowest priority of 10. A higher priority rule result overwrites a result from a lower priority rule.

Note: There may be more than one synchronization package with the same priority. The order of execution of the rules between synchronization packages with the same priority is not specified.

Example:

```
<?xml version="1.0" encoding="utf-8"?>  
<Package xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"  
  xsi:noNamespaceSchemaLocation="Schemas/Package.xsd">  
  <Name>mysyncpkg</Name>  
  <Description>Integrate My Topology in HP OMi</Description>  
  <Priority>5</Priority>  
</Package>
```

Context Mapping (Filtering): contextmapping.xml

The context mapping file assigns a context to CIs that match specified conditions. BSM Connector synchronizes all the CIs that you map to any context, and ignores all other CIs.

In the following example, the context myTopology is assigned to all discovered CIs that have the attribute myAttribute with a value of myAttributeValue.

Example:

```
<?xml version="1.0" encoding="utf-8"?>  
<Mapping xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"  
  xsi:noNamespaceSchemaLocation="Schemas/Mapping.xsd">  
  <Rules>
```

```
<Rule name="Filter my discovered CIs">
  <Condition>
    <Equals>
      <OMAttribute>myAttribute</OMAttribute>
      <Value>myAttributeValue</Value>
    </Equals>
  </Condition>
  <MapTo>
    <Context>myTopology</Context>
  </MapTo>
</Rule>
</Rules>
</Mapping>
```

Type Mapping File: typemapping.xml

The type mapping file maps the type of a discovered CI to the type of a CI in OMi.

In the following example, the CIs with the context `myTopology` that have the attribute `myType` with a value of `myTypeValue` are mapped to the CI type `myCIType` in OMi.

Example:

```
<?xml version="1.0" encoding="utf-8"?>
<Mapping xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:noNamespaceSchemaLocation="Schemas/Mapping.xsd">
  <Rules Context="myTopology">
    <Rule name="Map myTypeValue to myCIType">
      <Condition>
        <Equals>
          <OMAttribute>myType</OMAttribute>
          <Value>myTypeValue</Value>
        </Equals>
      </Condition>
      <MapTo>
        <CMDBType>
          <Value>myCIType</Value>
        </CMDBType>
      </MapTo>
    </Rule>
  </Rules>
</Mapping>
```

Attribute Mapping File: attributemapping.xml

The attribute mapping file maps the attributes of a discovered CI to the attributes of a CI in OMi.

In the following example, for the CIs with the context `myTopology` that have the attribute `myAttribute` with a value of `myAttributeValue`, the attribute `title` is mapped to the CI attribute name in OMI.

Example:

```
<?xml version="1.0" encoding="utf-8"?>
<Mapping xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
        xsi:noNamespaceSchemaLocation="Schemas/Mapping.xsd">
  <Rules Context="myTopology">
    <Rule name="Map my attributes to RTSM CI attributes">
      <Condition>
        <Equals>
          <OMAttribute>myAttribute</OMAttribute>
          <Value>myAttributeValue</Value>
        </Equals>
      </Condition>
      <MapTo>
        <CMDBAttribute>
          <Name>name</Name>
          <SetValue>
            <OMAttribute>title</OMAttribute>
          </SetValue>
        </CMDBAttribute>
      </MapTo>
    </Rule>
  </Rules>
</Mapping>
```

Relation Mapping File: `relationmapping.xml`

Using the relation mapping file, you can create CI relationships in OMI between specified discovered CIs.

In the following example, for CIs with the context `myTopology`, the CI `myAttributeValue1` creates a contains relationship to CIs that have the attribute `myAttribute1` with a value of `myAttributeValuew` or `myAttributeValuey`.

Example:

```
<?xml version="1.0" encoding="utf-8"?>
<Mapping xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
        xsi:noNamespaceSchemaLocation="Schemas/Mapping.xsd">
  <Rules Context="myTopology">
    <Rule name="Create relation from myAttributeValuew to myAttributeValue
    (root)">
      <Condition>
        <Equals>
          <OMAttribute>myAttribute1</OMAttribute>
          <Value>myAttributeValuew</Value>
        </Equals>
```

```
</Condition>
<MapTo>
  <RootContainer>
    <DependentCI relationType="contains">
      <Equals>
        <OMAttribute>myAttribute</OMAttribute>
        <Value>myAttributeValue</Value>
      </Equals>
    </DependentCI>
  </RootContainer>
</MapTo>
</Rule>
<Rule name="Create relation from myAttributeValue to myAttributeValue
(root)">
  <Condition>
    <Equals>
      <OMAttribute>myAttribute1</OMAttribute>
      <Value>myAttributeValue</Value>
    </Equals>
  </Condition>
  <MapTo>
    <RootContainer>
      <DependentCI relationType="contains">
        <Equals>
          <OMAttribute>myAttribute1</OMAttribute>
          <Value>myAttributeValue1</Value>
        </Equals>
      </DependentCI>
    </RootContainer>
  </MapTo>
</Rule>
</Rules>
</Mapping>
```

Mapping Syntax

Mapping is the mechanism used to map CIs, CI attributes, and CI relationships within the topology model of a third-party system to CIs and CI relationships in the RTSM. The file format, mapping syntax, and XPath query language used to navigate through the CI data structure is described in the following sections:

- ["Common Mapping File Format" on the next page](#)
- ["Mapping File Syntax" on the next page](#)
- ["XPath Navigation" on page 106](#)

Common Mapping File Format

Note: The rule name must be unique for all rules in the current file.

This example illustrates the common parts of the mapping file:

```
<?xml version="1.0" encoding="utf-8"?>
<Mapping>
  <Rules Context="web server SPI">
    <Rule name="Apache Server">
      <Condition>
        <!-- ... Boolean operators ... -->
      </Condition>
      <MapTo>
        <!-- ... Target Mappings ... -->
      </MapTo>
    </Rule>
    <!-- ... More Rules ... -->
  </Rules>
  <!-- ... More Rule sets with different contexts ... -->
</Mapping>
```

The components of the mapping files are described in ["Mapping File Syntax" below](#).

Mapping File Syntax

The following sections describe the valid syntax used in topology synchronization mapping files.

- ["Rules" on the next page](#)
- ["Rule Conditions" on the next page](#)
- ["Operator Elements" on page 89](#)
- ["Operand Elements" on page 92](#)
- ["Mapping Elements" on page 99](#)
- ["Filtering" on page 100](#)
- ["Type Mapping" on page 101](#)
- ["Attribute Mapping" on page 102](#)
- ["Relation Mapping" on page 104](#)

Rules

The <Rules> tag contains a set of rules. By using the optional Context attribute you can restrict these rules to a certain context. See ["Filtering" on page 100](#) for more information.

Rule Conditions

The <Condition> element of a rule contains a Boolean operator that specifies how the individual conditions relate to each other, and, for example, is similar to the <condition> task in Ant.

Each operator can implement an operation against operands. For example, attribute hosted_on has a value ending with .europe.example.com (attribute hosted_on and .europe.example.com are operands) or an operation against one or a set of other nested operators like <And>, <Or> or <Not>.

Condition Examples

Check if the type of the current discovered object is testtype.

Example:

```
<Condition>
  <Equals>
    <OMType/>
    <Value>testtype</Value>
  </Equals>
</Condition>
```

Check if the CI is related to a node that is located in the europe.example.com domain.

Example:

```
<Condition>
  <EndsWith>
    <XPathResult>//*[node='true']/attributes/
      host_dnsName<XPathResult>
    <Value>.europe.example.com</Value>
  </EndsWith>
</Condition>
```

Operator Elements

True

```
<True/>
```

This operator always returns true when all nested operators return true. It is useful for declaring default (fall-back) rules. In a mapping engine that is using the early-out mode, make sure that this operator is only used at the end of the synchronization package with the lowest priority.

False

```
<False/>
```

Always returns false. You can use the `False` element to temporarily disable rules.

And

```
<And>  
  <!-- Operator -->  
  <!-- Operator -->  
  [... more operators ...]  
</And>
```

Returns true when all nested operators return true.

The `<And>` operator is exclusive. This means that if the result of the first operator is false, the next operator is not evaluated. Use this operator to implement rules with higher performance by placing the simplest condition first and the most complex condition at the end.

Or

```
<Or>  
  <!-- Operator -->  
  <!-- Operator -->  
  [... more operators ...]  
</Or>
```

Returns true if at least one of the operators returns true.

Not

```
<Not>  
  <!-- Operator -->  
</Not>
```

Returns true if the operator does not return true.

The `<Not>` operator is exclusive. This means that evaluation stops as soon as a child operator returns true.

Exists

```
<Exists>  
  <!-- Operand -->  
</Exists>
```

The value of the operand must not be null.

Is Node

```
<IsNode/>
```

True if the CI is imported as a node, which is the case if the CI type is listed in the `nodetypes.xml` file.

True if the element is a managed node in HPOM.

Is Root CI

```
<IsRootCI/>
```

True if the CI is a root CI (a root CI has no parent).

Equals

```
<Equals>  
  <!-- Operand -->  
  <!-- Operand -->  
  <!-- ... -->  
</Equals>  
  
<Equals ignoreCase="[true|false]">  
  <!-- Operand -->  
  <!-- Operand -->  
  <!-- ... -->  
</Equals>
```

The values of the operands must be equal. If there are more than two operands, all operands must be equal to each other. Using the optional attribute `ignoreCase`, you can also compare the string values of the operands independent of capitalization. By default the equals operator does not ignore case.

Starts With

```
<StartsWith>  
  <!-- Operand -->  
  <!-- Operand -->  
</StartsWith>
```

The string value of the first operand must start with the value of the second operand.

Ends With

```
<EndsWith>  
  <!-- Operand -->  
  <!-- Operand -->  
</EndsWith>
```

The string value of the first operand must end with the value of the second operand.

Matches

```
<Matches>  
  <!-- Operand -->  
  <!-- Operand -->  
</Matches>
```

The string value of the first operand must match the regular expression of the second operand.

Example:

```
<Matches>  
  <Attribute>host_dnsname</Attribute>  
  <Value>.*\.example\.com</Value>  
</Matches>
```

For more information on applicable regular expressions, see:

<http://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html>

Contains

```
<Contains>  
  <!-- Operand -->  
  <!-- Operand -->  
</Contains>
```

The value returned by the first operand must contain the value of the second operand. If the operand's return type is a list, the list must contain at least one element that is equal to the second operand. If the operand's return type is a string, the value of the second operand must be a substring of the first operand.

Is Deletion CI

```
<IsDeletionCI/>
```

True if the CI is used to delete CIs.

Operand Elements

HPOM Service ID

<OMId/>

Return type: String

Returns the HPOM ID string of the CI as stored in Operations Management. The HPOM ID returns different values as follows:

Services: HPOM ID is the service ID

Nodes: HPOM ID is the unique ID

Node Groups: HPOM ID is the node group ID

HPOM Type

<OMType/>

Return type: String

Returns the HPOM Type stored in Operations Management. For HPOM services, the HPOM Type is the service type definition. For nodes, the HPOM Type is set to the constant value "node".

CMDB Type

<CMDBType/>

Return type: String

Returns the CMDB CI Type ID string of the CI as it is stored in the RTSM. Initially this is returned as null because the CMDB type must initially be set in the Type Mapping. After this is set, the CMDB CI Type ID string should be available.

Caption

<Caption/>

Return type: String

Returns the caption string of the CI in the RTSM or OMi.

HPOM Attribute

<OMAttribute>[Name]</OMAttribute>

Return type: String

Returns the value of the HPOM attribute with the given name.

CMDB Attribute

```
<CMDBAttribute>[Name]</CMDBAttribute>
```

Return type: String

Returns the value of the CMDB attribute with the given name as it will be written to the RTSM. There are no attributes available until the attribute mapping has been performed.

Replace

```
<Replace [regExp="true|false"]>  
  <In>  
    <!-- 1st. Operand -->  
  </In>  
  <For>  
    <!-- 2nd. Operand -->  
  </For>  
  <By>  
    <!-- 3rd. Operand -->  
  </By>  
</Replace>
```

Return type: String

Replaces the strings in the return value of the first operand for all occurrences of the return value of the second operator by the return value of the third operand. For example, to replace all occurrences of a backslash in the CI caption by an underscore, you must declare the following:

```
<Replace>  
  <In>  
    <CiCaption/>  
  </In>  
  <For>  
    <Value>\</Value>  
  </For>  
  <By>  
    <Value>_</Value>  
  </By>  
</Replace>
```

Optionally, you can use regular expressions for the second operand. You can also use back references in the third operand.

For more information on applicable regular expressions, see:

<http://docs.oracle.com/javase/7/docs/api/java/util/regex/Pattern.html>

This example uses regular expressions to extract part of a domain name:

```
<Replace regExp="true">  
  <In>
```

```
        <Attribute>host_dnsname</Attribute>
    </In>
    <For>
        <Value>^[^.]*\.[^.]*. *</Value>
    </For>
    <By>
        <Value>$1</Value>
    </By>
</Replace>
```

If the attribute `host_dnsname` contains the value `server.rio.example.com`, the result of the `Replace` operand is `rio`.

XPath Result

```
<XPathResult>[XPath]</XPathResult>
```

Return type: String

Returns the value of the XPath expression, which enables you to access data of any CI that is contained in the same hierarchy. The XPath expression must select a string value, if there are multiple matches an arbitrary element is returned.

For more information on XPath, see ["XPath Navigation" on page 106](#).

XPath Result List

```
<XPathResultList>[XPath]</XPathResultList>
```

Return type: List

Returns a list of all matched values.

For more information on XPath, see ["XPath Navigation" on page 106](#).

Value

```
<Value>[String]</Value>
```

Return type: String

Return the constant value.

List

```
<List>
    <!--Operand-->
    <!--Operand-->
    <!--...-->
</List>
```

Return type: List

The list operand is designed for use with operators that accept lists as input parameters, such as the contains operator. The list operand contains a list of other operands, the values of which are to be added to the returned list.

Parent CI

```
<ParentCI/>
```

Return type: CI

Returns the parent CI of the current CI. If the current CI is the root CI, null is returned.

Tip: To check for the root CI, use the IsRoot operator.

Child CI

```
<ChildCI>  
  [Operator]  
</ChildCI>
```

```
<ChildCI relationType="[relationType]">  
  [Operator]  
</ChildCI>
```

Return type: CI

Description: Returns the first child CI of the current CI that matches the enclosed operator.

Optional elements:

relationType: Only follow relations with the specified relation type.

Child CI List

```
<ChildCIList>  
  [Operator (Optional)]  
</ChildCIList>  
  
<ChildCIList relationType="[relationType]">  
  [Operator (Optional)]  
</ChildCIList>
```

Return type: List of CIs

Returns all CI children of the current CI.

Optional elements:

Operator: Only CIs that match the operator will be returned.

relationType: Only follow relations with the specified relation type.

Ancestor CI

```
<AncestorCI>  
  [Operator]  
</AncestorCI>  
  
<AncestorCI relationType="[relationType]">  
  [Operator]  
</AncestorCI>
```

Return type: CI

Returns the first ancestor CI of the current CI that matches the enclosed operator. An ancestor CI is the parent or parent of the parent (and so on) of the current CI.

Optional elements:

relationType: The dependency must have the specified relation type.

Descendant CI

```
<DescendantCI>  
  [Operator]  
</DescendantCI>  
  
<DescendantCI relationType="[relationType]">  
  [Operator]  
</DescendantCI>
```

Return type: CI

Returns the first descendant CI of the current CI that matches the enclosed operator. A descendant CI is the child or child of the child (and so on) of the current CI.

Optional elements:

relationType: Only follow relations with the specified relation type.

Descendant CI List

```
<DescendantCIList>  
  [Operator (Optional)]  
</DescendantCIList>  
  
<DescendantCIList relationType="[relationType]">  
  [Operator (Optional)]  
</DescendantCIList>
```

Return type: List of CIs

Returns the all descendant CIs of the current CI. A descendant CI is the child or child of the child (and so on) of the current CI.

Optional elements:

Operator: Only CIs that match the operator will be returned.

relationType: Only follow relations with the specified relation type.

Dependency CI

```
<DependencyCI>  
  [Operator]  
</DependencyCI>  
  
<DependencyCI relationType="[relationType]">  
  [Operator]  
</DependencyCI>
```

Return type: CI

Returns the first dependency CI that matched the included operator.

Optional elements:

relationType: Only follow relations with the specified relation type.

Dependency CI List

```
<DependencyCIList>  
  [Operator (Optional)]  
</DependencyCIList>  
  
<DependencyCIList relationType="[relationType]">  
  [Operator (Optional)]  
</DependencyCIList>
```

Return type: CI

Returns the list of dependencies.

Optional elements:

Operator: Only CIs that match the operator will be returned.

relationType: The dependency must have the specified relation type.

Dependent CI

```
<DependentCI>  
  [Operator]  
</DependentCI>  
  
<DependentCI relationType="[relationType]">  
  [Operator]  
</DependentCI>
```

Return type: CI

Returns the first dependent CI that matched the included operator.

Example for a dependent CI:

ServiceA > hosted_on > HostB

In this case ServiceA is a dependent CI of HostB. That means if you have HostB and want to have all services that depend on this host, you have to use the <DependentCI> operand. If you have ServiceA and want to have HostB, you have to use the <DependencyCI> operand instead.

Optional elements:

relationType: Only follow relations with the specified relation type.

Dependent CI List

```
<DependentCIList>  
  [Operator (Optional)]  
</DependentCIList>  
  
<DependentCIList relationType="[relationType]">  
  [Operator (Optional)]  
</DependentCIList>
```

Return type: CI

Returns the list of dependent CI.

Example for a dependent CI:

ServiceA > hosted_on > HostB

In this case ServiceA is a dependent CI of HostB. That means if you have HostB and want to have all services that depend on this host, you have to use the <DependentCI> operand. If you have ServiceA and want to have HostB, you have to use the <DependencyCI> operand instead.

Optional elements:

Operator: Only CIs that match the operator will be returned.

relationType: The dependency must have the specified relation type.

From CI Get

```
<From>  
  <CI>  
    [CI Operand]  
  </CI>  
  <Get>  
    [Operand]  
  </Get>  
</From>
```

Return type: Return type of the second operand.

Using this operand you can get values from another CI. The first operand [CI Operand] must return a CI instance. The second operand operates on that CI instance and the value of this second operand will be returned by this From operand.

Example:

```
<From>
  <CI>
    <ParentCI>
  </CI>
  <Get>
    <Caption/>
  </Get>
</From>
```

Returns the caption from the parent CI of the current CI.

Origin Server

```
<OriginServer/>
```

Return type: String

This operand returns the hostname of the server that originally received the discovery data before forwarding it to other servers.

Mapping Elements

<MapTo> defines the mappings. Each concrete implementation of an engine adds its own XML elements for its individual mappings here.

Mapping Examples

Map the attribute Caption to the CI attribute display_label in the RTSM.

Example:

```
<MapTo>
  <CMDBAttribute>
    <Name>display_label</Name>
    <SetValue>
      <Caption />
    </SetValue>
  </CMDBAttribute>
</MapTo>
```

Map the OMID to the CI attribute data_name in the RTSM.

Example:

```
<MapTo>
  <CMDBAttribute>
    <Name>data_name</Name>
    <SetValue>
      <OMId />
    </SetValue>
  </CMDBAttribute>
</MapTo>
```

Filtering

Filtering allows to select interesting parts of topology data by assigning a context to these CIs. This context allows to selectively apply mapping rules to CIs of the same context. All CIs that have no context attached will not be synchronized.

Note: The <Rules> tag for filter mapping rules *must not* contain the Context attribute.

Context Mapping

```
<Context>[Context Name]</Context>
```

In the following example, all CIs that are assigned to the type `exch_spi_std_server_role` and that are below a CI with a type `exch_spi_std_server` are assigned to the exchange context.

Example:

```
<Mapping xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
  xsi:noNamespaceSchemaLocation="../mapping.xsd">
  <Rules>
    <Rule name="Exchange Server Role Filter">
      <Condition>
        <And>
          <Exists>
            <XPathResult>ancestor::ci[omType='exch_spi_std_server']
          </XPathResult>
          </Exists>
          <Equals>
            <OMType/>
            <Value>exch_spi_std_server_role</Value>
          </Equals>
        </And>
      </Condition>
      <MapTo>
        <Context>exchange</Context>
      </MapTo>
    </Rule>
  </Rules>
</Mapping>
```

```
    </Rule>  
  </Rules>  
</Mapping>
```

Type Mapping

The type mapping maps the third-party CI type definitions to their CMDB types in the RTSM.

Mapping

Maps the CI to the specified CMDB type that is the concatenated string of the results of the operators. There must not be more than one <CMDBType> element in the <MapTo> section.

```
<CMDBType>  
  [Operand]  
  ...  
</CMDBType>
```

In the following example, all CIs that have an OM Type Exch2k7_ByServer and that have the context exchange assigned are mapped to the CMDB Type exchangeserver.

Example:

```
<?xml version="1.0" encoding="utf-8"?>  
<Mapping>  
  <Rules context="exchange">  
    </Rule>  
    <Rule name="Map Exchange Server">  
      <Condition>  
        <Equals>  
          <OMType/>  
          <Value>Exch2k7_ByServer</Value>  
        </Equals>  
      </Condition>  
      <MapTo>  
        <CMDBType>  
          <Value>exchangeserver</Value>  
        </CMDBType>  
      </MapTo>  
    </Rule>  
  </Rules>  
</Mapping>
```

In the following example, all nodes that have an attribute OSType that starts with the string windows are mapped to the CMDB type nt.

Example:

```
<Mapping>
  <Rules>
    <Rule name="Map Windows Host Type">
      <Condition>
        <And>
          <IsNode/>
          <StartsWith>
            <OMAttribute>OSType</OMAttribute>
            <Value>Windows</Value>
          </StartsWith>
        </And>
      </Condition>
      <MapTo>
        <CMDBType>
          <Value>nt</Value>
        </CMDBType>
      </MapTo>
    </Rule>
  </Rules>
</Mapping>
```

Attribute Mapping

The attribute mapping file `attributemapping.xml` defines the mapping between the attributes of a discovered object and the attributes of a CI in the RTSM.

Set the value of the attribute of the given name to the returned value of the given operand. If more than one operand is given, the values will be concatenated.

Mapping to String Values

```
<CMDBOMAttribute>
  <Name>[Attribute Name]</Name>
  <SetValue>
    [Operands]
  </SetValue>
</CMDBOMAttribute>
```

Mapping to String Values of a Maximum Length

```
<CMDBOMAttribute>
  <Name>[Attribute Name]</Name>
  <SetValue Length="[IntegerValue]">
    [Operands]
  </SetValue>
</CMDBOMAttribute>
```

Mapping to Integer Values

```
<CMDBOMAttribute>  
  <Name>[Attribute Name]</Name>  
  <SetIntValue>  
    [Operands]  
  </SetIntValue>  
</CMDBOMAttribute>
```

Mapping to Boolean Values

```
<CMDBOMAttribute>  
  <Name>[Attribute Name]</Name>  
  <SetBoolValue>  
    [Operands]  
  </SetBoolValue>  
</CMDBOMAttribute>
```

Mapping to Long Values

```
<CMDBOMAttribute>  
  <Name>[Attribute Name]</Name>  
  <SetLongValue>  
    [Operands]  
  </SetLongValue>  
</CMDBOMAttribute>
```

Mapping to Date Values

```
<CMDBOMAttribute>  
  <Name>[Attribute Name]</Name>  
  <SetdateValue>  
    [Operands]  
  </SetdateValue>  
</CMDBOMAttribute>
```

Mapping to Float Values

```
<CMDBOMAttribute>  
  <Name>[Attribute Name]</Name>  
  <SetFloatValue>  
    [Operands]  
  </SetFloatValue>  
</CMDBOMAttribute>
```

Mapping to Byte Values

```
<CMDBOMAttribute>  
  <Name>[Attribute Name]</Name>  
  <SetByteValue>  
    [Operands]  
  </SetByteValue>  
</CMDBOMAttribute>
```

Mapping to Double Values

```
<CMDBOMAttribute>  
  <Name>[Attribute Name]</Name>  
  <SetDoubleValue>  
    [Operands]  
  </SetDoubleValue>  
</CMDBOMAttribute>
```

Mapping to StringList Values

```
<CMDBAttribute>  
  <Name>[Attribute Name]</Name>  
  <SetStringListValue>  
    [Operands] (comma-separated)  
  </SetStringListValue>  
</CMDBAttribute>
```

Mapping to IntList Values

```
<CMDBAttribute>  
  <Name>[Attribute Name]</Name>  
  <SetIntListValue>  
    [Operands] (comma-separated)  
  </SetIntListValue>  
</CMDBAttribute>
```

Relation Mapping

Using the relation mapping you can create relations between CIs.

```
<RelationTo>  
  <To>  
    [Operand]  
  </To>  
  <Type>[RelationType]</Type>  
</RelationTo>
```

Define a relation from the current CI to the CI that is returned by the operand. The operand may either return a string, an instance of a CI, a list of CIs or a list of strings. String values must match the OM ID of the CI to which the relation is created. In the case of a list, a relation is created for each item (that is in turn either a string or a CI) contained in the list.

The relation has the type specified by [RelationType]. This type is the name of the relation, not the label.

```
<RelationFrom>  
  <From>  
    [Operand]  
  </From>  
  <Type>[RelationType]</Type>  
</RelationFrom>
```

Works just as the previous mapping, but in the opposite direction.

Root Container Mapping

The CMDB model defines certain root container CIs that have to be created before the actual CI can be created. Topology synchronization must know such relations to be able to create the CIs in the correct order.

```
<RootContainer>  
  [Operand]  
</RootContainer>
```

The root container of the current CI is set to the CI specified by the return value of the operand. The return value may either be a String or a CI.

Message Alias Mapping for CI Resolution

```
<RedirectMessagesOf>  
  [Operand]  
</RedirectMessagesOf>
```

The aliases of the current CI is set to the OMId(s) specified by the return value of the operand. The return value may either be a String or a CI or a list of CIs or Strings.

In the following example, the CI with the type Exch2k7_ByServer gets a relation of the type is_impacted_from to the node on which it is hosted and a relation of the type deployed to all descendant CIs with a type that starts with Exch2k7_Role_.

The same node is also the root container CI.

Example:

```
<Mapping>  
  <Rules Context="exchange">  
    <Rule name="Create relation server to node">  
      <Condition>  
        <Equals>
```

```
<OMType/>
  <Value>Exch2k7_ByServer</Value>
</Equals>
</Condition>
<MapTo>
  <RelationTo>
    <To>
      <DependencyCI relationType="hosted_on">
        <True/>
      </DependencyCI>
    </To>
    <Type>is_impacted_from</Type>
  </RelationTo>
  <RelationTo>
    <To>
      <DescendantCIList>
        <StartsWith>
          <OMType>
            <Value>Exch2k7_Role_</Value>
          </StartsWith>
        </DependencyCI>
      </To>
      <Type>deployed</Type>
    </RelationTo>
  <RootContainer>
    <DependencyCI relationType="hosted_on">
      <True/>
    </DependencyCI>
  </RootContainer>
  <RedirectMessagesOf>
    <ChildCIList/>
  </RedirectMessagesOf>
</MapTo>
</Rule>
</Rules>
</Mapping>
```

XPath Navigation

XPath is a syntax for defining parts of an XML document. XPath uses path expressions to navigate in XML documents.

XPath is used in the mapping engines to navigate through the CI data structure.

If you are not familiar with the XPath query language, an XPath tutorial can be found at the following Web site:

<http://www.w3schools.com/xpath/>

Data Structure

The data structure that is exposed to the XPath expression matching used in mapping rules is shown in ["Example of an XPath-Navigated Data Structure" on page 109](#).

CI Data Structure

- **OMAttributes**
Contains a map of all original RTSM CI attributes. The key of this map is the name of the RTSM CI attribute that references the RTSM value of the RTSM CI attribute.
- **Caption**
Represents the name of the CI to be displayed in Service Navigator. Caption has the same value as the RTSM CI attribute `display_label`.
- **Children**
References a list of relations to CIs that have a containment relationship from the current CI to other CIs. Using this field, you can create complex XPath queries to retrieve values of children as well as parents using the `..` XPath selector.
- **Dependencies**
References a list of relations to dependent CIs. Similar to `Children`. However, referenced objects are contained in a different hierarchy.
- **OMid**
Unique ID of a CI.
- **Node**
Boolean value that indicates whether this is a node in HPOM.
- **Type**
Contains the service type of an HPOM service.

This is not the display label of the CI Type.
- **Service**
Boolean value that indicates whether this element is a service in HPOM.

Node groups have Node and Service set to FALSE.

Relationship Data Structure

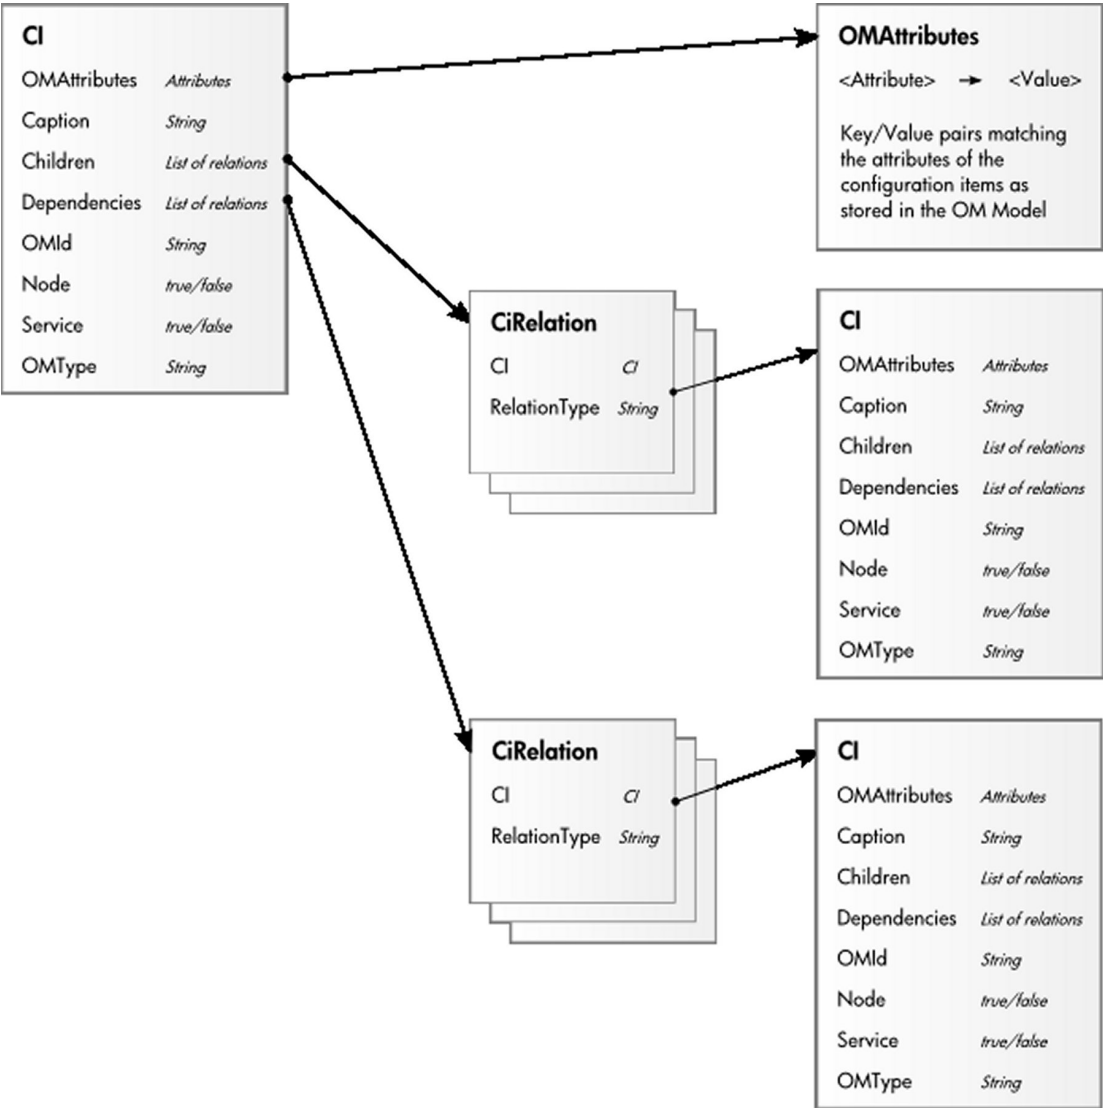

- CI
Contains the reference to the CI to which the current CI is related.
- RelationType
Relationship type as stored in the RTSM.

This is not the display label of the CI Type.

For services:
Contains `container_f` if it is a containment relation in HPOM.
Contains `dependency` if it is a dependency relation in HPOM.
Contains `hosted_on` if it is a hosted on relation in HPOM.

For nodes:
Contains `container_node` or `dependency_node`.

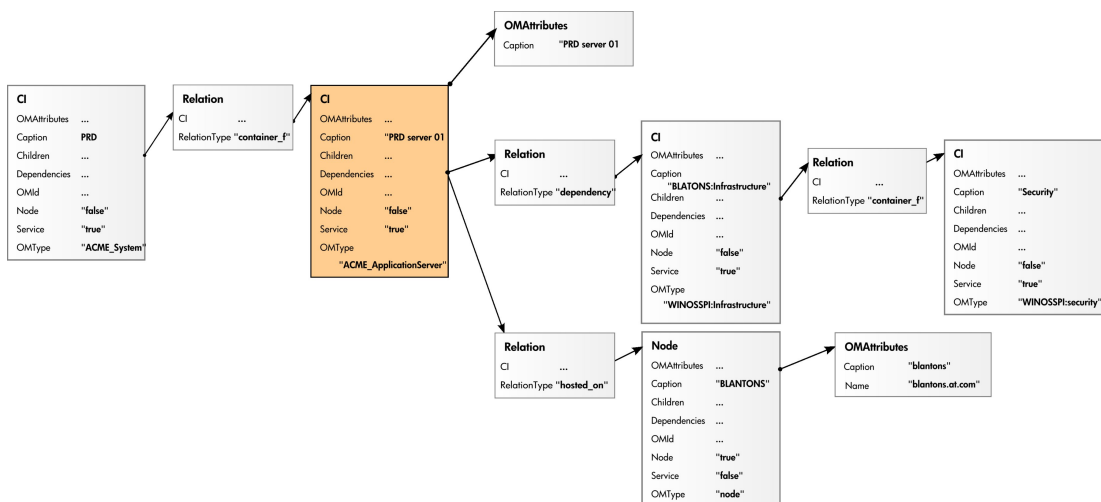

The following figure illustrates the data structure exposed to the navigation.

Example of an XPath-Navigated Data Structure

An example of an XPath-navigated data structure is shown in the figure below. The host is a UNIX system that has an Oracle application running on the HP-UX operating system. The starting point or context for the navigation is the CI that represents the Oracle application (orange background).

The following figure illustrates some XPath examples.

XPath Expressions and Example Values

The following table lists typical XPath expressions and provides an example for each expression.

Xpath Expression	Meaning	Example
Caption	Caption from CI	PRD server 01
./Caption	Caption from CI	PRD server 01
/Caption	Caption of the root (database) CIs	PRD
.././Caption	Selects the caption from the parent of the parent CI	PRD
../RelationType	Selects the parent relation type	container_f
.././OMType	Selects the parent of the parent type	ACME_System
/OMType	Selects type of the root CI	ACME_System
//.[type='WINOSSPI: Infrastructure']/Caption	Selects the caption of all CIs of type WINOSSPI: Infrastructure	BLANTONS: Infrastructure
//Dependencies[type='hosted_on']/CI/Caption	Selects the caption of all CIs with a hosted_on dependency	BLANTONS
//Dependencies/CI/Caption	Selects the caption of all CIs that have dependencies	BLANTONS

Note: If the Xpath expression selects a node below the starting database node, the “.” reads back one step. The following expression reads down to the node db and then links back to the

starting database node.

```
//dependencies[type='hosted_on']/CI/../../
```

However, if the node db is the starting node, the expression `../../` follows the containment links of the node db, which is not the dependency relation that is shown in this example. The result depends on the parent container of the node, which is a different hierarchy.

Uploading the Sync Package to the OMi server

Topology data processing is performed in OMi, therefore you need to upload the sync package to the server:

1. On the OMi server, copy the folder that contains the mapping rules to `%topaz_home%\conf\opr\topology-sync\sync-packages\`. For example, if you created the package in the folder `C:\temp\mysyncpkg`, copy the folder `mysyncpkg`.

2. Execute:

```
%topaz_home%\bin\opr-sdtool.[sh|bat] -uploadpackage <path to the sync folder>
```

3. Open the OMi UI and add the name of the topology sync folder to the list of packages:
 - a. Select **Administration > Setup and Maintenance > Infrastructure Settings**.
 - b. In the Applications drop-down list, select **Operations Management**.
 - c. Under Operations Management - HPOM Topology Synchronization Settings search for **Packages for Topology Sync** and click the  edit button.
 - d. At the end of the string, add a semicolon (;) and the folder name and save. For example, to add the folder `mysyncpkg`, append:
`<existing list>;mysyncpkg`

Topology Discovery Syntax

The XML file that the discovery script creates and to which the mapping rules are applied must use the BSM Connector topology discovery syntax described in this section.

This section includes:

- ["Configuration Item XML Schema Definition \(XSD\)" on the next page](#)
- ["Configuration Item XML Element Description" on page 114](#)
- ["Example Discovery XML" on page 115](#)

Configuration Item XML Schema Definition (XSD)

Your discovery script must output XML that conforms to the following schema:

```
<?xml version="1.0" encoding="utf-8"?>
<xs:schema xmlns:xs="http://www.w3.org/2001/XMLSchema">
  <xs:element name="Service">
    <xs:complexType>
      <xs:choice maxOccurs="unbounded">
        <xs:element ref="NewInstance" />
        <xs:element ref="NewRelationship" />
      </xs:choice>
    </xs:complexType>
    <xs:key name="InstanceKey">
      <xs:selector xpath="NewInstance">
      </xs:selector>
      <xs:field xpath="Key"></xs:field>
    </xs:key>
    <xs:keyref refer="InstanceKey" name="InstanceKeyRef">
      <xs:selector xpath="NewInstance">
      </xs:selector>
      <xs:field xpath="@ref"></xs:field>
    </xs:keyref>
    <xs:keyref refer="InstanceKey" name="InstanceRef">
      <xs:selector xpath="NewRelationship/*/Instance">
      </xs:selector>
      <xs:field xpath="@ref"></xs:field>
    </xs:keyref>
  </xs:element>
  <xs:element name="NewInstance" type="InstanceType" />
  <xs:complexType name="InstanceType">
    <xs:sequence>
      <xs:element ref="Std" />
      <xs:element ref="Virtual" minOccurs="0" />
      <xs:element ref="Key" />
      <xs:element ref="Attributes" />
    </xs:sequence>
    <xs:attribute name="ref" type="xs:string" use="required" />
  </xs:complexType>
  <xs:element name="NewRelationship" type="RelationType" />
  <xs:complexType name="RelationType">
    <xs:sequence>
      <xs:element ref="Parent" />
      <xs:element ref="GenericRelations" minOccurs="0" />
    </xs:sequence>
  </xs:complexType>
  <xs:element name="Std">
    <xs:simpleType>
      <xs:restriction base="xs:string">
        <xs:enumeration value="DiscoveredElement" />
      </xs:restriction>
    </xs:simpleType>
  </xs:element>
</xs:schema>
```

```
        </xs:restriction>
    </xs:simpleType>
</xs:element>
<xs:element name="Virtual">

                    <xs:element ref="Instance" maxOccurs="unbounded" />
                </xs:sequence>
            </xs:complexType>
        </xs:element>
    </xs:sequence>
</xs:complexType>
<xs:element name="Instance">
    <xs:complexType>
        <xs:attribute name="ref" type="xs:string" use="required" />
    </xs:complexType>
</xs:element>
</xs:schema>
```

Configuration Item XML Element Description

The following table describes the elements that the XML document can contain.

Element	Description
NewInstance	Represents a discovered CI. You must add a <i>ref</i> attribute, which must match the unique CI ID that you specify in the <i>Key</i> element. You can then use this reference in <i>Instance</i> elements in the current XML document if you want to create or delete relationships.
DeleteInstance	Represents a CI that you want to delete immediately. The agent automatically deletes previously discovered CIs from the agent repository if your discovery script runs five times (by default) without including the CI as a <i>NewInstance</i> in the XML document. Note: You can control how often the discovery script must run before a missing CI is automatically deleted by changing the agent parameter <code>INSTANCE_DELETION_THRESHOLD</code> in the <code>agtrep</code> namespace. However, if you specify this element, the agent deletes the CI immediately and publishes the change to the RTSM (Run-time Service Model).
NewRelationship	Defines a new relationship between CIs. This element must contain exactly one <i>Parent</i> element and can contain one or more <i>GenericRelations</i> elements.
DeleteRelationship	Defines relationships that you want to delete. This element must contain exactly one <i>Parent</i> element and can contain one or more <i>GenericRelations</i> elements.
Std	Must contain the string <code>DiscoveredElement</code> .
Virtual	Include this element if the CI is virtual. A virtual CI is abstract and does not exist on any node CI. Omit this element if the CI is hosted on a node CI.
Key	Contains the full CI ID for this CI, which must be unique. You must include this element in all <i>NewInstance</i> elements. You must not specify a <i>NewInstance</i> with the same key in the same XML document.
Attributes	Contains <i>Attribute</i> elements.

