## **Documentation Updates**

The title page of this document contains the following identifying information:

- Software Version number, which indicates the software version.
- Document Release Date, which changes each time the document is updated.
- Software Release Date, which indicates the release date of this version of the software.

To check for recent updates or to verify that you are using the most recent edition of a document, go to: http://h20230.www2.hp.com/selfsolve/manuals

This site requires that you register for an HP Passport and sign in. To register for an HP Passport ID, go to: http://h20229.www2.hp.com/passport-registration.html

Or click the  ${\bf New}\,\,{\bf users}\,\,{\bf -please}\,\,{\bf register}$  link on the HP Passport login page.

You will also receive updated or new editions if you subscribe to the appropriate product support service. Contact your HP sales representative for details.

HP ALM (12.20) Page 3 of 165

## Support

Visit the HP Software Support Online web site at: http://www.hp.com/go/hpsoftwaresupport

This web site provides contact information and details about the products, services, and support that HP Software offers.

HP Software online support provides customer self-solve capabilities. It provides a fast and efficient way to access interactive technical support tools needed to manage your business. As a valued support customer, you can benefit by using the support web site to:

- Search for knowledge documents of interest
- Submit and track support cases and enhancement requests
- Download software patches
- Manage support contracts
- Look up HP support contacts
- Review information about available services
- Enter into discussions with other software customers
- · Research and register for software training

Most of the support areas require that you register as an HP Passport user and sign in. Many also require a support contract. To register for an HP Passport ID, go to:

http://h20229.www2.hp.com/passport-registration.html

To find more information about access levels, go to:

http://h20230.www2.hp.com/new\_access\_levels.jsp

**HP Software Solutions Now** accesses the HPSW Solution and Integration Portal Web site. This site enables you to explore HP Product Solutions to meet your business needs, includes a full list of Integrations between HP Products, as well as a listing of ITIL Processes. The URL for this Web site is <a href="http://h20230.www2.hp.com/sc/solutions/index.jsp">http://h20230.www2.hp.com/sc/solutions/index.jsp</a>

HP ALM (12.20) Page 5 of 165

## ALM Functionality by Edition

HP Application Lifecycle Management is also available in several editions which provide subsets of ALM functionality.

HP ALM Edition	Description
HP ALM	A unified platform for managing and automating processes, activities, and assets for building, testing, delivering, and maintaining applications. It includes modules for requirements, test, defect, and development management, and overall release and project planning. HP ALM helps organizations drive consistent processes, shared best-practices, and asset sharing across projects.
HP ALM Essentials Edition	Provides a subset of HP ALM product functionality, and is designed to help smaller teams get up and running quickly. It provides core functionality for requirements management, test management, and defect management.
HP Quality Center Enterprise Edition	Resides on the same unified platform as HP ALM. It delivers core functionality for quality management. It supports building a quality center of excellence through tight integrations with HP Unified Functional Testing, HP Business Process Testing, and HP Sprinter.
HP ALM Performance Center Edition	Functionality for the complete management, scheduling, running, and monitoring of performance test scripts. It resides on the same platform as HP ALM and integrates directly with HP ALM and HP LoadRunner.
HP Quality Center Express Edition	Provides a subset of HP ALM product functionality, and is designed to introduce new customers to HP ALM. It provides core functionality for test management, including manual and automatic tests, and defect management. This license is limited to 20 named or concurrent users.

HP ALM (12.20) Page 6 of 165

HP ALM Edition	Description
HP Quality Center Community Edition	Provides a subset of HP ALM product functionality, and is designed to introduce new customers to HP ALM. It provides core functionality for test management and defect management. This license is free, and is limited to five named users.

The following table indicates the availability of ALM functionality according to edition. Further information on each function is provided below.

Functionality	HP ALM Editio n	HP ALM Essential s Edition	HP Quality Center Enterpris e Edition	HP ALM Performanc e Center Edition	HP Quality Center Express Edition	HP Quality Center Communit y Edition

HP ALM (12.20) Page 9 of 165

### Licensing

ALM licensing is determined according to your purchase agreement. The site administrator can manage and monitor the license usage from Site Administration. For more details, see the *HP Application Lifecycle Management Administrator Guide*.