Element	Description
Attribute	<p>Each <i>Attribute</i> element has the attributes <code>name</code> and <code>value</code>. You can also specify a datatype.</p> <p>Attributes with the following names have a special meaning:</p> <ul style="list-style-type: none"> • <code>hpom_citype</code> specifies the CI type as stored in the RTSM (for example, <code>nt</code>). • Attribute names with the prefix <code>ucmdb_map</code> directly to CI attributes (for example, <code>ucmdb_primary_dns_name</code> maps to the CI attribute <code>Primary DNS Name</code>).
Parent	<p>Contains an <i>Instance</i> element, which defines the CI that is the parent of this relationship.</p> <p>The parent instance that you specify must exist in the RTSM and in the agent repository on the BSM Connector server. Therefore, you may need to include a <i>NewInstance</i> element to add the parent to the agent repository, even if the parent already exists in the RTSM.</p>
Instance	<p>Has a <code>ref</code> attribute that refers to a <i>NewInstance</i> element in the current XML document.</p>
GenericRelations	<p>Contains one or more <i>Relations</i> elements.</p>
Relations	<p>Has a <code>type</code> attribute that refers to the type of relation as stored in the RTSM (for example, <code>usage</code>). Contains one or more <i>Instance</i> elements, which refer to the CIs that are related to the specified <i>Parent</i> element.</p> <p>For complex topologies which require a sync package, add the prefix <code>omrel_</code>. For example, if the type is <code>membership</code> when no sync package is used, it becomes <code>omrel_membership</code> with sync packages.</p>

Example Discovery XML

The following example XML creates three CI instances with the IDs `myUniqueID1`, `myUniqueID2`, and `myUniqueID3`. `myUniqueID1` is the parent CI, and has a contains relationship to `myUniqueID2` and `myUniqueID3`.

Example:

```
<?xml version="1.0" encoding="utf-8" standalone="yes"?>
<Service>
  <NewInstance ref="myUniqueID1">
    <Key>myUniqueID1</Key>
    <Std>DiscoveredElement</Std>
    <Attributes>
      <Attribute name="myAttribute" value="myAttributeValue" />
      <Attribute name="myAttribute1" value="myAttributeValue1" />
    </Attributes>
  </NewInstance>
  <NewInstance ref="myUniqueID2">
    <Key>myUniqueID2</Key>
    <Std>DiscoveredElement</Std>
    <Attributes>
      <Attribute name="myAttribute" value="myAttributeValue" />
      <Attribute name="myAttribute1" value="myAttributeValue1" />
    </Attributes>
  </NewInstance>
  <NewInstance ref="myUniqueID3">
    <Key>myUniqueID3</Key>
    <Std>DiscoveredElement</Std>
    <Attributes>
      <Attribute name="myAttribute" value="myAttributeValue" />
      <Attribute name="myAttribute1" value="myAttributeValue1" />
    </Attributes>
  </NewInstance>
  <GenericRelations>
    <Relations type="usage">
      <Instance ref="myUniqueID2" />
      <Instance ref="myUniqueID3" />
    </Relations>
  </GenericRelations>
</Service>
```

```
    <Attribute name="myType" value="myTypeValue" />
    <Attribute name="title" value="myTitle1" />
  </Attributes>
</NewInstance>
<NewInstance ref="myUniqueID2">
  <Key>myUniqueID2</Key>
  <Std>DiscoveredElement</Std>
  <Attributes>
    <Attribute name="myAttribute" value="myAttributeValue" />
    <Attribute name="myAttribute1" value="myAttributeValuew" />
    <Attribute name="myType" value="myTypeValue1" />
    <Attribute name="title" value="myTitle2" />
  </Attributes>
</NewInstance>
<NewInstance ref="myUniqueID3">
  <Key>myUniqueID3</Key>
  <Std>DiscoveredElement</Std>
  <Attributes>
    <Attribute name="myAttribute" value="myAttributeValue" />
    <Attribute name="myAttribute1" value="myAttributeValuey" />
    <Attribute name="myType" value="myTypeValue2" />
    <Attribute name="title" value="myTitle3" />
  </Attributes>
</NewInstance>
<NewRelationship>
  <Parent>
    <Instance ref="myUniqueID1"/>
  </Parent>
  <GenericRelations>
    <Relations type="omrel_contains">
      <Instance ref="myUniqueID2"/>
    </Relations>
    <Relations type="omrel_contains">
      <Instance ref="myUniqueID3"/>
    </Relations>
  </GenericRelations>
</NewRelationship>
</Service>
```

Troubleshooting

This section describes how to troubleshoot BSM Connector local topology synchronization.

This section includes:

- ["Troubleshooting local topology synchronization" below](#)
- ["Validating XML Mapping Files" below](#)
- ["Mapping Log Files" on the next page](#)
- ["Writing Rules" on the next page](#)
- ["Using the topology CLI tool" on the next page](#)

Troubleshooting local topology synchronization

Make sure the input XML file is written and updated correctly. Each time the topology policy runs, the mapping rules are applied to the whole discovery XML file, not only to appended entries.

For troubleshooting the mapping engine, see ["Mapping Log Files" on the next page](#).

Validating XML Mapping Files

You can use the supplied XML schema definitions to validate the correctness of XML configuration files. You can also use the supplied XML schema definition files to make writing new configuration files easier when using a suitable XML editor (for example Eclipse).

XSD XML Schema Definition is a standard from World Wide Web Consortium (W3C) for describing and validating the contents of XML files. XSD files are provided for all XML configuration files. For more information, see the XML Schema documentation by W3C available from the following Web site: <http://www.w3.org/XML/Schema>.

Each mapping file is automatically validated against the associated XSD file whenever it is read. If a file cannot be validated, an error message is written to the error log that describes the location of the error in the validated file.

The schema files are stored in the following directory:

```
%topaz_home%\conf\opr\topology-sync\schemas
```

The files are:

```
package.xsd
```

Validates the `package.xml` file in each synchronization package.

```
mapping.xsd
```

Validates the following mapping files contained in the synchronization packages:

- Context mapping - `contextmapping.xml`
- Type mapping - `typemapping.xml`

- Attribute mapping - `attributemapping.xml`
- Relation mapping - `relationmapping.xml`

Mapping Log Files

The mapping engine generates the following log file:

```
%topaz_home%\logs\opr-ts.log
```

Writing Rules

Use following guidelines when writing rules:

- **Simplify Rule Development.** You can ease the writing of rules by selecting an XML editor that can validate and suggest elements according to an XML schema.
- **Avoid Complex XPath Queries.** Avoid complex XPath queries, especially in general conditions, where such queries must be applied to every CI. If you cannot avoid a complex XPath query, try to narrow the condition using operators such as `OMType`, combined using the `And` operator. Make sure that the simpler, non-XPath conditions are checked first (hint: `And` is an exclusive operator).
- **Match Against Existing Attributes Only.** Accessing attributes that do not exist for all CIs is very performance intensive in combination with a relative expression depending on the complexity of the CI hierarchy.
- **Avoid Broad XPath Expressions.** Certain complex XPath expressions can result in excessive processing loads. For example, XPath expressions that include the following characteristics:
 - Apply to multiple nodes, such as expressions that contain `//` or `descendants:*/`
 - Do not match nodes or match only on nodes that are very distant from the current node

The same applies to the `XPathResultList` operator that returns all matched values. The time required for such operations grows approximately quadratically with the size of a hierarchy. Avoid such expressions where possible.

When using the `descendants` operator, do not use the star symbol (*) as node test, but specify the name of the node of interest. For example, do not use `descendants:*/caption` but use `descendants:ci/caption`.

If you cannot avoid such an XPath expression within a condition, try to limit its execution by using the exclusive `And` operator and perform simple tests before the `XPathResult` operand is being used. For example, you could first check for the CI type.

Using the topology CLI tool

Use the `topology` command line tool to list all topology repositories, delete repositories, and send the last known delta or repository to the `ServiceDiscoveryServer` (`SvcDscSvr`).

The tool is located in

%OvInstallDir%/bin/win64 (Windows systems)

/opt/OV/bin (Linux systems).

Usage

```
topology -h  
-list  
-publishrepo <SELECTION>  
-publishdelta <SELECTION>  
-clean <SELECTION>
```

<SELECTION>:

```
[-all | -polname <name>[/<src>|/*] | -polid <uuid>[/<src>|/*]]
```

Option descriptions

Option	Description
-h, --help	Show this help message.
-list	Lists all topology repositories.
-publishrepo <SELECTION>	Sends the repository through BBC to the SvcDscSvr.
-publishdelta <SELECTION>	Sends the last delta through BBC to the SvcDscSvr.
-clean <SELECTION>	Deletes the repository and the last delta file.

Part III: Integrating Data With BSM Connector

This section includes:

- "Database Policies (Events and Metrics only)" on page 122
- "Structured Log File Policies (Events and Metrics only)" on page 214
- "Open Message Interface Policies (Events only)" on page 149
- "Scheduled Task Policies (Events only)" on page 189
- "SNMP Interceptor Policies (Events only)" on page 206
- "REST Web Service Listener Policies" on page 161
- "XML File Policies" on page 240

Chapter 9: Database Policies (Events and Metrics only)

Database policies enable you to collect data from database tables used by third-party systems by performing a query through a JDBC connection.

The following are examples of data that can be integrated into OMi using database policies:

- Events from monitoring applications event tables or views.
- Data from monitoring applications metrics tables.

What Data Is Forwarded

Database policies use a user defined SQL query, an initial value statement, and a static initial value (session variable). The query you provide is used to define a search criterion on the database and with the initial value statement and a set up session variable, you can provide initial values that you can use in filtering. Starting with OMi 10.00, you are no longer limited to a fixed set of SQL clauses but can write more complex queries as well.

For example, if you fetch a field that contains a time stamp, you can write an SQL query to process only data records that happened after the policy was activated. You can do so by setting an appropriate initial value statement that is executed when the policy is activated and then compare the values retrieved in the main SQL clause against this initial value. For details on how the queries are used to fetch and filter records, see "[Understanding How Data From an SQL Query is Processed](#)" on page 126.

You use defaults and rules to control the data that is sent from BSM Connector to OMi.

How to Collect Event Data from Databases

This task describes how to collect event data from databases.

1. *Prerequisite:* Make sure the following applies:
 - a. Your BSM Connector is configured to work with OMi by using the `bsmc-conf` tool.
 - b. The certificate request is approved on the OMi side.
 - c. Your BSM Connector is set up as a connected server in OMi.
2. In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **Database**.

Alternatively, double-click an existing policy to edit it.

3. In the **Properties** page, define information that is related to the policy itself (for example, the name and description of the policy).

For details, see ["Configuring Database Policy Properties" on page 125](#).

4. In the **Source** page, define the connection to the database and the columns that the policy accesses.

For details, see ["Configuring the Data Source in Database Policies" on page 126](#).

5. In the **Mappings** page, configure the default mappings of table columns to custom variables.

For details, see ["Configuring Mappings in Database Policies" on page 131](#).

6. *Optional.* In the **Defaults** page, configure the default settings for all events generated by the policy (for example, default event correlation settings).

For details, see ["Configuring Event Defaults in Database Policies" on page 133](#).

7. In the **Rules** page, define what the policy should do in response to a specific type of event.

For details, see ["Configuring Event Rules in Database Policies" on page 139](#).

8. In the **Options** page, configure several policy behaviors (for example, pattern matching options).

For details, see ["Configuring Options in Database Policies" on page 147](#).

9. Click **Save and Close** to save the policy and close the editor.

10. *Optional.* If the list of policies does not refresh automatically in the BSM Connector user interface, click  in the toolbar.

How to Collect Metrics Data from Databases

This task describes how to collect metrics from databases.

Note: For examples and end-to-end workflow information on collecting metrics data, see ["Collecting and Viewing Metrics Data" on page 60](#).

1. *Prerequisite:* Make sure the following applies:
 - a. Your BSM Connector is configured to work with OMi by using the `bsmc-conf` tool.
 - b. The certificate request is approved on the OMi side.
 - c. Your BSM Connector is set up as a connected server in OMi.
2. In the BSM Connector user interface, click  in the toolbar. Then click **Metric >  Database**.

Alternatively, double-click an existing policy to edit it.

3. In the **Properties** page, define information that is related to the policy itself (for example, the name and description of the policy).

For details, see ["Configuring Database Policy Properties" on the next page](#).

4. In the **Source** page, define the connection to the database and the columns that the policy accesses.

For details, see ["Configuring the Data Source in Database Policies" on page 126](#).

5. In the **Mappings** page, map columns of database tables to custom variables.

For details, see ["Configuring Mappings in Database Policies" on page 131](#).

6. *Optional.* In the **Defaults** page, assign default values to the metric attributes.

For details, see ["Configuring Metrics Defaults in Database Policies" on page 136](#).

7. In the **Rules** page, define what the policy should do in response to a specific metric.

For details, see ["Configuring Metrics Rules in Database Policies" on page 143](#).

8. In the **Options** page, configure several policy behaviors (for example, pattern matching options).

For details, see ["Configuring Options in Database Policies" on page 147](#).

9. Click **Save and Close** to save the policy and close the editor.

10. *Optional.* If the list of policies does not refresh automatically in the BSM Connector user interface, click  in the toolbar.

Database Policy User Interface

Database policies display different pages depending on the type of data they are integrating and on the policy origin.

Choose the type of data you want to integrate and then complete the following tasks:

Event data

- ["Configuring Database Policy Properties" on the next page](#)
- ["Configuring the Data Source in Database Policies" on page 126](#)
- ["Configuring Mappings in Database Policies" on page 131](#)
- ["Configuring Event Defaults in Database Policies" on page 133](#)

- ["Configuring Event Rules in Database Policies" on page 139](#)
- ["Configuring Options in Database Policies" on page 147](#)

Metrics data

- ["Configuring Database Policy Properties" below](#)
- ["Configuring the Data Source in Database Policies" on the next page](#)
- ["Configuring Mappings in Database Policies" on page 131](#)
- ["Configuring Metrics Defaults in Database Policies" on page 136](#)
- ["Configuring Metrics Rules in Database Policies" on page 143](#)
- ["Configuring Options in Database Policies" on page 147](#)

Configuring Database Policy Properties

Every policy has a set of properties that identify and describe the policy. Properties include, for example, the policy name and a description of what the policy does.

To access

- In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **Database**.
- In the BSM Connector user interface, click  in the toolbar. Then click **Metric** >  **Database**.

Alternatively, double-click an existing policy to edit it.

Tasks

How to configure policy properties

In the Properties page, type a name for the policy. You can use spaces in the name. The equal sign (=) is not allowed.

Related tasks

- ["How to Collect Event Data from Databases" on page 122](#)
- ["How to Collect Metrics Data from Databases" on page 123](#)

UI Descriptions

For a description of the Properties page, see ["Properties Page" on page 313](#).

Configuring the Data Source in Database Policies

The source page of the database policy editor enables you to set up the connection to the database and to specify which database tables the policy accesses.

To access

- In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **Database**.
- In the BSM Connector user interface, click  in the toolbar. Then click **Metric** >  **Database**.

Alternatively, double-click an existing policy to edit it.

Click **Source** to open the policy Source page.

Learn More

This section includes:

- ["Database drivers packages supplied with BSM Connector" below](#)
- ["Understanding How Data From an SQL Query is Processed" below](#)

Database drivers packages supplied with BSM Connector

BSM Connector 10.00 does not provide any production driver packages. You need to install a compatible JDBC database driver provided by your database vendor or a third party driver.

In previous releases, BSM Connector provided driver packages that could be used in a *test* environment. Starting with BSM Connector 10.00, the testing drivers are no longer supplied.

Understanding How Data From an SQL Query is Processed

When querying the database - for example with a combination of `select` and `from` SQL clauses - all the rows from the table defined in the clause are retrieved, unless you define a further clause that filters the data. For example, you may want to retrieve only entries that were added after a certain point in time and not all entries in the table. To do so, you can compare the results returned by the SQL clause against a *data map* that you can populate with an initial SQL statement or by setting up a session variable for each key.

When the *initial SQL statement* is executed, the data map is initialized with values. The values returned as last record from the execution of the statement are copied to the data map and returned. You can

then compare the values in your SQL query against the values in the data map by referring to the keys (<\$DATA:<key>>). This will be replaced with the current value of the <key> in the data map.

To make sure that the data map is not empty if the initial SQL statement does not return any values, you should set a session variable for each key. This value is then used to replace <\$DATA:<key>> in the executable SQL statement.

For an example, see ["How to configure the database source" on the next page](#).

Tasks

This section includes:

- ["How to configure the prerequisites" below](#)
- ["How to configure the database source" on the next page](#)

How to configure the prerequisites

- There are several key database driver requirements for using this policy.
 - You must install or copy a compatible JDBC database driver or database access API locally on the BSM Connector systems. Many database driver packages are available as compressed (zipped) archive files or .jar files. If the file is in zip format, unzip the contents. A recommended location for the downloaded driver is the directory the C:/Program Files/HP/HP BTO Software/java.
 - You must know the syntax for accessing the database driver. See the driver documentation for details.

Examples of common database driver strings are:

- **com.microsoft.sqlserver.jdbc.SQLServerDriver** The Microsoft SQL Server JDBC driver.
- **oracle.jdbc.OracleDriver** The Oracle JDBC driver.
- You must know the syntax for the Database Connection string. The Database Connection string normally includes the class of driver you are using, some key name relating to the supplier of the driver software, followed by a combination of server, host, and port identifiers. For details, see the driver documentation.

Example: Database Connection URLs for Microsoft SQL Server for this policy:

- **jdbc:sqlserver://<hostname>:1433;Database=<name>;**

where <hostname> is the name of the host where the database is running and <name> is the name of the database.

- The database you want to query must be running, have a database name defined, and have at least one named table created in the database. In some cases, the database management software needs to be configured to enable connections by using the middleware or database driver.
- You need a valid user name and password to access and perform a query on the database. In some cases, the machine and user account that BSM Connector is running on must be given permissions to access the database.
- You must know a valid SQL query string for the database instance and database tables in the database you want to query. Consult your database administrator to work out required queries to use.
- Use a database client to connect to the relevant software database. Identify which tables contain the required data (the software schema documentation may help you with this).

How to configure the database source

This task describes how to configure the database source and how the policy queries the database.

1. Configure the connection to the database:

- a. In the **Classpath** field, type the location of the .jar file that is loaded.

Example: C:/Program Files/HP/HP BTO Software/java/sqljdbc4.jar
(Microsoft SQL Server installed in the default folder)

- b. In the **JDBC Driver Class** field, type the name of the driver used to connect to the database. Use the Fully Qualified Class Name of the JDBC driver you are using.

Example: com.microsoft.sqlserver.jdbc.SQLServerDriver
(Microsoft SQL Server Driver class)

- c. In the **Connect string** field, type the URL to the database connection (referred to as an Authentication string).

Example: jdbc:sqlserver://system2.company.com:1433;Database=BSMEVENTS
(Microsoft SQL Server Driver connection string)

- d. Enter the username and password.
- e. Under **Polling interval**, specify how often the policy queries the database. Use the spinboxes to specify increments of seconds, minutes, hours, and days.
- f. Optionally, enter any additional connection properties needed by the database to which you are connecting. See the database documentation for details.

2. Select the **Collection** tab and specify the SQL query:

- a. An **SQL statement** to query the data.

Write a query that fits the database you are using and the type of data you are querying.

For example, a basic query might look like this:

```
"select {* | <column>[,<column>...] [,<column> ...]} from <table>
[,<table>...] [where <SQL clause to define select criteria>"]
```

select clause: enter * for all fields or a comma separated list of column names to be retrieved from the database.

from clause: enter a table name or a comma separated list of tables from which the selected columns should be extracted.

where clause: enables you to define the selection criteria. If you not define it, all the rows from the table defined in the **from** clause are retrieved.

The queries are not limited to this example set and you can write more complex ones that suit your needs.

Click  to retrieve the specified table columns from the database. The results are displayed in the Sample Data tab of the policy.

See the example at the end of this step to see how you can connect the SQL statement, the initial value statement, and the memento.

- b. Define initial values for keys by setting up the **Session Variables**.

Click  to add a new field. Type the name of the key and its initial value. Alternatively, you can drag and drop entries from the Initial value sample data tab.

Note: It is recommended that you set up a session variable *for each key*. If no records are found with the initial value statement, the value set up in the session variable is used to replace the key in the executable SQL statement. Without an initial value the SQL statement for the execute method is not valid.

See the example at the end of this step to see how you can connect the SQL statement, the initial value statement, and the session variable.

- c. Enter the **Initial value** statement.

An SQL statement that is executed in the init method. It can be used to initialize the data map with values. The values returned as last record from the execution of the statement are copied to the data map and returned.

Click  to retrieve the specified table columns from the database. The results are displayed in the Initial Value Sample Data tab of the policy.

Example:

The following example shows how you can set up a combination of an SQL statement, an initial value statement, and a session variable to query the table "dbo.ALL_EVENTS" that contains the columns "ID", "TITLE", and "TIME_RECEIVED", and to collect all new records after the activation of the policy.

SQL statement:

```
"select ID,TITLE,TIME_RECEIVED from dbo.ALL_EVENTS where TIME_RECEIVED > '<$DATA:TIME_RECEIVED>' order by TIME_RECEIVED;"
```

<\$DATA:TIME_RECEIVED> will be replaced with the current value of TIME_RECEIVED in the data map. Therefore this SQL statement will return all new records that are added to the table after the SQL init statement was called and set the value in the data map.

Initial value statement: The following initial statement is used to fill the data map when the policy is activated:

```
"select top 1 ID,TIME_RECEIVED,TITLE from dbo.ALL_EVENTS order by TIME_RECEIVED DESC;"
```

This statement returns the newest record from the table. The values of the three columns are stored in the data map and can later be accessed in the SQL statement.

Session variables: TIME_RECEIVED "2014-09-09 00:00:00.000"

This is the initial value for the key TIME_RECEIVED. If no records are found with the initial SQL statement, this value is used to replace <\$DATA:TIME_RECEIVED> in the executable SQL statement.

3. Optionally, select the **Internals** tab and modify the default settings for the:
 - a. **Fetch Size** - the maximum number of entries the policy sends at once.
 - b. **Result size** - the maximum number of entries the policy retrieves from the database in each run.

By adjusting the fetch and result sizes you can balance the loads on the database and the BSM Connector system.

Configuring Mappings in Database Policies

The Mappings page enables you to map columns of database tables to custom variables.

To access

- In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **Database**.
- In the BSM Connector user interface, click  in the toolbar. Then click **Metric** >  **Database**.

Alternatively, double-click an existing policy to edit it.

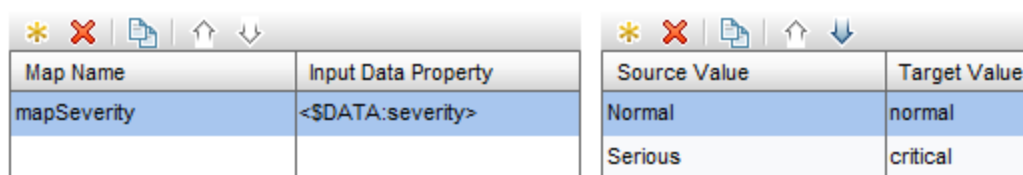

Click **Mappings** to open the policy Mappings page.

Learn More

Mappings overview

A custom variable consists of a map name, an optional database table column, and one or more source and target value pairs. For example, you can assign the table column SEVERITY to the map name mapSeverity, and add a source value of Serious. You can then assign the target value critical to the variable so that BSM Connector inserts the value critical into the event in all places where the variable is used and the source value is Serious in the database record.

Default Value Mapping

Map Name	Input Data Property
mapSeverity	<\$DATA:severity>

Source Value	Target Value
Normal	normal
Serious	critical

Table columns use the following syntax: <\$DATA: <table_column>>

where <table_column> is the name of the table column in the third-party database, for example <\$DATA:severity>.

For example, the custom variable `mapSEVERITY` has the table column `SEVERITY` assigned.

Assigning a table column to a map name is optional. If you do not assign a table column to a variable, you must add the source value directly to the variable when you insert the variable in an event attribute.

You can rearrange the information that appears in the lists by clicking the up or down arrows at the top of the list.

The Sample Data tab is empty if no sample data has been loaded into the policy or if the database query fails.

The Table Column tab shows the following information, if sample data is available:

- Input Data Properties

If sample data is available, then the Input Data Properties section shows the table columns specified in the query.

- Values for `<table column>`

The Values for `<table column>` section displays the values of a column selected in the Input Data Properties section. If a value appears more than once, click  to show or hide duplicate values. To find values that belong to more than one row, select the value and click . The Database Sample Data window opens and shows all rows that have the selected value.

When you drag a column from the table columns list and drop it on the Default Value Mapping list, BSM Connector automatically adds the default prefix `map` to the map name and inserts the table column. You can then drag one or more column source values from the values list and drop them on the Source Value list. You then finally only have to type the target values.

Tasks

How to configure mappings for table columns

This task describes how to map table columns to custom variables.

1. Create one or more custom variables.

If you are working with sample data, drag the table column from the table column list to the Map Name column. BSM Connector automatically adds the default prefix `map` to the map name and inserts the column name.

Alternatively, click  above the Map Name column and type the variable name in the map name field. Columns are optional. If you do not assign a column to a variable, you must add the source value directly to the variable when you insert the variable in an event attribute.

2. Add one or more source and target value pairs to each custom variable.

- If you are working with sample data, drag the value from the Values list to the Source Value column, and type the target value in the corresponding field.

Alternatively, click  above the Source Value column and type the source and target values in the corresponding fields.

- Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types.

To insert an indicator in a source or target value field, drag and drop the indicator state (for example, HTTPServer:Normal) from the Indicators tab to the policy.

- Optionally, use the **Policy Variables** tab to add policy variables to event or metric attributes. BSM Connector replaces the variables with the appropriate values in the generated event or metric.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example "<MSG_NODE>".

Configuring Event Defaults in Database Policies

The Defaults page enables you to indicate default settings for all events generated by the policy.

These defaults affect all new and existing rules. You can override the defaults in individual rules if needed. If a rule contains empty event attributes, the agent will use the defaults for the new event.

To access

In the BSM Connector user interface, click  in the toolbar. Then click **Event >  Database**.

Alternatively, double-click an existing policy to edit it.

Click **Defaults** to open the policy Default Event Attributes page.

Tasks

How to configure event defaults for database policies

This task describes how to configure default settings for all events generated by the policy.

1. Click **Event Attributes** to define default event attributes, such as severity and category.

Tip: After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated event type indicators (ETIs).

To insert an indicator, drag and drop the indicator with its state from the Indicators tab to the policy.

2. Click **Event Correlation** to set the type of duplicate event suppression and define the method used to suppress duplicate events.
3. Click **Custom Attributes** to add additional information to all events generated by this policy. For example, you might add a company name, contact information, or a city location to an event.
4. Click **Advanced** to define default advanced attributes such as legacy HPOM attributes and agent MSI (Message Stream Interface) settings.
5. Optionally, use the **Sample Data** tab to drag table columns and values to the policy fields. Alternatively, you can type the path to the table column directly into the attribute box.

Table columns use the following syntax: <\$DATA:<table_column>>

<table_column> is the name of the table column in the third-party database.

BSM Connector replaces the table column at runtime with the value of the specified column. If you insert a column value, the value will be used.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or if the database query did not succeed. See also "[Configuring the Data Source in Database Policies](#)" on page 126.

6. Optionally, use the **Mappings** tab to add mapping definitions to the attribute boxes.

Mappings are custom variables that you define in the Mappings page (see also "[Configuring Mappings in Database Policies](#)" on page 131).

Custom variable into the attribute box using the following syntax:

`<$MAP(<custom_variable>)>` where `<custom_variable>` is the map name of the variable (for example, `<$MAP(mapSEVERITY)>`).

If the custom variable does not have a table column Input Data Property, use the following syntax:

`<$MAP(<custom_variable>,<<source_value>>)>` where `<source_value>` can be one of the following:

- Name of the table column, for example `<$MAP(mapSEVERITY)>`, `<$DATA:SEVERITY>`
 - The source value itself, for example `<$MAP(SEVERITY)>`, `Critical`
7. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated health indicators (HIs) and event type indicators (ETIs).
 8. Optionally, use the **Policy Variables** tab to add policy variables to event attributes. BSM Connector replaces the variables with the appropriate values in the generated event.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example `"<$MSG_NODE>"`.

Configuring Metrics Defaults in Database Policies

The Default Metric Attributes page enables you to assign default values to the metric attributes. The values can be used when defining the policy rules on the Rules tab, and can also be overridden there.

Note: For examples and end-to-end workflow information on collecting metrics data, see ["Collecting and Viewing Metrics Data" on page 60](#).

To access

In the BSM Connector user interface, click  in the toolbar. Then click **Metric >  Database**.

Alternatively, double-click an existing policy to edit it.

Click **Defaults** to open the policy Default Metric Attributes page.

Learn More

Metrics attributes

Each time a metrics policy runs, it extracts raw data from its defined data source and builds a metric structure.

A metric structure consists of these attributes:

- Basic attributes:
 - Data domain
 - The namespace of the integrated performance records, used in the Operations Agent store to avoid clashes.
 - Metric class
 - Defines the metric class under which the metric appears in the Operations Agent store and consumers.
 - Metric name
 - Defines the metric name under which the metric appears in the Operations Agent store and consumers.
 - Related CI
 - Used to identify an instance of a performance record and associates it with a concrete CI instance. For details on how to associate the Related CI with the values in the RTSM model,

see ["Create a policy" on page 60](#). For an example, see ["Example – Create a Metrics Policy" on page 61](#).

- Node
Used to identify a node-like CI to which the performance records are associated to.
- Value
The actual performance value which is converted to 64-bit floating point number.
- Time measured
The time stamp when the value was determined in the third-party system.
- Advanced attributes:
 - Original metric name
The name of the metric as used on the third-party system.
 - Unit
The unit of the metric.
 - Integration id
An id, used to identify the source of the integration.

Tasks

How to configure metrics defaults for database policies

This task describes how to configure metric attribute defaults for all metrics collected by this policy.

1. Define the metric attributes common to all metrics collected by this policy, such as metric class and name. All metrics in the **Basic** tab marked with a * are required. **Advanced** attributes are optional.
2. Optionally, use the **Sample Data** tab to drag table columns and values to the policy fields. Alternatively, you can type the table column directly into the attribute boxes.

Table columns use the following syntax: <\$DATA:<table_column>>

<table_column> is the name of the table column in the third-party database.

BSM Connector replaces the table column at runtime with the value of the specified column. If you insert a column value, the value will be used.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or if the database query did not succeed. See also ["Configuring the Data Source in Database Policies" on page 126](#).

3. Optionally, use the **Mappings** tab to add mapping definitions to the attribute boxes.

Mappings are custom variables that you define in the Mappings page (see also ["Configuring Mappings in Database Policies" on page 131](#)).

Custom variable into the attribute box using the following syntax:

`<$MAP(<custom_variable>)>` where `<custom_variable>` is the map name of the variable (for example, `<$MAP(mapSEVERITY)>`).

If the custom variable does not have a table column Input Data Property, use the following syntax:

`<$MAP(<custom_variable>,<<source_value>>)>` where `<source_value>` can be one of the following:

- Name of the table column, for example `<$MAP(mapSEVERITY)>`, `<$DATA:SEVERITY>`
- The source value itself, for example `<$MAP(SEVERITY)>`, `<Critical>`

4. Optionally, use the **Operators** tab to apply operators to the metric attribute values. Two functions are available:

- `<$MATCH(<>)>`, to get a sub string of input data: The `$MATCH` function accepts three or four parameters:

- the input string
- the pattern definition
- the output string if pattern matches on the input string
- optionally, the output string if the pattern does not match.

Example: The data of the input field hostname start always with "TEST" (for example "TESTABC"). The `$MATCH` function to use the string after "TEST" is:

```
$MATCH(<$DATA:hostname>,TEST<*.prefix>,<prefix>)
```

- `<$DATETIME(FORMAT,VALUE)>`, to convert a string with date and time information to the internal integer data time format.

For detailed description of the format, see ["Pattern Matching in Policy Rules" on page 265](#).

5. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After

loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types.

6. Optionally, use the **Policy Variables** tab to add policy variables to metric attributes. BSM Connector replaces the variables with the appropriate values in the generated metric.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example "<MSG_NODE>".

Related tasks

Configuring Event Rules in Database Policies

Rules define what a policy should do in response to a specific type of event. Each rule consists of a condition and of settings for the event generated by the policy. The condition is the part of a policy that describes the source. The settings enable you to configure the event that BSM Connector sends to OMi.

A policy must contain at least one rule. If the policy contains multiple rules, it is important to remember that the rules are evaluated in a specific order, and that when one condition is matched, no additional rules will be evaluated.

To access

- In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **Database**.

Alternatively, double-click an existing policy to edit it.

Click **Rules** to open the policy Rules page.

Learn More

Rule types

The rule types are:

- **Event on matched rule.** If matched, BSM Connector sends an event to OMi. The event uses the settings defined for the rule. If you do not configure these settings, the default settings are used.
- **Suppress on matched rule.** If matched, BSM Connector stops processing and does not send an event to OMi.
- **Suppress on unmatched rule.** If not matched, BSM Connector stops processing and does not send an event to OMi.

Tasks

How to configure rules in database policies

This task describes how to configure policy rules.

1. In the policy **Rules** section, click  and select the type of rule to define what the policy should do in response to a specific value in a table column. Each policy must have at least one rule.
2. In the **Rule Content** section, use the **Condition** tab to specify the table column and values that the policy searches for in the database that the policy accesses. If the policy finds a match, it may or may not generate an event, depending on the rule type.
 - a. Click  to create a new condition. New conditions by default use the equals operator.
 - b. Click  to expand the new condition.
 - c. In the **Property** field, specify the name of the table column that the policy searches (for example, SEVERITY).

If you are working with sample data, you can drag and drop the table column from the Table Column list to the Properties field.

- d. Select the pattern operator.

If you select the matches operator, you can type a pattern in the Operand field. For a list of available operators, see ["Operator" on page 296](#).

- e. In the **Operand** field, type the value or pattern that you want the policy to compare with the table column. If you are working with sample data, you can drag the value from the Values list and drop it in the Operand field.

3. Use the **Event Attributes** tab to define event attributes (for example, event title and description) for all events generated by this rule.

Tip: After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated event type indicators (ETIs).

To insert an indicator, drag and drop the indicator with its state from the Indicators tab to the policy.

4. Use the **Event Correlation** tab to set the type of duplicate event suppression and define the method used to suppress duplicate events.
5. Use the **Custom Attributes** tab to add additional information to all events generated by this rule. For example, you might add a company name, contact information, or a city location to an event.
6. Use the **Advanced** tab to define an event drill-down URL, legacy HPOM attributes, and agent MSI (Message Stream Interface) settings.
7. Optionally, use the **Sample Data** tab to drag table columns and values to the policy fields. Alternatively, you can type the path to the table column directly into the attribute box.

Table columns use the following syntax: `<$DATA:<table_column>>`

`<table_column>` is the name of the table column in the third-party database.

BSM Connector replaces the table column at runtime with the value of the specified column. If you insert a column value, the value will be used.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or if the database query did not succeed. See also "[Configuring the Data Source in Database Policies](#)" on page 126.

8. Optionally, use the **Mappings** tab to add mapping definitions to the attribute boxes.

Mappings are custom variables that you define in the Mappings page (see also "[Configuring Mappings in Database Policies](#)" on page 131).

Custom variable into the attribute box using the following syntax:

`<$MAP(<custom_variable>)>` where `<custom_variable>` is the map name of the variable (for example, `<$MAP(mapSEVERITY)>`).

If the custom variable does not have a table column Input Data Property, use the following syntax:

`<$MAP(<custom_variable>,<<source_value>>)>` where `<source_value>` can be one of the following:

- Name of the table column, for example `<$MAP(mapSEVERITY)>`, `<$DATA:SEVERITY>`
- The source value itself, for example `<$MAP(SEVERITY)>`, `Critical)`

9. Optionally, use the **Pattern Matching Variables** tab to add variables created through pattern matching.

Pattern matching variables insert matched strings that have previously been assigned to variables. To insert a pattern matching variable, type the variable name enclosed in angle brackets (for example, `<variablename>`) or drag and drop it from the Pattern Matching Variables list to the event attribute.

10. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated health indicators (HIs) and event type indicators (ETIs).
11. Optionally, use the **Policy Variables** tab to add policy variables to event attributes. BSM Connector replaces the variables with the appropriate values in the generated event.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example `"<$MSG_NODE>"`.

Configuring Metrics Rules in Database Policies

Rules define what a policy should do in response to a specific type of metric. Each rule consists of a condition and of settings for the metrics generated by the policy. The condition is the part of a policy that describes the source. The settings enable you to configure the metrics that BSM Connector sends to OMi.

A policy must contain at least one rule. If the policy contains multiple rules, it is important to remember that the rules are evaluated in a specific order, and that when one condition is matched, no additional rules will be evaluated.

Note: For examples and end-to-end workflow information on collecting metrics data, see ["Collecting and Viewing Metrics Data" on page 60](#).

To access

In the BSM Connector user interface, click  in the toolbar. Then click **Metric >  Database**.

Alternatively, double-click an existing policy to edit it.

Click **Rules** to open the policy Rules page.

Learn More

This section includes:

- ["Rule types" below](#)
- ["Metrics attributes" on the next page](#)

Rule types

The rule types are:

- **Store on matched rule.** If matched, BSM Connector stores metrics in a buffer until a maximum number of records or a maximum amount of time are reached. These metrics are sent to OMi when they are requested. The metrics use the settings defined for the rule. If you do not configure these settings, the default settings are used.

- **Suppress on matched rule.** If matched, BSM Connector stops processing.
- **Suppress on unmatched rule.** If not matched, BSM Connector stops processing.

Metrics attributes

Each time a metrics policy runs, it extracts raw data from its defined data source and builds a metric structure.

A metric structure consists of these attributes:

- Basic attributes:
 - Data domain
The namespace of the integrated performance records, used in the Operations Agent store to avoid clashes.
 - Metric class
Defines the metric class under which the metric appears in the Operations Agent store and consumers.
 - Metric name
Defines the metric name under which the metric appears in the Operations Agent store and consumers.
 - Related CI
Used to identify an instance of a performance record and associates it with a concrete CI instance. For details on how to associate the Related CI with the values in the RTSM model, see ["Create a policy" on page 60](#). For an example, see ["Example – Create a Metrics Policy" on page 61](#).
 - Node
Used to identify a node-like CI to which the performance records are associated to.
 - Value
The actual performance value which is converted to 64-bit floating point number.
 - Time measured
The time stamp when the value was determined in the third-party system.
- Advanced attributes:

- Original metric name
The name of the metric as used on the third-party system.
- Unit
The unit of the metric.
- Integration id
An id, used to identify the source of the integration.

Tasks

How to configure rules for metrics in database policies

1. In the policy **Rules** section, click  and select the type of rule to define what the policy should do in response to a specific string in the table column.
2. In the **Rule Content** section, use the **Condition** tab to define the match condition.

Click  to create a new condition. Enter the property and select the operator from the drop-down list. Add the operand. Use the arrows and collapse/expand buttons to navigate the conditions.

3. *Optional.* If you are creating a rule of the type 'store on matched rule', set the attributes (**Basic** or/and **Advanced**) for metrics that you want the rule to override. If default attributes are specified in the Defaults tab, you use the defaults or you can override them as described below.

The attributes are in two groups, basic and advanced. The metrics in the **Basic** tab are required. **Advanced** attributes are optional.

4. Optionally, use the **Sample Data** tab to drag table columns and values to the policy fields. Alternatively, you can type the table column directly into the attribute boxes.

Table columns use the following syntax: <\$DATA:<table_column>>

<table_column> is the name of the table column in the third-party database.

BSM Connector replaces the table column at runtime with the value of the specified column. If you insert a column value, the value will be used.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or if the database query did not succeed. See also "[Configuring the Data Source in Database Policies](#)" on page 126.

5. Optionally, use the **Mappings** tab to add mapping definitions to the attribute boxes.

Mappings are custom variables that you define in the Mappings page (see also "[Configuring Mappings in Database Policies](#)" on page 131).

Custom variable into the attribute box using the following syntax:

`<$MAP(<custom_variable>)>` where `<custom_variable>` is the map name of the variable (for example, `<$MAP(mapSEVERITY)>`).

If the custom variable does not have a table column Input Data Property, use the following syntax:

`<$MAP(<custom_variable>,<<source_value>>)>` where `<source_value>` can be one of the following:

- Name of the table column, for example `<$MAP(mapSEVERITY)>`, `<$DATA:SEVERITY>`
- The source value itself, for example `<$MAP(SEVERITY)>`, `Critical)>`

6. Optionally, use the **Pattern Matching Variables** tab to add variables created through pattern matching.

Pattern matching variables insert matched strings that have previously been assigned to variables. To insert a pattern matching variable, type the variable name enclosed in angle brackets (for example, `<variablename>`) or drag and drop it from the Pattern Matching Variables list to the metric attribute.

7. Optionally, use the **Operators** tab to apply operators to the metric attribute values. Two functions are available:

- `<$MATCH()>`, to get a sub string of input data: The `$MATCH` function accepts three or four parameters:

- the input string
- the pattern definition
- the output string if pattern matches on the input string
- optionally, the output string if the pattern does not match.

Example: The data of the input field hostname start always with "TEST" (for example "TESTABC"). The `$MATCH` function to use the string after "TEST" is:

```
$MATCH(<$DATA:hostname>,TEST<*.prefix>,<prefix>)
```

- `<$DATETIME(FORMAT,VALUE)>`, to convert a string with date and time information to the internal integer data time format.

For detailed description of the format, see "[Pattern Matching in Policy Rules](#)" on page 265.

8. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types.
9. Optionally, use the **Policy Variables** tab to add policy variables to metric attributes. BSM Connector replaces the variables with the appropriate values in the generated metric.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example "<MSG_NODE>".

Configuring Options in Database Policies

The options tab enables you to configure several policy behaviors, for example which events are logged locally, how the policy handles unmatched events, and defaults for pattern matching in policy rules.

To access

- In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **Database**.
- In the BSM Connector user interface, click  in the toolbar. Then click **Metric** >  **Database**.

Alternatively, double-click an existing policy to edit it.

Click **Options** to open the policy Options page.

Tasks

How to configure options for database file policies

In the Options page, configure which events or metrics are logged locally, how the policy handles unmatched events, and defaults for pattern matching in policy rules.

For more information about the other fields, see ["Options Page" on page 307](#).

Related tasks

- ["How to Collect Event Data from Databases" on page 122](#)

Troubleshooting Database Policies

This section describes troubleshooting and limitations when working with database policies.

This section includes:

- ["Debugging errors" below](#)
- ["Troubleshooting Database Policies" above](#)

Debugging errors

- Check the Operations Agent log files in %OvDataDir%\log (Windows) or /var/opt/OV/log (Linux).
- Any policy logs (policy execution related issues) are saved to %OvDataDir%\log\System.txt (Windows) or /var/opt/OV/log/System.txt (Linux).

Note: Log files that start with opr-* are used for the BSMCWeb console.

Chapter 10: Open Message Interface Policies (Events only)

BSM Connector can integrate data generated by its own open message interface command, `opcmsg`. Open message interface policies filter messages by defining rules for these messages.

For example, you might have a suppress on matched rule in the open message interface policy, which for example suppresses all submitted messages with `application=Test`. If you have such a condition and submit the call `opcmsg application=Test object=Object msg_text="Test message"`, then no event will be sent to OMi (the message has been suppressed).

BSM Connector also provides Java classes that you can use to implement a Java program that submits messages to open message interface policies.

How to Collect Event Data from the Open Message Interface

This task describes how to collect event data submitted by the `opcmsg` command-line tool to the open message interface.

1. *Prerequisite:* Make sure the following applies:
 - a. Your BSM Connector is configured to work with OMi by using the `bsmc-conf` tool.
 - b. The certificate request is approved on the OMi side.
 - c. Your BSM Connector is set up as a connected server in OMi.
2. In the BSM Connector user interface, click  in the toolbar, then click **Event >  Open Message Interface**. The open message interface policy editor opens.

Alternatively, double-click an existing open message interface policy to edit it.

3. In the **Properties** page, define information that is related to the policy itself (for example, the name and description of the policy).

For details, see ["Configuring Open Message Interface Policy Properties" on page 155](#).

4. In the **Default Event Attributes** page, configure the default settings for all events generated by the policy (for example, default event correlation settings).

For details, see ["Configuring Event Defaults in Open Message Interface Policies" on page 155](#).

5. In the **Policy Rules** page, define what the policy should do in response to a specific type of message submitted to the open message interface.

For details, see ["Configuring Rules in Open Message Interface Policies" on page 157](#).

6. In the **Options** page, configure several policy behaviors (for example, pattern matching options).

For details, see ["Configuring Options in Open Message Interface Policies" on page 160](#).

7. Click **Save and Close** to save the policy and close the editor.
8. *Optional.* If the list of policies does not refresh automatically in the BSM Connector user interface, click  in the toolbar.
9. Activate the open message interface policy to start the opcmgsi process on the BSM Connector server.
10. Use the opcmgsi command-line tool to submit messages to the open message interface policy. For details, see ["opcmgsi Command-Line Tool" below](#).

Alternatively, use the available Java classes or C API to implement a program that generates messages. For details, see ["opcmgsi Java API" on page 152](#) and ["opcmgsi C API" on page 154](#).

opcmgsi Command-Line Tool

The command opcmgsi generates a message that BSM Connector open message interface policies evaluate.

The opcmgsi command-line tool is located in:

- Windows 32-bit: %OvInstallDir%/bin/opcmgsi
- Windows 64-bit: %OvInstallDir%/bin/win64/opcmgsi
- Linux: /opt/OV/bin/opcmgsi

Note: To enable the opcmgsi command-line tool, at least one open message interface policy must be activated on the BSM Connector server. Otherwise the command displays the following message:

```
The OVO Message Command is not configured on this system. Contact your OVO Administrator to configure it. (OpC30-913)
```

Command Synopsis and Options

```
opcmgsi [-help]
```

```

[-id]
[severity=normal|warning|minor|major|critical]
application=<application>
object=<object>
msg_text=<text>
[msg_grp=<message group>]
[node=<node>]
[service_id=<svcid>]
[-option <var>=<value>]
    
```

Tip: You can specify any unique prefix for the available options. Note that the prefix for the option severity is **s** while the prefix for the option service_id is **ser**.

Option	Description
[-help]	<i>Optional.</i> Prints the usage message of opcmsg. All other options are ignored and no message is submitted.
[-id]	<i>Optional.</i> Returns the message ID of the submitted message to stdout. This option also sets the OPCDATA_REMARK_FOR_ACK flag of the message, so that the manager information of the message is held by the message agent.
[severity=normal warning minor major critical]	<i>Optional.</i> Sets the severity of the message. The following severities are supported: normal, warning, minor, major, critical. By default, the severity normal is applied.
application=<application>	Sets the application of the message. Tip: Specify the name of the application (or script or program) that is affected by or has detected the event or problem.
object=<object>	Sets the object of the message. Tip: Specify the name of the object (or process or sub-program) that is affected by or has detected the event or problem.
msg_text=<text>	Sets the message text of the message. Tip: Specify a descriptive text that explains the event or problem in more detail.
[msg_grp=<message group>]	<i>Optional.</i> Sets the message group to which the message belongs. By default, no message group is assigned.

Option	Description
[node=<node>]	<p><i>Optional.</i> Sets the node of the message. By default the system name of the BSM Connector system is applied.</p> <div style="border: 1px solid gray; padding: 5px; background-color: #f0f0f0;"> <p>Tip: Specify the fully qualified domain name, the system name, or the IP address of the system on which the event or problem is detected.</p> </div>
[service_id=<svcid>]	<p><i>Optional.</i> Sets the service ID of the message. This is the ID of the service associated with the event. A service ID is a unique identifier for a service and can be used in OMi to identify the node and CI associated with the event.</p>
[-option <var>=<value>]	<p><i>Optional.</i> Sets the variable <\$OPTION(variable)> to value. You can use this variable within the policy conditions to access the value passed the opcmsg call.</p> <p>Special characters must be escaped.</p>

Exit Values

Value	Description
0	Message is successfully generated.
1	Internal error.
2	Syntax or usage error. An error message displays.

Example

To submit a normal message issued when a user logs onto the system, you could set up the following scheduled task

```
opcmsg appl=ScheduledTask obj=login severity=normal msg_t="%USERNAME% logged onto system %COMPUTERNAME%" -option CIHint=myApplication@@%COMPUTERNAME%
```

opcmsg Java API

HP Operations Agent provides a set of Java classes to generate messages for open message interface policies. The classes can be used to generate messages from within a Java program.

Note: The Java classes can also be used to acknowledge previously generated messages, and to send monitor values to the HP Operations Agent. BSM Connector does not support these uses.

JAR files

The JAR files `jopcagtbase.jar` and `jopcagtmsg.jar` that are necessary to use the APIs are installed as part of HP Operations Agent on the BSM Connector server at:

Windows: `%0vInstallDir%\java`

Linux: `/opt/OV/java`

Prerequisites

To use the Java classes:

- The `-classpath` parameter used for the `javac` and `java` commands must include the `jopcagtbase.jar` and `jopcagtmsg.jar` files.
- The `PATH` system variable must include the directory where the shared library files reside. The agent installation does this automatically.

Documentation

Javadoc style class documentation is available at the following location:

Windows: `%0vInstallDir%\www\htdocs\jdoc_agent\index.html`

Linux: `/opt/OV/www\htdocs/jdoc_agent/index.html`

For more information, see the section "Java API" in the *HP Operations Agent Reference Guide* PDF.

Examples

Examples of how the API classes can be used from Java are available in the following directory on the BSM Connector server:

Windows: `%0vInstallDir%\examples\jopcagtapi`

Linux: `/opt/OV/OpC/examples/jopcagtapi`

To compile and run the example code on Windows

1. Change to the folder `%0vInstallDir%/examples/jopcagtapi` on the BSM Connector server.
2. Compile the example code, type:

```
javac -classpath
"%0vInstallDir%/java/jopcagtbase.jar;%0vInstallDir%/java/jopcagtmsg.jar"
JOpCAgtMsgTest.java
```

3. Run the example code, type:

```
java -classpath  
" :%0vInstallDir%/java/jopcagtbse.jar:%0vInstallDir%/java/jopcagtmgs.jar"  
J0pcAgtMsgTest
```

To compile and run the example code on Linux

1. Change to the directory `/opt/0V/OpC/examples/jopcagtap` on the BSM Connector server.
2. Compile the example code, type:

```
javac -classpath "/opt/0V/java/jopcagtbse.jar:/opt/0V/java/jopcagtmgs.jar"  
J0pcAgtMsgTest.java
```

3. Run the example code, type:

```
java -classpath " :/opt/0V/java/jopcagtbse.jar:/opt/0V/java/jopcagtmgs.jar"  
J0pcAgtMsgTest
```

opcmsg C API

HP Operations Agent provides a C-based API (application programming interface) to generate messages for open message interface policies. The API can be used to generate messages from within a C program.

Note: The API can also be used to acknowledge previously generated messages, and to send monitor values to the HP Operations Agent. BSM Connector does not support these uses.

For more information about the C-based message API, see the section "Agent Application Programming Interface" in the *HP Operations Agent Reference Guide* PDF.

Open Message Interface Policy User Interface

This section includes:

- ["Configuring Open Message Interface Policy Properties" on the next page](#)
- ["Configuring Event Defaults in Open Message Interface Policies" on the next page](#)
- ["Configuring Rules in Open Message Interface Policies" on page 157](#)
- ["Configuring Options in Open Message Interface Policies" on page 160](#)

Configuring Open Message Interface Policy Properties

Every policy has a set of properties that identify and describe the policy. Properties include, for example, the policy name and a description of what the policy does.

To access

In the BSM Connector user interface, click  in the toolbar, then click **Event >  Open Message Interface**. The open message interface policy editor opens.

Alternatively, double-click an existing open message interface policy to edit it.

Tasks

How to configure policy properties

In the Properties page, type a name for the policy. You can use spaces in the name. The equal sign (=) is not allowed.

Related tasks

- ["How to Collect Event Data from the Open Message Interface" on page 149](#)

UI Descriptions

For a description of the Properties page, see ["Properties Page" on page 313](#).

Configuring Event Defaults in Open Message Interface Policies

The Default Event Attributes page enables you to indicate default settings for all events generated by the policy.

These defaults affect all new and existing rules. You can override the defaults in individual rules if needed. If a rule contains empty event attributes, the agent will use the defaults for the new event.

To access

In the BSM Connector user interface, click  in the toolbar, then click **Event >  Open Message Interface**. The open message interface policy editor opens.

Alternatively, double-click an existing open message interface policy to edit it.

Click **Defaults** to open the Default Event Attributes page.

Tasks

How to configure events for open message interface policies

This task describes how to configure default settings for all events generated by the policy.

1. Click **Event Attributes** to define default event attributes, such as category.

Tip: After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated event type indicators (ETIs).

To insert an indicator, drag and drop the indicator with its state from the Indicators tab to the policy.

2. Click **Event Correlation** to set the type of duplicate event suppression and define the method used to suppress duplicate events.
3. Click **Advanced** to define default advanced attributes such as legacy HPOM attributes and agent MSI (Message Stream Interface) settings.
4. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated health indicators (HIs) and event type indicators (ETIs).
5. Optionally, use the **Policy Variables** tab to add policy variables to event attributes. BSM Connector replaces the variables with the appropriate values in the generated event.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example "<MSG_NODE>".

Related tasks

- ["How to Collect Event Data from the Open Message Interface" on page 149](#)

UI Descriptions

For a description of the Defaults page, see the following sections:

- ["Event Attributes Tab" on page 283](#)
- ["Event Correlation Tab" on page 288](#)
- ["Advanced Tab" on page 293](#)

- ["Indicators Tab" on page 305](#)
- ["Policy Variables Tab \(Events and Metrics Only\)" on page 310](#)

Configuring Rules in Open Message Interface Policies

Rules define what a policy should do in response to a specific type of event. Each rule consists of a condition and of settings for the event generated by the policy. The condition is the part of a policy that describes the source. The settings enable you to configure the event that BSM Connector sends to OMi.

A policy must contain at least one rule. If the policy contains multiple rules, it is important to remember that the rules are evaluated in a specific order, and that when one condition is matched, no additional rules will be evaluated.

To access

In the BSM Connector user interface, click  in the toolbar, then click **Event >  Open Message Interface**. The open message interface policy editor opens.

Alternatively, double-click an existing open message interface policy to edit it.

Click **Rules** to open the policy Rules page.

Learn More

Rule types

The rule types are:

- **Event on matched rule.** If matched, BSM Connector sends an event to OMi. The event uses the settings defined for the rule. If you do not configure these settings, the default settings are used.
- **Suppress on matched rule.** If matched, BSM Connector stops processing and does not send an event to OMi.
- **Suppress on unmatched rule.** If not matched, BSM Connector stops processing and does not send an event to OMi.

Tasks

How to configure rules in open message interface policies

This task describes how configure policy rules.

1. In the **Policy Rules** section, click  and select the type of rule to define what the policy should do in response to a specific string in a message. Each policy must have at least one rule.
2. In the **Rule Content** section, use the **Condition** tab to specify the attributes and values that the policy searches for in the message that the policy receives from opcmmsg. If the policy finds a match, it may or may not generate an event, depending on the rule type.

- a. In the **Node** field, type the fully qualified domain name, the node name, or the IP address if you only want to match messages whose node attribute is set to a specific node. Give multiple entries with the OR (|) operator (for example: `node1.example.com|node2.example.com`), or leave blank for all nodes.

This field corresponds to the `node` option of the `opcmmsg` command.

- b. In the **Message Group** field, type the message group if you only want to match messages whose message group attribute is set to a specific message group. Give multiple entries with the OR (|) operator (for example: `msggrp1|msggrp2`), or leave blank for all message groups.

This field corresponds to the `msg_grp` option of the `opcmmsg` command.

- c. In the **Application** field, type the name of the application if you only want to match messages whose application attribute is set to a specific application. Give multiple entries with the OR (|) operator (for example: `app11|app12`), or leave blank for all applications.

This field corresponds to the `application` option of the `opcmmsg` command.

- d. In the **Object** field, type the name of the object if you only want to match messages whose object attribute is set to a specific object. Give multiple entries with the OR (|) operator (for example: `object1|object2`), or leave blank for all objects.

This field corresponds to the `object` option of the `opcmmsg` command.

Note: Although the term *application* generally refers to a general program name and *object* generally refers to a process or sub-program, you should use these values to assist your own organizational scheme.

- e. Clear the **Severity** checkboxes if you only want to match messages whose severity attribute is set to a specific severity. You can select multiple severities but must select at least one.

This field corresponds to the `severity` option of the `opcmmsg` command.

- f. In the **Message Text** field, type the pattern that you want the policy to compare with the message text in the source message that it is evaluating.

This field corresponds to the `msg_text` option of the `opcmmsg` command.

Tip: You can use standard HP Operations Agent pattern-matching rules when matching values. Select the matches operator and click ► in the Operand field to open the pattern matching expression toolbox. The toolbox displays the following:

- **Pattern Matching Expressions.** Click an expression to insert it in the Operand field.
- **Variable Bindings Options.** Variable bindings options include case sensitivity and field separators for the rule. If you do not specify pattern matching options for the rule, either the defaults (case sensitive; a blank and the tab character as separators) or the default options set for the policy will be used.

3. Use the **Event Attributes** tab to define event attributes (for example, event title and description) for all events generated by this rule.

Tip: After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated event type indicators (ETIs).

To insert an indicator, drag and drop the indicator with its state from the Indicators tab to the policy.

4. Use the **Event Correlation** tab to set the type of duplicate event suppression and define the method used to suppress duplicate events.
5. Use the **Custom Attributes** tab to add additional information to all events generated by this rule. For example, you might add a company name, contact information, or a city location to an event.
6. Use the **Advanced** tab to define an event drill-down URL, legacy HPOM attributes, and agent MSI (Message Stream Interface) settings.

Chapter 11: REST Web Service Listener Policies

REST Web service policies receive and process data from third party systems through the BSM Connector REST Web service listener since collection is done outside.

The chunks of the XML data are sent to the BSM Connector REST Web service listener by using the HTTP POST method.

What Data Is Collected

REST Web service process XML data that is received by the BSM Connector REST Web service listener. The policies process the data by applying policy defaults and rules, and then send the data to OMi.

How to Collect Event Data Through the REST Web Service Listener

This task describes how to collect event data through the BSM Connector REST Web service listener.

1. *Prerequisite:* Make sure the following applies:
 - a. Your BSM Connector is configured to work with OMi by using the `bsmc-conf` tool.
 - b. The certificate request is approved on the OMi side.
 - c. Your BSM Connector is set up as a connected server in OMi.
2. In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **REST Web Service Listener**.

Alternatively, double-click an existing policy to edit it.

3. In the **Properties** page, define information that is related to the policy itself (for example, the name and description of the policy).

For details, see ["Configuring REST Web Service Listener Policy Properties" on page 165](#).

4. In the **Source** page, define the path parameter that is a part of the actual URL where the REST Web Service Listener listens for the XML data from the Web service client.

For details, see ["Configuring the Data Source in REST Web Service Listener Policies" on page 166](#).

5. In the **Mappings** page, configure the default mappings of the XML properties to custom variables.

For details, see "[Configuring Mappings in REST Web Service Listener Policies](#)" on page 169.

6. *Optional.* In the **Defaults** page, configure the default settings for all events generated by the policy (for example, default event correlation settings).

For details, see "[Configuring Event Defaults in REST Web Service Listener Policies](#)" on page 172.

7. In the **Rules** page, define what the policy should do in response to a specific Web service data.

For details, see "[Configuring Event Rules in REST Web Service Listener Policies](#)" on page 178.

8. In the **Options** page, configure several policy behaviors (for example, pattern matching options).

For details, see "[Configuring Options in REST Web Service Listener Policies](#)" on page 187.

9. Click **Save and Close** to save the policy and close the editor.

10. *Optional.* If the list of policies does not refresh automatically in the BSM Connector user interface, click  in the toolbar.

How to Collect Metrics Data Through the REST Web Service Listener

This task describes how to collect metrics data through the BSM Connector REST Web service listener.

Note: For examples and end-to-end workflow information on collecting metrics data, see "[Collecting and Viewing Metrics Data](#)" on page 60.

1. *Prerequisite:* Make sure the following applies:
 - a. Your BSM Connector is configured to work with OMi by using the `bsmc-conf` tool.
 - b. The certificate request is approved on the OMi side.
 - c. Your BSM Connector is set up as a connected server in OMi.
2. In the BSM Connector user interface, click  in the toolbar. Then click **Metrics** >  **REST Web Service Listener**.

Alternatively, double-click an existing policy to edit it.
3. In the **Properties** page, define information that is related to the policy itself (for example, the name

and description of the policy).

For details, see ["Configuring REST Web Service Listener Policy Properties" on page 165](#).

4. In the **Source** page, define the path parameter that is a part of the actual URL where the REST Web Service Listener listens for the XML data from the Web service client.

For details, see ["Configuring the Data Source in REST Web Service Listener Policies" on page 166](#).

5. *Optional*. In the **Defaults** page, assign default values to the metric attributes.

For details, see ["Configuring Metrics Defaults in REST Web Service Listener Policies" on page 174](#).

6. In the **Rules** page, define what the policy should do in response to a specific metric.

For details, see ["Configuring Metrics Rules in REST Web Service Listener Policies" on page 181](#).

7. Click **Save and Close** to save the policy and close the editor.

8. *Optional*. If the list of policies does not refresh automatically in the BSM Connector user interface, click  in the toolbar.

Configuring Topology Through the REST Web Service Listener

You can collect the topology data by using the separate REST Web Service Topology policy, which is configured as follows:

1. *Prerequisite*: Make sure the following applies:
 - a. Your BSM Connector is configured to work with OMi by using the `bsmc-conf` tool.
 - b. The certificate request is approved on the OMi side.
 - c. Your BSM Connector is set up as a connected server in OMi.
2. In the BSM Connector user interface, click  in the toolbar. Then click **Topology** >  **REST Web Service Listener**.

Alternatively, double-click an existing policy to edit it.

3. In the **Properties** page, define information that is related to the policy itself (for example, the name and description of the policy).

For details, see ["Configuring REST Web Service Listener Policy Properties" on the next page.](#)

4. In the **Source** page, define age to deletion and specify whether delta detection should be done.

For details, see ["How to configure the REST Web service listener source \(topology\)" on page 168.](#)

5. Click **Save and Close** to save the policy and close the editor.
6. *Optional.* If the list of policies does not refresh automatically in the BSM Connector user interface, click  in the toolbar.

REST Web Service Listener Policy User Interface

REST Web service listener policies display different pages depending on the type of data they are integrating and on the policy origin.

Choose the type of data you want to integrate and then complete the following tasks:

Event data

- ["Configuring REST Web Service Listener Policy Properties" on the next page](#)
- ["Configuring the Data Source in REST Web Service Listener Policies " on page 166](#)
- ["Configuring Mappings in REST Web Service Listener Policies " on page 169](#)
- ["Configuring Event Defaults in REST Web Service Listener Policies" on page 172](#)
- ["Configuring Event Rules in REST Web Service Listener Policies" on page 178](#)
- ["Configuring Options in REST Web Service Listener Policies" on page 187](#)

Metrics data

- ["Configuring REST Web Service Listener Policy Properties" on the next page](#)
- ["Configuring the Data Source in REST Web Service Listener Policies " on page 166](#)
- ["Configuring Mappings in REST Web Service Listener Policies " on page 169](#)
- ["Configuring Metrics Defaults in REST Web Service Listener Policies" on page 174](#)
- ["Configuring Metrics Rules in REST Web Service Listener Policies" on page 181](#)
- ["Configuring Options in REST Web Service Listener Policies" on page 187](#)

Topology data

The topology data is integrated by using the separate REST Web Service Topology policy, which is configured as described in the ["Configuring Topology Through the REST Web Service Listener" on the](#)

[previous page](#)

Configuring REST Web Service Listener Policy Properties

Every policy has a set of properties that identify and describe the policy. Properties include, for example, the policy name and a description of what the policy does.

To access

- In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **REST Web Service Listener**.
- In the BSM Connector user interface, click  in the toolbar. Then click **Metrics** >  **REST Web Service Listener**.
- In the BSM Connector user interface, click  in the toolbar. Then click **Topology** >  **REST Web Service Listener**.

Alternatively, double-click an existing policy to edit it.

Tasks

How to configure policy properties

In the Properties page, type a name for the policy. You can use spaces in the name. The equal sign (=) is not allowed.

For more information about the other fields, see "[Configuring REST Web Service Listener Policy Properties](#)" above.

Related tasks

- "[How to Collect Event Data Through the REST Web Service Listener](#)" on page 161
- "[How to Collect Metrics Data Through the REST Web Service Listener](#)" on page 162
- "[Configuring Topology Through the REST Web Service Listener](#)" on page 163

UI Descriptions

For a description of the Properties page, see "[Properties Page](#)" on page 313.

Configuring the Data Source in REST Web Service Listener Policies

The source page of the REST Web service listener policy editor enables you to set up the path as part of URL where the REST Web Service Listener will listen for the XML data. In event and metric integrations, you can additionally upload the sample data to BSM Connector, and to specify one or more XML tags that create the shortcuts to the XML elements that you want to process. When integrating the topology data, you can specify the age to deletion and to decide whether delta detection should be done.

To access

- In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **REST Web Service Listener**.
- In the BSM Connector user interface, click  in the toolbar. Then click **Metrics** >  **REST Web Service Listener**.
- In the BSM Connector user interface, click  in the toolbar. Then click **Topology** >  **REST Web Service Listener**.

Alternatively, double-click an existing policy to edit it.

Click **Source** to open the policy Source page.

Learn More

Customizing REST Web Service Listener

REST Web Service Listener listens for the XML data at the predefined URL. For example, for the event integration this URL should look as follows:

```
http(s)://<bsmc_FQDN>:<configured_port>/bsmc/rest/events/<PATH>
```

In this instance, *<PATH>* is the string, entered in the policy. The REST Web Service Listener for the metric and topology integrations should look as follows:

- */bsmc/rest/metrics/<PATH>*
- */bsmc/rest/topology/<PATH>*

You can customize the BSMC REST Web Service Listener by using the `bsmc-wsconf`. [bat | sh] utility, located at:

```
$OvDataDir/installation/HP0prBSMC/
```

For example, to enable basic authentication, set the listener port to 12345 and set the credentials any client needs to provide to post data, type the following:

```
bsmc-wsconf.bat -enable_auth -port 12345 -username integrator -password bsmcRESTd8a
```

For the `bsmc-wsconf`. [bat | sh] utility usage details, type:

```
bsmc-wsconf.[bat | sh] -help
```

The following table lists the available XPL configuration parameters that apply to each activated web service policy:

Attribute Name	Default	Description
RESTWS_PORT	30005	BSM Connector will spawn an HTTP(s) server on the specified port.
RESTWS_USE_BASIC_AUTH	false	If set to TRUE, the REST Web Service Listener requires credentials. The basic HTTP authentication mechanism is used.
RESTWS_AUTH_USER		Encrypted user name, used for the basic HTTP authentication. Encryption is done by using the OvSecCore crypt mechanism.
RESTWS_AUTH_PASSWORD		Encrypted password, used for the basic HTTP authentication. Encryption is done by using the OvSecCore crypt mechanism.
RESTWS_REGISTER_CB	false	If set to TRUE, the REST Web Service Listener is registered at the BBC communication broker. This enables accessing the Web Service Listener through the port 383.

You can view the XPL configuration parameters by using the `ovconfget` command.

Creating the XML data

REST Web Service accepts the regular XML data without an XML header structure ("`<?xml version=.....`") and all-embracing XML root tag. Additionally, you can collect the data for multiple events and send them consolidated to the REST Web Service.

Note: A successful Web Service call should result in HTTP status code 200. Otherwise status codes like 501 or 401 are returned.

The following is an example of the XML event:

```
<BSMCEvent>
  <title>Detected neglectable impact on system hydrogen.elementary.com caused by
  monitored aspect workers_restart_rate [1/s]: 0.0000 at Tue Aug 5 13:41:32
  2014</title>
  <timeStamp>12/13/14 08:59:57 AM</timeStamp>
  <impact>neglectable</impact>
  <category>Monitor Alert</category>
  <relatedCounter>workers_restart_rate [1/s]</relatedCounter>
```

```
<relatedEntity>hydrogen.elementary.com</relatedEntity>  
</BSMCEvent>
```

Tasks

This section includes:

- ["How to configure the REST Web service listener source \(events and metrics\)" below](#)
- ["Events and Metrics only: How to load sample data into the policy" on the next page](#)

How to configure the REST Web service listener source (events and metrics)

This task describes how configure the REST Web service listener source and how the policy reads it.

1. Enter the Path parameter string, which is a part of the actual URL where the REST Web Service Listener listens for the XML data from the Web service client.
2. Click  to load a sample XML file. You can load a sample file from the BSM Connector system or from the system where the Web browser runs.

When you load sample data, BSM Connector replaces already loaded data with the new data. This does not affect any mappings that are defined based on previously available sample data.

3. Click  to create one or more XML event or metric tags. You can create a tag manually by typing the XML element. If you are working with sample data, you can create a tag by double-clicking the XML element in the list.

The XML tag creates a shortcut to the XML element that you want the policy to process. An event tag typically identifies an event record in an XML log file, while a metric tag identifies a metric record in an XML log file. You can define more than one XML tag. For example, an XML file may contain two types of events: `<PerformanceAlert>` and `<AvailabilityAlert>`. To process both types, define both elements as event tags.

How to configure the REST Web service listener source (topology)

This task describes how configure the XML source file and how the policy reads it.

1. Enter the Path parameter string, which is a part of the actual URL where the REST Web Service Listener listens for the XML data from the Web service client.
2. Enter the age to deletion - the number of times for the policy to be run for a host that is not part of the topology data. After this number of policy executions, this host is deleted from the server.
3. Optionally, enable delta detection, so that only the difference between the received XML file and the repository is sent to the topology server.

Events and Metrics only: How to load sample data into the policy

1. Create a file that contains the XML data, and then send it to the REST Web Service listener.
2. Click  to upload the XML file to the BSM Connector user interface policy editor. The results are displayed in the Sample Data tabs of the policy.

Related tasks

- ["How to Collect Event Data Through the REST Web Service Listener" on page 161](#)
- ["How to Collect Metrics Data Through the REST Web Service Listener" on page 162](#)

UI Descriptions

For a description of the Source page, see ["Source Page - REST Web Service Listener Policies" on page 328](#).

Configuring Mappings in REST Web Service Listener Policies

The Mappings page enables you to map key and value strings contained in Web service requests to custom variables.

To access

- In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **REST Web Service Listener**.
- In the BSM Connector user interface, click  in the toolbar. Then click **Metrics** >  **REST Web Service Listener**.

Alternatively, double-click an existing policy to edit it.

Click **Mappings** to open the policy Mappings page.

Learn More

Mappings overview

A custom variable consists of a map name, an optional XML property (XML elements or attributes), and one or more source and target value pairs. For example, you can assign the XML element *Severity* to

the map name `mapSeverity`, and add a source value of `serious`. You can then assign the target value `critical` to the variable so that BSM Connector inserts the value `critical` into the event in all places where the variable is used.

Default Value Mapping

Map Name	Input Data Property	Source Value	Target Value
<code>mapSeverity</code>	<code><\$DATA:/PerformanceAlert/Severity></code>	<code>serious</code>	<code>critical</code>
		<code>not so serious</code>	<code>warning</code>

XML properties use the following syntax: `<$DATA:/<XML_property>>`

`<XML_property>` is the XML path, separated by slash marks (/), from the XML tag to the XML element or attribute.

For example, the custom variable `mapSeverity` has the following XML property:

`<$DATA:/PerformanceAlert/Severity>` where `Severity` is a child element of `PerformanceAlert`.

XML properties are optional. If you do not assign an XML property to a variable, you must add the source value directly to the variable when you insert the variable in an event attribute.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or if the sample data does not match any specified XML tags.

The Sample Data tab shows the following information if sample data is available:

- XML Properties

If sample data is available, the XML Properties section of the Sample Data tab shows all XML elements and attributes that match an XML tag.

The XML Properties section by default shows the short path to the XML property or value. To view the full path, click . The full path begins with the XML tag specified in the Source tab.

The items in the XML Properties section are by default sorted alphabetically in ascending order.

To search for an XML property or value, type the search string in the Search Properties box. The list changes as you type; only matching items appear.

- Values for `<XML_property>`

This section displays the values of an XML property selected in the XML Properties section. If a value appears more than once, click  to show or hide duplicate values. To find values that belong to more than one XML property, select the value and click . The XML Sample Data window opens and shows all XML properties that have the selected value.

Tasks

How to configure REST Web Service mappings (events and metrics)

This task describes how to map XML elements and attributes to custom variables.

1. Create one or more custom variables.

If you are working with sample data, drag the XML elements or attributes from the XML Properties list to the Map Name column. BSM Connector automatically adds the default prefix `map` to the map name and inserts the correct path to the XML property.

Alternatively, click  above the Map Name column and type the variable name in the map name field. XML properties are optional. If you do not assign an XML property to a variable, you must add the source value directly to the variable when you insert the variable in an event or a metric attribute.

2. Add one or more source and target value pairs to each custom variable.

- If you are working with sample data, drag the value from the Values list to the Source Value column, and type the target value in the corresponding field.

Alternatively, click  above the Source Value column and type the source and target values in the corresponding fields.

- Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types.

To insert an indicator in a source or target value field, drag and drop the indicator state (for example, `HTTPServer:Normal`) from the Indicators tab to the policy.

- Optionally, use the **Policy Variables** tab to add policy variables to event or metric attributes. BSM Connector replaces the variables with the appropriate values in the generated event or metric.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example "`<MSG_NODE>`".

Configuring Event Defaults in REST Web Service Listener Policies

The Event Defaults page enables you to indicate default settings for all events generated by the policy.

These defaults affect all new and existing rules. You can override the defaults in individual rules if needed. If a rule contains empty event attributes, the agent will use the defaults for the new event.

To access

In the BSM Connector user interface, click  in the toolbar. Then click **Event >  REST Web Service Listener**.

Alternatively, double-click an existing policy to edit it.

Click **Defaults** to open the policy Default Event Attributes page.

Tasks

How to configure event defaults for REST Web service listener policies

This task describes how to configure default settings for all events generated by the policy.

1. Click **Event Attributes** to define default event attributes, such as severity and category.

Tip: After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated event type indicators (ETIs).

To insert an indicator, drag and drop the indicator with its state from the Indicators tab to the policy.

2. Click **Event Correlation** to set the type of duplicate event suppression and define the method used to suppress duplicate events.
3. Click **Custom Attributes** to add additional information to all events generated by this policy. For example, you might add a company name, contact information, or a city location to an event.
4. Click **Advanced** to define default advanced attributes such as legacy HPOM attributes and agent MSI (Message Stream Interface) settings.

5. Optionally, use the **Sample Data** tab to drag XML properties (XML elements and attributes) and values to the attribute boxes. Alternatively, you can type the path to the XML property or value directly into the attribute box.

XML properties use the following syntax: `<$DATA: /<XML_property>>`

`<XML_property>` is the XML path, separated by slash marks (`/`), from the XML tag to the XML element or attribute.

BSM Connector replaces the XML property at runtime with the value of the specified XML element or attribute. If you insert an XML value, the value will be used.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or no XML data has been received for the policy.

6. Optionally, use the **Mappings** tab to add mapping definitions to the attribute boxes.

Mappings are custom variables that you define in the mappings tab (see also "[Configuring Event Defaults in REST Web Service Listener Policies](#)" on the previous page). The default name of the mapping variable is `map<XML_property>`, for example `mapSeverity`.

Alternatively, type the custom variable into the attribute box using the following syntax:

- Map Name list contains the map name of the variable: `map<XML property>`, for example `mapSeverity`.
- Input Data Property list item: `<$DATA: /<XML_tag> /<XML_property>>`

For example, the custom variable `mapSeverity` has the following input data property: `<$DATA: /PerformanceAlert/Severity>` where `Severity` is a child element of `PerformanceAlert`.

7. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated health indicators (HIs) and event type indicators (ETIs).
8. Optionally, use the **Policy Variables** tab to add policy variables to event attributes. BSM Connector replaces the variables with the appropriate values in the generated event.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example `"<$MSG_NODE>"`.

Configuring Metrics Defaults in REST Web Service Listener Policies

The Default Metric Attributes page enables you to assign default values to the metric attributes. The values can be used when defining the policy rules on the Rules tab, and can also be overridden there.

Note: For examples and end-to-end workflow information on collecting metrics data, see ["Collecting and Viewing Metrics Data" on page 60](#).

To access

In the BSM Connector user interface, click  in the toolbar. Then click **Metrics >**  **REST Web Service Listener**.

Alternatively, double-click an existing policy to edit it.

Click **Defaults** to open the policy Default Metric Attributes page.

Learn More

This section includes:

- ["Metrics attributes" on the next page](#)
- ["Configuring Metrics Defaults in REST Web Service Listener Policies" above](#)

Metrics attributes

Each time a metrics policy runs, it extracts raw data from its defined data source and builds a metric structure.

A metric structure consists of these attributes:

- Basic attributes:
 - Data domain

The namespace of the integrated performance records, used in the Operations Agent store to avoid clashes.
 - Metric class

Defines the metric class under which the metric appears in the Operations Agent store and consumers.
 - Metric name

Defines the metric name under which the metric appears in the Operations Agent store and consumers.
 - Related CI

Used to identify an instance of a performance record and associates it with a concrete CI instance. For details on how to associate the Related CI with the values in the RTSM model, see ["Create a policy" on page 60](#). For an example, see ["Example – Create a Metrics Policy" on page 61](#).
 - Node

Used to identify a node-like CI to which the performance records are associated to.
 - Value

The actual performance value which is converted to 64-bit floating point number.
 - Time measured

The time stamp when the value was determined in the third-party system.
- Advanced attributes:
 - Original metric name

The name of the metric as used on the third-party system.
 - Unit

The unit of the metric.

- Integration id

An id, used to identify the source of the integration.

Tasks

How to configure metrics defaults for REST Web service listener policies

This task describes how to configure metric attribute defaults for all metrics collected by this policy.

1. Define the metric attributes common to all metrics collected by this policy, such as metric class and name. All metrics in the **Basic** tab marked with a * are required. **Advanced** attributes are optional.
2. Optionally, use the **Sample Data** tab to drag XML properties (XML elements and attributes) and values to the attribute boxes. Alternatively, you can type the path to the XML property or value directly into the attribute box.

XML properties use the following syntax: `<${DATA:}/<XML_property>>`

`<XML_property>` is the XML path, separated by slash marks (/), from the XML tag to the XML element or attribute.

BSM Connector replaces the XML property at runtime with the value of the specified XML element or attribute. If you insert an XML value, the value will be used.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or no XML data has been received for the policy.

3. Optionally, use the **Mappings** tab to add mapping definitions to the attribute boxes.

Mappings are custom variables that you define in the mappings tab (see also "[Configuring Metrics Defaults in REST Web Service Listener Policies](#)" on page 174). The default name of the mapping variable is `map<XML_property>`, for example `mapSeverity`.

Alternatively, type the custom variable into the attribute box using the following syntax:

- Map Name list contains the map name of the variable: `map<XML property>`, for example `mapSeverity`.
- Input Data Property list item: `<${DATA:}/<XML_tag>/<XML_property>>`

For example, the custom variable `mapSeverity` has the following input data property:
`<$DATA:/PerformanceAlert/Severity>` where `Severity` is a child element of `PerformanceAlert`.

4. Optionally, use the **Operators** tab to apply operators to the metric attribute values. Two functions are available:

- `<$MATCH(<>>`, to get a sub string of input data: The `$MATCH` function accepts three or four parameters:

- the input string
- the pattern definition
- the output string if pattern matches on the input string
- optionally, the output string if the pattern does not match.

Example: The data of the input field `hostname` start always with "TEST" (for example "TESTABC"). The `$MATCH` function to use the string after "TEST" is:

```
$MATCH(<$DATA:hostname>,TEST<*.prefix>,<prefix>)
```

- `<$DATETIME(FORMAT,VALUE)>`, to convert a string with date and time information to the internal integer data time format.

For detailed description of the format, see ["Pattern Matching in Policy Rules" on page 265](#).

5. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types.
6. Optionally, use the **Policy Variables** tab to add policy variables to metric attributes. BSM Connector replaces the variables with the appropriate values in the generated metric.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example `"<$MSG_NODE>"`.

Configuring Event Rules in REST Web Service Listener Policies

Rules define what a policy should do in response to a specific type of event. Each rule consists of a condition and of settings for the event generated by the policy. The condition is the part of a policy that describes the source. The settings enable you to configure the event that BSM Connector sends to OMi.

A policy must contain at least one rule. If the policy contains multiple rules, it is important to remember that the rules are evaluated in a specific order, and that when one condition is matched, no additional rules will be evaluated.

To access

In the BSM Connector user interface, click  in the toolbar. Then click **Event >  REST Web Service Listener**.

Alternatively, double-click an existing policy to edit it.

Click **Rules** to open the policy Rules page.

Learn More

Rule types

The rule types are:

- **Event on matched rule.** If matched, BSM Connector sends an event to OMi. The event uses the settings defined for the rule. If you do not configure these settings, the default settings are used.
- **Suppress on matched rule.** If matched, BSM Connector stops processing and does not send an event to OMi.
- **Suppress on unmatched rule.** If not matched, BSM Connector stops processing and does not send an event to OMi.

Tasks

How to configure event rules in REST Web service listener policies

This task describes how to configure policy rules.

1. In the **Policy Rules** section, click  and select the type of rule to define what the policy should do in response to a specific string in the XML data. Each policy must have at least one rule.
2. In the **Rule Content** section, use the **Condition** tab to specify the XML properties and values that the policy searches for in the XML data that the policy reads. If the policy finds a match, it may or may not generate an event, depending on the rule type.

- a. Click  to create a new condition. New conditions by default use the equals operator.
- b. Click  to expand the new condition.
- c. In the **Property** field, specify the XML element or attribute that the policy searches for. You must specify the XML path from the XML event tag to the property, separated by slash marks (/) (for example, /PerformanceAlert/Severity).

If you are working with sample data, you can drag and drop the XML element or attribute from the XML Properties list to the Properties field.

- d. Select the pattern operator.

If you select the matches operator, you can type a pattern in the Operand field. For a list of available operators, see ["Operator" on page 296](#).

- e. In the **Operand** field, type the value or pattern that you want the policy to compare with the XML property. If you are working with sample data, you can drag the value from the Values list and drop it in the Operand field.
3. Use the **Event Attributes** tab to define event attributes (for example, event title and description) for all events generated by this rule.

Tip: After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated event type indicators (ETIs).

To insert an indicator, drag and drop the indicator with its state from the Indicators tab to the policy.

4. Use the **Event Correlation** tab to set the type of duplicate event suppression and define the method used to suppress duplicate events.
5. Use the **Custom Attributes** tab to add additional information to all events generated by this rule.

For example, you might add a company name, contact information, or a city location to an event.

6. Use the **Advanced** tab to define an event drill-down URL, legacy HPOM attributes, and agent MSI (Message Stream Interface) settings.
7. Optionally, use the **Sample Data** tab to drag XML properties (XML elements and attributes) and values to the attribute boxes. Alternatively, you can type the path to the XML property or value directly into the attribute box.

XML properties use the following syntax: `<$DATA:/<XML_property>>`

`<XML_property>` is the XML path, separated by slash marks (/), from the XML tag to the XML element or attribute.

BSM Connector replaces the XML property at runtime with the value of the specified XML element or attribute. If you insert an XML value, the value will be used.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or no XML data has been received for the policy. See also ["Configuring the Data Source in REST Web Service Listener Policies " on page 166.](#)

8. Optionally, use the **Mappings** tab to add mapping definitions to the attribute boxes.

Mappings are custom variables that you define in the mappings tab (see also ["Configuring Event Rules in REST Web Service Listener Policies" on page 178.](#)) The default name of the mapping variable is `map<XML_property>`, for example `mapSeverity`.

Alternatively, type the custom variable into the attribute box using the following syntax:

- Map Name list contains the map name of the variable: `map<XML property>`, for example `mapSeverity`.
- Input Data Property list item: `<$DATA:/<XML_tag>/<XML_property>>`

For example, the custom variable `mapSeverity` has the following input data property:
`<$DATA:/PerformanceAlert/Severity>` where `Severity` is a child element of `PerformanceAlert`.