### Release Management

You organize and track your upcoming releases in the Releases module. Performance Center Edition does not support release management. If you are working with Performance Center Edition, fields and commands related to cycles and releases are not available. For example, Target Cycle and Target Release are not available.

### Project Planning and Tracking (PPT) Releases

ALM project planning and tracking (PPT) functionality enables quality assurance managers to track application readiness by defining goals for activities of an application release. PPT is available for ALM Edition only.

### Multiple Requirement Types

You can assign each requirement in the Requirements module to a default ALM requirement type. In addition, you can customize the default types and create your own requirement types. The Requirements module is not available in Quality Center Community Edition or Quality Center Express Edition.

## Requirement to Requirement Traceability

Requirements traceability defines a relationship between two or more requirements, assisting you when analyzing the impact of a change proposed in a specific requirement. The Requirements module is not available in Quality Center Community Edition or Quality Center Express Edition.

## Risk-Based Quality Management

The risk-based quality management feature enables you to calculate at which level to test each requirement, based on the nature of the requirement and the resources you have available. In the ALM Essentials Edition, the Risk tab is unavailable in the Requirements module. In addition, any risk related fields are unavailable. The Requirements module is not available in Quality Center Community Edition or Quality

HP ALM (12.20) Page 10 of 165

#### Center Express Edition.

#### Business Models Module

The Business Models module enables you to import business process models from standard modeling tools, and test their quality in ALM. The Business Models module is available in ALM Edition and Quality Center Enterprise Edition only.

### Test Authoring and Execution

You can build test plans and design tests based on your project requirements, and then execute those tests to diagnose and resolve problems. ALM Performance Center Edition supports performance testing only. Quality Center Community Edition supports manual testing only.

#### Test Resources

The Test Resources module enables you to manage resources used by your tests.

### **Test Configurations**

Test configurations enable testing of various use-cases, each time with a different set of data.

## **HP Sprinter**

HP Sprinter provides enhanced manual testing functionality and a variety of tools to assist in the manual testing process. Sprinter is available for ALM Edition, Quality Center Enterprise Edition, and Quality Center Express Edition.

## Lab Management

Lab Management allows users to manage the lab resources and systems they use for functional and performance testing in ALM. Lab Management is available for functional and performance testing with ALM Edition and for performance testing with Performance Center Edition.

For more details, refer to the HP ALM Lab Management Guide.

### Automatic Provisioning of Cloud Test Hosts

Cloud provisioning is currently available only for provisioning of load generators.

HP ALM (12.20) Page 11 of 165

For more details, refer to the HP ALM Lab Management Guide.

### Versioning

Version control enables you to create and manage ALM entities while maintaining previous versions of those entities. ALM Essentials Edition, Quality Center Community Edition, and Quality Center Express Edition do not support single entity versioning of your ALM projects.

### Baselining

You can create a baseline to store a snapshot of multiple entities in your project, at a specific point in time. ALM Essentials Edition, Quality Center Community Edition, and Quality Center Express Edition do not support baselining.

### Sharing Requirements and Tests

The Libraries module enables you to create and compare baselines of requirements, tests, test resources, and business components. You can also reuse an existing set of entities by importing, synchronizing and comparing libraries across multiple projects.

Quality Center Enterprise Edition: You can use the Libraries module to create and compare baselines in a project. Quality Center Enterprise Edition does not include importing, synchronizing and comparing libraries across multiple projects. ALM Essentials Edition, Quality Center Community Edition, and Quality Center Express Edition do not support sharing requirements and tests.

## Sharing Defects

You can share and synchronize defects across multiple ALM projects using the *HP ALM Synchronizer*. Defect sharing is available for ALM Edition only.

For more details, see the *HP ALM Synchronizer User Guide*, available from the HP Application Lifecycle Management Adds-ins page.

## Cross Project Customization

Cross project customization enables you to work with template projects to standardize policies and procedures across projects in your organization. Cross project customization is not available for Quality Center Enterprise Edition, Quality Center Community Edition, or Quality Center Express Edition.