9. Optionally, use the **Pattern Matching Variables** tab to add variables created through pattern matching.

Pattern matching variables insert matched strings that have previously been assigned to variables. To insert a pattern matching variable, type the variable name enclosed in angle brackets (for example, `<variablename>`) or drag and drop it from the Pattern Matching Variables list to the event attribute.

10. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of

configuration item types with the associated health indicators (HIs) and event type indicators (ETIs).

11. Optionally, use the **Policy Variables** tab to add policy variables to event attributes. BSM Connector replaces the variables with the appropriate values in the generated event.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example "<MSG_NODE>".

Configuring Metrics Rules in REST Web Service Listener Policies

Rules define what a policy should do in response to a specific type of metric. Each rule consists of a condition and of settings for the metrics generated by the policy. The condition is the part of a policy that describes the source. The settings enable you to configure the metrics that BSM Connector sends to OMi.

A policy must contain at least one rule. If the policy contains multiple rules, it is important to remember that the rules are evaluated in a specific order, and that when one condition is matched, no additional rules will be evaluated.

Note: For examples and end-to-end workflow information on collecting metrics data, see ["Collecting and Viewing Metrics Data" on page 60](#).

To access

In the BSM Connector user interface, click  in the toolbar. Then click **Metrics** >  **REST Web Service Listener**.

Alternatively, double-click an existing policy to edit it.

Click **Rules** to open the policy Rules page.

Learn More

This section includes:

- ["Rule types" below](#)
- ["Metrics attributes" below](#)
- ["Configuring Metrics Rules in REST Web Service Listener Policies" on the previous page](#)

Rule types

The rule types are:

- **Store on matched rule.** If matched, BSM Connector stores metrics in a buffer until a maximum number of records or a maximum amount of time are reached. These metrics are sent to OMi when they are requested. The metrics use the settings defined for the rule. If you do not configure these settings, the default settings are used.
- **Suppress on matched rule.** If matched, BSM Connector stops processing.
- **Suppress on unmatched rule.** If not matched, BSM Connector stops processing.

Metrics attributes

Each time a metrics policy runs, it extracts raw data from its defined data source and builds a metric structure.

A metric structure consists of these attributes:

- Basic attributes:
 - Data domain

The namespace of the integrated performance records, used in the Operations Agent store to avoid clashes.
 - Metric class

Defines the metric class under which the metric appears in the Operations Agent store and consumers.
 - Metric name

Defines the metric name under which the metric appears in the Operations Agent store and consumers.
 - Related CI

Used to identify an instance of a performance record and associates it with a concrete CI instance. For details on how to associate the Related CI with the values in the RTSM model, see ["Create a policy" on page 60](#). For an example, see ["Example – Create a Metrics Policy" on page 61](#).
 - Node

Used to identify a node-like CI to which the performance records are associated to.
 - Value

The actual performance value which is converted to 64-bit floating point number.
 - Time measured

The time stamp when the value was determined in the third-party system.
- Advanced attributes:
 - Original metric name

The name of the metric as used on the third-party system.
 - Unit

The unit of the metric.
 - Integration id

An id, used to identify the source of the integration.

Tasks

How to configure rules for metrics in REST Web service listener policies

This task describes how to configure policy rules.

1. In the **Policy Rules** section, click  and select the type of rule to define what the policy should do in response to a specific string in the XML file. Each policy must have at least one rule.
2. In the **Rule Content** section, use the **Condition** tab to specify the XML properties and values that the policy searches for in the XML file that the policy reads. If the policy finds a match, it may or may not generate a metric record, depending on the rule type.

- a. Click  to create a new condition. New conditions by default use the equals operator.
- b. Click  to expand the new condition.
- c. In the **Property** field, specify the XML element or attribute that the policy searches for. You must specify the XML path from the XML metric tag to the property, separated by slash marks (/) (for example, /PerformanceAlert/Severity).

If you are working with sample data, you can drag and drop the XML element or attribute from the XML Properties list to the Properties field.

- d. Select the pattern operator.

If you select the matches operator, you can type a pattern in the Operand field. For a list of available operators, see ["Operator" on page 296](#).

- e. In the **Operand** field, type the value or pattern that you want the policy to compare with the XML property. If you are working with sample data, you can drag the value from the Values list and drop it in the Operand field.
3. *Optional.* If you are creating a rule of the type 'store on matched rule', set the attributes (**Basic** or/and **Advanced**) for metrics that you want the rule to override. All metrics on the **Basic** tab are required. **Advanced** attributes are optional. If default attributes are specified in the Defaults tab, you use the defaults or you can override them as described below.
 4. Optionally, use the **Sample Data** tab to drag XML properties (XML elements and attributes) and values to the attribute boxes. Alternatively, you can type the path to the XML property or value directly into the attribute box.

XML properties use the following syntax: <\$DATA:!/<XML_property>>

<XML_property> is the XML path, separated by slash marks (/), from the XML tag to the XML element or attribute.

BSM Connector replaces the XML property at runtime with the value of the specified XML element or attribute. If you insert an XML value, the value will be used.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or no XML data has been received for the policy. See also ["Configuring the Data Source in REST Web Service Listener Policies "](#) on page 166.

5. Optionally, use the **Mappings** tab to add mapping definitions to the attribute boxes.

Mappings are custom variables that you define in the mappings tab (see also ["Configuring Metrics Rules in REST Web Service Listener Policies" on page 181](#)). The default name of the mapping variable is `map<XML_property>`, for example `mapSeverity`.

Alternatively, type the custom variable into the attribute box using the following syntax:

- Map Name list contains the map name of the variable: `map<XML property>`, for example `mapSeverity`.
- Input Data Property list item: `<${DATA: /<XML_tag> /<XML_property>>`

For example, the custom variable `mapSeverity` has the following input data property: `<${DATA: /PerformanceAlert/Severity}>` where `Severity` is a child element of `PerformanceAlert`.

6. Optionally, use the **Pattern Matching Variables** tab to add variables created through pattern matching.

Pattern matching variables insert matched strings that have previously been assigned to variables. To insert a pattern matching variable, type the variable name enclosed in angle brackets (for example, `<variablename>`) or drag and drop it from the Pattern Matching Variables list to the metric attribute.

7. Optionally, use the **Operators** tab to apply operators to the metric attribute values. Two functions are available:

- `<${MATCH()}>`, to get a sub string of input data: The `SMATCH` function accepts three or four parameters:
 - the input string
 - the pattern definition
 - the output string if pattern matches on the input string
 - optionally, the output string if the pattern does not match.

Example: The data of the input field hostname start always with "TEST" (for example "TESTABC"). The \$MATCH function to use the string after "TEST" is:

```
$MATCH(<$DATA:hostname>,TEST<*.prefix>,<prefix>)
```

- <\$DATETIME(FORMAT,VALUE)>, to convert a string with date and time information to the internal integer data time format.

For detailed description of the format, see ["Pattern Matching in Policy Rules" on page 265](#).

8. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types.
9. Optionally, use the **Policy Variables** tab to add policy variables to metric attributes. BSM Connector replaces the variables with the appropriate values in the generated metric.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example "<\$MSG_NODE>".

Configuring Options in REST Web Service Listener Policies

The options tab enables you to configure several policy behaviors, for example which events are logged locally, how the policy handles unmatched events, and defaults for pattern matching in policy rules.

To access

- In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **REST Web Service Listener**.
- In the BSM Connector user interface, click  in the toolbar. Then click **Metrics** >  **REST Web Service Listener**.

Alternatively, double-click an existing policy to edit it.

Click **Options** to open the policy Options page.

Tasks

How to configure options for the REST Web Service listener policies

In the Options page, configure which events or metrics are logged locally, how the policy handles unmatched events and metrics, and defaults for pattern matching in policy rules.

For more information about the other fields, see ["Options Page" on page 307](#).

Related tasks

UI Descriptions

For a description of the Options page, see ["Options Page" on page 307](#).

Troubleshooting REST Web Service Listener Policies

This section describes troubleshooting and limitations when working with REST Web service listener policies.

This section includes:

- ["Debugging errors" below](#)
- ["Troubleshooting REST Web Service Listener Policies" on the previous page](#)

Debugging errors

- Check the Operations Agent log files in %OvDataDir%\log (Windows) or /var/opt/OV/log (Linux).
- Any policy logs (policy execution related issues) are saved to %OvDataDir%\log\System.txt (Windows) or /var/opt/OV/log/System.txt (Linux).

Note: Log files that start with opr-* are used for the BSMCWeb console.

Chapter 12: Scheduled Task Policies (Events only)

Scheduled task policies enable you to schedule commands or scripts to run on the BSM Connector system, and will send an event to OMi to indicate the success or failure of the command or script. Use this policy if you want to run commands or scripts on the BSM Connector system once or according to a specific schedule.

How to Schedule Tasks

This section describes how to schedule tasks.

1. *Prerequisite:* Make sure the following applies:
 - a. Your BSM Connector is configured to work with OMi by using the `bsmc-conf` tool.
 - b. The certificate request is approved on the OMi side.
 - c. Your BSM Connector is set up as a connected server in OMi.
2. In the BSM Connector user interface, click  in the toolbar, then click **Event** >  **Scheduled Task**. The scheduled task policy editor opens.

Alternatively, double-click an existing scheduled task policy to edit it.

3. In the **Properties** page, define information that is related to the policy itself (for example, the name and description of the policy).

For details, see ["Configuring Scheduled Task Policy Properties" on the next page](#).

4. In the **Task** page, specify the command or script that you want to run.

For details, see ["Configuring Tasks in Scheduled Task Policies" on page 191](#).

5. In the **Schedule** page, configure the schedule according to which the command or script should run.

Note: If you do not configure a schedule, the command or script runs every minute.

For details, see ["Configuring Schedules in Scheduled Task Policies" on page 192](#).

6. In the **Start Event**, **Success Event**, and **Failure Event** pages, design the start, success, or failure events that you want to receive.

For details, see ["Configuring Events in Scheduled Task Policies" on page 193](#).

7. Click **Save and Close** to save the policy and close the editor.
8. *Optional.* If the list of policies does not refresh automatically in the BSM Connector user interface, click  in the toolbar.

Scheduled Task Policy User Interface

This section includes:

- ["Configuring Scheduled Task Policy Properties" below](#)
- ["Configuring Tasks in Scheduled Task Policies" on the next page](#)
- ["Configuring Schedules in Scheduled Task Policies" on page 192](#)
- ["Configuring Events in Scheduled Task Policies" on page 193](#)

Configuring Scheduled Task Policy Properties

Every policy has a set of properties that identify and describe the policy. Properties include, for example, the policy name and a description of what the policy does.

To access

In the BSM Connector user interface, click  in the toolbar, then click **Event >  Scheduled Task**. The scheduled task policy editor opens.

Alternatively, double-click an existing scheduled task policy to edit it.

Tasks

How to configure policy properties

In the Properties page, type a name for the policy. You can use spaces in the name. The equal sign (=) is not allowed.

Related tasks

- ["How to Schedule Tasks" on the previous page](#)

UI Descriptions

For a description of the Properties page, see ["Properties Page" on page 313](#).

Configuring Tasks in Scheduled Task Policies

In the **Task** page, you specify a command or script that you want to run on the BSM Connector system.

To access

In the BSM Connector user interface, click  in the toolbar, then click **Event >  Scheduled Task**. The scheduled task policy editor opens.

Alternatively, double-click an existing scheduled task policy to edit it.

Click **Task**.

Tasks

How to configure tasks

In **Task type**, select one of the following options:

- **Command**

By default, the command runs under the same account as the agent is running, which is Local System or root by default.

- **Command:** Type the complete path and extension of the command that you want to run on the BSM Connector system (for example, %0vDataDir%\bin\instrumentation\cleanup.exe). The file that you specify should exist on the system.
- **Username:** Type the user name under which the command should be run. The user must exist and have permission to run the command on the system. If you specify a non-existent user, the command fails to run.
- **Password:** Specify a password for the user. If the password changes, the policy must be updated and reactivated.

- **VB Script**

Type the VB script in the window. Alternatively, click **Load VB script file from Client** to load an existing script.

Tip: Use the policy method `Rule.Status` to specify whether the task is successful. For example, to specify that the task has failed (and trigger a failure message), use `Rule.Status=False`. (See "[Rule Object](#)" on page 197 .)

Note: HP Operations Agent uses a generic Microsoft scripting engine to run VBScript

scripts. You can therefore use standard VBScript objects (for example, the FileSystemObject object) in your scripts. Objects that are specific to wscript or cscript (for example, the WScript object) are not supported.

- Perl Script

Type the Perl script in the window. Alternatively, click **Load VB script file from client** to load an existing script.

Tip: Use the policy method `$Rule->Status` to specify whether the task is successful. For example, to specify that the task has failed (and trigger a failure message), use `$Rule.Status (False)`. (See ["Rule Object" on page 197](#).)

Note: The agent runs as a service that has no standard input, standard output, or standard error. Therefore, the predefined file handles STDIN, STDOUT, and STDERR are not available for Perl scripts in scheduled task policies. It is also not possible to open file handles that use command pipes or capture the standard output from commands within backticks (`).

Related tasks

- ["How to Schedule Tasks" on page 189](#)

UI Descriptions

For a description of the Task page, see ["Task Page \(Scheduled Task Policies\)" on page 335](#).

Configuring Schedules in Scheduled Task Policies

Scheduled task policies can start commands either once or according to a schedule.

To access

In the BSM Connector user interface, click  in the toolbar, then click **Event >  Scheduled Task**. The scheduled task policy editor opens.

Alternatively, double-click an existing scheduled task policy to edit it.

Click **Schedule**.

Tasks

How to configure schedules

In the Schedule page, select one of the following schedule options:

- **Once.** When **Once** is selected, the command will be run on one specific day at the time you indicate.

Note: If the selected date or time occurs in the past, the command is not executed, and the Schedule tab shows a warning.

- **Once per interval.** When **Once per interval** is selected, the command will be run once each time the interval that you indicate passes.
- **Advanced.** When Advanced is selected, you can indicate specific days and times when the command should be run. You select specific days of the week, specific days of the month, and specific months. This allows you to specify odd schedules such as, "On Monday when it falls on the 2nd of the month." You can also indicate that the command should only be run during a specific year.

Note: If you select Advanced but then do not specify a schedule, the command by default runs every minute.

Tip: To select multiple times, click the time, press **Ctrl** or **Shift**, and select additional times.

To select the entire time range, click . To delete a selected time, click .

Related tasks

- ["How to Schedule Tasks" on page 189](#)

UI Descriptions

For a description of the Schedule page, see ["Schedule Page - Scheduled Task Policies" on page 318](#).

Configuring Events in Scheduled Task Policies

Scheduled task policies can send a notification event to OMi when a command or script starts, finishes, or fails. You can design the start, success, or failure events that you want to receive by completing the information in the Start Event, Success Event, and Failure Event tabs.

To access

In the BSM Connector user interface, click  in the toolbar, then click **Event** >  **Scheduled Task**. The scheduled task policy editor opens.

Alternatively, double-click an existing scheduled task policy to edit it.

Click **Start Event**, **Success Event**, or **Failure Event**.

Tasks

How to configure events for scheduled task policies

This section describes how configure events generated by scheduled task policies.

1. Select **Send Start Event**, **Send Success Event**, or **Send Failure Event**.
2. Click **Event Attributes** to define default event attributes, such as severity and category.

Tip: After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated event type indicators (ETIs).

To insert an indicator, drag and drop the indicator with its state from the Indicators tab to the policy.

3. Click **Event Correlation** to set the type of duplicate event suppression and define the method used to suppress duplicate events.
4. Click **Custom Attributes** to add additional information to all events generated by this policy. For example, you might add a company name, contact information, or a city location to an event.
5. Click **Advanced** to define default advanced attributes such as legacy HPOM attributes and agent MSI (Message Stream Interface) settings.
6. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated health indicators (HIs) and event type indicators (ETIs).
7. Optionally, use the **Policy Variables** tab to add policy variables to event attributes. BSM Connector replaces the variables with the appropriate values in the generated event.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example "<MSG_NODE>".

Policy Objects for Scripts

The objects listed here are available for scheduled task policies and can be manipulated with Visual Basic Scripting Edition or with Perl. These policy objects can only be used in scripts that run within a policy. They cannot be used in standalone scripts that are executed at a command prompt.

Caution: Policy scripts provide administrators with a powerful tool to evaluate and manipulate data. If, however, a script is incorrectly written, it could cause the agent to fail. Hewlett-Packard Company is not responsible for agent failures resulting from incorrectly written scripts.

This section includes:

- ["Policy Object" below](#)
- ["Rule Object" on page 197](#)
- ["ConsoleMessage Object" on page 198](#)
- ["ExecuteCommand Object" on page 202](#)

Policy Object

This object is used to access the attributes of a policy.

Policy Method:	CreateObject
Parameter:	<i>progID</i> (string of format: [Vendor.]Component[.Version])
Return Type:	VB Script: IDispatch Perl: not applicable
VB Script Syntax:	Policy.CreateObject("progID")
Perl Syntax:	not applicable
Description:	Creates a component instance of a COM object. Note that this method is valid only on Windows nodes, and cannot be used in a Perl script.

Policy Method:	Execute
Parameter:	<i>command</i> (string)
Return Type:	VB Script: void Perl: void
VB Script Syntax:	Policy.Execute("command")
Perl Syntax:	<code>\$Policy->Execute("command");</code>
Description:	Run the specified command asynchronously. The command is executed in the context of agent security, so could be run as Local System or any other user-selected user to run the agent. The method will return immediately. See the ExecuteCommand method Command for more information about how to indicate commands.

Policy Method:	Output
Parameter:	<i>string</i>
Return Type:	VB Script: void Perl: void
VB Script Syntax:	Policy.Output("string")
Perl Syntax:	<code>\$Policy->Output("string");</code>
Description:	Appends the string to the annotation field of the event sent to BSM in response to the success or failure of a scheduled task.

Policy Method:	ExecuteEx
Parameter:	<i>command</i> (string)
Return Type:	VB Script: BSTR Perl: string
VB Script Syntax:	Policy.ExecuteEx("command")

Policy Method:	ExecuteEx
Perl Syntax:	<code>\$Policy->ExecuteEx("command");</code>
Description:	<p>Run the specified command synchronously and wait for it to complete before returning the output of the command.</p> <ul style="list-style-type: none"> • Security. The command is executed in the context of agent security, so could be run as Local System or any other user-selected user to run the agent. • Return values. If the command is successful, STDOUT is returned. If the command is not successful (return value non-zero), the string "ERROR:\n" followed by STDERR will be returned. <p>To handle non-zero return values, run ExecuteEx in an eval function and then check the result, for example for the string ERROR.</p> <p>Perl script example:</p> <pre>eval '\$ReturnText = \$ExecuteCommand->ExecuteEx()'; \$returnText = \$@ if \$@;</pre> <ul style="list-style-type: none"> • Paths. You must use complete paths or ensure that any needed path is included in the PATH variable. <p>Example: <code>dir_con = Policy.ExecuteEx ("cmd /c dir c:\")</code></p>

Rule Object

In scheduled task policies, the Rule object is used to indicate whether the command has succeeded or failed. TRUE = command succeeded, FALSE = command failed.

Rule Method:	Status
Parameter:	void
Return Type:	VB Script: Boolean Perl: integer
VB Script Syntax:	for put: <code>Rule.Status = boolValue</code> for get: <code>boolValue = Rule.Status</code>
Perl Syntax:	for put: <code>\$Rule.Status(boolValue);</code> for get: <code>boolValue = \$Rule.Status();</code>
Description:	For scheduled task policies, FALSE indicates that the scheduled task failed.

ConsoleMessage Object

The ConsoleMessage object provides a method for sending events directly to BSM. Events sent in this way are not intercepted by an open message interface policy, but instead are sent directly to the server. Multiple uses of the Send method are supported. The same script can then send multiple events to OMi depending on which problem it detects.

Note: You cannot use action variables with the ConsoleMessage object.

ConsoleMessage Method:	Application
Parameter:	<i>application</i> (string)
Return Type:	VB Script: void Perl: void
VB Script Syntax:	ConsoleMessage.Application = " <i>application</i> "
Perl Syntax:	<code>\$ConsoleMessage->Application("<i>application</i>");</code>
Description:	This optional method sets the content of Application in the event properties.

ConsoleMessage Method:	Object
Parameter:	<i>object</i> (string)
Return Type:	VB Script: void Perl: void
VB Script Syntax:	ConsoleMessage.Object = " <i>object</i> "
Perl Syntax:	<code>\$ConsoleMessage->Object("<i>object</i>");</code>
Description:	This optional method sets the content of Object in the event properties.

ConsoleMessage Method:	MsgText
Parameter:	<i>msgtext</i> (string)
Return Type:	VB Script: void Perl: void
VB Script Syntax:	ConsoleMessage.MsgText = " <i>msgtext</i> "
Perl Syntax:	<code>\$ConsoleMessage->MsgText("<i>msgtext</i>");</code>
Description:	This method sets the message text for the event.

ConsoleMessage Method:	Severity
Parameter:	<i>severity</i> (valid strings are: Unknown Normal Warning Minor Major Critical)
Return Type:	VB Script: void Perl: void
VB Script Syntax:	<code>ConsoleMessage.Severity = "severity"</code>
Perl Syntax:	<code>\$ConsoleMessage->Severity("severity");</code>
Description:	Sets the severity of the event that is sent. If not specifically set with this method, the default is Normal. If an invalid string is supplied, severity Unknown will be used.

ConsoleMessage Method:	MsgGrp
Parameter:	<i>messagegroup</i> (string)
Return Type:	VB Script: void Perl: void
VB Script Syntax:	<code>ConsoleMessage.MsgGrp = "messagegroup"</code>
Perl Syntax:	<code>\$ConsoleMessage->MsgGrp("messagegroup");</code>
Description:	Sets the value for the Message Group in event properties. If this method does not supply a value, Misc is used.

ConsoleMessage Method:	Node
Parameter:	<i>nodename</i> (IP address or fully qualified hostname)
Return Type:	VB Script: void Perl: void
VB Script Syntax:	<code>ConsoleMessage.Node = "nodename"</code>
Perl Syntax:	<code>\$ConsoleMessage->Node("nodename");</code>
Description:	Sets the value for Primary Node Name that will be displayed in the event properties. IP addresses and fully qualified hostnames are valid. If this method does not supply a value, the hostname of the system is used by default.

ConsoleMessage Method:	ServiceId
Parameter:	<i>serviceid</i> (string)
Return Type:	VB Script: void Perl: void

ConsoleMessage Method:	ServiceId
VB Script Syntax:	<code>ConsoleMessage.ServiceId = "serviceid"</code>
Perl Syntax:	<code>\$ConsoleMessage->ServiceId("serviceid");</code>
Description:	This optional method sets the Service ID for the event.

ConsoleMessage Method:	MessageType
Parameter:	<i>messagetype</i> (string)
Return Type:	VB Script: void Perl: void
VB Script Syntax:	<code>ConsoleMessage.MessageType = "messagetype"</code>
Perl Syntax:	<code>\$ConsoleMessage->MessageType("messagetype");</code>
Description:	This optional method sets the value for the message type field of the event properties.

ConsoleMessage Method:	MessageKey
Parameter:	<i>messagekey</i> (string)
Return Type:	VB Script: void Perl: void
VB Script Syntax:	<code>ConsoleMessage.MessageKey = "messagekey"</code>
Perl Syntax:	<code>\$ConsoleMessage->MessageKey("messagekey");</code>
Description:	This optional methods sets a key for event correlation.

ConsoleMessage Method:	AcknowledgeMessageKey
Parameter:	<i>messagekey</i> (string)
Return Type:	VB Script: void Perl: void
VB Script Syntax:	<code>ConsoleMessage.AcknowledgeMessageKey = "messagekey"</code>
Perl Syntax:	<code>\$ConsoleMessage->AcknowledgeMessageKey("messagekey");</code>
Description:	This optional method sets the message key to indicate which events are automatically closed.

ConsoleMessage Method:	TroubleTicket
Parameter:	<i>Booleanvalue</i>
Return Type:	VB Script: void Perl: void
VB Script Syntax:	ConsoleMessage.TroubleTicket = <i>Booleanvalue</i>
Perl Syntax:	<code>\$ConsoleMessage->TroubleTicket(<i>Booleanvalue</i>);</code>
Description:	This optional method specifies if the event is to be sent to a trouble ticket interface. Default is FALSE.

ConsoleMessage Method:	Notification
Parameter:	<i>Booleanvalue</i>
Return Type:	VB Script: void Perl: void
VB Script Syntax:	ConsoleMessage.Notification = <i>Booleanvalue</i>
Perl Syntax:	<code>\$ConsoleMessage->Notification(<i>Booleanvalue</i>);</code>
Description:	This optional method specifies if the event is sent to the notification mechanism. Default is FALSE.

ConsoleMessage Method:	AgentMSI
Parameter:	<i>type</i> (valid strings are: copy divert none)
Return Type:	VB Script: void Perl: void
VB Script Syntax:	ConsoleMessage.AgentMSI = " <i>type</i> "
Perl Syntax:	<code>\$ConsoleMessage->AgentMSI("<i>type</i>");</code>
Description:	This optional method specifies if the event is to be sent through the message stream interface on the agent. Default (or if string misspelled) is none.

ConsoleMessage Method:	ServerMSI
Parameter:	<i>type</i> (valid strings are: copy divert none)
Return Type:	VB Script: void Perl: void
VB Script Syntax:	ConsoleMessage.ServerMSI = " <i>type</i> "
Perl Syntax:	<code>\$ConsoleMessage->ServerMSI("<i>type</i>");</code>

ConsoleMessage Method:	ServerMSI
Description:	This optional method specifies if event is sent through the event stream interface on the server. Default (or if string misspelled) is none.

ConsoleMessage Method:	Send
Parameter:	void
Return Type:	VB Script: void Perl: void
VB Script Syntax:	ConsoleMessage.Send()
Perl Syntax:	<code>\$ConsoleMessage->Send();</code>
Description:	This method sends the event to the OMi server. The MsgText method must set the message text before using this method. Multiple uses of the Send method are supported. Policy variables will not be expanded.

ExecuteCommand Object

Object used for requesting a command to be run. It starts a command to be run by the HP Operations Agent.

ExecuteCommand Method:	Command
Parameter:	<i>command</i> (string)
Return Type:	VB Script: void Perl: void
VB Script Syntax:	<code>ExecuteCommand.Command = "command"</code>
Perl Syntax:	<code>\$ExecuteCommand->Command("command");</code>
Description:	<p>This mandatory method is the name of the command to run with all necessary parameters.</p> <div style="border: 1px solid gray; padding: 5px; background-color: #f0f0f0;"> <p>Note: For scripts that will run on Windows systems, internal commands such as Copy, Rename, and DIR use a command interpreter that must be started before the command can be run. For commands of this type, the command must be preceded with <code>cmd /k</code>, followed by any other parameters required.</p> </div>

ExecuteCommand Method:	KillonTimeout
Parameter:	<i>seconds</i> (integer)

ExecuteCommand Method:	KillonTimeout
Return Type:	VB Script: void Perl: void
VB Script Syntax:	ExecuteCommand.KillonTimeout = <i>seconds</i> ;
Perl Syntax:	<code>\$ExecuteCommand->KillonTimeout(<i>seconds</i>);</code>
Description:	This method sets the maximum time, in seconds, that the command will run. The default is unlimited. Valid only with the StartEx method.

ExecuteCommand Method:	UserName
Parameter:	username (string)
Return Type:	VB Script: void Perl: void
VB Script Syntax:	ExecuteCommand.UserName = " <i>username</i> "
Perl Syntax:	<code>\$ExecuteCommand->UserName("<i>username</i>");</code>
Description:	User name under which the command should be run. Optional, default is \$AGENT_USER.

ExecuteCommand Method:	Password
Parameter:	password (string)
Return Type:	VB Script: void Perl: void
VB Script Syntax:	ExecuteCommand.Password = " <i>password</i> "
Perl Syntax:	<code>\$ExecuteCommand->Password("<i>password</i>");</code>

ExecuteCommand Method:	Password
Description:	<p>Password for accessing the specified user account. To prevent the password from being visible in the script, use the following instructions:</p> <ol style="list-style-type: none"> 1. Open a command prompt. 2. Change directory to the agent install directory: <code><install_dir>/bin/<arch>/OpC/install</code> 3. Encrypt your password with the command: <code>opcpwcrpt <yourpassword></code> 4. Use the output string as the password in your script. <p>In some cases it is better not to supply a password.</p> <p>Should I provide the password or not?</p> <p>Executing the command without the password is the easier of the two methods, but it has some restrictions that make it unsuitable in some situations. The lists below show the restrictions and advantages of both methods.</p> <p>Without a password:</p> <ul style="list-style-type: none"> • For Windows systems, resources accessed through the network are not available. • For all systems, changed passwords do not invalidate the policy. <p>With a password:</p> <ul style="list-style-type: none"> • For all systems, resources accessed through the network are available. • For all systems, the encrypted password is sent over the network. • For all systems, if the password changes, the policy must be updated and redeployed.

ExecuteCommand Method:	Start
Parameter:	void
Return Type:	VB Script: void Perl: void

ExecuteCommand Method:	Start
VB Script Syntax:	ExecuteCommand.Start()
Perl Syntax:	\$ExecuteCommand->Start();
Description:	Run the command specified by ExecuteCommand.Command and return immediately the control to the script so the next lines can be processed right away.

ExecuteCommand Method:	StartEx
Parameter:	void
Return Type:	VB Script: BSTR Perl: String
VB Script Syntax:	ExecuteCommand.StartEx
Perl Syntax:	\$ExecuteCommand->StartEx();
Description:	<p>Run ExecuteCommand.Command and wait until it finishes. Commands can be run synchronously or asynchronously, as needed. Multiple uses of the Start method are supported. This way, the same script can trigger multiple external commands.</p> <p>If the command is successful, STDOUT is returned. If the command is not successful (return value non-zero), the string "ERROR:\n" followed by STDERR will be returned.</p> <p>To handle non-zero return values, run StartEx in an eval function and then check the result, for example for the string ERROR.</p> <p>Perl script example:</p> <pre>eval '\$ReturnText = \$ExecuteCommand->StartEx()'; \$returnText = \$@ if \$@;</pre>

Chapter 13: SNMP Interceptor Policies (Events only)

SNMP trap policies configure HP Operations Agent to watch for SNMP traps received by BSM Connector from third-party systems. The third-party system must be configured to send traps to the BSM Connector server. The SNMP trap policy reads SNMP traps, and responds when a character pattern that you choose is found in an SNMP trap.

SNMP trap policies collect data from any SNMP trap (version 1 and 2) received by BSM Connector, and send events to OMi containing preferred values from the original SNMP trap.

Before setting up an SNMP trap policy, you should be clear about the purpose and usage of the data in OMi.

Event data that is forwarded to OMi is controlled by policy rules. Policy rules consist of a condition and of settings for the event generated by the policy. The condition uses regular expressions to match the source data. The settings enable you to configure the event that BSM Connector sends to OMi.

Note: You can use this policy type to forward information from HP Network Node Manager i (NNMi) to OMi. When you install BSM Connector on an NNMi management server, you must enable the HP Operations Agent integration with NNMi so that the HP Operations Agent can receive SNMP traps from the NNMi northbound interface. To enable the NNMi integration, follow the procedures in the *NNMi Deployment Reference* instead of the one below.

Configuring the Trap Interceptor (opctrapi) Process

By default, the trap interceptor process (opctrapi) of HP Operations Agent uses the Net-SNMP APIs to receive SNMPv1 and SNMPv2 traps at port 162. If port 162 is already bound by another process (for example the Microsoft SNMP Trap service or the Linux snmptrapd process), the trap interceptor process fails to start.

You can reconfigure the trap interceptor process to listen at another port by setting the `SNMP_TRAP_PORT` variable. Alternatively, for Windows systems, you can configure the trap interceptor process to subscribe to the Microsoft SNMP Trap service. This configuration provides the trap interceptor process with SNMPv1 traps only.

To configure HP Operations Agent for the Microsoft SNMP Trap service, complete the following steps:

1. Open a command prompt, and then type:

```
ovconfchg -ns eaagt -set SNMP_SESSION_MODE WIN_SNMP
```

2. Restart the trap interceptor process:

```
ovc -restart opctrapi
```

For more information about the `SNMP_SESSION_MODE` and `SNMP_TRAP_PORT` variables, see the HP Operations Agent Reference Guide.

Troubleshooting

- If on Windows, the trap interceptor process does not receive SNMPv2 traps, make sure the Microsoft SNMP Trap service is disabled, and the `SNMP_SESSION_MODE` variable is set to `NETSNMP`.
- To check that BSM Connector receives SNMP traps, complete the following steps:
 - a. Edit the SNMP trap policy and open the Options page.
 - b. In the Options page, select one or more of the **Log Local Events** options.
 - c. Reactivate the SNMP trap policy.
 - d. Open the following log file and check that SNMP trap events are logged:

Windows: %OvDataDir%\log\OpC\opcmsglg

Linux: /var/opt/OV/log/OpC/opcmsglg

For details on logging local events, see ["Configuring Options in SNMP Trap Policies" on page 213](#).

How to Collect Event Data from SNMP Traps

This task describes how to collect event data from SNMP traps.

1. *Prerequisite:* Make sure the following applies:
 - a. Your BSM Connector is configured to work with OMi by using the `bsmc-conf` tool.
 - b. The certificate request is approved on the OMi side.
 - c. Your BSM Connector is set up as a connected server in OMi.
2. In the BSM Connector user interface, click  in the toolbar, then click **Event >  SNMP Interceptor**. The SNMP Trap Policy editor opens.

Alternatively, double-click an existing SNMP trap policy to edit it.

3. In the **Properties** page, define information that is related to the policy itself (for example, the name and description of the policy).

For details, see ["Configuring SNMP Trap Policy Properties" on the next page](#).

4. *Optional.* In the **Default Event Attributes** page, configure the default settings for all events generated by the policy (for example, default event correlation settings).

For details, see ["Configuring Event Defaults in SNMP Trap Policies" on the next page](#).

5. In the **Rules** page, define what the policy should do in response to a specific type of event.

For details, see ["Configuring Rules in SNMP Trap Policies" on page 210](#).

6. In the **Options** page, configure several policy behaviors (for example, pattern matching options).

For details, see ["Configuring Options in SNMP Trap Policies" on page 213](#).

7. Click **Save and Close** to save the policy and close the editor.
8. *Optional.* If the list of policies does not refresh automatically in the BSM Connector user interface, click  in the toolbar.
9. Activate the SNMP trap policy to start the opctrapi process on the BSM Connector server.

SNMP Trap Policy User Interface

This section includes:

- ["Configuring SNMP Trap Policy Properties" below](#)
- ["Configuring Event Defaults in SNMP Trap Policies" on the next page](#)
- ["Configuring Rules in SNMP Trap Policies" on page 210](#)
- ["Configuring Options in SNMP Trap Policies" on page 213](#)

Configuring SNMP Trap Policy Properties

Every policy has a set of properties that identify and describe the policy. Properties include, for example, the policy name and a description of what the policy does.

To access

In the BSM Connector user interface, click  in the toolbar, then click **Event >**  **SNMP Interceptor**. The SNMP Trap Policy editor opens.

Alternatively, double-click an existing SNMP trap policy to edit it.

Tasks

How to configure policy properties

In the Properties page, type a name for the policy. You can use spaces in the name. The equal sign (=) is not allowed.

Related tasks

- ["How to Collect Event Data from SNMP Traps" on page 207](#)

UI Descriptions

For a description of the Properties page, see ["Properties Page" on page 313](#).

Configuring Event Defaults in SNMP Trap Policies

The Default Event Attributes page enables you to indicate default settings for all events generated by the policy.

These defaults affect all new and existing rules. You can override the defaults in individual rules if needed. If a rule contains empty event attributes, the agent will use the defaults for the new event.

To access

In the BSM Connector user interface, click  in the toolbar, then click **Event** >  **SNMP Interceptor**. The SNMP Trap Policy editor opens.

Alternatively, double-click an existing SNMP trap policy to edit it.

Click **Defaults** to open the Default Event Attributes page.

Tasks

Configure events for SNMP trap policies

This task describes how to configure default settings for all events generated by the policy.

1. Click **Event Attributes** to define default event attributes, such as severity and category.

Tip: After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated event type indicators (ETIs).

To insert an indicator, drag and drop the indicator with its state from the Indicators tab to the policy.

2. Click **Event Correlation** to specify the Event Key and Close Events with Key. Additionally you can suppress deduplication on server by selecting the available check box.
3. Click **Advanced** to define default advanced attributes such as legacy HPOM attributes and agent MSI (Message Stream Interface) settings.
4. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated health indicators (HIs) and event type indicators (ETIs).
5. Optionally, use the **Policy Variables** tab to add policy variables to event attributes. BSM Connector replaces the variables with the appropriate values in the generated event.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example "<MSG_NODE>".

Related tasks

Configuring Rules in SNMP Trap Policies

Rules define what a policy should do in response to a specific type of event. Each rule consists of a condition and of settings for the event generated by the policy. The condition is the part of a policy that describes the source. The settings enable you to configure the event that BSM Connector sends to OMi.

A policy must contain at least one rule. If the policy contains multiple rules, it is important to remember that the rules are evaluated in a specific order, and that when one condition is matched, no additional rules will be evaluated.

To access

In the BSM Connector user interface, click  in the toolbar, then click **Event** >  **SNMP Interceptor**. The SNMP Trap Policy editor opens.

Alternatively, double-click an existing SNMP trap policy to edit it.

Click **Rules** to open the policy Rules page.

Learn More

Rule types

The rule types are:

- **Event on matched rule.** If matched, BSM Connector sends an event to OMi. The event uses the settings defined for the rule. If you do not configure these settings, the default settings are used.
- **Suppress on matched rule.** If matched, BSM Connector stops processing and does not send an event to OMi.
- **Suppress on unmatched rule.** If not matched, BSM Connector stops processing and does not send an event to OMi.

Tasks

How to configure rules in SNMP trap policies

This task describes how to configure policy rules.

1. In the **Policy Rules** section, click  in the toolbar and select the rule type. Then type a description for the rule. After a rule has been added, you can change the rule type by clicking the current rule type in the list of rules and selecting another rule type from the drop-down list.

Alternatively, select an existing rule and click  to copy the rule. You can then rewrite the description of the copied rule and edit the rule.

2. In the **Rule Content** section, use the **Condition** tab to define the match condition for the SNMP traps. You can match SNMP traps generated from a specific node, or SNMP traps with specific IDs.
3. In the **Condition Variable Bindings** tab, select the variable bindings you want the policy to read, and write one or more match patterns for each binding. You can use pattern-matching rules when

matching variable bindings.

For example, \$2 contains in many SNMP events the hostname of the sender of the SNMP event. To only match events from systems in the domain example.com, use the pattern <*>.example.com:

4. Use the **Event Attributes** tab to define event attributes (for example, event title and description) for all events generated by this rule.

Tip: After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated event type indicators (ETIs).

To insert an indicator, drag and drop the indicator with its state from the Indicators tab to the policy.

5. Use the **Event Correlation** tab to set the type of duplicate event suppression and define the method used to suppress duplicate events.
6. Use the **Custom Attributes** tab to add additional information to all events generated by this rule. For example, you might add a company name, contact information, or a city location to an event.
7. Use the **Advanced** tab to define an event drill-down URL, legacy HPOM attributes, and agent MSI (Message Stream Interface) settings.

UI Descriptions

For a description of the Options page, see ["Options Page" on page 307](#).

Chapter 14: Structured Log File Policies (Events and Metrics only)

This policy type reads entries in a log file and matches the desired text against the log file structure fields defined by using the OM pattern-matching language. When the policy finds a match and certain conditions apply, the policy responds by sending event or metrics data to OMi. You can define the details of the data sent to OMi based on information in the log file.

Note: You must have the format and syntax of the log file that the policy reads. You must define a log file structure to match on the entries in the log file that contain the data you want to read and forward to OMi. For examples of how the log file structure is defined, see ["Defining a log file structure by using OM pattern-matching language" on page 218](#).

What Data Is Collected

The structured log file policy sends to BSM Connector data that is extracted from any log file row that matched against the log file structure fields defined by OM pattern-matching language.

Before setting up the structured log file policy, you should be clear about the purpose and usage of the data in OMi.

The specific data that is forwarded to OMi (for events) or stored on the BSM Connector system (for metrics) is controlled by the type of policy (event or metrics integration policy) and by the defaults and rules that the policy applies to the data.

How to Collect Event Data from Structured Log Files

This task describes how to collect event data from structured log files.

1. *Prerequisite:* Make sure the following applies:
 - a. Your BSM Connector is configured to work with OMi by using the `bsmc-conf` tool.
 - b. The certificate request is approved on the OMi side.
 - c. Your BSM Connector is set up as a connected server in OMi.
2. In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **Structured Log File**.

Alternatively, double-click an existing policy to edit it.
3. In the **Properties** page, define information that is related to the policy itself (for example, the name

and description of the policy).

For details, see ["Configuring Structured Log File Policy Properties" on page 217](#).

4. In the **Source** page, define the structure pattern of the log file by using the OM pattern-matching language.

For details, see ["Configuring Data Source in Structured Log File Policies" on page 218](#).

5. In the **Mappings** page, map the structured log file's input data properties to custom variables.

For details, see ["Configuring Mappings in Structured Log File Policies " on page 221](#).

6. *Optional*. In the **Defaults** page, configure the default settings for all events generated by the policy (for example, default event correlation settings).

For details, see ["Configuring Event Defaults in Structured Log File Policies" on page 224](#).

7. In the **Rules** page, define what the policy should do in response to a specific type of event.

For details, see ["Configuring Event Rules in Structured Log File Policies" on page 230](#).

8. In the **Options** page, configure several policy behaviors (for example, pattern matching options).

For details, see ["Configuring Options in Structured Log File Policies" on page 238](#).

9. Click **Save and Close** to save the policy and close the editor.

10. *Optional*. If the list of policies does not refresh automatically in the BSM Connector user interface, click  in the toolbar.

How to Collect Metrics Data from Structured Log Files

This task describes how to collect metrics from structured log files.

Note: For examples and end-to-end workflow information on collecting metrics data, see ["Collecting and Viewing Metrics Data" on page 60](#).

1. *Prerequisite:* Make sure the following applies:
 - a. Your BSM Connector is configured to work with OMi by using the `bsmc-conf` tool.
 - b. The certificate request is approved on the OMi side.
 - c. Your BSM Connector is set up as a connected server in OMi.
2. In the BSM Connector user interface, click

 in the toolbar. Then click **Metrics** >  **Structured Log File**.

Alternatively, double-click an existing policy to edit it.

3. In the **Properties** page, define information that is related to the policy itself (for example, the name and description of the policy).

For details, see ["Configuring Structured Log File Policy Properties" on the next page](#).

4. In the **Source** page, define the structure pattern of the log file by using either the OM pattern-matching language or static fields. Additionally define the possible recurring fields.

For details, see ["Configuring Data Source in Structured Log File Policies" on page 218](#).

5. In the **Mappings** page, map the structured log file's input data properties to custom variables.

For details, see ["Configuring Mappings in Structured Log File Policies " on page 221](#).

6. *Optional*. In the **Defaults** page, assign default values to the metric attributes.

For details, see ["Configuring Metrics Defaults in Structured Log File Policies" on page 226](#).

7. In the **Rules** page, define what the policy should do in response to a specific metric.

For details, see ["Configuring Metrics Rules in Structured Log File Policies" on page 233](#).

8. Click **Save and Close** to save the policy and close the editor.

9. *Optional*. If the list of policies does not refresh automatically in the BSM Connector user interface, click  in the toolbar.

Structured Log File Policy User Interface

Structured log file policies display different pages depending on the type of data they are integrating and on the policy origin.

Choose the type of data you want to integrate and then complete the following tasks:

Event data

- ["Configuring Structured Log File Policy Properties" on the next page](#)
- ["Configuring Data Source in Structured Log File Policies" on page 218](#)
- ["Configuring Mappings in Structured Log File Policies " on page 221](#)
- ["Configuring Event Defaults in Structured Log File Policies" on page 224](#)

- ["Configuring Event Rules in Structured Log File Policies" on page 230](#)
- ["Configuring Options in Structured Log File Policies" on page 238](#)

Metrics data

- ["Configuring Structured Log File Policy Properties" below](#)
- ["Configuring Data Source in Structured Log File Policies" on the next page](#)
- ["Configuring Mappings in Structured Log File Policies " on page 221](#)
- ["Configuring Metrics Defaults in Structured Log File Policies" on page 226](#)
- ["Configuring Metrics Rules in Structured Log File Policies" on page 233](#)
- ["Configuring Options in Structured Log File Policies" on page 238](#)

Configuring Structured Log File Policy Properties

Every policy has a set of properties that identify and describe the policy. Properties include, for example, the policy name and a description of what the policy does.

To access

- In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **Structured Log File**.
- In the BSM Connector user interface, click  in the toolbar. Then click **Metrics** >  **Structured Log File**.

Alternatively, double-click an existing policy to edit it.

Tasks

How to configure policy properties

In the Properties page, type a name for the policy. You can use spaces in the name. The equal sign (=) is not allowed.

For more information about the other fields, see ["Configuring Structured Log File Policy Properties" above](#).

Related tasks

- ["How to Collect Event Data from Structured Log Files" on page 214](#)
- ["How to Collect Metrics Data from Structured Log Files" on page 215](#)

UI Descriptions

For a description of the Properties page, see ["Properties Page" on page 313](#).

Configuring Data Source in Structured Log File Policies

The source page of the structured log file policy editor enables you to specify which log file the policy reads. You can also configure the policy to extract data, to which the log file structure is applied, from the log file. The policy retains that structured data for later reuse in other pages of the policy editor.

To access

- In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **Structured Log File**.
- In the BSM Connector user interface, click  in the toolbar. Then click **Metrics** >  **Structured Log File**.

Alternatively, double-click an existing policy to edit it.

Click **Source** to open the policy Source page.

Learn More

Defining a log file structure by using OM pattern-matching language

A log file structure is defined by using the OM pattern-matching language, so that the dynamic parts of the text-based events can be extracted from any log file row, assigned to variables, and then used as parameters to build the event description or to set other attributes. For more information on the OM pattern matching in policy rules, see ["Pattern Matching in Policy Rules" on page 265](#).

You can use an asterisk (<*>) wildcard in the **Log File Path / Name** field to match multiple file names. For example, to match the source file names `events.1.log` and `events.2.log`, use the pattern `<path>/events<*>.xml` in the Log File Path / Name field. For more information on pattern matching, see ["Pattern-Matching Details" on page 265](#).

Example 1: Use OM pattern-matching language to extract the log file structure from the following log file line:

```
Mon, 28 Jul 2014 23:19:29 GMT;SEVERE;frogproc;123456;ERR-123;failed connect to db 'pond'
```

This is done by defining the fields from which the log file line is logically constituted, and allocating the correspondent variables by which these fields can be organized within a structure. The log file line in this example is constituted logically from the following fields:

```
timestamp;severity;processname;pid;errorcode;errortext
```

Allocate the appropriate variable extractions to all fields by using the OM pattern-matching language, as follows:

```
<*.timestamp>;<*.severity>;<*.processname>;<*.pid>;<*.errorcode>;<*.errortext>
```

Now each field from the log file line can be identified by the variable name, that can be also used in all subsequent policy operations, such as mappings, default attributes and rules.

For example, when setting the `Title` field of the event attribute with the value of the `errortext` field, you should enter `<${DATA:errortext}>` in the `Title` field of the Event Attributes tab of the editor, or you could just drag the `errortext` property from the Sample Data tab to the `Title` field.

In the Rules tab the field is simply referred to as `errortext` in the `Property` field.

Defining a log file structure by using static fields (Metric only)

In addition to defining a log file structure by using the OM pattern-matching language, you can identify a log file structure by using the static fields.

Example 2: Static fields are actually word lists of nonrecurring data from the log file separated by comma. In case only one metric per line is present, all fields can be addressed. For example:

Use static fields to extract the log file structure from the following log file line:

```
1380004749|tcpc113.RIESLING.INTERN|LogicalDisk|C:|% Free  
Space|66.379264831543|Microsoft.Windows.Server.2008.LogicalDisk
```

This is done by defining the fields from which the log file line is logically constituted, and by using these fields as static fields with the defined field separator char. The log file line in this example is constituted logically from the following fields:

```
timestamp|hostname|entitytype|entityid|countername|countervalue|scomtype
```

The corresponding static fields should be entered as follows:

```
timestamp,hostname,entitytype,entityid,countername,countervalue,scomtype
```

Field separator char is a pipe symbol (|).

Note that the static fields require comma instead of the pipe symbol as a delimiter.

Note: This is actually the recommended method, due to performance reasons.

Using recurring fields in defining a log file structure (Metric only)

The "Recurring fields" configuration parameter is useful in case when more than one performance value

is present within a single log file line. This is actually a word list that contains the recurring part from the log line. Each recurrence creates a record in the store.

Example 3: Extract the log file structure from the following log file lines by using also the recurring fields:

```
1380004749|tcpc113.RIESLING.INTERN|LogicalDisk|C:|% Free  
Space|66.379264831543|Current Disk Queue Length|0|Avg. Disk  
sec/Transfer|0.000484383897855878
```

```
1380004748|tcpc113.RIESLING.INTERN|Network Interface|10|Bytes  
Total/sec|55230.0703125|Current Bandwidth|1000000000
```

This is done by defining the fields from which the log file line is logically constituted, and then identifying which of them can be addressed as static fields, and which can be described as a variable part that consists of an arbitrary number of countername-countervalue pairs. These are the recurring fields. The log file lines in this example are constituted logically from the following fields:

```
timestamp|hostname|entitytype|entityid|countername_1|countervalue_1|countername_  
2|countervalue_2|countername_3|countervalue_3
```

```
timestamp|hostname|entitytype|entityid|countername_1|countervalue_1|countername_  
2|countervalue_2
```

The corresponding static fields should be entered as follows:

```
timestamp,hostname,entitytype,entityid
```

In addition, enter the following recurring fields:

```
countername,countervalue
```

Field separator char is a pipe symbol (|).

Static fields can also be specified by using the OM pattern-matching language. However, this is not the recommended method, because of the performance reasons. The syntax is as follows:

```
<*.timestamp>|<*.hostname>|<*.entitytype>|<*.entityid>
```

Tasks

How to configure the structured log file source

This task describes how to configure the structured log file source file and how the policy reads it.

1. Type the full path to the log file on the BSM Connector system.
2. Click  to load a sample log file. You can load a sample file from the BSM Connector system or from the system where the Web browser runs.

When you load sample data, BSM Connector replaces already loaded data with the new data. This does not affect any mappings that are defined based on previously available sample data.

3. *For the Event integration only:* In the Logfile Structure field, enter an OM pattern by which the log file will be structured. You can see the newly structured data on the Structured data tab of the Structured logfile sample data window .

For the Metric integration only: In the Logfile Structure field:

- a. Choose the data field by which the log file structure will be identified. You can choose either to identify by using OM pattern, or by using static fields.
- b. Define the recurring fields in the log file structure.
- c. Enter the field separator.

Related tasks

- ["How to Collect Event Data from Structured Log Files" on page 214](#)
- ["How to Collect Metrics Data from Structured Log Files" on page 215](#)

UI Descriptions

For a description of the Source page, see ["Source Page - Structured Log File Policies \(Events and Metrics Only\)" on page 323](#).

Configuring Mappings in Structured Log File Policies

The Mappings page enables you to map the log file input data properties, which are the structural fields extracted from log files, to custom variables.

To access

- In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **Structured Log File**.
- In the BSM Connector user interface, click  in the toolbar. Then click **Metrics** >  **Structured Log File**.

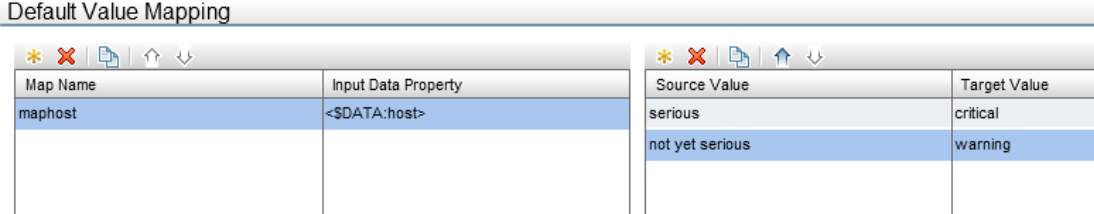

Alternatively, double-click an existing policy to edit it.

Click **Mappings** to open the policy Mappings page.

Learn More

Mappings overview

A custom variable consists of a map name, a field extracted from the log file by using the OM pattern matching language, and one or more source and target value pairs. For example, you can assign the pattern matching field `host` to the map name `maphost`, and add a source value of `critical`. You can then assign the target value `serious` to the variable so that BSM Connector inserts the value `critical` into the event in all places where the variable is used and the source value is `serious` in the log file.

Map Name	Input Data Property	Source Value	Target Value
maphost	<\$DATA:host>	serious	critical
		not yet serious	warning

Input data references use the following syntax: `<$DATA:<input_reference_field>>`

Field values originate from the structured log file pattern settings defined for the data source.

For example, the custom variable `maphost` has the pattern matching field `host` assigned.

Assigning a pattern matching field to a map name is optional. If you do not assign a pattern matching field to a variable, you must add the source value directly to the variable when you insert the variable in an event attribute.

The Sample Data tab is empty if no sample data has been loaded into the policy or if the sample data does not match the structured log file pattern.

The Sample Data tab shows the following information, if sample data is available:

- Input Data Properties

If sample data is available, the Input Data Properties section shows all fields that match the structured log file pattern.

The items in the Input Data Properties section are by default sorted alphabetically in ascending order.

- Values for 'host'

This section displays the values of a field selected in the Input Data Properties section. If a value appears more than once, click  to show or hide duplicate values. To find values that belong to more than one group, select the value and click . The Sample Data window opens and shows all fields that have the selected value.

When you drag a field from the Input Data Properties list and drop it on the Default Value Mapping List, BSM Connector automatically adds the default prefix `map` to the map name and inserts the pattern

matching field. You can then drag one or more structured log file source values from the values list and drop them on the Source Value list. You then finally only have to type the target values.

Tasks

How to configure structured log file mappings

This task describes how to map pattern matching fields to custom variables.

1. Create one or more custom variables.

If you are working with sample data, drag the field from the Input Data Properties list to the Map Name column. BSM Connector automatically adds the default prefix `map` to the map name and inserts the group name.

Alternatively, click  above the Map Name column and type the variable name in the map name field. Fields are optional. If you do not assign a field to a variable, you must add the source value directly to the variable when you insert the variable in an event attribute.

2. Add one or more source and target value pairs to each custom variable.

- If you are working with sample data, drag the value from the Values list to the Source Value column, and type the target value in the corresponding field.

Alternatively, click  above the Source Value column and type the source and target values in the corresponding fields.

- Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types.

To insert an indicator in a source or target value field, drag and drop the indicator state (for example, `HTTPServer:Normal`) from the Indicators tab to the policy.

- Optionally, use the **Policy Variables** tab to add policy variables to event or metric attributes. BSM Connector replaces the variables with the appropriate values in the generated event or metric.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example "`<MSG_NODE>`".

Configuring Event Defaults in Structured Log File Policies

The Defaults page enables you to indicate default settings for all events generated by the policy.

These defaults affect all new and existing rules. You can override the defaults in individual rules if needed. If a rule contains empty event attributes, the agent will use the defaults for the new event.

To access

In the BSM Connector user interface, click  in the toolbar. Then click **Event >**  **Structured Log File**.

Alternatively, double-click an existing policy to edit it.

Click **Defaults** to open the policy Default Event Attributes page.

Tasks

How to configure events for structured log file policies

This task describes how to configure default settings for all events generated by the policy.

1. Click **Event Attributes** to define default event attributes, such as severity and category.

Tip: After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated event type indicators (ETIs).

To insert an indicator, drag and drop the indicator with its state from the Indicators tab to the policy.

2. Click **Event Correlation** to set the type of duplicate event suppression and define the method used to suppress duplicate events.
3. Click **Custom Attributes** to add additional information to all events generated by this policy. For example, you might add a company name, contact information, or a city location to an event.
4. Click **Advanced** to define default advanced attributes such as legacy HPOM attributes and agent MSI (Message Stream Interface) settings.

5. Optionally, use the **Sample Data** tab to drag the input data references to the attribute boxes. Alternatively, you can type the reference directly into the attribute box.

Input data references use the following syntax: `<$DATA:<input_reference_field>>`.

Field names originate from the structured log file pattern settings defined for the data source.

BSM Connector replaces the pattern matching field at runtime with the value of the specified field. If you insert a field value, the value will be used.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or if the sample data does not match the structured log file pattern specified in the source page. See also ["Configuring Data Source in Structured Log File Policies" on page 218](#).

6. Optionally, use the **Mappings** tab to add mapping definitions to the attribute boxes.

Mappings are custom variables that you define in the Mappings page (see also ["Configuring Mappings in Structured Log File Policies" on page 221](#)).

Alternatively, type the custom variable into the attribute box using the following syntax:

`<$MAP(<custom_variable>>` where `<custom_variable>` is the map name of the variable (for example, `<$MAP(maphost)>`).

If the custom variable does not have an input data reference assigned, use the following syntax:

`<$MAP(<custom_variable>,<source_value>)` where `<source_value>` can be one of the following:

- Name of the input data reference, for example `<$MAP(maphost)>`, `<$DATA:host>`
- The source value itself, for example `<$MAP(maphost,Critical)>`

7. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated health indicators (HIs) and event type indicators (ETIs).
8. Optionally, use the **Policy Variables** tab to add policy variables to event attributes. BSM Connector replaces the variables with the appropriate values in the generated event.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example `"<$MSG_NODE>"`.

Configuring Metrics Defaults in Structured Log File Policies

The Default Metric Attributes page enables you to assign default values to the metric attributes. The values can be used when defining the policy rules on the Rules tab, and can also be overridden there.

Note: For examples and end-to-end workflow information on collecting metrics data, see ["Collecting and Viewing Metrics Data" on page 60](#).

To access

In the BSM Connector user interface, click  in the toolbar. Then click **Metrics >**  **Structured Log File**.

Alternatively, double-click an existing policy to edit it.

Click **Defaults** to open the policy Default Metric Attributes page.

Learn More

Metrics attributes

Each time a metrics policy runs, it extracts raw data from its defined data source and builds a metric structure.

A metric structure consists of these attributes:

- Basic attributes:
 - Data domain

The namespace of the integrated performance records, used in the Operations Agent store to avoid clashes.
 - Metric class

Defines the metric class under which the metric appears in the Operations Agent store and consumers.
 - Metric name

Defines the metric name under which the metric appears in the Operations Agent store and consumers.
 - Related CI

Used to identify an instance of a performance record and associates it with a concrete CI instance. For details on how to associate the Related CI with the values in the RTSM model, see ["Create a policy" on page 60](#). For an example, see ["Example – Create a Metrics Policy" on page 61](#).
 - Node

Used to identify a node-like CI to which the performance records are associated to.
 - Value

The actual performance value which is converted to 64-bit floating point number.
 - Time measured

The time stamp when the value was determined in the third-party system.
- Advanced attributes:
 - Original metric name

The name of the metric as used on the third-party system.
 - Unit

The unit of the metric.
 - Integration id

An id, used to identify the source of the integration.

Tasks

How to configure metrics defaults for structured log file policies

This task describes how to configure metric attribute defaults for all metrics collected by this policy.

1. Define the metric attributes common to all metrics collected by this policy, such as metric class and name. All metrics in the **Basic** tab marked with a * are required. **Advanced** attributes are optional.
2. Optionally, use the **Sample Data** tab to drag the input data references to the attribute boxes. Alternatively, you can type the reference directly into the attribute box.

Input data references use the following syntax: `<$DATA:<input_reference_field>>`.

Field names originate from the structured log file pattern settings defined for the data source.

BSM Connector replaces the pattern matching field at runtime with the value of the specified field. If you insert a field value, the value will be used.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or if the sample data does not match the structured log file pattern specified in the source page. See also ["Configuring Data Source in Structured Log File Policies" on page 218](#).

3. Optionally, use the **Mappings** tab to add mapping definitions to the attribute boxes.

Mappings are custom variables that you define in the Mappings page (see also ["Configuring Mappings in Structured Log File Policies" on page 221](#)).

Alternatively, type the custom variable into the attribute box using the following syntax:

`<$MAP(<custom_variable>>` where `<custom_variable>` is the map name of the variable (for example, `<$MAP(maphost)>`).

If the custom variable does not have an input data reference assigned, use the following syntax:

`<$MAP(<custom_variable>,<source_value>)` where `<source_value>` can be one of the following:

- Name of the input data reference, for example `<$MAP(maphost)>`, `<$DATA:host>`
- The source value itself, for example `<$MAP(maphost,Critical)>`

4. Optionally, use the **Operators** tab to apply operators to the metric attribute values. Two functions are available:

- `<$MATCH(>`, to get a sub string of input data: The `$MATCH` function accepts three or four parameters:

- the input string
- the pattern definition
- the output string if pattern matches on the input string
- optionally, the output string if the pattern does not match.

Example: The data of the input field hostname start always with "TEST" (for example "TESTABC"). The `$MATCH` function to use the string after "TEST" is:

```
$MATCH(<$DATA:hostname>,TEST<*.prefix>,<prefix>)
```

- `<$DATETIME(FORMAT,VALUE)>`, to convert a string with date and time information to the internal integer data time format.

For detailed description of the format, see ["Pattern Matching in Policy Rules" on page 265](#).

5. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types.
6. Optionally, use the **Policy Variables** tab to add policy variables to metric attributes. BSM Connector replaces the variables with the appropriate values in the generated metric.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example "`<$MSG_NODE>`".

Configuring Event Rules in Structured Log File Policies

Rules define what a policy should do in response to a specific type of event. Each rule consists of a condition and of settings for the event generated by the policy. The condition is the part of a policy that describes the source. The settings enable you to configure the event that BSM Connector sends to OMi.

A policy must contain at least one rule. If the policy contains multiple rules, it is important to remember that the rules are evaluated in a specific order, and that when one condition is matched, no additional rules will be evaluated.

To access

In the BSM Connector user interface, click  in the toolbar. Then click **Event >  Structured Log File**.

Alternatively, double-click an existing policy to edit it.

Click **Rules** to open the policy Rules page.

Learn More

Rule types

The rule types are:

- **Event on matched rule.** If matched, BSM Connector sends an event to OMi. The event uses the settings defined for the rule. If you do not configure these settings, the default settings are used.
- **Suppress on matched rule.** If matched, BSM Connector stops processing and does not send an event to OMi.
- **Suppress on unmatched rule.** If not matched, BSM Connector stops processing and does not send an event to OMi.

Tasks

How to configure rules in log file policies

1. In the **Policy Rules** section, click  and select the type of rule to define what the policy should do in response to a specific pattern matching field. Each policy must have at least one rule.

2. In the **Rule Content** section, use the **Condition** tab to specify the pattern matching fields and values that the policy searches for in the structured log file that the policy reads. If the policy finds a match, it may or may not generate an event, depending on the rule type.

- a. Click  to create a new condition. New conditions by default use the equals operator.
- b. Click  to expand the new condition.
- c. In the **Property** field, specify the pattern matching field that the policy searches for (for example, host).

If you are working with sample data, you can drag and drop the pattern matching field from the Input Data Properties list to the Properties field.

- d. Select the pattern operator.

If you select the matches operator, you can type a pattern in the Operand field. For a list of available operators, see "[Operator](#)" on page 296.

- e. In the **Operand** field, type the value or pattern that you want the policy to compare with the input data reference field. If you are working with sample data, you can drag the value from the Values list and drop it in the Operand field.

3. Use the **Event Attributes** tab to define event attributes (for example, event title and description) for all events generated by this rule.

Tip: After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated event type indicators (ETIs).

To insert an indicator, drag and drop the indicator with its state from the Indicators tab to the policy.

4. Use the **Event Correlation** tab to set the type of duplicate event suppression and define the method used to suppress duplicate events.
5. Use the **Custom Attributes** tab to add additional information to all events generated by this rule. For example, you might add a company name, contact information, or a city location to an event.
6. Use the **Advanced** tab to define an event drill-down URL, legacy HPOM attributes, and agent MSI (Message Stream Interface) settings.
7. Optionally, use the **Sample Data** tab to drag the input data references to the attribute boxes. Alternatively, you can type the reference directly into the attribute box.

Input data references use the following syntax: `<$DATA:<input_reference_field>>`.

Field names originate from the structured log file pattern settings defined for the data source.

BSM Connector replaces the pattern matching field at runtime with the value of the specified field. If you insert a field value, the value will be used.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or if the sample data does not match the structured log file pattern specified in the source page. See also ["Configuring Data Source in Structured Log File Policies" on page 218](#).

8. Optionally, use the **Mappings** tab to add mapping definitions to the attribute boxes.

Mappings are custom variables that you define in the Mappings page (see also ["Configuring Mappings in Structured Log File Policies" on page 221](#)).

Alternatively, type the custom variable into the attribute box using the following syntax:

`<$MAP(<custom_variable>)>` where `<custom_variable>` is the map name of the variable (for example, `<$MAP(maphost)>`).

If the custom variable does not have an input data reference assigned, use the following syntax:

`<$MAP(<custom_variable>,<source_value>)>` where `<source_value>` can be one of the following:

- Name of the input data reference, for example `<$MAP(maphost)>`, `<$DATA:host>`
- The source value itself, for example `<$MAP(maphost,Critical)>`

9. Optionally, use the **Pattern Matching Variables** tab to add variables created through pattern matching.

Pattern matching variables insert matched strings that have previously been assigned to variables. To insert a pattern matching variable, type the variable name enclosed in angle brackets (for example, `<variablename>`) or drag and drop it from the Pattern Matching Variables list to the event attribute.

10. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated health indicators (HIs) and event type indicators (ETIs).
11. Optionally, use the **Policy Variables** tab to add policy variables to event attributes. BSM Connector replaces the variables with the appropriate values in the generated event.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example `"<$MSG_NODE>"`.

Configuring Metrics Rules in Structured Log File Policies

Rules define what a policy should do in response to a specific type of metric. Each rule consists of a condition and of settings for the metrics generated by the policy. The condition is the part of a policy that describes the source. The settings enable you to configure the metrics that BSM Connector sends to OMi.

A policy must contain at least one rule. If the policy contains multiple rules, it is important to remember that the rules are evaluated in a specific order, and that when one condition is matched, no additional rules will be evaluated.

Note: For examples and end-to-end workflow information on collecting metrics data, see ["Collecting and Viewing Metrics Data" on page 60](#).

To access

In the BSM Connector user interface, click  in the toolbar. Then click **Metrics >**  **Structured Log File**.

Alternatively, double-click an existing policy to edit it.

Click **Rules** to open the policy Rules page.

Learn More

This section includes:

- ["Rule types" below](#)
- ["Metrics attributes" below](#)

Rule types

The rule types are:

- **Store on matched rule.** If matched, BSM Connector stores metrics in a buffer until a maximum number of records or a maximum amount of time are reached. These metrics are sent to OMi when they are requested. The metrics use the settings defined for the rule. If you do not configure these settings, the default settings are used.
- **Suppress on matched rule.** If matched, BSM Connector stops processing.
- **Suppress on unmatched rule.** If not matched, BSM Connector stops processing.

Metrics attributes

Each time a metrics policy runs, it extracts raw data from its defined data source and builds a metric structure.

A metric structure consists of these attributes:

- Basic attributes:
 - Data domain
The namespace of the integrated performance records, used in the Operations Agent store to avoid clashes.
 - Metric class
Defines the metric class under which the metric appears in the Operations Agent store and consumers.
 - Metric name
Defines the metric name under which the metric appears in the Operations Agent store and consumers.
 - Related CI
Used to identify an instance of a performance record and associates it with a concrete CI instance. For details on how to associate the Related CI with the values in the RTSM model, see ["Create a policy" on page 60](#). For an example, see ["Example – Create a Metrics Policy" on page 61](#).
 - Node

Used to identify a node-like CI to which the performance records are associated to.

- Value

The actual performance value which is converted to 64-bit floating point number.

- Time measured

The time stamp when the value was determined in the third-party system.

- Advanced attributes:

- Original metric name

The name of the metric as used on the third-party system.

- Unit

The unit of the metric.

- Integration id

An id, used to identify the source of the integration.

Tasks

How to configure rules for metrics in log file policies

1. In the **Policy Rules** section, click  and select the type of rule to define what the policy should do in response to a specific pattern matching field. Each policy must have at least one rule.
2. In the **Rule Content** section, use the **Condition** tab to specify the pattern matching fields and values that the policy searches for in the structured log file that the policy reads. If the policy finds a match, it may or may not generate an event, depending on the rule type.

- a. Click  to create a new condition. New conditions by default use the equals operator.
- b. Click  to expand the new condition.
- c. In the **Property** field, specify the pattern matching field that the policy searches for (for example, host).

If you are working with sample data, you can drag and drop the pattern matching field from the Input Data Properties list to the Properties field.

- d. Select the pattern operator.

If you select the matches operator, you can type a pattern in the Operand field. For a list of available operators, see ["Operator" on page 296](#).

- e. In the **Operand** field, type the value or pattern that you want the policy to compare with the pattern matching field. If you are working with sample data, you can drag the value from the Values list and drop it in the Operand field.
3. *Optional.* If you are creating a rule of the type 'store on matched rule', set the attributes (**Basic** or/and **Advanced**) for metrics that you want the rule to override. If default attributes are specified in the Defaults tab, you use the defaults or you can override them as described below.
4. Optionally, use the **Sample Data** tab to drag the input data references to the attribute boxes. Alternatively, you can type the reference directly into the attribute box.

Input data references use the following syntax: `<$DATA:<input_reference_field>>`.

Field names originate from the structured log file pattern settings defined for the data source.

BSM Connector replaces the pattern matching field at runtime with the value of the specified field. If you insert a field value, the value will be used.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or if the sample data does not match the structured log file pattern specified in the source page. See also ["Configuring Data Source in Structured Log File Policies" on page 218](#).

5. Optionally, use the **Mappings** tab to add mapping definitions to the attribute boxes.

Mappings are custom variables that you define in the Mappings page (see also ["Configuring Mappings in Structured Log File Policies" on page 221](#)).

Alternatively, type the custom variable into the attribute box using the following syntax:

`<$MAP(<custom_variable>>` where `<custom_variable>` is the map name of the variable (for example, `<$MAP(maphost)>`).

If the custom variable does not have an input data reference assigned, use the following syntax:

`<$MAP(<custom_variable>,<source_value>)` where `<source_value>` can be one of the following:

- Name of the input data reference, for example `<$MAP(maphost)>`, `<$DATA:host>`
- The source value itself, for example `<$MAP(maphost,Critical)>`

6. Optionally, use the **Pattern Matching Variables** tab to add variables created through pattern matching.

Pattern matching variables insert matched strings that have previously been assigned to variables. To insert a pattern matching variable, type the variable name enclosed in angle brackets

(for example, <variablename>) or drag and drop it from the Pattern Matching Variables list to the metric attribute.

7. Optionally, use the **Operators** tab to apply operators to the metric attribute values. Two functions are available:

- <\$MATCH(>, to get a sub string of input data: The \$MATCH function accepts three or four parameters:

- the input string
- the pattern definition
- the output string if pattern matches on the input string
- optionally, the output string if the pattern does not match.

Example: The data of the input field hostname start always with "TEST" (for example "TESTABC"). The \$MATCH function to use the string after "TEST" is:

```
$MATCH(<$DATA:hostname>,TEST<*.prefix>,<prefix>)
```

- <\$DATETIME(FORMAT,VALUE)>, to convert a string with date and time information to the internal integer data time format.

For detailed description of the format, see ["Pattern Matching in Policy Rules" on page 265](#).

8. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types.
9. Optionally, use the **Policy Variables** tab to add policy variables to metric attributes. BSM Connector replaces the variables with the appropriate values in the generated metric.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example "<\$MSG_NODE>".

For a description of the Options page, see ["Options Page" on page 307](#).

Troubleshooting Structured Log File Policies

This section describes troubleshooting and limitations when working with log file policies.

Debugging errors

- Check the Operations Agent log files in %OvDataDir%\log (Windows) or /var/opt/OV/log (Linux).
- Any policy logs (policy execution related issues) are saved to %OvDataDir%\log/System.txt (Windows) or /var/opt/OV/log/System.txt (Linux).

Note: Log files that start with opr-* are used for the BSMCWeb console.

Chapter 15: XML File Policies

XML file policies read values in XML files and respond when the value that you choose appears in the file. XML file policies are especially suited for integrating data from third-party systems that can store their information in XML format.

XML file policies process XML files and send data to OMi when certain conditions apply. You can define the attributes of the BSM event or metric based on information in the XML file. This enables you to process data generated by other applications and to convert it to BSM events or metrics.

XML file policies process exactly the XML elements and attributes that you define. The XML syntax is not important to the policy, as long as the information is embedded in XML elements and attributes.

Tip: If the application does not store its data in XML files, you may write a program or script that extracts the events, metrics, or topology data from wherever they are stored, formats the data using XML syntax, and generates an XML file with the data. If you have control over the XML elements that are used in the XML file, choose XML elements and attributes that map to event or metric attributes and values. This will simplify the policy.

How to Collect Event Data from XML Files

This task describes how to collect event data from XML files.

1. *Prerequisite:* Make sure the following applies:
 - a. Your BSM Connector is configured to work with OMi by using the `bsmc-conf` tool.
 - b. The certificate request is approved on the OMi side.
 - c. Your BSM Connector is set up as a connected server in OMi.
2. In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **XML File**.
3. In the **Properties** page, define information that is related to the policy itself (for example, the name and description of the policy).

For details, see "[Configuring XML File Policy Properties](#)" on page 243.
4. In the **Source** page, define the XML file that the policy reads (for example, the path and name of the XML file).

For details, see "[Configuring the Data Source in XML File Policies](#)" on page 244.
5. In the **Mappings** page, configure the default mappings of XML elements and attributes to custom

variables.

For details, see ["Configuring Mappings in XML File Policies" on page 247](#).

6. *Optional*. In the **Defaults** page, configure the default settings for all events generated by the policy (for example, default event correlation settings).

For details, see ["Configuring Event Defaults in XML File Policies" on page 250](#).

7. In the **Rules** page, define what the policy should do in response to a specific type of event.

For details, see ["Configuring Event Rules in XML File Policies" on page 254](#).

8. In the **Options** page, configure several policy behaviors (for example, pattern matching options).

For details, see ["Configuring Options in XML File Policies" on page 262](#).

9. Click **Save and Close** to save the policy and close the editor.

10. *Optional*. If the list of policies does not refresh automatically in the BSM Connector user interface, click  in the toolbar.

How to Collect Metric Data from XML Files

This task describes how to collect metric data from XML files.

1. *Prerequisite*: Make sure the following applies:
 - a. Your BSM Connector is configured to work with OMi by using the `bsmc-conf` tool.
 - b. The certificate request is approved on the OMi side.
 - c. Your BSM Connector is set up as a connected server in OMi.
2. In the BSM Connector user interface, click  in the toolbar. Then click **Metric >  XML File**.
3. In the **Properties** page, define information that is related to the policy itself (for example, the name and description of the policy).

For details, see ["Configuring XML File Policy Properties" on page 243](#).
4. In the **Source** page, define the XML file that the policy reads (for example, the path and name of the XML file).

For details, see ["Configuring the Data Source in XML File Policies" on page 244](#).
5. In the **Mappings** page, configure the default mappings of XML elements and attributes to custom

variables.

For details, see ["Configuring Mappings in XML File Policies" on page 247](#).

6. *Optional*. In the **Defaults** page, assign default values to the metric attributes.

For details, see ["Configuring Metric Defaults in XML File Policies" on page 252](#).

7. In the **Rules** page, define what the policy should do in response to a specific metric.

For details, see ["Configuring Metrics Rules in XML File Policies" on page 258](#).

8. In the **Options** page, configure several policy behaviors (for example, pattern matching options).

For details, see ["Configuring Options in XML File Policies" on page 262](#).

9. Click **Save and Close** to save the policy and close the editor.

10. *Optional*. If the list of policies does not refresh automatically in the BSM Connector user interface, click  in the toolbar.

How to Collect Topology Data from XML Files

This task describes how to collect topology data from XML files that are produced by topology discovery scripts.

Note: For detailed information on topology discovery scripts, see ["Topology Policies and Topology Synchronization" on page 77](#).

1. *Prerequisite:* Make sure the following applies:
 - a. Your BSM Connector is configured to work with OMi by using the `bsmc-conf` tool.
 - b. The certificate request is approved on the OMi side.
 - c. Your BSM Connector is set up as a connected server in OMi.
2. In the BSM Connector user interface, click  in the toolbar. Then click **Topology** >  **XML File**.

Alternatively, double-click an existing policy to edit it.

3. In the **Properties** page, define information that is related to the policy itself (for example, the name and description of the policy).

For details, see ["Configuring XML File Policy Properties" on the next page](#).

4. In the **Source** page, define the path of the XML file and set the age to deletion.
For details, see ["How to configure the XML source \(topology\)" on page 246](#).
5. Click **Save and Close** to save the policy and close the editor.
6. *Optional.* If the list of policies does not refresh automatically in the BSM Connector user interface, click  in the toolbar.

XML File Policy User Interface

This section includes:

Configuring the Data Source in XML File Policies

The source page of the XML file policy editor enables you to specify which XML file the policy reads. You can also set options that configure how the policy reads the file.

To access

- In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **XML File**.
- In the BSM Connector user interface, click  in the toolbar. Then click **Metric** >  **XML File**.
- In the BSM Connector user interface, click  in the toolbar. Then click **Topology** >  **XML File**.

Alternatively, double-click an existing policy to edit it.

Click **Source** to open the policy Source page.

Learn More

Requirements for XML source files (events)

XML files must meet the following criteria so that they can be processed correctly by XML file policies:

- XML file requirements:
 - Use file rolling to create at least two or more XML input files. BSM Connector first reads the older file before starting to process the younger file. Each file should not be larger than 2 GB.

You can use an asterisk (<*>) wildcard in the **Log File Path / Name** field to match multiple file names. For example, to match the XML source file names `events.1.xml` and `events.2.xml`, use the pattern `<path>/events<*>.xml` in the Log File Path / Name field. For more information on pattern matching, see ["Pattern-Matching Details" on page 265](#).

Make sure the **Close after reading** check box is set when using file rolling.

- Make sure the polling interval is shorter than the frequency in which data is written to the file.
- XML format requirements:
 - The root element is optional.
 - If a root element exists, it must not be closed by an end tag.
 - All other XML elements must be complete.

The following example XML begins with the root tag `<AllAlerts>` and contains two types of events: performance alerts and availability alerts. If you define the XML elements `<PerformanceAlert>` and `<AvailabilityAlert>` as event tags in the Source tab of XML file policies, only those events are processed by XML file policies.

Example:

```
<AllAlerts>
  <AvailabilityAlert>
    <Title>Host Unreachable</Title>
    <Severity>Critical</Severity>
    <TimeOccured>02/11/10 03:52:18AM</TimeOccured>
    <Object>Host:fish.example.com</Object>
  </AvailabilityAlert>
  <PerformanceAlert>
    <Title>Disk IO rate high</Title>
    <Severity>Warning</Severity>
    <TimeOccured>02/11/10 04:08:31AM</TimeOccured>
    <Object>Disk:disk0:dog.example.com</Object>
  </PerformanceAlert>
  <AvailabilityAlert>
    <Title>Web Application unresponsive</Title>
    <Severity>Critical</Severity>
    <TimeOccured>02/11/10 05:01:26AM</TimeOccured>
    <Object>WebApp:http://employeeportal.intra.example.com</Object>
  </AvailabilityAlert>
  <PerformanceAlert>
    <Title>Phyiscal Read Rate high for Bufferpool BP1</Title>
    <Severity>Warning</Severity>
    <TimeOccured>02/11/10 08:37:09AM</TimeOccured>
    <Object>DB:USRDB:cat.example.com</Object>
  </PerformanceAlert>
```

```
<PerformanceAlert>  
  <Title>Physiscal Read Rate high for Bufferpool BP1</Title>  
  <Severity>Warning</Severity>  
  <TimeOccured>02/11/10 08:37:09AM</TimeOccured>  
  <Object>DB:USRDB:cat.example.com</Object>  
</PerformanceAlert>  
</AllAlerts>
```

Requirements for XML files (topology)

XML files must follow the topology discovery syntax. See ["Topology Discovery Syntax" on page 111](#).

Tasks

How to configure the XML source (events and metrics)

This task describes how configure the XML source file and how the policy reads it.

1. Type the full path to the XML file on the BSM Connector system.
2. Click  to load a sample XML file. You can load a sample file from the BSM Connector system or from the system where the Web browser runs.

When you load sample data, BSM Connector replaces already loaded data with the new data. This does not affect any mappings that are defined based on previously available sample data.

3. Click  to create one or more XML tags. You can create a tag manually by typing the XML element. If you are working with sample data, you can create a tag by double-clicking the XML element in the list.

The XML tag creates a shortcut to the XML element that you want the policy to process. An event tag typically identifies an event record in an XML log file, while a metric tag identifies a metric record in an XML log file. You can define more than one XML tag. For example, an XML file may contain two types of events: `<PerformanceAlert>` and `<AvailabilityAlert>`. To process both types, define both elements as event tags.

How to configure the XML source (topology)

This task describes how configure the XML source file and how the policy reads it.

1. Type the full path to the XML file on the BSM Connector system.
2. Enter the age to deletion - the number of times for the policy to be run for a host that is not part of the topology data. After this number of policy executions, this host is deleted from the server.

3. Optionally, enable delta detection, so that only the difference between the received XML file and the repository is sent to the topology server.

For a description of the Source page, see ["Source Page - XML File Policies" on page 330](#).

Configuring Mappings in XML File Policies

The Mappings page enables you to map XML elements and attributes to custom variables.

To access

- In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **XML File**.
- In the BSM Connector user interface, click  in the toolbar. Then click **Metric** >  **XML File**.

Click **Mappings** to open the policy Mappings page.

Learn More

Mappings overview

A custom variable consists of a map name, an optional XML property (XML elements or attributes), and one or more source and target value pairs. For example, you can assign the XML element `Severity` to the map name `mapSeverity`, and add a source value of `serious`. You can then assign the target value `critical` to the variable so that BSM Connector inserts the value `critical` into the event in all places where the variable is used.

Default Value Mapping

Map Name	Input Data Property	Source Value	Target Value
mapSeverity	<\$DATA:/PerformanceAlert/Severity>	serious	critical
		not so serious	warning

XML properties use the following syntax: <\$DATA:/<XML_property>>

<XML_property> is the XML path, separated by slash marks (/), from the XML tag to the XML element or attribute.

For example, the custom variable mapSeverity has the following XML property:

<\$DATA:/PerformanceAlert/Severity> where Severity is a child element of PerformanceAlert.

XML properties are optional. If you do not assign an XML property to a variable, you must add the source value directly to the variable when you insert the variable in an event attribute.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or if the sample data does not match any specified XML tags.

The Sample Data tab shows the following information if sample data is available:

- XML Properties

If sample data is available, the XML Properties section of the Sample Data tab shows all XML elements and attributes that match an XML tag.

The XML Properties section by default shows the short path to the XML property or value. To view the full path, click . The full path begins with the XML tag specified in the Source tab.

The items in the XML Properties section are by default sorted alphabetically in ascending order.

To search for an XML property or value, type the search string in the Search Properties box. The list changes as you type; only matching items appear.

- Values for <XML_property>

This section displays the values of an XML property selected in the XML Properties section. If a value appears more than once, click  to show or hide duplicate values. To find values that belong to more than one XML property, select the value and click . The XML Sample Data window opens and shows all XML properties that have the selected value.