HP ALM (12.20) Page 12 of 165

For more details, see the HP Application Lifecycle Management Administrator Guide.

### **Cross Project Reporting**

When you create graphs in ALM, you can combine and compare data from multiple projects. Cross project reporting is unavailable for some entities. Cross project reporting is not available for Quality Center Enterprise Edition, Quality Center Community Edition, or Quality Center Express Edition.

### **Export Data to Excel**

All editions enable exporting ALM data to Excel for reporting. Exporting functionality is unavailable for some entities.

### **Business Process Testing**

Business Process Testing enables non-technical subject matter experts to build and work with business components in a script-free environment and to create application-quality business process tests. Business Process Testing is not available for ALM Essentials Edition, Performance Center Edition, Quality Center Community Edition, or Quality Center Express Edition.

Each user with the proper permissions who logs into an ALM server with a Business Process Testing license uses up both a Business Process Testing license and an ALM license.

**Note:** You can run test sets containing business process tests in the Test Lab module and you can also edit automated components in Unified Functional Testing, even if no Business Process Testing license is available in ALM.

For more information on Business Process Testing, refer to the *HP Business Process Testing User Guide*.

#### Extensions

ALM extensions provide added functionality to ALM. Various extensions are available, depending on the edition with which you are working. If you have a license for an ALM extension, you can utilize the added functionality by enabling the extension on a per project basis. For more details on enabling extensions, refer to the *HP Application Lifecycle Management Administrator Guide*. Extensions are not available in Quality Center Community Edition.

HP ALM (12.20) Page 13 of 165

To view the list of extensions available with ALM 12.20 or to download documentation for the extensions, access the HP ALM Add-ins Page. You can access the Add-ins page in ALM from **Help > Add-ins**.

## **Upgrading Editions**

You can upgrade your current edition to another edition. For example, you can upgrade from HP ALM Essentials Edition 12.20 to HP ALM Edition 12.20.

For more information on upgrading, refer to the *HP Application Lifecycle Management Installation and Upgrade Guide*.

HP ALM (12.20) Page 14 of 165

## System Requirements

## ALM Server-Side System Requirements

This section includes the server-side system requirements and configurations for installing HP ALM 12.20 on Windows and Linux.

#### **ALM Server-Side Hardware Requirements**

The following table lists the **minimum** hardware requirements for installing ALM on a server machine:

CPU	Windows: Quad Core AMD64 processor or equivalent x86- compatible processor  Linux: Quad Core AMD64 processor or equivalent x86- compatible processor
Memory (RAM)	Minimum: 8 GB
Free disk Space	Minimum: 8 GB

#### **Recommended ALM Server-Side Environments**

The following table lists the recommended configurations for each operating system:

Operating System	Database Server	Web Server
Microsoft Windows Server 2008 R2 Enterprise SP1 64 Bit	Microsoft SQL Server 2008 R2 SP2	Microsoft IIS 7.5
Red Hat Enterprise Linux 6.4 64 Bit	Oracle 11.2.0.4	Apache 2.2

HP ALM (12.20) Page 15 of 165

#### **Supported ALM Server-Side Configurations**

The following table lists all supported ALM server-side configurations.

However, to ensure best performance and quick support resolutions, use one of the "Recommended ALM Server-Side Environments" on the previous page.

## Operating Systems

- Microsoft Windows Server 2008 R2 Enterprise SP1 64 Bit
- Microsoft Windows Server 2012 Standard 64 Bit
- Microsoft Windows Server 2012 R2 Standard 64 Bit
- Red Hat Enterprise Linux 6.4 64 Bit
- Red Hat Enterprise Linux 6.5 64 Bit
- Red Hat Enterprise Linux 7.0 64 Bit
- Oracle Enterprise Linux 6.4 64 Bit
- Oracle Enterprise Linux 6.5 64 Bit
- Oracle Enterprise Linux 7.0 64 Bit
- SUSE Linux Enterprise Server 11.0 SP3 64 bit

#### Note:

- Localized editions of ALM are supported only on Windows operating systems.
- Oracle Enterprise Linux versions are supported, provided they are compatible with the supported versions of Red Hat Linux.