When you drag an XML element or attribute from the XML properties list and drop it on the Default Value Mapping List, BSM Connector automatically adds the default prefix map to the map name and inserts the correct path to the XML property. You can then drag one or more XML source values from

the XML values list and drop them on the Source Value list. You then finally only have to type the target values.

Tasks

How to configure XML mappings

This task describes how to map XML elements and attributes to custom variables.

1. Create one or more custom variables.

If you are working with sample data, drag the XML elements or attributes from the XML Properties list to the Map Name column. BSM Connector automatically adds the default prefix `map` to the map name and inserts the correct path to the XML property.

Alternatively, click  above the Map Name column and type the variable name in the map name field. XML properties are optional. If you do not assign an XML property to a variable, you must add the source value directly to the variable when you insert the variable in an event attribute.

2. Add one or more source and target value pairs to each custom variable.

- If you are working with sample data, drag the value from the Values list to the Source Value column, and type the target value in the corresponding field.

Alternatively, click  above the Source Value column and type the source and target values in the corresponding fields.

- Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types.

To insert an indicator in a source or target value field, drag and drop the indicator state (for example, `HTTPServer:Normal`) from the Indicators tab to the policy.

- Optionally, use the **Policy Variables** tab to add policy variables to event or metric attributes. BSM Connector replaces the variables with the appropriate values in the generated event or metric.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example "`<MSG_NODE>`".

Related tasks

Configuring Event Defaults in XML File Policies

The Default Event Attributes page enables you to indicate default settings for all events generated by the policy.

These defaults affect all new and existing rules. You can override the defaults in individual rules if needed. If a rule contains empty event attributes, the agent will use the defaults for the new event.

To access

In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **XML File**.

Alternatively, double-click an existing policy to edit it.

Click **Defaults** to open the Default Event Attributes page.

Tasks

How to configure events for XML file policies

This task describes how to configure default settings for all events generated by the policy.

1. Click **Event Attributes** to define default event attributes, such as severity and category.

Tip: After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated event type indicators (ETIs).

To insert an indicator, drag and drop the indicator with its state from the Indicators tab to the policy.

2. Click **Event Correlation** to set the type of duplicate event suppression and define the method used to suppress duplicate events.
3. Click **Custom Attributes** to add additional information to all events generated by this policy. For example, you might add a company name, contact information, or a city location to an event.
4. Click **Advanced** to define default advanced attributes such as legacy HPOM attributes and agent MSI (Message Stream Interface) settings.

5. Optionally, use the **Sample Data** tab to drag XML properties (XML elements and attributes) and values to the attribute boxes. Alternatively, you can type the path to the XML property or value directly into the attribute box.

XML properties use the following syntax: `<$DATA: /<XML_property>>`

`<XML_property>` is the XML path, separated by slash marks (`/`), from the XML tag to the XML element or attribute.

BSM Connector replaces the XML property at runtime with the value of the specified XML element or attribute. If you insert an XML value, the value will be used.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or no XML data has been received for the policy.

6. Optionally, use the **Mappings** tab to add mapping definitions to the attribute boxes.

Mappings are custom variables that you define in the mappings tab (see also "[Configuring Event Defaults in XML File Policies](#)" on the previous page). The default name of the mapping variable is `map<XML_property>`, for example `mapSeverity`.

Alternatively, type the custom variable into the attribute box using the following syntax:

- Map Name list contains the map name of the variable: `map<XML property>`, for example `mapSeverity`.
- Input Data Property list item: `<$DATA: /<XML_tag> /<XML_property>>`

For example, the custom variable `mapSeverity` has the following input data property: `<$DATA: /PerformanceAlert/Severity>` where `Severity` is a child element of `PerformanceAlert`.

7. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated health indicators (HIs) and event type indicators (ETIs).
8. Optionally, use the **Policy Variables** tab to add policy variables to event attributes. BSM Connector replaces the variables with the appropriate values in the generated event.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example `"<$MSG_NODE>"`.

Configuring Metric Defaults in XML File Policies

The Metric page enables you to indicate default settings for all metrics generated by the policy.

These defaults affect all new and existing rules. You can override the defaults in individual rules if needed. If a rule contains empty event attributes, the agent will use the defaults for the new event.

To access

In the BSM Connector user interface, click  in the toolbar. Then click **Metric** >  **XML File**.

Alternatively, double-click an existing policy to edit it.

Click **Defaults** to open the Default Metric Attributes page.

Tasks

How to configure metrics defaults for XML file policies

This task describes how to configure metric attribute defaults for all metrics collected by this policy.

1. Define the metric attributes common to all metrics collected by this policy, such as metric class and name. All metrics in the **Basic** tab marked with a * are required. **Advanced** attributes are optional.
2. Optionally, use the **Sample Data** tab to drag XML properties (XML elements and attributes) and

values to the attribute boxes. Alternatively, you can type the path to the XML property or value directly into the attribute box.

XML properties use the following syntax: `<$DATA: /<XML_property>>`

`<XML_property>` is the XML path, separated by slash marks (/), from the XML tag to the XML element or attribute.

BSM Connector replaces the XML property at runtime with the value of the specified XML element or attribute. If you insert an XML value, the value will be used.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or no XML data has been received for the policy.

3. Optionally, use the **Mappings** tab to add mapping definitions to the attribute boxes.

Mappings are custom variables that you define in the mappings tab (see also "[Configuring Metric Defaults in XML File Policies](#)" on the previous page). The default name of the mapping variable is `map<XML_property>`, for example `mapSeverity`.

Alternatively, type the custom variable into the attribute box using the following syntax:

- Map Name list contains the map name of the variable: `map<XML property>`, for example `mapSeverity`.
- Input Data Property list item: `<$DATA: /<XML_tag> /<XML_property>>`

For example, the custom variable `mapSeverity` has the following input data property: `<$DATA: /PerformanceAlert/Severity>` where `Severity` is a child element of `PerformanceAlert`.

4. Optionally, use the **Operators** tab to apply operators to the metric attribute values. Two functions are available:

- `<$MATCH(<>>`, to get a sub string of input data: The `$MATCH` function accepts three or four parameters:
 - the input string
 - the pattern definition
 - the output string if pattern matches on the input string
 - optionally, the output string if the pattern does not match.

Example: The data of the input field `hostname` start always with "TEST" (for example

"TESTABC"). The \$MATCH function to use the string after "TEST" is:

```
$MATCH(<$DATA:hostname>, TEST<*.prefix>, <prefix>)
```

- <\$DATETIME (FORMAT, VALUE)>, to convert a string with date and time information to the internal integer data time format.

For detailed description of the format, see ["Pattern Matching in Policy Rules" on page 265](#).

5. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types.
6. Optionally, use the **Policy Variables** tab to add policy variables to metric attributes. BSM Connector replaces the variables with the appropriate values in the generated metric.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example "<\$MSG_NODE>".

Configuring Event Rules in XML File Policies

Rules define what a policy should do in response to a specific type of event. Each rule consists of a condition and of settings for the event generated by the policy. The condition is the part of a policy that describes the source. The settings enable you to configure the event that BSM Connector sends to OMi.

A policy must contain at least one rule. If the policy contains multiple rules, it is important to remember that the rules are evaluated in a specific order, and that when one condition is matched, no additional rules will be evaluated.

To access

In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **XML File**.

Click **Rules** to open the policy Rules page.

Learn More

Rule types

The rule types are:

- **Event on matched rule.** If matched, BSM Connector sends an event to OMi. The event uses the settings defined for the rule. If you do not configure these settings, the default settings are used.
- **Suppress on matched rule.** If matched, BSM Connector stops processing and does not send an event to OMi.
- **Suppress on unmatched rule.** If not matched, BSM Connector stops processing and does not send an event to OMi.

Tasks

How to configure event rules in XML policies

This task describes how to configure policy rules.

1. In the **Policy Rules** section, click  and select the type of rule to define what the policy should do in response to a specific string in the XML file. Each policy must have at least one rule.
2. In the **Rule Content** section, use the **Condition** tab to specify the XML properties and values that the policy searches for in the XML file that the policy reads. If the policy finds a match, it may or may not generate an event, depending on the rule type.
 - a. Click  to create a new condition. New conditions by default use the equals operator.
 - b. Click  to expand the new condition.
 - c. In the **Property** field, specify the XML element or attribute that the policy searches for. You must specify the XML path from the XML event tag to the property, separated by slash marks (/) (for example, /PerformanceAlert/Severity).

If you are working with sample data, you can drag and drop the XML element or attribute from the XML Properties list to the Properties field.

- d. Select the pattern operator.

If you select the matches operator, you can type a pattern in the Operand field. For a list of available operators, see ["Operator" on page 296](#).

- e. In the **Operand** field, type the value or pattern that you want the policy to compare with the XML property. If you are working with sample data, you can drag the value from the Values list and drop it in the Operand field.
3. Use the **Event Attributes** tab to define event attributes (for example, event title and description) for all events generated by this rule.

Tip: After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated event type indicators (ETIs).

To insert an indicator, drag and drop the indicator with its state from the Indicators tab to the policy.

4. Use the **Event Correlation** tab to set the type of duplicate event suppression and define the method used to suppress duplicate events.
5. Use the **Custom Attributes** tab to add additional information to all events generated by this rule. For example, you might add a company name, contact information, or a city location to an event.
6. Use the **Advanced** tab to define an event drill-down URL, legacy HPOM attributes, and agent MSI (Message Stream Interface) settings.
7. Optionally, use the **Sample Data** tab to drag XML properties (XML elements and attributes) and values to the attribute boxes. Alternatively, you can type the path to the XML property or value directly into the attribute box.

XML properties use the following syntax: `<$DATA:!/<XML_property>>`

`<XML_property>` is the XML path, separated by slash marks (`/`), from the XML tag to the XML element or attribute.

BSM Connector replaces the XML property at runtime with the value of the specified XML element or attribute. If you insert an XML value, the value will be used.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or no XML data has been received for the policy. See also ["Configuring the Data Source in XML File Policies" on page 244](#).

8. Optionally, use the **Mappings** tab to add mapping definitions to the attribute boxes.

Mappings are custom variables that you define in the mappings tab (see also ["Configuring Event Rules in XML File Policies" on page 254](#)). The default name of the mapping variable is `map<XML_property>`, for example `mapSeverity`.

Alternatively, type the custom variable into the attribute box using the following syntax:

- Map Name list contains the map name of the variable: `map<XML_property>`, for example `mapSeverity`.
- Input Data Property list item: `<$DATA:/<XML_tag>/<XML_property>>`

For example, the custom variable `mapSeverity` has the following input data property: `<$DATA:/PerformanceAlert/Severity>` where `Severity` is a child element of `PerformanceAlert`.

9. Optionally, use the **Pattern Matching Variables** tab to add variables created through pattern matching.

Pattern matching variables insert matched strings that have previously been assigned to variables. To insert a pattern matching variable, type the variable name enclosed in angle brackets (for example, `<variablename>`) or drag and drop it from the Pattern Matching Variables list to the event attribute.

10. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types with the associated health indicators (HIs) and event type indicators (ETIs).
11. Optionally, use the **Policy Variables** tab to add policy variables to event attributes. BSM Connector replaces the variables with the appropriate values in the generated event.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example `"<$MSG_NODE>"`.

Configuring Metrics Rules in XML File Policies

Rules define what a policy should do in response to a specific type of metric. Each rule consists of a condition and of settings for the metrics generated by the policy. The condition is the part of a policy that describes the source. The settings enable you to configure the metrics that BSM Connector sends to OMi.

A policy must contain at least one rule. If the policy contains multiple rules, it is important to remember that the rules are evaluated in a specific order, and that when one condition is matched, no additional rules will be evaluated.

To access

In the BSM Connector user interface, click  in the toolbar. Then click **Metric** >  **XML File**.

Alternatively, double-click an existing policy to edit it.

Click **Rules** to open the policy Rules page.

Learn More

Rule types

The rule types are:

- **Store on matched rule.** If matched, BSM Connector stores metrics in a buffer until a maximum number of records or a maximum amount of time are reached. These metrics are sent to OMi when they are requested. The metrics use the settings defined for the rule. If you do not configure these settings, the default settings are used.

- **Suppress on matched rule.** If matched, BSM Connector stops processing.
- **Suppress on unmatched rule.** If not matched, BSM Connector stops processing.

Metrics attributes

Each time a metrics policy runs, it extracts raw data from its defined data source and builds a metric structure.

A metric structure consists of these attributes:

- Basic attributes:
 - Data domain

The namespace of the integrated performance records, used in the Operations Agent store to avoid clashes.
 - Metric class

Defines the metric class under which the metric appears in the Operations Agent store and consumers.
 - Metric name

Defines the metric name under which the metric appears in the Operations Agent store and consumers.
 - Related CI

Used to identify an instance of a performance record and associates it with a concrete CI instance. For details on how to associate the Related CI with the values in the RTSM model, see ["Create a policy" on page 60](#). For an example, see ["Example – Create a Metrics Policy" on page 61](#).
 - Node

Used to identify a node-like CI to which the performance records are associated to.
 - Value

The actual performance value which is converted to 64-bit floating point number.
 - Time measured

The time stamp when the value was determined in the third-party system.
- Advanced attributes:

- Original metric name
The name of the metric as used on the third-party system.
- Unit
The unit of the metric.
- Integration id
An id, used to identify the source of the integration.

Tasks

How to configure metric rules in XML policies

This task describes how configure policy rules.

1. In the **Policy Rules** section, click  and select the type of rule to define what the policy should do in response to a specific string in the XML file. Each policy must have at least one rule.
2. In the **Rule Content** section, use the **Condition** tab to define the match condition.

Click  to create a new condition. Enter the property and select the operator from the drop-down list. Add the operand. Use the arrows and collapse/expand buttons to navigate the conditions.

3. *Optional.* If you are creating a rule of the type 'store on matched rule', set the attributes (**Basic** or/and **Advanced**) for metrics that you want the rule to override. If default attributes are specified in the Defaults tab, you use the defaults or you can override them as described below.

The attributes are in two groups, basic and advanced. The advanced attributes are optional.

4. Optionally, use the **Sample Data** tab to drag XML properties (XML elements and attributes) and values to the attribute boxes. Alternatively, you can type the path to the XML property or value directly into the attribute box.

XML properties use the following syntax: `<$DATA:!/<XML_property>>`

`<XML_property>` is the XML path, separated by slash marks (/), from the XML tag to the XML element or attribute.

BSM Connector replaces the XML property at runtime with the value of the specified XML element or attribute. If you insert an XML value, the value will be used.

Note: The Sample Data tab is empty if no sample data has been loaded into the policy or no XML data has been received for the policy. See also "[Configuring the Data Source in XML File](#)"

[Policies" on page 244.](#)

5. Optionally, use the **Mappings** tab to add mapping definitions to the attribute boxes.

Mappings are custom variables that you define in the mappings tab (see also "[Configuring Metrics Rules in XML File Policies" on page 258](#)). The default name of the mapping variable is `map<XML_property>`, for example `mapSeverity`.

Alternatively, type the custom variable into the attribute box using the following syntax:

- Map Name list contains the map name of the variable: `map<XML_property>`, for example `mapSeverity`.
- Input Data Property list item: `<$DATA:/<XML_tag>/<XML_property>>`

For example, the custom variable `mapSeverity` has the following input data property: `<$DATA:/PerformanceAlert/Severity>` where `Severity` is a child element of `PerformanceAlert`.

6. Optionally, use the **Pattern Matching Variables** tab to add variables created through pattern matching.

Pattern matching variables insert matched strings that have previously been assigned to variables. To insert a pattern matching variable, type the variable name enclosed in angle brackets (for example, `<variablename>`) or drag and drop it from the Pattern Matching Variables list to the metric attribute.

7. Optionally, use the **Operators** tab to apply operators to the metric attribute values. Two functions are available:

- `<$MATCH(<>>`, to get a sub string of input data: The `$MATCH` function accepts three or four parameters:
 - the input string
 - the pattern definition
 - the output string if pattern matches on the input string
 - optionally, the output string if the pattern does not match.

Example: The data of the input field `hostname` start always with "TEST" (for example "TESTABC"). The `$MATCH` function to use the string after "TEST" is:

```
$MATCH(<$DATA:hostname>, TEST<*.prefix>, <prefix>)
```

- `<$DATETIME(FORMAT, VALUE)>`, to convert a string with date and time information to the internal integer data time format.

For detailed description of the format, see ["Pattern Matching in Policy Rules" on page 265](#).

8. Optionally, use the **Indicators** tab to add indicators to the source or target value fields. After loading the indicators from the connected OMi server, the Indicators tab shows a hierarchy of configuration item types.
9. Optionally, use the **Policy Variables** tab to add policy variables to metric attributes. BSM Connector replaces the variables with the appropriate values in the generated metric.

It is often useful to surround the variable with quotation marks, especially if it may return a value that contains spaces, for example "<MSG_NODE>".

Configuring Options in XML File Policies

The options tab enables you to configure several policy behaviors, for example which events or metrics are logged locally, how the policy handles unmatched events, and defaults for pattern matching in policy rules.

To access

- In the BSM Connector user interface, click  in the toolbar. Then click **Event** >  **XML File**.

- In the BSM Connector user interface, click  in the toolbar. Then click **Metric >  XML File**.

Alternatively, double-click an existing policy to edit it.

Tasks

How to configure options for XML policies

In the Options page, configure which events or metric records are logged locally, how the policy handles unmatched events or metric records, and defaults for pattern matching in policy rules.

For more information about the other fields, see ["Options Page" on page 307](#).

Part IV: BSM Connector Reference

This section includes:

- ["Pattern Matching in Policy Rules" on page 265](#)
- ["Command-Line Tools" on page 275](#)
- ["UI Descriptions" on page 282](#)

Appendix A: Pattern Matching in Policy Rules

BSM Connector uses pattern matching to determine if an event or metric record should be sent to OMI or should be suppressed.

BSM Connector compares the pattern that you specify with the data contained in XML elements or attributes. When the pattern is matched, the policy sends or suppresses an event or metric record, depending on the rule type.

Example: A structured log file policy contains a rule of the type "event on matched rule". A condition compares the pattern `<![administrator]>` with the value of "user".

The screenshot shows a configuration window for a rule condition. The title bar reads "user matches <![administrator]>". Below the title bar, there are three fields: "Property:" with the value "user", "Operator:" with a dropdown menu set to "matches", and "Operand:" with the value "<![administrator]>".

If the value of "user" is `administrator`, the pattern does not match and the next condition is evaluated. If the value is `user1`, the pattern matches and an event is sent to OMI.

For more information about the pattern matching syntax used to in rule conditions, see "[Pattern-Matching Details](#)" below.

Pattern-Matching Details

HP Operations Agent provides a powerful pattern-matching language that reduces the number of conditions you must use. Selected, dynamic parts of text-based events can be extracted, assigned to variables, and used as parameters to build the event description or to set other attributes.

The pattern-matching language enables you to very accurately specify the character string that you want a rule to match.

Note: In text boxes where pattern-matching expressions are allowed you can click  for a shortcut menu with pattern-matching expressions that can be selected and inserted into the text box.

Matching special characters

Ordinary characters are expressions which represent themselves. Any character of the supported character set may be used. However, if any of the following special characters are used they must be prefaced with a backslash (`\`) that masks their usual function.

`\ [] < > | ^ $`

If ^ and \$ are not used as anchoring characters, that is, not as first or last characters, they are considered ordinary characters and do not need to be masked.

Matching characters at the beginning or end of a line

If the caret (^) is used as the first character of the pattern, only expressions discovered at the beginning of lines are matched. For example, "^ab" matches the string "ab" in the line "abcde", but not in the line "xabcde".

If the dollar sign is used as the last character of a pattern, only expressions at the end of lines are matched. For example, "de\$" matches "de" in the line "abcde", but not in the line "abcdex".

Matching multiple characters

Patterns used to match strings consisting of an arbitrary number of characters require one or more of the following expressions:

- <*> matches any string of zero or more arbitrary characters (including separators)
- <n*> matches a string of *n* arbitrary characters (including separators)
- <#> matches a sequence of one or more digits
- <n##> matches a number composed of *n* digits
- <_> matches a sequence of one or more field separators
- <n_> matches a string of *n* separators
- <@> matches any string that contains no separator characters, in other words, a sequence of one or more non-separators; this can be used for matching words
- </> matches one or more line breaks
- <n/> matches exactly *n* line breaks
- <S> matches one or more white space characters: space, tab and new line characters (" ", \t, \n, \r)
- <nS> matches exactly *n* white space characters

Note: On Windows operating systems, a new line consists of two white space characters (\n\r).

Separator characters are configurable for each pattern. By default, separators are the space and the tab characters.

Matching two or more different expressions

Two expressions separated by the special character vertical bar (|) matches a string that is matched by

either expression. For example, the pattern:

```
[ab|c]d
```

matches the string "abd" and the string "cd".

Matching text that does not contain an expression

The NOT **operator** (!) must be used with delimiting square brackets, for example:

```
<![WARNING]>
```

The pattern above matches all text which does not contain the string "WARNING".

The **NOT operator** may also be used with complex subpatterns:

```
SU <*> + <@.tty> <![root|[user[1|2]]].from>-<*.ot>
```

The above pattern makes it possible to generate a "switch user" event for anyone who is not user1, user2 or root. Therefore the following would be matched:

```
SU 03/25 08:14 + tty2 user11-root
```

However, this line would not be matched, because it contains an entry concerning "user2":

```
SU 03/25 08:14 + tty2 user2-root
```

Notice that if the subpattern including the **not operator** does not find a match, the **not operator** behaves like a <*>: it matches zero or more arbitrary characters. For this reason, the pattern-matching expression: <![1|2|3]> matches any character or any number of characters, except 1, 2, or 3.

Mask (\) Operator

The backslash (\) is used to mask the special meaning of the characters:

```
[ ] < > | ^ $
```

A special character preceded by \ results in an expression that matches the special character itself.

Notice that because ^ and \$ only have special meaning when placed at the beginning and end of a pattern respectively, you do not need to mask them when they are used within the pattern (in other words, not at beginning or end).

The only exception to this rule is the tab character, which is specified by entering "\t" into the pattern string.

Bracket ([and]) Expressions

The brackets ([and]) are used as delimiters to group expressions. To increase performance, brackets should be avoided wherever they are unnecessary. In the pattern:

```
ab[cd[ef]gh]
```

all brackets are unnecessary--"abcdefgh" is equivalent.

Bracketed expressions are used frequently with the **OR operator**, the **NOT operator** and when using **subpatterns** to assign strings to variables.

Numeric range operators

HP Operations Agent provides six numeric range operators that can be used in pattern matching. The operators are used in this way:

Operator name	Syntax	Example/Explanation
Less than	<[<i>pattern</i> This is a match pattern you provide that returns the number to be compared] -lt <i>n</i> This is the value against which you want to test the number returned by the match pattern>	<[<#>] -lt 5> matches every number less than 5
Less than or equal to	<[<i>pattern</i>] -le <i>n</i> >	<[<#>] -le 5> matches 5 and every number less than 5
Greater than	<[<i>pattern</i>] -gt <i>n</i> >	<[<#>] -gt 5> matches every number greater than 5
Greater than or equal to	<[<i>pattern</i>] -ge <i>n</i> >	<[<#>] -ge 5> matches 5 and every number greater than 5
Equal to	<[<i>pattern</i>] -eq <i>n</i> >	<[<#>] -eq 5> matches 5 or 5.0
Not equal to	<[<i>pattern</i>] -ne <i>n</i> >	<[<#>] -ne 5> matches every number but 5 and 5.0
The operators can also be combined to produce matches according to ranges of numbers:		
Matches numbers that belong to the interval, excluding the limits	< <i>n</i> -lt [<i>pattern</i>] -lt <i>n</i> >	<5 -lt [<#>] -lt 10> matches every number between 5 and 10 (but not 5 or 10)

Matches numbers that belong to the interval, including the limits	<code>< n -le [pattern] -le n ></code>	<code><5 -le [<#>] -le 10></code> matches every number between 5 and 10 (including 5 and 10)
Matches numbers that do not belong to the interval, excluding the limits	<code>< n -gt [pattern] -gt n ></code>	<code><10 -gt [<#>] -gt 5></code> matches every number between 5 and 10 (but not 5 or 10)
Matches numbers that do not belong to the interval, including the limits	<code>< n -ge [pattern] -ge n ></code>	<code><10 -ge [<#>] -ge 5></code> matches every number between 5 and 10 (including 5 and 10)

User-Defined Variables in Patterns

Any matched string can be assigned to a variable, which can be used to compose events. To define a parameter, add ". parametername " before the closing bracket. The pattern:

```
^errno: <#.number> - <*.error_text>
```

matches an event such as:

```
errno: 125 - device does not exist
```

and assigns "125" to **number** and "device does not exist" to **error_text**.

When using these variables, the syntax is `<variable_name>` (for example, `<number>`).

Rules by which HP Operations Agent assigns strings to variables

In matching the pattern `<*.var1><*.var2>` against the string "abcdef", it is not immediately clear which substring of the input string will be assigned to each variable. For example, it is possible to assign an empty string to **var1** and the whole input string to **var2**, as well as assigning "a" to **var1** and "bcdef" to **var2**, and so forth.

The pattern matching algorithm always scans both the input line and the pattern definition (including alternative expressions) from left to right. `<*>` expressions are assigned as few characters as possible. `<#>`, `<@>`, `<S>` expressions are assigned as many characters as possible. Therefore, **var1** will be assigned an empty string in the example above.

To match an input string such as:

```
this is error 100: big bug
```

use a pattern such as:

```
error<#.errnumber>:<*.errtext>
```

In which:

- "100" is assigned to **errnumber**
- "big bug" is assigned to **errtext**

For performance and pattern readability purposes, you can specify a delimiting substring between two expressions. In the above example, ":" is used to delimit `<#>` and `<*>`.

Matching `<@.word><#.num>` against "abc123" assigns "abc12" to **word** and "3" to **num**, as digits are permitted for both `<#>` and `<@>`, and the left expression takes as many characters as possible.

Patterns without expression anchoring can match any substring within the input line. Therefore, patterns such as:

```
this is number<#.num>
```

are treated in the same way as:

```
<*>this is number<#.num><*>
```

Using subpatterns to assign strings to variables

In addition to being able to use a single operator, such as `*` or `#`, to assign a string to a variable, you can also build up a complex subpattern composed of a number of operators, according to the following pattern: `<[subpattern].var>`

For instance: `<[<@>file.tmp].fname>`

In the example above, the period (.) between "file" and "tmp" matches a similar dot character, while the dot between "]" and "**fname**" is necessary syntax. This pattern would match a string such as "Logfile.tmp" and assigns the complete string to **fname**.

Other examples of subpatterns are:

- `<[Error|Warning].sev>`
- `<[Error[<#.n><*.msg>]].complete>$`

In the first example above, any line with either the word "Error" or the word "Warning" is assigned to the variable, **sev**. In the second example, any line containing the word "Error" has the error number

assigned to the variable, **n**, and any further text assigned to **msg**. Finally, the word "Error", the error number, and the text are assigned to **complete**.

The second example requires the dollar sign (\$) at the end to anchor the expression. As mentioned above, patterns without expression anchoring can match any substring within the input line. Therefore, the pattern:

```
<[Error[<#.n><*.msg>]].complete>
```

would be treated as:

```
<*><[Error[<#.n><*.msg>]].complete><*>
```

Patterns are evaluated from left to right, and `<*>` expressions are assigned as few characters as possible. Therefore, without a dollar sign (\$) to anchor the end of the expression, the `<*.msg>` expression always matches zero characters, and the remainder of the line is matched with the implicit `<*>` expression at the end.

Pattern Matching for Variables

You can test a string or variable against a pattern, and define an output string that is conditional on the result. You can do this using `$MATCH`, which has the following syntax:

```
$MATCH(string, pattern, true, [false])
```

Specify the parameters as follows:

`string`

Specify a literal string (for example, `TEST STRING`) or a policy variable (for example `<$LOGPATH>`).

`pattern`

Specify a pattern, using HP Operations Agent pattern matching syntax. You can create user-defined variables in the pattern to use in the parameters `true` and `false`. The pattern is case sensitive.

`true`

Specify a string to return if the string and pattern match. You can specify a literal string, or a user-defined variable, or a policy variable.

`false`

Optional. Specify a string to return if the string and pattern do not match. You can specify a literal string, or a user-defined variable, or a policy variable.

Separate each parameter with a comma (.). To specify a comma within a parameter, you must precede it with two backslashes (\\).

You can use `$MATCH` within your policies in the following event attributes:

- Service ID
- Message type
- Category

- Application
- Object
- Title

Note: You can use \$MATCH only once in each message attribute. You cannot use \$MATCH recursively.

Example

A policy can read a number of log files. The name of the path of the log file is available in the policy variable <\$LOGPATH>. If part of the log file path corresponds to an application name, you can use \$MATCH to set the application event attribute as follows:

```
$MATCH(<$LOGPATH>,<@.application>.log, <application>, Unknown)
```

Examples of Pattern Matching in Rule Conditions

The following examples show some of the many ways in which the pattern-matching language can be used.

- Error

Recognizes any event containing the keyword Error at any place in the event. (It is case sensitive by default.)

- panic

Matches all events containing panic, Panic, PANIC anywhere in the text of the event, when case sensitive mode is switched off.

- logon|logoff

Uses the **OR operator** to recognize any event containing the keyword logon or logoff.

- ^getty:<*.msg> errno<*><#.errnum>\$

Recognizes any event such as: getty: cannot open ttyxx errno : 6 or getty: can't open ttyop3; errno 16

In the example getty: cannot open ttyxx errno : 6, the string "cannot open ttyxx" is assigned to the variable **msg**. The digit 6 is assigned to the variable **errnum**. Note that the dollar sign (\$) is used as an anchoring symbol to specify that the digit 6 will only be matched if it is at the end of the line.

- ^errno[|=]<#.errnum> <*.errtext>

Matches events such as: `errno 6 - no such device or address or errno=12 not enough core.`

Note the space before the **OR operator**. The expression in square brackets matches either this blank space, or the "equals" sign. The space between `<#.errnum>` and `<*.errtext>` is used as a delimiter. Although not strictly required for assignments to the variables shown here, this space serves to increase performance.

- `^hugo:<*>:<*.uid>:`

Matches any `/etc/passwd` entry for user `hugo` and returns the user ID to variable `uid`. Notice that ":" in the middle of the pattern is used to delimit the string passed to `uid` from the preceding string. The colon ":" at the end of the pattern is used to delimit the string passed to `uid` from the succeeding group ID in the input pattern. Here, the colon is necessary not only as a speed enhancement, but also as a means of logical separation between strings.

- `^Warning:<*.text>on node<@.node>$`

Matches any event such as: `Warning: too many users on node hpbbx` and assigns `too many users` to `text`, and `hpbbx` to `node`.

- `^<*.line1><1/><*.line2><1/><*.line3><1/><*.line4>$`

Matches four lines of text, for example:

```
Security ID:      S-1-5-21-3358208617-1210941181-189752109-500
Account Name:    Administrator
Account Domain:  EXAMPLE
Logon ID:        0x228a2
```

There is one line break between each line. The pattern assigns each line of text to a variable.

- `<<#> -le 45>`

This pattern matches all strings containing a number which is less than or equal to 45. For example, the event: *ATTENTION: Error 40 has occurred* would be matched.

Note that the number 45 in the pattern is a true numeric value and not a string. Numbers higher than 45, for instance, "4545" will not be matched even if they contain the combination, "45".

- `<15 -lt <2#> -le 87>`

This pattern matches any event in which the first two digits of a number are within the range 16-87. For instance, the event: *Error Message 3299* would be matched. The string: *Error Message 9932* would not be matched.

- `^ERROR_<[<#.err>] -le 57>`

This pattern matches any text starting with the string "ERROR_" immediately followed by a number less than, or equal to, 57.

For example, the event: *ERROR_34: processing stopped* would be matched and the string 34 would be assigned to the variable, *err*.

- <120 -gt [<#>1] -gt 20>

Matches all numbers between 21 and 119 which have 1 as their last digit. For instance, events containing the following numbers would be matched: 21, 31, 41... 101... 111 and so on.

- Temperature <*> <@.pLant>: <<#> -gt 100> F\$

This pattern matches strings such as: "Actual Temperature in Building A: 128 F". The letter "A" would be assigned to the variable, *plant*.

- Error <<#> -eq 1004>

This pattern matches any event containing the string "Error" followed by a space and the sequence of digits, "1004".

For example, *Warning: Error 1004 has occurred* would be matched by this pattern. However, *Error 10041* would not be matched by this pattern.

- WARNING <<#> -ne 107>

This pattern matches any event containing the string "WARNING" followed by a space and any sequence of one or more digits, except "107". For example, the event: *Application Enterprise (94/12/45 14:03): WARNING 3877* would be matched.

Appendix B: Command-Line Tools

You can use the following command-line tools to configure BSM Connector:

- ["BSM Connector Configuration Tool" below](#)
- ["Local User Configuration Tool" on page 279](#)

Tool location

The BSM Connector command-line tools are located on the BSM Connector server in:

Windows: %OvDataDir%\installation\HPOprBSMC\

Linux: /var/opt/OV/installation/HPOprBSMC/

Log files

All BSM Connector command-line tools write information to the following log file on the BSM Connector server:

Windows: %OvDataDir%\log\opr-pm-cli.log

Linux: /var/opt/OV/log/opr-pm-cli.log

The tools append log information to the file when you run them again.

BSM Connector Configuration Tool

You can reconfigure BSM Connector by running the configuration program **bsmc-conf**.

The **bsmc-conf** tool is located on the BSM Connector server at the following location:

Windows: %OvDataDir%\installation\HPOprBSMC\bsmc-conf.bat

Linux: /var/opt/OV/installation/HPOprBSMC/bsmc-conf.sh

Command Syntax

```
bsmc-conf.[bat|sh] -srv <hostname> [-cs <hostname>] [-f] [-flexmgmt]
  -admin_user <username> <password>
  [-https_port <port>] [-http_port <port>]
  [-lwsso_domain <domain_name>] [-lwsso_groups <group0> [<group1> ...]]
  [-lwsso_key <initString>]
```

This section includes:

- ["BSM Connector Configuration Tool" on the previous page](#)
- ["To reconnect BSM Connector to another OMi server" on page 278](#)
- ["To install and configure BSM Connector on an HPOM managed node" on page 278](#)
- ["Log files" on page 279](#)
- ["Using ovconfchg" on page 279](#)

Option Descriptions

Option	Value
-srv <hostname>	<p>Specifies the OMi Gateway Server to which the BSM Connector sends the collected data.</p> <p><hostname> is the full qualified domain name (FQDN) of the OMi Gateway Server.</p> <p>Default: not set</p>
-cs <hostname>	<p>Specifies the certificate server for your OMi environment.</p> <p><hostname> is the FQDN or IP address of the certificate server.</p> <p>Use this option if you want to issue certificates from a certificate server other than the OMi server specified using the -s option (for example from an HP Operations Manager server or a OMi server from another OMi deployment).</p> <p>If you omit this option, bsmc-conf uses the server specified with the -srv option.</p> <p>Note: When accessing OMi through an IIS secure reverse proxy (SRP), enter the FQDN of the OMi gateway server. For more information on configuring an IIS reverse proxy for OMi, see the <i>OMi Administration guide</i>.</p>
-flexmgmt	<p>Creates the flexible management policy BSM Connector FlexMgmt Policy. The policy configures the agent to send the following data to the OMi server:</p> <ul style="list-style-type: none"> • Events generated by BSM Connector policies. These events automatically have the Type attribute set to BSMC_Message.
[-f]	Force mode (used to reconnect your HP Operations Agent).

<p>-admin_user <username> <password></p>	<p>Specify the credentials for the BSM Connector administrator. This user can access the local BSM Connector instance only by logging on with these credentials, and cannot gain access to OMi.</p> <p>Default: not set</p>
<p>-https_port <port></p>	<p>Specify the secure (HTTPS) port at which the BSM Connector user interface runs.</p> <p>If not specified, port 30000 is used.</p>
<p>-http_port <port></p>	<p>Specifies the HTTP port at which the BSM Connector user interface runs.</p> <p>By default, the connection is redirected and HTTPS is used instead.</p>
<p>-lwssso_domain <domain_name></p>	<p>Specifies the domain of the associated OMi gateway server. For more information about obtaining the domain name, see the <i>Installation and Upgrade Guide</i>.</p> <p>LW-SSO does not require an external computer for authentication. LW-SSO enables a user to log into OMi once and gain access to all BSM applications in the same domain without being prompted to log in again. If you configure BSM Connector to use LW-SSO, OMi users can launch the BSM Connector user interface without having to provide additional credentials. For more information about LW-SSO, see the OMi Admin Guide.</p> <p>Default: <lwssso_disabled></p>
<p>-lwssso_groups [<group0> [<group1>...]</p>	<p>Specifies the OMi users and roles that will have access to BSM Connector. Separate individual groups with spaces (for example, -lwssso_groups BSMC_ADMINS SUPERUSER). For information about users and roles, see the <i>Installation and Upgrade Guide</i>.</p> <p>Default: <lwssso_disabled></p>
<p>-lwssso_key <initString></p>	<p>Init string from SSO config.</p> <p>The token key (init string) generated in the OMi Users and Permissions manager.</p> <div style="background-color: #f0f0f0; padding: 10px; margin: 10px 0;"> <p>Note: Single-sign on can only work if the token key that you type here is exactly the same as the token key on the OMi server. For more information about obtaining the token key, see the <i>Installation and Upgrade Guide</i>.</p> </div> <p>Default: <lwssso_disabled></p>

<code>-omc_srv <hostname></code>	<p>FQDN of the HPOM management server.</p> <p>If you omit this option, bsmc-conf takes the value of <code>MANAGER</code> from the internal configuration settings file and inserts it as target server in the flexible management policy BSM Connector FlexMgmt Policy. All events that do not have the Type attribute set to BSMC_Message are sent to this server.</p> <div data-bbox="532 489 1369 619" style="background-color: #f0f0f0; padding: 5px;"><p>Tip: Use the following command to find the current value of <code>MANAGER</code>:</p><pre>ovconfget sec.core.auth MANAGER</pre></div>
--	--

Example

To configure HP BSM Connector to connect to the server "server1.company.com", with "server2.company.com" as the certificate server, using the user "admin" with the password "long3Not4short1password!" and using the default HTTPS port, execute:

```
bsmc-conf.bat -srv server1.company.com -cs server2.company.com -admin_user admin  
long3Not4short1password!
```

To reconnect BSM Connector to another OMi server

1. On the BSM Connector server, type the following command to reconnect the system to another OMi server:

```
bsmc-conf -srv <new OMi server> -force
```
2. Add the BSM Connector as a connected server to the OMi Connected Servers manager (**Administration > Setup and Maintenance > Connected Servers**).
3. In the Certificate Requests Manager (**Administration > Setup and Maintenance > Certificate Requests**), grant the certificate generated by **bsmc-conf**.
4. Delete the BSM Connector integration from the old OMi server.
5. **Results.** BSM Connector sends all collected data to the new OMi server.

To install and configure BSM Connector on an HPOM managed node

1. On the BSM Connector server, type the following command to configure the BSM Connector on an HPOM managed node:

```
bsmc-conf -srv <new OMi server> -force -flexmgmt -omc_srv <HPOM management  
server>
```

2. Add the BSM Connector as a connected server to the OMi Connected Servers manager (**Administration > Setup and Maintenance > Connected Servers**).

Do *not* select the **Configure policy management** checkbox.

3. In the Certificate Requests Manager (**Administration > Setup and Maintenance > Certificate Requests**), grant the certificate generated by **bsmc-conf**.
4. **Results.** The new OMi server becomes the primary manager of the HP Operations Agent. The flexible management policy **BSM Connector FlexMgmt Policy** configures the agent to send the following data to the OMi server:
 - Events generated by BSM Connector policies. These events automatically have the **Type** attribute set to **BSMC_Message**.

The HPOM management server receives only events that do not have the **Type** attribute set to **BSMC_Message**.

Log files

bsmc-conf writes information to the following log file:

Windows: %OvDataDir%\log\opr-pm-cli.log

Linux: /var/opt/OV/log/opr-pm-cli.log

The tool appends log information to the file when you run the program again.

Using ovconfchg

The command-line tool **ovconfchg** enables you to change one or more configuration parameters in the internal configuration settings file. **ovconfchg** is an expert tool and should be used by experienced administrators only.

To run **ovconfchg**:

Windows: **ovconfchg -edit**

Linux: **/opt/OV/bin/ovconfchg -edit**

The **-edit** option starts a text editor to edit the settings file. After you have saved your changes, you must restart the application.

Local User Configuration Tool

Each BSM Connector instance maintains a local users store. These users can access the local BSM Connector instance only and cannot not gain access to other BSM Connector applications. When BSM Connector users launch the BSM Connector user interface, they have to provide the credentials of a local BSM Connector user, or, if smart card authentication is configured, the smart card PIN.

To add additional users to the user store, run the BSM Connector local user configuration tool **user**.

Note: Users added the local user store cannot be specified as BSM Connector user in the **Main Settings** of the OMi Connected Servers manager (**Administration > Setup and Maintenance > Connected Servers**). You must enter the BSM Connector administration user that you configured in the configuration wizard during installation.

The **user** tool is located on the BSM Connector server in:

Windows: %OvDataDir%\installation\HPOprBSMC\user.bat

Linux: /var/opt/OV/installation/HPOprBSMC/user.sh

user accepts the following options:

user -help | -list | -add <username> <password> | -delete <username> | -version

Command options

-h,-help

Shows tool usage and description.

-l,-list

Lists the users stored in the local user store.

-a,-add <username> <password>

Adds a user to the local users store. If the user already exists, the password is overwritten.

The username and password must contain ASCII characters only. The user name must contain at least three characters. Valid characters in user names are alphanumeric characters (a-z, A-Z, and 0-9), hyphens (-), underscores (_), periods (.), and the at sign (@).

When configuring BSM Connector for smart card authentication, use the value of the User Principal Name (UPN) in the certificate as user name.

-d,-delete <username>

Deletes the specified user from the local user store.

-v,-version

Displays the BSM Connector version number.

Local user store

The local user store is located in the following file on the BSM Connector system:

Windows: %OvDataDir%\conf\HPOprBSMC\users.properties

Linux: /var/opt/OV/conf/HPOprBSMC/users.properties

To add local users

1. *Windows.* Run the local user configuration tool:

- a. Open a command prompt and type:

```
cd %OvDataDir%\installation\HPOprBSMC
```

- b. Run the BSM Connector local user configuration tool, type:

```
user.bat -add <username> <password>
```

Linux. Start the BSM Connector local user configuration tool, type:

```
/var/opt/OV/installation/HPOprBSMC/user.sh -add <username> <password>
```

2. *Optional.* Review the log file at:

Windows: %OvDataDir%\log\opr-pm-cli.log

Linux: /var/opt/OV/log/opr-pm-cli.log

The program appends log information to the file when you run the program again.

Defaults and Rules Pages (Events)

Note: In the default event attributes of open message interface policies, you can set only the Category attribute.

In the default event attributes of SNMP trap policies, you can set only the Severity and Category attributes.

You can set the other event attributes within individual rules.

Event Attributes Tab

UI Element	Description
Title	Brief description of the nature of the event.
Description	Detailed description of the event.
Severity	Severity assigned to the event.
Time Created	<p><i>Database, structured log file, REST Web service listener, and XML file policies only:</i></p> <p>Date and time when the event was created.</p> <p>Use the following conventions when specifying the date and time attribute:</p> <ul style="list-style-type: none"> • Integers. BSM Connector interprets integers in the policy source as seconds since 00:00:00 UTC on 1 January 1970 (Unix time). For example, 1276600333 is 15 June 2010, at 11:12:13. • Default time formats. BSM Connector by default interprets the following time formats: <code>yyyy-mm-ddTHH:MM:SS</code> (for example, 2010-06-15T11:12:13) <code>mm/dd/yyyy HH:MM:SS</code> (for example, 06/15/2010 11:12:13) Additional time zone formats are supported: <code>yyyy-mm-ddTHH:MM:SS tz</code> (for example, 2010-06-15T11:12:13 +3) <code>mm/dd/yyyy HH:MM:SS tz</code>(for example, 06/15/2010 11:12:13 -2) where <code>tz</code> is a number for the offset to the UTC time zone. You can also use half or quarter hours (.25, .5, or .75, for example, 2010-06-15T11:12:13 -2.75). If you want to create your own pattern, you can store the time zone information in <code><@.tz></code> to match all above mentioned time zones. • Pattern matching. You can use the function <code><\$DATETIME (FORMAT, VALUE) ></code> to specify a pattern (FORMAT) that matches the time string in the policy source (VALUE). You can use standard pattern-matching rules when matching values. By default, pattern matching for the time format is case sensitive. The default field separators are the space and the tab characters. FORMAT must be enclosed in quotation marks ("FORMAT") and accepts the following variables: H (hours), M (minutes), S (seconds). If H, M, or S is not set, the hour, minute, or second displays as zero.

UI Element	Description
	<p>d (day), m (month), y (year). If d or m is not set, the day or month display as one. If y is not set, the current year is assumed. If y is less than 100, the current millennium is assumed; for example, if y matches 10, the year displays as 2010. It is not possible to match a year earlier than 1970.</p> <p>p (P.M.) If p is set, BSM Connector adds 12 hours to the hours that precede the variable.</p> <p>VALUE is one of the following:</p> <ul style="list-style-type: none"> <p>■ Database policies. VALUE is the table column or value to match.</p> <p>Table columns use the following syntax: <code><\$DATA:<table_column>></code></p> <p>where <code><table_column></code> is the name of the table column in the third-party database, for example <code><\$DATA:severity></code>.</p> <p>Examples:</p> <p>To match the time format 06/15/2010 11:12:13 in the table column <code><\$DATA:/BSMConnectorEvent/TIMERECEIVED></code>, type <code><\$DATETIME ("^<#.m>/<#.d>/<#.y><#.H>:<#.M>:<#.S>\$", <\$DATA:/BSMConnectorEvent/TIMERECEIVED>)></code></p> <p>To match the time format 11:12 15.06.2010 in the table column <code><\$DATA:/BSMConnectorEvent/TIMERECEIVED></code>, type <code><\$DATETIME ("^<#.H>:<#.M><#.d>.<#.m>.<#.y>\$", <\$DATA:/BSMConnectorEvent/TIMERECEIVED>)></code></p> <p>To match the time format 06/15/2010 1:35 PM in the table column <code><\$DATA:/BSMConnectorEvent/TIMERECEIVED></code>, type <code><\$DATETIME ("^<#.m>/<#.d>/<#.y> <#.H>:<#.M><2*.p>\$", <\$DATA:/BSMConnectorEvent/TIMERECEIVED>)></code></p> <p>■ Structured log file policies. VALUE is the input data reference value to match.</p> <p>Input data references use the following syntax: <code><\$DATA:<input_reference_field>></code></p> <p>Field values originate from the structured log file pattern settings defined for the data source.</p> <p>Examples:</p> <p>To match the time format 06/15/2010 11:12:13 in the input data reference <code><\$DATA:timestamp></code>, type</p>

UI Element	Description
	<p><\$DATETIME ("^<#.m>/<#.d>/<#.y> <#.H>:<#.M>:<#.S>\$", <\$DATA:timestamp>)></p> <p>To match the time format 11:12 15.06.2010 in the input data reference <\$DATA:timestamp>, type <\$DATETIME ("^<#.H>:<#.M> <#.d>.<#.m>.<#.y>\$", <\$DATA:timestamp>) ></p> <p>To match the time format 06/15/2010 1:35 PM in the input data reference <\$DATA:timestamp>, type <\$DATETIME ("^<#.m>/<#.d>/<#.y> <#.H>:<#.M> <2*.p>\$", <\$DATA:timestamp>)></p> <ul style="list-style-type: none"> <p>REST Web Service Listener policies. VALUE is the XML property or value to match.</p> <p>XML properties use the following syntax: <\$DATA:/<XML_property>></p> <p><XML_property> is the XML path, separated by slash marks (/), from the XML tag to the XML element or attribute.</p> <p>Examples:</p> <p>To match the time format 06/15/2010 11:12:13 in the XML property <\$DATA:/BSMCEvent/timeStamp>, type <\$DATETIME ("^<#.m>/<#.d>/<#.y> <#.H>:<#.M>:<#.S>\$", <\$DATA:/BSMCEvent/timeStamp>)></p> <p>To match the time format 11:12 15.06.2010 in the XML property <\$DATA:/BSMCEvent/timeStamp>, type <\$DATETIME ("^<#.H>:<#.M> <#.d>.<#.m>.<#.y>\$", <\$DATA:/BSMCEvent/timeStamp>)></p> <p>To match the time format 06/15/2010 1:35 PM in the XML property <\$DATA:/BSMCEvent/timeStamp>, type <\$DATETIME ("^<#.m>/<#.d>/<#.y> <#.H>:<#.M> <2*.p>\$", <\$DATA:/BSMCEvent/timeStamp>)></p> <p>XML file policies. VALUE is the XML property or value to match.</p> <p>XML properties use the following syntax: <\$DATA:/<XML_property>></p> <p><XML_property> is the XML path, separated by slash marks (/), from the XML tag to the XML element or attribute.</p> <p>Examples:</p>

UI Element	Description
	<p>To match the time format 06/15/2010 11:12:13 in the XML property <\$DATA:/SCOM_Alert/TimeRaised>, type <\$DATETIME ("^<#.m>/<#.d>/<#.y> <#.H>:<#.M>:<#.S>\$", <\$DATA:/SCOM_Alert/TimeRaised>)></p> <p>To match the time format 11:12 15.06.2010 in the XML property <\$DATA:/SCOM_Alert/TimeRaised>, type <\$DATETIME ("^<#.H>:<#.M> <#.d>.<#.m>.<#.y>\$", <\$DATA:/SCOM_Alert/TimeRaised>)></p> <p>To match the time format 06/15/2010 1:35 PM in the XML property <\$DATA:/SCOM_Alert/TimeRaised>, type <\$DATETIME ("^<#.m>/<#.d>/<#.y> <#.H>:<#.M> <2*.p>\$", <\$DATA:/SCOM_Alert/TimeRaised>)></p> <p>If you leave the attribute empty or if none of the time formats above can be matched, then the date and time when the agent created the event appears in OMi. This time always appears using the time zone of the agent at creation time (for example, 11:30 (CET/winter). This means that this time always appears in this fixed time zone.</p>
Category	Name of the logical group to which the event belongs (for example, Database, Security, or Network). The event category is similar in concept to the HP Operations Manager message group.
Subcategory	Name of the logical subgroup (category) to which the event belongs (for example, Oracle (database), Accounts (security), or Routers (network)).
ETI	<p>Contains the event type indicator (ETI) resolution hint, which OMi uses to associate the event with an ETI and for event correlation.</p> <p>Use the format <ETI name>:<ETI state>:<metric value>. Specify the name of the indicator (for example, CPUload), the indicator state (for example, High), and optionally the metric value (for example, 80). When BSM receives an event with an ETI resolution hint of CPUload:High, and the ETI and state exist, the Event Type Indicator attribute is set to CPUload:High in the event. The metric value is optional and serves informational purposes only.</p>
Node	Name of the system where the event occurred (for example, node.example.com).
Related CI	<p>Contains the CI that is related to the event or metric (for example, oraclesid01@@node.example.com or C:@@server.example.com). Use the format <CI 1>:<CI 2>:...:<CI n>@@<hostname>.</p> <p>Best practices for related CIs</p> <p>It is necessary to differentiate between CIs that have a Composition relationship to a node, and those that do not have such a relationship:</p>

UI Element	Description
	<ul style="list-style-type: none"> For “hosted on” CIs <code><key attribute 1>:<key attribute 2>:<key attribute n>@@<hostname></code> Typically, a “hosted on” CI is a sub-type of “Running Software”. For example, a CI of type <code>websphereas</code> has a Composition relationship to a node. For virtual CIs <code><key attribute 1>:<key attribute 2>:<key attribute n></code> A virtual CI does not have a strong containment relationship (Composition relationship) to node. An example of a typical virtual CI type is <code>cluster</code>. This CI type does not have a strong containment relationship to a node. <div style="background-color: #f0f0f0; padding: 5px; margin: 10px 0;"> <p>Tip: If you have problems resolving non-hosted CIs, provide the RTSM ID of the desired CI by using the format <code>UCMDB:<ci_uuid></code>.</p> </div> <p>For more information about CI resolution in OMi, see the <i>OMi User guide</i> or online help.</p>
<p>Sub Component</p>	<p>Information used to identify a subcomponent of a CI. This CI subcomponent is used to calculate an aggregated status within OMi's Service Health for selected CIs.</p> <p>If an HI is populated by events from multiple components, you can specify a component name in this field in order to ensure the correct calculation of the HI state.</p> <p>For example, if you have a Computer CI with two CPUs, <code>cpu #1</code> and <code>cpu #2</code>, events from both CPUs will be sent to the same CPU Load HI. By default, the events will override each other and create an incorrect HI state. To prevent this, you can populate Sub Component with values <code>"cpu #1"</code> and <code>"cpu #2"</code> which will cause the HI state to be calculated as an aggregated state between the two events.</p>
<p>Source CI</p>	<p>Contains the source related CI. For example, type the name and instance of the third-party system that provides events (for example, <code>NNMi@@mgmt1.example.com</code> or <code>SCOM@@mgmt2.example.com</code>).</p> <p>If you enter a source related CI, OMi tries to find the corresponding CI in the RTSM.</p>

UI Element	Description
Source Event ID	<p>ID of the event in the third-party system. This ID is required for synchronization of event changes with the source event. It also enables drilldown into the third-party system in the Event Browser in OMi.</p> <p>Tip: The file that the policy reads usually contains the source event ID. If you are working with sample data, you can drag the source event ID from the Sample Data tab and add it to the source event ID field.</p>
Send with closed status	<p>Sets the event's lifecycle status to Closed before sending it to OMi.</p>
Send with closed status	<p>Sets the event's lifecycle status to Closed before sending it to OMi. Possible values:</p> <p>yes = Sets lifecycle status to Closed.</p> <p>no = Does not set the lifecycle status to Closed.</p> <p>Default value: empty (= no)</p> <p>Tip: Click  and select yes or no from the menu.</p>

Event Correlation Tab

Note: You cannot set the following attributes in the event defaults of open message interface and SNMP trap policies:

- Close Events with Key
- Suppress Deduplication on Server

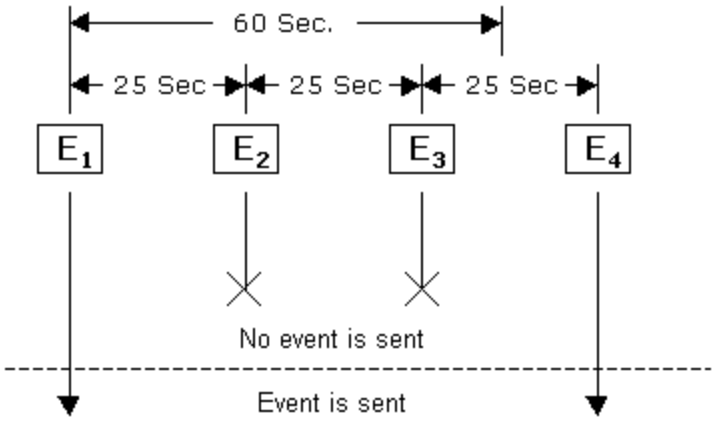

You can set these event attributes within individual rules.

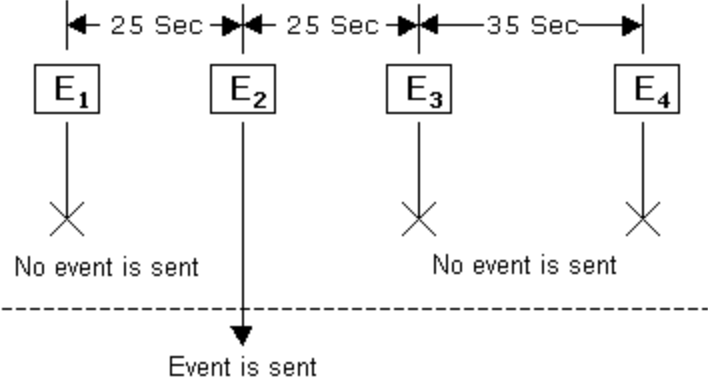

In scheduled task policies, you can set only the following event correlation attributes:

- Event Key
- Suppress Deduplication on Server

UI Element	Description
Event Key	An identifier used to identify duplicates and for Close Events with Key.

UI Element	Description
Close Events with Key	<p>If events with the event key that you type here exist in the OMi event database when this event is received, these events are automatically closed. You can use pattern matching and variables to match multiple event keys. For example, consider the following pattern:</p> <pre data-bbox="440 464 886 489"><\$MSG_SEV>:<\$MSG_NODE_NAME>:<5*></pre> <p>This pattern is evaluated by first replacing the variables with the values that they resolve to, for example:</p> <pre data-bbox="440 604 899 630">critical:cabbage.example.com:<5*></pre> <p>This pattern is then compared using pattern matching rule against the event keys for all events in the OMi event database. The pattern above would match the following event keys:</p> <pre data-bbox="440 779 915 804">critical:cabbage.example.com:12345</pre> <pre data-bbox="440 814 915 840">critical:cabbage.example.com:TEST1</pre> <div data-bbox="440 863 1370 974" style="background-color: #f0f0f0; padding: 5px;"> <p>Note: An HP Operations Manager i Event Management Foundation License is required to enable the Close Events with Key feature in OMi.</p> </div>
Suppress Deduplication on Server	<p>Stops automatic discarding of new events that are duplicates of existing events.</p>
Event Suppression	
Suppress events which are	<ul style="list-style-type: none"> <li data-bbox="440 1184 1382 1314">• Generated by the same input event. Select this option to suppress events that were sent in response to two separate input events that are identical except for the date and time that the event was generated (for example, identical entries in a log file). <li data-bbox="440 1352 1382 1514">• Generated by the same rule. Select this option to suppress events that match the pattern specified for the selected rule. This is a more general setting for the suppression of duplicate events. For example, a policy might contain a rule with this match pattern: Error Message<#> The log file lines Error Message10 and Error Message20 are not identical, but would both match this rule. <li data-bbox="440 1551 1382 1675">• Identical relative to their attributes. Select this option to suppress either events that have the same event key or (if no event key is present) events that have identical event attributes (except for the date and time that the event was generated).
Suppression Method	<p>For event correlation, you can define one of three correlation methods:</p> <ul style="list-style-type: none"> <li data-bbox="440 1772 1370 1829">• Time Interval. This correlation method lets you define an interval during which duplicate events will be ignored. For more information, read this detailed

UI Element	Description
	<p>example.</p> <p>Time interval correlation example</p> <p>In the illustration below, the interval is set to 30 seconds, but the suppression is limited to 60 seconds.</p> <p>Time Interval</p> <hr/> <p>Suppress duplicate events within a specified time interval.</p> <p>Time interval <input type="text" value="0"/> h <input type="text" value="0"/> m <input type="text" value="30"/> s</p> <p><input checked="" type="checkbox"/> Suppress for no longer than <input type="text" value="0"/> h <input type="text" value="0"/> m <input type="text" value="60"/> s</p>  <p>The <input type="text" value="E<sub>x</sub>"/> represents events that are identical.</p> <ol style="list-style-type: none"> The first input event (E1) matches a rule in the policy. The policy sends an event and starts timing. A second matching event (E2) occurs 25 seconds later. This event occurred <i>less than 30</i> seconds after the first event, and is therefore suppressed. A third matching event (E3) occurs <i>less than 30 seconds after the second event</i>, and so is also suppressed. The next matching event (E4) occurs less than thirty seconds after the third event, but is also <i>more than 60 seconds after the first event</i>, and therefore the policy sends an event. <ul style="list-style-type: none"> Counter. This correlation method counts the number of matching input events and sends an event only after the number of matching input events equals the

UI Element	Description
	<p>counter threshold. The counter can also be reset to zero after a time period that you specify. For more information, read this detailed example.</p> <p>Counter correlation example</p> <p>Counter</p> <hr/> <p>Send a new event only when the number of events reaches the threshold.</p> <p>Counter threshold <input type="text" value="2"/></p> <p><input checked="" type="checkbox"/> Reset counter threshold after <input type="text" value="0"/> h <input type="text" value="0"/> m <input type="text" value="30"/> s</p>  <p>The <input type="text" value="E<sub>x</sub>"/> represent events that are identical.</p> <ol style="list-style-type: none"> The first input event (E₁) matches a rule in the policy, and the counter increments to one. No event is sent. A second matching event (E₂) occurs, the counter increments to two, an event is sent, and the counter resets. A third matching event (E₃), and the counter increments to one. No event is sent. The next matching event (E₄) occurs <i>more than thirty seconds</i> after the third event. Since at thirty seconds the counter was reset to zero, the counter now increments to one. No event is sent. <ul style="list-style-type: none"> Time Interval/Counter. If you use the Time interval and Counter together, events are evaluated first by the timer. If an event passes the timer, it is then evaluated by the counter, which either suppresses it or sends an event to OMi.

UI Element	Description
	<p>Note: If you specify just time interval correlation or just counter-based correlation in an individual event, any event defaults for the other correlation method also apply. For example, if you specify time interval correlation for an event, and the event defaults specify counter-based correlation, the combined time interval and counter-based correlation applies to both new rules and existing rules.</p> <p>You can change this default behavior, so that only the correlation method that you specify in the individual event applies. To change the default behavior, set the parameter <code>OPC_IGNORE_DEFAULT_MSG_CORRELATION=TRUE</code> in the <code>eaagt</code> namespace on the node. You can configure this parameter using <code>ovconfchg</code> at a command prompt.</p>
Time Interval	Time interval during which duplicate events are ignored.
Suppress for no longer than	Time interval after which duplicate events are no longer ignored.
Counter threshold	Value that triggers an event if met or crossed.
Reset counter threshold after	Time interval after which the counter is reset to 0.

Custom Attributes Tab

Note: You cannot set custom attributes in the event defaults of the following policy types:

- Open message interface policies
- SNMP trap policies

You can set custom attributes within individual rules for these policy types.

UI Element	Description
	Create New Custom Attribute: Creates a new custom attribute.
	Delete Custom Attribute: Deletes an existing custom attribute.

UI Element	Description
Name	<p>The name of the custom attribute. The name is case-insensitive.</p> <p>Custom attributes are additional attributes that contain any information that is meaningful to you. For example, you might add a company name, contact information, or a city location to an event. You can have more than one custom attribute attached to a single event.</p> <p>The following custom attribute names cannot be used because they are reserved for internal use:</p> <ul style="list-style-type: none"> Description EtiHint HP_OPR_SAAS_CUSTOMER_ID NoDuplicateSuppression RelatedCiHint SourceCiHint SourcedFromExternalId SourcedFromExternalUrl SubCategory SubCiHint
Value	Value of the custom attribute.

Advanced Tab

Note: You cannot set the following attributes in the event defaults of open message interface and SNMP trap policies:

- Event Drilldown URL
- Type

You can set these event attributes within individual rules.

UI Element	Description
Event Drilldown URL	<p><i>Rules only:</i> URL of the event in the third-party system. This is the complete path of the URL, and includes the FQDN (Fully Qualified Domain Name) of the computer that hosts the third-party system, the communication port, and the root URL path (for example, <code>http://nnmi.example.com:8004/nnm/launch?cmd=showForm&objtype=Incident&objuuid=\$OPC_CUSTOM[nnm.incident.uuid]&menus=true</code>).</p> <p>Event drilldown information enables OMi users to launch the user interface of the third-party system in the context of an event.</p> <div data-bbox="412 583 1369 758" style="background-color: #f0f0f0; padding: 5px; margin: 10px 0;"> <p>Tip: To drill down to a specific event in the third-party system, add the source event ID to the URL. If you are working with sample data, you can drag the source event ID from the Sample Data tab and add it to the Event Drilldown URL field.</p> </div> <div data-bbox="412 783 1369 926" style="background-color: #f0f0f0; padding: 5px; margin: 10px 0;"> <p>Note: This event attribute can also be set by OMi based on a BSM Connector integration server configuration. If a policy and an integration server configuration both set this attribute, the information in the policy takes precedence.</p> </div>
Application	<p>Application that caused the event to occur. Unlike the Related CI attribute, which is a direct relationship to a CI in the RTSM, the application attribute is a simple string-type attribute (for example, Oracle and OS).</p>
Object	<p>Device such as a computer, printer, or modem. Unlike the Related CI attribute, which is a direct relationship to a CI in the RTSM, the object attribute is a simple string-type attribute (for example, C:, and /dev/spool).</p>
Type	<p><i>Rules only:</i> String used to organize different types of events within an event category or subcategory (for example, users or applications, accounts and security).</p> <p>The attribute is automatically set to <code>BSMC_Message</code>. You can delete the value but it will be inserted when you save the policy.</p>
HPOM Service ID	<p>ID of the service associated with the event. A service ID is a unique identifier for a service and can be used in OMi to identify the node and CI associated with the event.</p>
Use event default	<p><i>Rules only:</i> Indicates the agent MSI settings configured in the event defaults:</p> <p>Agent MSI not set. Output to the agent MSI is not configured in the event defaults.</p> <p>Divert events. The Divert events setting is configured in the event defaults.</p> <p>Copy events. The Copy events setting is configured in the event defaults.</p>

UI Element	Description
Agent MSI	The message stream interface (MSI) allows external applications to interact with the internal event flow of HP Operations Agent. The external application can be a read-write application, for example, an event processing program that can read events, modify attributes, and generate new events for retransmission to the server. The application could also read events, or send its own events.
Divert events	Divert an event to the MSI instead of to the server when an event is requested by an external application.
Copy events	Send the event to the server, and a copy of the event to the MSI.

Condition Tab - Rules Only

The following policy types use this condition tab:

- Database policies
- Structured log file policies
- REST Web service listener policies
- XML file policies

UI Element	Description
	New Item. Creates a new condition with the default operator equals.
	Delete Item. Deletes the selected condition.
	Move Up. Moves the selected condition higher in the condition order.
	Move Down. Moves the selected condition lower in the condition order.
	Expand. Expands the list of conditions to display all details.
	Collapse. Collapses the list of conditions to display only the names and hide the details.
	Click to expand the details of a condition.
	Click to hide the details of a condition.

UI Element	Description
Property	<p><i>Database policies:</i> Table column that the policy searches for (for example, /BSMConnectorEvent/Severity).</p> <p><i>Structured log file policies:</i> Input data property that the policy searches for (for example, host).</p> <p><i>REST Web service listener policies:</i> XML Property that the policy searches for. You must prefix the XML property with <XML Event/Metric Tag> (/<XML Event/Metric Tag>/<full path to XML Property>).</p> <p><i>XML file policies:</i> XML property that the policy searches for. You must specify the XML path from the XML tag to the property, separated by slash marks (/) (for example, /PerformanceAlert/Severity).</p>
Operator	<p>The following operators are available:</p> <ul style="list-style-type: none"> • equals • not equals • less than • greater than • less or equal • greater or equal • matches (Enables you to enter a pattern in the Operand field.)
Operand	<p>Value or pattern that you want the policy to compare with the table column (database policies), or the input data reference (structured log file policies), or the value of the XML property (REST Web service listener policies and XML policies). If you are working with sample data, you can drag the value from the Values list and drop it in the Operand field.</p>

Condition Tab - Open Message Interface Policy Rules Only

UI Element	Description
Node	<p>Fully qualified domain name, node name, or IP address that the policy compares with the node in the source message.</p> <p>Separate multiple entries with the OR operator () or leave blank to match all nodes.</p> <p>This field corresponds to the node option of the opcmsg command.</p>

UI Element	Description
Message Group	<p>Message group that the policy compares with the message group in the source message.</p> <p>Separate multiple entries with the OR operator () or leave blank to match all message groups.</p> <p>This field corresponds to the <code>msg_grp</code> option of the <code>opcmsg</code> command.</p>
Application	<p>Application that the policy compares with the application in the source message.</p> <p>Separate multiple entries with the OR operator () or leave blank to match all applications.</p> <p>This field corresponds to the <code>application</code> option of the <code>opcmsg</code> command.</p>
Object	<p>Object that the policy compares with the object in the source message.</p> <p>Separate multiple entries with the OR operator () or leave blank to match all objects.</p> <p>This field corresponds to the <code>object</code> option of the <code>opcmsg</code> command.</p> <div style="background-color: #f0f0f0; padding: 5px; margin-top: 10px;"> <p>Note: Although the term <i>application</i> generally refers to a general program name and <i>object</i> generally refers to a process or sub-program, you should use these values to assist your own organizational scheme.</p> </div>
Severity	<p>Severity that the policy compares with the severity in the source message. At least one severity must be selected.</p> <p>This field corresponds to the <code>severity</code> option of the <code>opcmsg</code> command.</p>
Message Text	<p>Message text or pattern that the policy compares with the message text in the source message.</p>

Condition Definition Tab - SNMP Interceptor Policy Rules Only

UI Element	Description
Node	<p>FQDN (Fully Qualified Domain Name), the primary node name, or the IP address of the configuration item for which you want to forward events.</p> <p>If you only want to match SNMP events from a specific configuration item, type the FQDN (Fully Qualified Domain Name), the primary node name, or the IP address. Give multiple entries with the OR operator (for example, <code>celery.example.com broccoli.example.com</code>), or leave blank for all configuration items.</p>

Event Object ID	<p>Complete Event Object Identifier for the SNMP trap that you want to match.</p> <p>For example: .1.3.6.1.4.1.11.2.17.1.0.40000001</p>
SNMPv1 notation	<p>If selected, you can specify only part of the identifier rather than the complete event object ID.</p> <p>For example, by specifying only the Enterprise ID, you can match all events with a specific Enterprise ID.</p>
Enterprise ID	<p>Enterprise ID for incoming SNMP traps to be compared with this condition. The enterprise ID is a vendor-specific identifier for the trap. Standard BSM Connector pattern-matching syntax may not be used in this field; however, it is possible to match a range of objects by entering only a prefix. For instance, the pattern:</p> <p>.1.3.6.1.4.1.11.2.17</p> <p>would match:</p> <p>.1.3.6.1.4.1.11.2.17.1</p> <p>.1.3.6.1.4.1.11.2.17.2</p> <p>and so on.</p>
Generic ID	<p>Generic Trap ID. Possible values are:</p> <ul style="list-style-type: none"> • (0) ColdStart • (1) WarmStart • (2) LinkDown • (3) LinkUp • (4) Authentication • (5) EgpNeighborLoss • (6) EnterpriseSpecific • (7) don't care <p>If you select (6) EnterpriseSpecific, you can type in the specific trap ID. Select don't care to intercept any kind of trap.</p>
Specific ID	<p>Type in the specific trap ID if you have selected (6) EnterpriseSpecific in Generic Trap. Enterprise-specific SNMP traps can be implemented by vendors on their specific network devices. The specific trap ID is used to identify the source of the trap.</p>

Note: The SNMP syntax used by the editor requires that the trap string begins with a point.

Condition Variable Bindings Tab - SNMP Interceptor Policy Rules Only

UI Element	Description
	Creates a new variable binding.
	Deletes the selected variable binding.
	Opens the Variable Bindings Options page.
Variable	Variable binding you want the policy to read. 1 represents the first variable binding in the event, 2 the second variable, and so on. You do not need to prefix the variable with a dollar sign (\$); BSM Connector does this automatically.
Pattern	Match pattern for the binding. You can click the  button to open the pattern matching expression toolbox. <div style="border: 1px solid #ccc; padding: 10px; margin-top: 10px;"> <p>Tip: You can use standard HP Operations Agent pattern-matching rules when matching values. Select the matches operator and click  in the Operand field to open the pattern matching expression toolbox. The toolbox displays the following:</p> <ul style="list-style-type: none"> • Pattern Matching Expressions. Click an expression to insert it in the Operand field. • Variable Bindings Options. Variable bindings options include case sensitivity and field separators for the rule. If you do not specify pattern matching options for the rule, either the defaults (case sensitive; a blank and the tab character as separators) or the default options set for the policy will be used. </div>

Defaults and Rules Pages (Metrics)

Default Metric Attributes and Attributes Tabs

Most metrics attributes are represented by string values and must be enclosed in quotation marks (""). You can optionally use the plus sign (+) to add group values (for example, "Disk Usage on " + \$group0). For details, see ["UI Descriptions" on page 282](#).

Value attribute is represented by numeric values and must *not* be enclosed in quotation marks.

UI Element	Description
Basic tab	
Data domain	The namespace of the integrated performance records, used in the Operations Agent store to avoid clashes. Example: "BSMConnector"
Metric class	Defines the metric class under which the metric appears in the Operations Agent store and consumers. Example: "Windows CPU Monitor on"+group0
Metric name	Defines the metric name under which the metric appears in the Operations Agent store and consumers. Example: "CPU Utilization"

UI Element	Description
<p>Related CI</p>	<p>Contains the CI that is related to the event or metric (for example, oraclesid01@@node.example.com or C:@@server.example.com). Use the format <CI 1>:<CI 2>:...:<CI n>@@<hostname>.</p> <p>Best practices for related CIs</p> <p>It is necessary to differentiate between CIs that have a Composition relationship to a node, and those that do not have such a relationship:</p> <ul style="list-style-type: none"> For “hosted on” CIs <p><key attribute 1>:<key attribute 2>:<key attribute n>@@<hostname></p> <p>Typically, a “hosted on” CI is a sub-type of “Running Software”. For example, a CI of type websphereas has a Composition relationship to a node.</p> For virtual CIs <p><key attribute 1>:<key attribute 2>:<key attribute n></p> <p>A virtual CI does not have a strong containment relationship (Composition relationship) to node.</p> <p>An example of a typical virtual CI type is cluster. This CI type does not have a strong containment relationship to a node.</p> <div style="border: 1px solid gray; padding: 5px; background-color: #f0f0f0;"> <p>Tip: If you have problems resolving non-hosted CIs, provide the RTSM ID of the desired CI by using the format UCMDB:<ci_uid>.</p> </div> <p>For more information about CI resolution in OMi, see the <i>OMi User guide</i> or online help.</p>
<p>Node</p>	<p>Used to identify a node-like CI to which the performance records are associated to.</p> <p>Example: "dbsys1.company.com"</p>

UI Element	Description
Value	<p>The actual performance value. It is automatically converted to a double-precision number.</p> <p>Example: 80</p>
Time measured	<p>The time stamp when the value was determined in the third-party system, expressed in the following formats:</p> <ul style="list-style-type: none"> <p>Integers. BSM Connector interprets integers in the policy source as seconds since 00:00:00 UTC on 1 January 1970 (Unix time). For example, 1276600333 is 15 June 2010, at 11:12:13.</p> <p>Use the \$DATETIME function to convert it. For details about the function, see "Time Created" on page 283.</p> <p>Default time formats. BSM Connector by default interprets the following time formats:</p> <p>yyyy-mm-ddTHH:MM:SS (for example, 2010-06-15T11:12:13)</p> <p>mm/dd/yyyy HH:MM:SS (for example, 06/15/2010 11:12:13)</p> <p>Additional time zone formats are supported:</p> <p>yyyy-mm-ddTHH:MM:SS tz (for example, 2010-06-15T11:12:13 +3)</p> <p>mm/dd/yyyy HH:MM:SS tz (for example, 06/15/2010 11:12:13 -2)</p> <p>where tz is a number for the offset to the UTC time zone. You can also use half or quarter hours (.25, .5, or .75, for example, 2010-06-15T11:12:13 -2.75).</p> <p>If you want to create your own pattern, you can store the time zone information in <@.tz> to match all above mentioned time zones.</p>
Advanced tab	
Original metric name	<p>The name of the metric as used on the third-party system.</p> <p>Example:</p>

UI Element	Description
Unit	The unit of the metric values. Example: "MB"
Integration id	An ID, used to identify the source of the integration. Example: "DB-ORA"

Condition Tab - Rules Only

The following policy types use this condition tab:

- Database policies
- Structured log file policies
- REST Web service listener policies
- XML file policies

UI Element	Description
	New Item. Creates a new condition with the default operator equals.
	Delete Item. Deletes the selected condition.
	Move Up. Moves the selected condition higher in the condition order.
	Move Down. Moves the selected condition lower in the condition order.
	Expand. Expands the list of conditions to display all details.
	Collapse. Collapses the list of conditions to display only the names and hide the details.
	Click to expand the details of a condition.
	Click to hide the details of a condition.

UI Element	Description
Property	<p><i>Database policies:</i> Table column that the policy searches for (for example, /BSMConnectorEvent/Severity).</p> <p><i>Structured log file policies:</i> Input data property that the policy searches for (for example, host).</p> <p><i>REST Web service listener policies:</i> XML Property that the policy searches for. You must prefix the XML property with <XML Event/Metric Tag> (/<XML Event/Metric Tag>/<full path to XML Property>).</p> <p><i>XML file policies:</i> XML property that the policy searches for. You must specify the XML path from the XML tag to the property, separated by slash marks (/) (for example, /PerformanceAlert/Severity).</p>
Operator	<p>The following operators are available:</p> <ul style="list-style-type: none"> • equals • not equals • less than • greater than • less or equal • greater or equal • matches (Enables you to enter a pattern in the Operand field.)
Operand	<p>Value or pattern that you want the policy to compare with the table column (database policies), or the input data reference (structured log file policies), or the value of the XML property (REST Web service listener policies and XML policies). If you are working with sample data, you can drag the value from the Values list and drop it in the Operand field.</p>

Field Mapping Page

UI Element	Description
Field Mapping Script	<p>Defines the conversion rules from third-party data to the OMi event format.</p> <p>For more information on field mapping, see the SiteScope Help or the the Using SiteScope Guide.</p>

Indicators Tab

UI Element	Description
	<p>Refresh. Loads the configured indicators from the connected OMi server.</p> <p>Note:</p> <ul style="list-style-type: none"> • Loading indicators from the OMi server may take a few seconds. • The BSM Connector server must be configured as a BSM Connector integration server in BSM for the indicators to load successfully.
<Search ...>	<p>Entered search string is used to search the indicators and highlight only the indicators containing the specified string.</p> <p>To search for indicators with specific text strings in the name, type the string in the <Search ...> field and click the  button. The first matching indicator is selected in the list of rules. Click the  and  buttons to move to the previous and next matching indicator.</p>
<Indicators>	<p>Hierarchy of configuration item types with associated health indicators (HIs) and event type indicators (ETIs). To insert an indicator in a policy, drag and drop the indicator from the Indicators tab to the relevant field in the policy.</p>

Mappings Page

UI Element	Description
	Create new mapping definition. Adds a new mapping definition to the list of mappings.
	Delete mapping definition. Deletes the selected mapping definition.
	Copy Mapping Definition. Creates a copy of the selected mapping definition.
	Move Up. Moves the selected mapping definition up to a higher position.
	Move Down. Moves the selected mapping definition down to a lower position.
Map Name	Name of the custom variable. BSM Connector automatically adds the default prefix <code>map</code> to the map name if the variable has been created from sample data.

<p>Input Data Property</p>	<p><i>Database policies:</i> Table column assigned to the custom variable. BSM Connector replaces the table column at runtime with the value of the specified column. If you insert a value, the value will be used.</p> <p><i>Structured Log file policies:</i> Input data property assigned to the custom variable. BSM Connector replaces the pattern matching field at runtime with the value of the specified field. If you insert a value, the value will be used.</p> <p><i>REST Web service listener policies:</i> XML property assigned to the custom variable. BSM Connector replaces the XML property at runtime with the value of the specified XML property. If you insert a value, the value will be used.</p> <p><i>XML file policies:</i> XML element or attribute assigned to the custom variable. XML properties use the following syntax: <\$DATA:/<XML_property>> <XML_property> is the XML path, separated by slash marks (/), from the XML tag to the XML element or attribute. BSM Connector replaces the XML property at runtime with the value of the specified XML element or attribute. If you insert an XML value, the value will be used.</p>
	<p>Create new mapping. Adds a new pair of source and target values to the mapping definition.</p>
	<p>Delete mapping. Deletes the selected source and target value pair.</p>
	<p>Copy Value Mapping. Creates a copy of the selected value mapping.</p>
	<p>Move Up. Moves the selected value mapping up to a higher position.</p>
	<p>Move Down. Moves the selected value mapping down to a lower position.</p>
<p>Source Value</p>	<p><i>Database policies:</i>Original value of the table column. <i>Structured Log file policies:</i>Original value of the input data reference. <i>REST Web service listener policies:</i>Original value associated with the XML property from the XML file. <i>XML file policies:</i>Original value of the XML element or attribute.</p>
<p>Target Value</p>	<p><i>Database policies:</i>New value of the table column. <i>Structured log file policies:</i>New value of the input data reference. <i>REST Web service listener policies:</i>New value associated with XML property. <i>XML file policies:</i>New value of the XML element or attribute.</p>

Mappings Tab

UI Element	Description
<Mappings>	Displays the mapping definitions configured for the policy.

Operators Tab (Metrics Only)

Expressions and Functions	Description
<code><\$MATCH (inputStr , patternDef , outputStr ,outputStrNoMatch)></code>	<p>Gets a substring of input data: The \$MATCH function accepts three or four parameters:</p> <ul style="list-style-type: none"> - the input string - the pattern definition - the output string if pattern matches on the input string - optionally, the output string if the pattern does not match. <p>Example: The data of the input field hostname start always with "TEST" (for example "TESTABC"). The \$MATCH function to use the string after "TEST" is:</p> <pre>\$MATCH(<\$DATA:hostname>,TEST<*.prefix>,<prefix>)</pre>
<code><\$DATETIME (FORMAT, VALUE) ></code>	<p>Converts a string with date and time information to the internal integer data time format.</p>

Options Page

UI Element	Description
Log Local Events	<p>Defines which incoming events are logged. These events are logged on the BSM Connector system in the log file:</p> <p>Windows: %OvDataDir%\log\OpC\opcmsglg Linux: /var/opt/OV/log/OpC/opcmsglg</p>
that match a rule and trigger an event	<p>Logs any events in the event source that match the policy rules.</p>

UI Element	Description
that match a rule and are ignored	Logs any events in the event source that are suppressed. (Suppressed events are not sent to OMi.)
that do not match any rule	Logs any events that do not match any of the rules in the policy.
Unmatched Events	<p>Send an event to OMi when the input event does not match any rule in the policy because none of the conditions apply or because the policy does not contain any rules. This ensures that unexpected events that might be important do not go unreported. By default, unmatched events are ignored.</p> <p>Each policy that sends unmatched events to OMi creates an event with the default values of the policy.</p> <div data-bbox="407 783 1369 894" style="background-color: #f0f0f0; padding: 5px;"> <p>Tip: If you want a policy to send events only with the default values, omit all rules from the policy.</p> </div> <div data-bbox="407 915 1369 1272" style="background-color: #f0f0f0; padding: 5px;"> <p>Note:</p> <p>Open message interface and SNMP trap policies: The agent creates an event for an unmatched event only if the input event is unmatched in all policies on the BSM Connector system. The agent sends only one event for each unmatched input event.</p> <p>Database, structured log file, REST Web service listener, and XML file policies: If several event policies forward unmatched events to OMi, you could receive multiple events about a single input event.</p> </div>
are forwarded to OMi Server	Sends unmatched events to OMi.
are forwarded to OMi Server with state 'closed'	Sets the unmatched event's lifecycle status to Closed before sending it to OMi.
are ignored	Ignores unmatched events.

UI Element	Description
Store records that do not match any rule	BSM Connector stores events and metrics that do not match any rule and sends them to OMi.
Pattern Matching Options	Defines case sensitivity and field separators for all rules.
Case sensitive check	Defines whether the case (uppercase or lowercase) of a text string is considered when the pattern of a rule is compared with the source data. When switched on, a match only occurs if the use of uppercase and lowercase letters is exactly the same in both the source data and the pattern. This is the default setting.
Field Separators	<p>Defines which characters should be considered to be field separators. Field separators are used in the pattern as separator characters for the rule condition. You can define up to seven separators, including these special characters:</p> <div data-bbox="407 898 1203 1150" style="border: 1px solid black; padding: 10px;"> <ul style="list-style-type: none"> • \n New line (NL) • \t Horizontal tab (HT) • \v Vertical tab (VT) • \b Backspace (BS) • \r Carriage return (CR) • \f Form feed (FF) • \a Alert (BEL) • \\ Backslash (\) </div> <p>For example, if you wanted a backslash, an asterisk, and the letter A to define the fields in the event, you would type *A (with no spaces separating the characters).</p> <p>If you leave this box empty, the default separators (a blank and the tab character) are used by default.</p> <p>You can set case sensitivity and separator characters for individual rules in a policy by clicking the ► button in rule's match condition.</p>
Apply to All	<p>Applies the pattern matching options to all existing rules in a policy. This overwrites any modifications made to the pattern matching options in individual rules.</p> <p>If you change the pattern matching options and do not click Apply to all, they only apply to all new rules in a policy.</p>

Pattern Matching Variables Tab (Events and Metrics Only)

UI Element	Description
<variables>	Displays the user-defined variables configured in the Condition tab. For more information about assigning strings to variables, see "User-Defined Variables in Patterns" on page 269 .

Policy Variables Tab (Events and Metrics Only)

Variable	Description
< \$# >	Returns the number of variables in an enterprise-specific SNMP event (generic event 6 Enterprise specific ID). Sample output: 2
< \$* >	Returns all variables assigned to the event up to the possible fifteen. Sample output: [1] .1.1 (OctetString): arg1 [2] .1.2 (OctetString): turnip.example.com
< \$@ >	Returns the time the event was received as the number of seconds since Jan 1, 1970 using the <i>time_t</i> representation. Sample output: 859479898
< \$1 >	Returns one or more of the fifteen possible event parameters that are part of an SNMP event. (<\$1> returns the first variable, <\$2> returns the second variable, and so on.)
< \$ \> 1 >	Returns all attributes greater than <i>n</i> as <i>value</i> strings, useful for printing a variable number of arguments. <\$ \> 0 > is equivalent to \$* without sequence numbers, names, or types. Sample output: bokchoy.example.com
< \$ \> + 1 >	Returns all attributes greater than <i>n</i> as <i>name:value</i> string. Sample output: .1.2: asparagus.example.com
< \$ + 2 >	Returns the <i>n</i> th variable binding as <i>name:value</i> . Sample output: .1.2: artichoke.example.com
< \$ \> - n >	Returns all attributes greater than <i>n</i> as [<i>seq</i>] <i>name (type): value</i> strings. Sample output: [2] .1.2 (OctetString): cauliflower.example.com
< \$ - 2 >	Returns the <i>n</i> th variable binding as [<i>seq</i>] <i>name-type:value</i> . Sample output: [2] .1.2 (OctetString): brusselsprouts.example.com
< \$ A >	Returns the node that produced the event. Sample output: eggplant.example.com
< \$ C >	Returns the community of the event. Sample output: public

Variable	Description
<\$E>	Returns the enterprise ID of the event. Sample output: .1.3.6.1.4.1.11.2.17.1
<\$e>	Returns the enterprise object ID. Sample output: .1.3.6.1.4.1.11.2.17.1
<\$DATABASE_SERVER>	Returns the name of the database server as specified in the Server name field in the Source page. Sample output: dbserver.example.com
<\$DATABASE_TABLES>	Returns the names of the queried tables as specified in the FROM field in the Source page. Sample output: ALL_EVENTS
<\$F>	Returns the textual name of the remote postmaster daemon's computer if the event was forwarded. Sample output: cress.example.com
<\$G>	Returns the generic event ID. Sample output: 6
<\$LOGFILE>	Returns the name of the log file that contains the input event. Sample output: program_log.txt
<\$LOGPATH>	Returns the name and path of the log file that contains the input event. Sample output: C:\temp\mylogfile\program_log.txt
<\$MSG_APPL>	Returns the name of the application associated with the input event that caused the message. Sample output: /usr/bin/su(1) Switch User
<\$MSG_GEN_NODE>	Returns the IP address of the node that sends the event. Sample output: 192.168.1.123.
<\$MSG_GEN_NODE_NAME>	Returns the host name of the node that sends the event. Sample output: node123.example.com.
<\$MSG_GRP>	Returns the default category of the event. Sample output: Security
<\$MSG_ID>	Returns the unique identity number of the event, as generated by the HP Operations Agent. Note that identity numbers are not generated for suppressed messages. Sample output: 6e998f80-a06b-71d0-012e-0f887a7c0000
<\$MSG_NODE>	Returns the IP address of the node on which the original event took place. Sample output: 192.168.1.123
<\$MSG_NODE_NAME>	Returns the name of the node on which the original event took place. This is the hostname that the agent resolves for the node. This variable is not fixed, however, and can be changed by a policy on a per-event basis. For example, if the policy is receiving SNMP traps that originate from other devices, you might want to set this variable to the name of the device where the trap originated.
<\$MSG_SERVICE>	Returns the service name associated with the event.
<\$MSG_OBJECT>	Delivers the name of the object associated with the event.

Variable	Description
<\$MSG_OBJECT>	Returns the name of the object associated with the event. This is set in the Event Defaults section of the policy editor.
<\$MSG_SEV>	Returns the default value for the severity of the event. Sample output: Normal
<\$MSG_TEXT>	Returns the full text of the event. For open message interface policies, this value is the msg_text parameter submitted by the opcmsg command. Sample output: SU 03/19 16:13 + ttyp7 bill-root
<\$MSG_TIME_CREATED>	Returns the time the message was created on the managed node in seconds elapsed since midnight (00:00:00), January 1, 1970, coordinated universal time. Sample output: 950008585
<\$MSG_TYPE>	Delivers the name set for message type.
<\$N>	Returns the event name (textual alias) of the event format specification used to format the event, as defined in the Event Configurator. Sample output: OV_Node_Down
<\$NAME>	Returns the name of the policy that sent the event. Sample output: cpu_util
<\$O>	Returns the name (object identifier) of the event. Sample output: .1.3.6.1.4.1.11.2.17.1.0.58916865
<\$o>	Returns the numeric object identifier of the event. Sample output: .1.3.6.1.4.1.11.2.17.1.0.58916865
<\$OPTION(N)>	Returns the value of an optional variable that is set by opcmsg (for example, <\$OPTION(A)>, <\$OPTION(B)>, and so on.).
<\$PROG>	Returns the name of the program executed by the scheduled task policy Sample output: check_for_upgrade.bat
<\$R>	Returns the true source of the event. This value is inferred through the transport mechanism which delivered the event. Sample output: carrot.example.com
<\$r>	Returns the implied source of the event. This may not be the true source of the event if the true source is proxying for another source, such as when an application running locally is reporting information about a remote node. Sample output: rutabaga.example.com
<\$S>	Returns the specific event ID. Sample output: 5891686
<\$s>	Returns the event's severity. Sample output: Normal
<\$T>	Returns the event time stamp. Sample output: 0
<\$USER>	Returns the name of the user under which the scheduled task was executed. Sample output: administrator

Variable	Description
<\$V>	Returns the event type, based on the transport from which the event was received. Currently supported types are SNMPv1, SNMPv2, CMIP, GENERIC, and SNMPv2INFORM. Sample output: SNMPv1
<\$X>	Returns the time the event was received using the local time representation. Sample output: 17:24:58
<\$x>	Returns the date the event was received using the local date representation. Sample output: 03/27/10

Properties Page

UI Element	Description
Name	Name of the policy. You can use spaces in the name. The equal sign (=) is not allowed. <div style="background-color: #f0f0f0; padding: 5px; margin-top: 10px;">Tip: Include the name of the integrated software in the policy name.</div>
Description	Description of what the policy does. You might also add other notes (for example, data sources that are used).
Category	Name of the logical group to which the policy belongs. Categories may help you to better group your policies. Separate multiple categories with commas.
Policy ID	GUID (globally unique identifier) assigned to the policy when it is first created.
Last Modification	The date and time that the policy was saved. The date and time displays using the current time zone of the computer on which the Web browser runs. The language setting of the Web browser determines the date and time format (for example, 09/14/2010 8:16:38 AM for English (United States)). If the Web browser and the computer on which the server run have different language settings, the language setting of the Web browser takes precedence. However, English is the default language if the Web browser is configured to use a language that is not available on the server.
Last Modified by	The name of the user active when the policy was saved.

Rules Page - Policy Rules

Policy Rules List

UI Element	Description
	<p><i>Event policies: Create New Rule: Provides the following options:</i></p> <ul style="list-style-type: none"> • Event on matched rule. If matched, BSM Connector sends an event to OMi. The event uses the settings defined for the rule. If you do not configure these settings, the default settings are used. • Suppress on matched rule. If matched, BSM Connector stops processing and does not send an event to OMi. • Suppress on unmatched rule. If not matched, BSM Connector stops processing and does not send an event to OMi. <p><i>Metrics policies: Create New Rule: Provides the following options:</i></p> <ul style="list-style-type: none"> • Store on matched rule. If matched, BSM Connector stores metrics in a buffer until a maximum number of records or a maximum amount of time are reached, when it sends them to OMi. The metrics use the settings defined for the rule. If you do not configure these settings, the default settings are used. • Suppress on matched rule. If matched, BSM Connector stops processing and does not send metrics to OMi. • Suppress on unmatched rule. If not matched, BSM Connector stops processing and does not send metrics to OMi.
	<p>Copy Rule. Copies the selected rule. You can then rewrite the description of the copied rule and edit the rule.</p>
	<p>Delete Rule. Deletes the selected rule.</p>
	<p>Move Up. Moves the selected rule higher in the rule order.</p>
	<p>Move Down. Moves the selected rule lower in the rule order.</p>
<p><Move to></p>	<p>Entered number is used to select the rule with that sequence number in the list of rules.</p> <p>To select a specific rule in the rule list, type the rule's sequence number in the <Move to> field and click the ▶ button.</p>

UI Element	Description
<Search rules>	<p>Entered search string is used to search the rule descriptions and highlight only the rules containing the specified string.</p> <p>To search for rules with specific text strings in the rule description, type the string in the <Search rules> field and click the  button. The first matching rule is selected in the list of rules. Click the ◀ and ▶ buttons to move the previous and next matching rule.</p>
	Activate/Deactivate Rule Filter. Activates and deactivates the rule filter.
Seq.	Sequence number of the rules. Rules are evaluated in a specific order. When one condition is matched, no additional rules are evaluated.
Rule Description	Description of the rule. It is good practice to use a description that helps you remember what the rule does.
Rule Type	<p>The three rule types of event policies are:</p> <ul style="list-style-type: none"> • Event on matched rule. If matched, BSM Connector sends an event to OMi. The event uses the settings defined for the rule. If you do not configure these settings, the default settings are used. • Suppress on matched rule. If matched, BSM Connector stops processing and does not send an event to OMi. • Suppress on unmatched rule. If not matched, BSM Connector stops processing and does not send an event to OMi. <p>The three rule types of metrics policies are:</p> <ul style="list-style-type: none"> • Store on matched rule. If matched, BSM Connector stores metrics in a buffer until a maximum number of records or a maximum amount of time are reached, when it sends them to OMi. The metrics use the settings defined for the rule. If you do not configure these settings, the default settings are used. • Suppress on matched rule. If matched, BSM Connector stops processing and does not send metrics to OMi. • Suppress on unmatched rule. If not matched, BSM Connector stops processing and does not send metrics to OMi. <p>You can change the rule type by clicking the current rule type in the list of rules and selecting another rule type from the drop-down list.</p>

Sample Data Tab

Sample Data Tab - Database Policies

UI Element	Description
<Search Properties>  	Entered search string is used to find a table column. The list changes as you type; only matching items appear. To clear the search results, click  .
	Toggle Short/Full Path Notation. Shows or hides the full path to the table column. The full path starts with /BSMConnectorEvents/BSMConnectorEvent. The Table Column section by default shows the short path to the table column.
	Find Matching Events. To find values that belong to more than one table row, select the value and click  . The Database Sample Data window opens and shows all rows that have the selected value.
	Toggle Deduplication. Shows or hides duplicate values.
Table Column	Shows all columns that are returned by the database query. <div style="background-color: #f0f0f0; padding: 5px;"> Note: The Sample Data tab is empty if no sample data has been loaded into the policy or if the database query did not succeed. See also "Configuring the Data Source in Database Policies" on page 126. </div>
Values for <...>	Displays the values of the column selected in the Table Column section.

Sample Data Tab - Structured Log File Policies

UI Element	Description
<Search Properties>  	Entered search string is used to find a pattern matching field . The list changes as you type; only matching items appear. To clear the search results, click  .
	Find Matching Events. To find values that belong to more than one pattern matching field , select the value and click  . The Structured Log File Sample Data window opens and shows all pattern matching fields tha have the selected value.

UI Element	Description
	Toggle Deduplication. Shows or hides duplicate values.
Input Data Properties	Shows all pattern matching fields that are extracted from the log file by using the OM pattern-matching language. <div style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px; margin-top: 10px;"> <p>Note: The Sample Data tab is empty if no sample data has been loaded into the policy or if the sample data does not match the structured log file pattern specified in the source page. See also "Configuring Data Source in Structured Log File Policies" on page 218.</p> </div>
Values for <...>	Displays the values of the pattern matching field selected in the Input Data Properties section.

Sample Data Tab - REST Web Service Listener Policies

UI Element	Description
<Search Properties>  	Entered search string is used to find an XML property. The list changes as you type; only matching items appear. To clear the search results, click  .
	Toggle Short/Full Path Notation. Shows or hides the full path to the XML property. The full path starts with /BSMConnectorEvents/BSMConnectorEvent. The XML properties section by default shows the short path to the XML property.
	Find Matching Events. To find values that belong to more than one XML property, select the value and click  . The Web Service Sample Data window opens and shows all XML properties that have the selected value.
	Toggle Deduplication. Shows or hides duplicate values.
XML Properties	Shows all XML properties that have been received by the REST Web service listener for this policy. <div style="border: 1px solid #ccc; background-color: #f9f9f9; padding: 10px; margin-top: 10px;"> <p>Note: The Sample Data tab is empty if no sample data has been loaded into the policy or if no XML data has been received for the policy. For information about loading sample data into a REST Web service listener policy, see "Events and Metrics only: How to load sample data into the policy" on page 169.</p> </div>
Values for <...>	Displays the values of the XML properties selected in the XML Properties section.

Sample Data Tab - XML File Policies

UI Element	Description
<Search Properties>  	Entered search string is used to find an XML property or value. The list changes as you type; only matching items appear. To clear the search results, click  .
	Toggle Short/Full Path Notation. Shows or hides the full path to the XML property or value. The full path begins with the XML tag specified in the Source tab. The XML Properties section by default shows the short path to the XML property or value.
	Find Matching Events. To find values that belong to more than one XML property, select the value and click  . The XML Sample Data window opens and shows all XML properties that have the selected value.
	Toggle Deduplication. Shows or hides duplicate values.
XML Properties	Shows all XML elements and attributes that match an XML tag. <div style="background-color: #f0f0f0; padding: 5px;"> <p>Note: The XML properties list is empty if no sample data has been loaded into the policy or if the sample data does not match any specified XML tags.</p> </div>
Values for <...>	Displays the values of the XML property selected in the XML Properties section.

Schedule Page

Schedule Page - Scheduled Task Policies

UI Element	Description
	Clears the selection.
	Select All. Selects all units of time.

UI Element	Description
Scheduling Options	<p>The following options are available:</p> <ul style="list-style-type: none"> Once. When Once is selected, the command runs on one specific day at the time you indicate. <div data-bbox="451 464 1370 575" style="background-color: #f0f0f0; padding: 5px; margin: 10px 0;"> <p>Note: If the selected date or time occurs in the past, the command is not executed, and the Schedule tab shows a warning.</p> </div> Once per interval. When Once per interval is selected, the command runs once each time the interval that you indicate passes. Advanced. When Advanced is selected, you can indicate specific days and times when the command should be run. You select specific days of the week, specific days of the month, and specific months. This allows you to specify odd schedules such as, "On Monday when it falls on the 2nd of the month." You can also indicate that the command should only be run during a specific year. <div data-bbox="451 905 1370 1016" style="background-color: #f0f0f0; padding: 5px; margin: 10px 0;"> <p>Note: If you select Advanced but then do not specify a schedule, the command by default runs every minute.</p> </div>
Once	
Set to current time	Selects the current time in the schedule.
Minute of Hour	0 to 59 minutes.
Hours of Day	1 to 12 AM and 1 to 12 PM.
Date: <> 	Date when the command should run. Click the calendar icon to open a calendar view for the current month.
Once per interval	
Interval: <> d <> h <> m <> s	Interval in days, hours, minutes, and seconds. The interval must be bigger than 0 seconds.
Advanced (daily execution)	
Minute of Hour	0 to 59 minutes.

UI Element	Description
Hours of Day	1 to 12 AM and 1 to 12 PM.
Days of Month	1 to 31 days of the month.
Months of Year	Months from January to December.
Days of Week	Days of the week from Sunday to Saturday.
Restrict schedule to the year	Select to schedule the task for the specified year only.

Source Page

Source Page - Database Policies

UI Element	Description
Connection settings tab	
Classpath	The jar files that need to be loaded to use the JDBC driver class.
JDBC driver class	The driver used to connect to the database. Use the fully qualified class name (FQCN) of your JDBC driver.
Connect string	The URL to a database connection (referred to as a Connection string). For details about the connection string, see the driver documentation.
Username	User name used to log on to the database.
Password	Password used to log on to the database.
Polling interval	How often the policy queries the database (in days, hours, minutes, and seconds). Default value: 5 minutes Minimum value: 3 seconds

UI Element	Description
Additional connection properties	<p>Any additional connection properties needed by a driver. For details see the driver documentation.</p> <p>Click  to add a new property. Type the name of the property and its value.</p> <p>To remove a property, select the property and click .</p>
Collection settings tab	
SQL statement	<p>The SQL query used to query the database. For details on how to write queries, see "How to configure the database source" on page 128.</p> <p>To retrieve sample data using the specified query, click .</p> <div data-bbox="407 726 1365 800" style="background-color: #f0f0f0; padding: 5px;"> <p>Note: BSM Connector can only load a maximum of 50 MB of sample data.</p> </div>
Session variables	<p>A list of keys and initial values for them. These values are used in the data map if the initial value statement fails to load the values to the data map.</p> <p>Click  to add a new field. Type the name of the key and its initial value.</p> <p>Alternatively, you can drag and drop entries from the Initial value sample data tab.</p> <p>To remove a key, select the key and click .</p>
Initial value statement	<p>An SQL statement that is executed in the init method during the policy activation. It can be used to initialize the data map with values. The values returned as last record from the execution of the statement are copied to the data map and returned.</p> <p>To retrieve sample data using the specified query, click .</p> <div data-bbox="407 1283 1365 1356" style="background-color: #f0f0f0; padding: 5px;"> <p>Note: BSM Connector can only load a maximum of 50 MB of sample data.</p> </div>
Internals tab	

UI Element	Description
Fetch size	<p>Maximum number of rows the policy retrieves from the database for each cycle.</p> <p>Default value: 100 rows</p> <p>If the number of result rows exceeds the set maximum, the policy retrieves the remaining rows (those that exceeded the maximum) on future cycles, until all result rows are retrieved.</p> <p>The value should be sufficient to keep up with database table growth, yet small enough to avoid java.lang.OutOfMemoryException errors. Further, policy run frequency should also be considered. Make sure that the rate at which data is collected by the policy—which is dependent on both policy run frequency and network/system speed—is greater than, or equal to, the rate of data insertion on the third-party system.</p>
Result size	<p>Maximum number of rows that are collected on the receiver side before the entries are processed. By modifying this parameter together with the fetch size you can balance the loads on the database and the BSM Connector system.</p> <p>Default value: 100 rows</p>

Source Page - Database Policies - Sample Data

UI Element	Description
<Search Properties>  	<p>Entered search string is used to find a table column. The list changes as you type; only matching items appear.</p> <p>To clear the search results, click .</p>
	Find Matching Events. Use it to find values that belong to more than one Data input property.
	Toggle deduplication.

	Find Matching Events. Use it to find values that belong to more than one Data input property.
	Toggle deduplication.

Source Page - Structured Log File Policies (Events and Metrics Only)

UI Element	Description
Log File Path / Name	<p>Path and name of the structured log file that the policy reads.</p> <p>Note: BSM Connector cannot process log files that are larger than 2 GB.</p>
Polling Interval	<p>Determines how often the policy reads the structured log file (in days, hours, minutes, and seconds). This period of time is the polling interval. The larger polling interval is set, the less performance is needed. However, more memory is used (this depends on the amount of the data in the log file). Setting the polling interval below 30 seconds is not recommended, the default setting is usually appropriate.</p> <p>Note that a policy begins to evaluate data <i>after</i> the first polling interval passes, unless the Read from beginning (first time) or Read from beginning (always) checkboxes are selected, which results in evaluation of the already existing data at the policy activation. A shorter polling interval is better when you are testing a policy.</p> <p>Default value: 5 minutes</p>
Logfile Character Set	<p>Name of the character set used by the structured log file that the policy reads.</p> <p>Note: It is important to choose the correct character set. If the character set that the policy is expecting does not match the character set in the structured log file, pattern matching may not work, and the event details can have incorrect characters or be truncated in OMi. If you are unsure of which character set is used by the structured log file that the policy reads, consult the documentation of the program that writes the file.</p> <p>Default value: UTF-8</p>
Send event if log file does not exist	<p>BSM Connector sends an event if the specified structured log file does not exist.</p> <p>Default value: not selected</p>

Close after reading	<p>If you select this option, the file handle of the structured log file closes and reopens again after the polling interval. The file is read from the last position. If this file had a rollover in the meantime, it is read from the beginning. If the name of the structured log file changes, and a new file was started in the meantime, the policy continues to read the new structured log file and the original structured log file data is lost.</p> <p>If you do not select this option, the file handle remains and is read entirely each time, unless there is a newer file with the same name (or name pattern). In that case the original structured log file is read to the end, and then the newer file is read. Therefore, no data is lost.</p> <p>Consider the following example: a policy reads the structured log file <code>system.log</code>. While there is still some unread data in the <code>system.log</code> file, it is renamed to <code>system_Monday.log</code>, and a new version of the <code>system.log</code> file is written.</p> <p>In case this option is selected, the unread data from the <code>system_Monday.log</code> file remains unread and the <code>system.log</code> file is read entirely.</p> <p>In case this option is not selected, the unread data from the new <code>system.log</code> file is read after the reading of the <code>system_Monday.log</code> file is completed.</p> <p>Default value: not selected</p>
----------------------------	---

<p>Read Mode</p>	<p>The read mode of a structured log file policy indicates whether the policy processes the entire file or only new entries.</p>	
	<p>Read from last position. The policy reads only new—appended—entries written in the structured log file while the policy is activated. If the file decreases in size between readings, then the entire file is read. Entries that are added to the file when the policy is disabled are not processed by the policy.</p> <p>Choose this option if you are concerned only with entries that occur when the policy is enabled.</p>	<p>Advantage: No chance of reading the same entry twice. (Unless the file decreases in size because some entries were deleted.)</p> <p>Disadvantage: Entries written to file while the policy is disabled or the agent is not running are not processed by the policy.</p>
	<p>Read from beginning (first time). The policy reads the complete structured log file each time the policy is activated or the agent restarts. This ensures that all entries in the file are compared with the rules in the policy. Each successive time that the policy reads the file, only new (appended) entries in the file are processed.</p> <p>Choose this option if you want to ensure that every existing and future entry in the file is processed by the policy while it is activated.</p>	<p>Advantage: Every existing and future entry in the file will be processed by the policy.</p> <p>Disadvantage: Duplicate entries can occur if an activated policy is deactivated and reactivated, or if the agent stops and restarts.</p>
	<p>Read from beginning (always). The policy reads the complete structured log file every time it detects that the file has changed. The policy scans the file at the specified polling interval. If no change is detected, the file is not processed. Any entries overwritten while the agent is not running or the policy is deactivated will not be evaluated by the policy.</p> <p>Choose this option if the policy reads a file that is overwritten, rather than appended.</p>	<p>Advantage: Ensures that files that are overwritten are correctly processed.</p> <p>Disadvantage: Only valid for files that are overwritten, rather than appended.</p>
<p>Note: Every policy reads the same structured log files independently from any other policies. This means, for example, that if "Policy 1" with read mode Read from beginning (first time) is activated and "Policy 2" with the same read mode already exists, "Policy 1" still reads the entire file after it has been activated.</p>		

	Default value: Read from last position
Sample Data	
	<p>Loads the log file to the BSM Connector. The log file can be loaded from Server or from the local file system.</p> <p>Note: BSM Connector can only load a maximum of 50 MB of sample data.</p>
	<p>Opens the Structured logfile sample data dialog box. This dialog box contains the following tabs:</p> <ul style="list-style-type: none"> • Raw data <p>Raw data tab displays the actual lines of the uploaded log file marked with the numbers. For example:</p> <pre>1380004749 tcpc113.RIESLING.INTERN LogicalDisk C: % Free Space 66.379264831543 Microsoft.Windows.Server.2008.LogicalDisk</pre> <ul style="list-style-type: none"> • Structured data <p>Structured data tab displays the lines of the uploaded log file after the log file pattern is applied. These lines are now divided by the fields that were identified by the applied pattern. These field can be used throughout the rest of the policy configuration, for example, as Input Data Properties from the Sample Data in the Mappings and the Defaults tabs. For example, for the above stated example log line, these fields would be the following:</p> <pre>timestamp hostname entitytype entityid countertype countervalue scomtype</pre>
Log File Structure	
Log File Pattern (Events only)	<p>A pattern by which the log file's structure is extracted, and which will be used in all other policy operations. This pattern should comply with the standard pattern definition used by all HP Operations Manager products (OM pattern). For example, this structure could like as follows:</p> <pre><*.timestamp>\ <*.hostname> <*.entitytype>\ <*.entityid>\ <*.countertype>\ <*.countervalue>\ <*.scomtype></pre> <p>For more information about how this structure is extracted from a log file, see "Configuring Data Source in Structured Log File Policies" on page 218.</p> <p>For more information about the OM pattern matching details, see "Pattern Matching in Policy Rules" on page 265.</p>

<p>Data Fields (Metrics only)</p>	<p>identify using OM Pattern Identifying the log file's structure components by using the OM pattern. For example:</p> <pre><*.timestamp>\ <*.hostname> <*.entitytype>\ <*.entityid>\ <*.countername> <*.countervalue>\ <*.scomtype></pre> <p>This field can contain the data that matches the whole line or just the static part of the log line. For more information about the OM pattern matching details, see "Pattern Matching in Policy Rules" on page 265.</p> <div style="background-color: #f0f0f0; padding: 5px; border: 1px solid #ccc;"> <p>Note: In case a value in the identify using static fields field is already specified, the value of this field is ignored.</p> </div>
	<p>identify using static fields Identifying the log file's structure components by using static fields. For example:</p> <pre>timestamp,hostname,entitytype,entityid,countername,countervalue,scomtype</pre> <p>For more information on static fields, see "Defining a log file structure by using static fields (Metric only)" on page 219.</p> <div style="background-color: #f0f0f0; padding: 5px; border: 1px solid #ccc;"> <p>Tip: This is a recommended method (applies also for recurring fields) for extracting a structure from the log file due to performance reasons.</p> </div>
<p>Recurring Fields (Metrics only)</p>	<p>A word list that contains the recurring part from the log line. Each recurrence creates a record in the store. For example:</p> <pre>countername,countervalue</pre> <p>For more information about the recurring fields, see "Using recurring fields in defining a log file structure (Metric only)" on page 219.</p>
<p>Data Field Separator (Metrics only)</p>	<p>The separator that is used as a data separator in the log file.</p>

Source Page - REST Web Service Listener Policies

UI Element	Description
Path	<p>A string entered in the policy. This string is a part of the actual URL where the REST Web Service Listener listens for the XML data. For example, for the events this URL should look as follows:</p> <pre>http(s)://<BSMC_FQDN>:<configured_port>/bsmc/rest/events/<PATH></pre> <p>Only the following characters are allowed in a path: [a-zA-Z0-9()-=*.?;,+/&_]</p> <p>For more information on customizing the REST Web Service Listener, see "Configuring the Data Source in REST Web Service Listener Policies " on page 166.</p>
Character Set	<p>Name of the character set used by the XML data that the policy reads.</p> <div style="background-color: #f0f0f0; padding: 10px; margin: 10px 0;"> <p>Note: It is important to choose the correct character set. If the character set that the policy is expecting does not match the character set in the XML data, pattern matching may not work, and the event details can have incorrect characters or be truncated in OMi. If you are unsure of which character set is used by the XML data that the policy reads, consult the documentation of the program that writes the file.</p> </div> <p>Default value: UTF-8</p>
Sample Data (Events and Metrics only)	
	<p>Uploads the XML file to the BSM Connector.</p> <div style="background-color: #f0f0f0; padding: 10px; margin: 10px 0;"> <p>Note: BSM Connector can only load a maximum of 50 MB of sample data.</p> </div>
	<p>Opens the REST Web Service Sample Data dialog box. This dialog box displays the XML elements and values contained in the uploaded XML sample data.</p>
XML Event Tag (Events only)	<p>Enables you to specify one or more XML event tags. The XML event tag creates a shortcut to the XML element that you want to process. An event tag typically identifies an event record in an XML file. You can define more than one event tag.</p>

UI Element	Description
	<p>Create new XML event tag manually. Enables you to type an XML element in the provided box.</p> <p>Create new XML event tag from XML sample data. Opens the XML Sample Data Outline dialog box. This dialog box displays the XML elements and attributes contained in the uploaded XML sample data.</p>
	<p>Deletes the selected XML event tag.</p> <p>Caution: Deleting an event tag that is referenced in a policy corrupts the policy and renders it unusable.</p>
<p>XML Metric Tag (Metrics only)</p>	<p>Enables you to specify one or more XML metric tags. The XML metric tag creates a shortcut to the XML element that you want to process. A metric tag typically identifies a metric record in an XML file. You can define more than one metric tag.</p>
	<p>Create new XML metric tag manually. Enables you to type an XML element in the provided box.</p> <p>Create new XML metric tag from XML sample data. Opens the XML Sample Data Outline dialog box. This dialog box displays the XML elements and attributes contained in the uploaded XML sample data.</p>
	<p>Deletes the selected XML metric tag.</p> <p>Caution: Deleting a metric tag that is referenced in a policy corrupts the policy and renders it unusable.</p>
<p>Detect deltas (Topology only)</p>	<p>A delta is the difference between the received XML file and the repository. The delta is the bare minimum of information about the changes. It discovers all changes without regards to the RTSM model.</p> <p>If an instance or relation is not discovered for a certain amount of time (Age to deletion), it is deleted. The counter goes up each time when the algorithm is running (this depends on the interval and the last time the file was written / sent via web service).</p> <p>If not selected, no delta detection is done and the incoming topology file is directly sent to the topology server.</p> <p>Default value: selected.</p>
<p>Age to deletion (Topology only)</p>	<p>A number of times for the policy to be run for a host that is not part of the topology data. After this number of policy executions, this host is deleted from the server.</p>

Source Page - XML File Policies

UI Element	Description
<p>Log File Path / Name Events and Metrics only)</p> <p>Topology XML File (Topology only)</p>	<p>Path and name of the XML file that the policy reads. Type the drive letter and the full path for the location of this file on the BSM Connector system.</p> <p>You can use the following configurations to make your policy more flexible:</p> <ul style="list-style-type: none"> • Windows environment variables (for example, <code>winnt</code> or <code>clusterlog</code>). The syntax for these variables is <code><\$variablename></code>, for example <code><\$winnt></code>. • Script or command that returns the path and name of the log file you want to access. For example, type <code><`command`></code> where <code>command</code> is the name of a script that returns the path and name of the log file you want the policy to read. <p>The command can also return more than one log file path separated by spaces. The HP Operations Agent processes each of the files using the same options and conditions as configured for this policy. This is very useful when you want to dynamically determine the log file path or process multiple instances of a log file.</p> <ul style="list-style-type: none"> • Pattern matching. The pattern-matching language enables you to very accurately specify the file names that you want the policy to match. For example, you can use the pattern <code><path>/events<*>.xml</code> to match XML source file names such as <code>events.1.xml</code> and <code>events.2.xml</code>. <p>For more information on pattern matching, see "Pattern-Matching Details" on page 265.</p> <div style="background-color: #f0f0f0; padding: 5px; border: 1px solid #ccc;"> <p>Note: BSM Connector cannot process log files that are larger than 2 GB.</p> </div>
<p>Polling Interval</p>	<p>Determines how often the policy reads the XML file (in days, hours, minutes, and seconds). This period of time is the polling interval. The larger polling interval is set, the less performance is needed. However, more memory is used (this depends on the amount of the data in the XML file). Setting the polling interval below 30 seconds is not recommended, the default setting is usually appropriate.</p> <p>Note that a policy begins to evaluate data <i>after</i> the first polling interval passes, unless the Read from beginning (first time) or Read from beginning (always) checkboxes are selected, which results in evaluation of the first data at the policy activation. A shorter polling interval is better when you are testing a policy.</p> <p>Default value: 5 minutes</p>

<p>Logfile Character Set (Event and Metrics only)</p> <p>Character Set (Topology only)</p>	<p>Name of the character set used by the XML file that the policy reads.</p> <div style="background-color: #f0f0f0; padding: 10px; margin: 10px 0;"> <p>Note: It is important to choose the correct character set. If the character set that the policy is expecting does not match the character set in the XML file, pattern matching may not work, and the event details can have incorrect characters or be truncated in OMi. If you are unsure of which character set is used by the XML file that the policy reads, consult the documentation of the program that writes the file.</p> </div> <p>Default value: UTF-8</p>
<p>Send event if log file does not exist (Events and Metrics only)</p> <p>Send OMi event if topology file does not exist (Topology only)</p>	<p>BSM Connector sends an event if the specified XML file does not exist.</p> <p>Default value: not selected</p>
<p>Close after reading (Events and Metric only)</p>	<p>If you select this option, the file handle of the XML file closes and reopens again after the polling interval. The XML file is read from the last position. If this file had a rollover in the meantime, it is read from the beginning. If the name of the XML file changes, and a new file was started in the meantime, the policy continues to read the new XML file and the original XML file data is lost.</p> <p>If you do not select this option, the file handle remains and is read entirely each time, unless there is a newer file with the same name (or name pattern). In that case the original XML file is read to the end, and then the newer file is read. Therefore, no data is lost.</p> <p>Consider the following example: a policy reads the XML file <code>system.xml</code>. While there is still some unread data in the <code>system.xml</code> file, it is renamed to <code>system_Monday.xml</code>, and a new version of the <code>system.xml</code> file is written.</p> <p>In case this option is selected, the unread data from the <code>system_Monday.xml</code> file remains unread and the <code>system.xml</code> file is read entirely.</p> <p>In case this option is not selected, the unread data from the new <code>system.xml</code> file is read after the reading of the <code>system_Monday.xml</code> file is completed.</p> <p>Default value: not selected</p>

<p>Read Mode (Events and Metric only)</p>	<p>The read mode of an XML file policy indicates whether the policy processes the entire file or only new entries.</p>	
	<p>Read from last position. The policy reads only new—appended—entries written in the XML file while the policy is activated. If the file decreases in size between readings, then the entire file is read. Entries that are added to the file when the policy is disabled are not processed by the policy.</p> <p>Choose this option if you are concerned only with entries that occur when the policy is enabled.</p>	<p>Advantage: No chance of reading the same entry twice. (Unless the file decreases in size because some entries were deleted.)</p> <p>Disadvantage: Entries written to file while the policy is disabled or the agent is not running are not processed by the policy.</p>
	<p>Read from beginning (first time). The policy reads the complete XML file each time the policy is activated or the agent restarts. This ensures that all entries in the file are compared with the rules in the policy. Each successive time that the policy reads the file, only new (appended) entries in the file are processed.</p> <p>Choose this option if you want to ensure that every existing and future entry in the file is processed by the policy while it is activated.</p>	<p>Advantage: Every existing and future entry in the file will be processed by the policy.</p> <p>Disadvantage: Duplicate entries can occur if an activated policy is deactivated and reactivated, or if the agent stops and restarts.</p>
	<p>Read from beginning (always). The policy reads the complete XML file every time it detects that the file has changed. The policy scans the file at the specified polling interval. If no change is detected, the file is not processed. Any entries overwritten while the agent is not running or the policy is deactivated will not be evaluated by the policy.</p> <p>Choose this option if the policy reads a file that is overwritten, rather than appended.</p>	<p>Advantage: Ensures that files that are overwritten are correctly processed.</p> <p>Disadvantage: Only valid for files that are overwritten, rather than appended.</p>
<p>Note: Every policy reads the same XML files independently from any other</p>		

	<p>policies. This means, for example, that if "Policy 1" with read mode Read from beginning (first time) is activated and "Policy 2" with the same read mode already exists, "Policy 1" still reads the entire file after it has been activated.</p> <p>Default value: Read from last position</p>
<p>Sample Data (Events and Metrics only)</p>	<p>Enables you to upload an XML sample file. BSM Connector makes the XML elements and values of the sample file available to you in the Event and Rules pages so that you can insert them by dragging and dropping.</p>
	<p>Load sample data from server. Loads an XML sample file from the OMI Connector system.</p> <p>Load sample data from local file system. Loads an XML sample file from the system where the Web browser runs.</p> <p>Note: BSM Connector can only load a maximum of 50 MB of sample data.</p>
	<p>Opens the XML Sample Data dialog box. This dialog box displays the contents of the uploaded XML sample file.</p>
<p>XML Event Tag (Events only)</p>	<p>Enables you to specify one or more XML event tags. The XML event tag creates a shortcut to the XML element that you want to process. An event tag typically identifies an event record in an XML file. You can define more than one event tag.</p>
	<p>Create new XML event tag manually. Enables you to type an XML element in the provided box.</p> <p>Create new XML event tag from XML sample data. Opens the XML Sample Data Outline dialog box. This dialog box displays the XML elements and attributes contained in the uploaded XML sample data.</p>
	<p>Deletes the selected XML event tag.</p> <p>Caution: Deleting an event tag that is referenced in a policy corrupts the policy and renders it unusable.</p>
<p>XML Metric Tag (Metrics only)</p>	<p>Enables you to specify one or more XML metric tags. The XML metric tag creates a shortcut to the XML element that you want to process. A metric tag typically identifies a metric record in an XML file. You can define more than one metric tag.</p>

	<p>Create new XML metric tag manually. Enables you to type an XML element in the provided box.</p> <p>Create new XML metric tag from XML sample data. Opens the XML Sample Data Outline dialog box. This dialog box displays the XML elements and attributes contained in the uploaded XML sample data.</p>
	<p>Deletes the selected XML metric tag.</p> <div style="background-color: #f0f0f0; padding: 5px;"> <p>Caution: Deleting a metric tag that is referenced in a policy corrupts the policy and renders it unusable.</p> </div>
<p>Detect deltas (Topology only)</p>	<p>A delta is the difference between the received XML file and the repository. The delta is the bare minimum of information about the changes. It discovers all changes without regards to the RTSM model.</p> <p>If an instance or relation is not discovered for a certain amount of time (Age to deletion), it is deleted. The counter goes up each time when the algorithm is running (this depends on the interval and the last time the file was written / sent via web service).</p> <p>If not selected, no delta detection is done and the incoming topology file is directly sent to the topology server.</p> <p>Default value: selected.</p>
<p>Age to deletion (Topology only)</p>	<p>A number of times for the policy to be run for a host that is not part of the topology data. After this number of policy executions, this host is deleted from the server.</p>

Start, Success, Failure Event Pages (Scheduled Task Policies)

UI Element	Description
Send Start Event	Click to send an event when the command begins to run.
Send Success Event	Click to send an event when the command completes successfully.
Send Failure Event	Click to send an event when the command fails to run or fails to complete successfully.

Task Page (Scheduled Task Policies)

UI Element	Description
	<p>Load. Opens a file selection dialog box for you to select the VB or Perl script to load into the policy.</p>
<p>Task Type</p>	<p>Type of task:</p> <ul style="list-style-type: none"> • Command • VB Script • Perl Script
<p>Command</p>	<p>Complete path and extension of the command that you want to run (for example, %OvDataDir%\bin\instrumentation\cleanup.exe). The file that you specify should exist on the system.</p> <p>By default, the command runs under the same account as the agent is running, which is Local System or root by default.</p>
<p>Username</p>	<p>User name under which the command should be run. The user must exist and have permission to run the command on the system. If you specify a non-existent user, the command fails to run.</p>
<p>Password</p>	<p>Password for the user. If the password changes, the policy must be updated and reactivated.</p>
<p>VB Script</p>	<p>Code that defines the VB script. Instead of typing the script into the field, you can upload an existing script.</p> <div style="background-color: #f0f0f0; padding: 5px; margin-top: 10px;"> <p>Tip: Use the policy method <code>Rule.Status</code> to specify whether the task is successful. For example, to specify that the task has failed (and trigger a failure event), use <code>Rule.Status=False</code>. (See "Rule Object" on page 197 .)</p> </div> <div style="background-color: #f0f0f0; padding: 5px; margin-top: 10px;"> <p>Note: HP Operations Agent uses a generic Microsoft scripting engine to run VBScript scripts. You can therefore use standard VBScript objects (for example, the <code>FileSystemObject</code> object) in your scripts. Objects that are specific to <code>wscript</code> or <code>cscript</code> (for example, the <code>WScript</code> object) are not supported.</p> </div>

UI Element	Description
Perl Script	<p>Code that defines the Perl script. Instead of typing the script into the field, you can upload an existing script.</p> <p>Tip: Use the policy method <code>\$Rule->Status</code> to specify whether the task is successful. For example, to specify that the task has failed (and trigger a failure message), use <code>\$Rule->Status(False)</code>. (See "Rule Object" on page 197.)</p> <p>Note: The agent runs as a service that has no standard input, standard output, or standard error. Therefore, the predefined file handles <code>STDIN</code>, <code>STDOUT</code>, and <code>STDERR</code> are not available for Perl scripts in scheduled task policies. It is also not possible to open file handles that use command pipes or capture the standard output from commands within backticks (<code>`</code>).</p>