HP ALM (12.20) Page 16 of 165

#### Database Servers

- Oracle 11.2.0.3
- Oracle 11.2.0.4
- Oracle 12.1.0.1
- Microsoft SQL Server 2008 R2 SP2
- Microsoft SQL Server 2012 SP1

#### Note:

- All database servers, unless otherwise stated, have been validated on 64 bit configurations.
- HP ALM is certified to work with Enterprise and Standard editions of Microsoft and Oracle databases.
- HP ALM is certified to work with Transparent Data Encryption (TDE) for Microsoft and Oracle databases.
   Implementation of TDE does have an impact on system performance. For details, contact the database vendor that provides the encryption.

## Applications Servers

The Application server functionality is now built in to the ALM platform and there is no need to install a third party application server (WebLogic, WebSphere, and JBoss) from version 11.50 and later. The HP ALM application server uses JDK7 (1.7) and supports 64 bit JVM.

HP ALM (12.20) Page 17 of 165

#### **Web Servers**

- Apache 2.2
- Microsoft IIS 7.5
- Microsoft IIS 8.0
- Microsoft IIS 8.5

#### Note:

- By default, application servers include HTTP servers. If you need additional functionality a web server can be added.
- HP will certify the major and minor releases of Apache (e.g. Apache 2.2) while all minor-minor releases of Apache (e.g. version 2.2.x) will not undergo specific certifications, as it is expected that minor-minor software releases from Apache will maintain full compatibility.

## Virtual Environments

VMWare ESX/ESXi Server 5.0 and later

#### Note:

HP ALM/QC is certified to work with VMWare ESX/ESXi. Due to the rapidly evolving architectures provided by virtualization vendors (e.g. Hyper V or Citrix), as long as the above stated vendor guarantees full compatibility of the virtualized environment to the HP ALM approved system requirements for physical hardware, HP ALM/QC will support the virtualized environments and function as designed.

### Full Disk Encryption

Full disk encryption (FDE) is supported for all system components, including database, server, repository server, and client machines. Implementation of FDE does have an impact on system performance. For details, contact the vendor that provides the encryption.

HP ALM (12.20) Page 18 of 165

## **ALM Client System Requirements**

The following are the client-side system requirements and configurations for installing an HP ALM/HP Quality Center Enterprise client:

CPU	Dual Core 1.6 Ghz (or higher) or equivalent compatible processor
Memory (RAM)	Minimum: 2 GB
Free Disk Space	Minimum: 2 GB

#### **Recommended ALM Client Environments**

The following table lists the recommended client configuration:

Operating System	Browsers	Office Suites
Microsoft Windows 7 SP1 32 Bit	Microsoft Internet Explorer 10	Microsoft Office 2010 SP2 32 Bit

#### **ALM Desktop Client Supported Environments**

The following table lists all supported ALM Desktop client configurations.

However, to ensure best performance and quick support resolutions, use one of the "Recommended ALM Client Environments" above.

Prerequisites	<ul> <li>Microsoft .NET Framework 4.0 / Microsoft .NET Framework 4.5</li> </ul>
	Microsoft Office 2010 / Microsoft Office 2013

HP ALM (12.20) Page 19 of 165

## Operating System

- Microsoft Windows 7 SP1 32 Bit
- Microsoft Windows 7 SP1 64 Bit
- Microsoft Windows 8 32 Bit (Requires Microsoft Fix 449677. For more details, see http://support.microsoft.com/kb/2870007)
- Microsoft Windows 8 64 Bit (Requires Microsoft Fix 449677. For more details, see http://support.microsoft.com/kb/2870007)
- Microsoft Windows 8.1 32 Bit
- Microsoft Windows 8.1 64 Bit
- Microsoft Windows Server 2008 R2 SP1 64 Bit

#### Note:

- If you are integrating Quality Center with other HP testing tools, you must modify the DCOM permissions on your client machine.
- DCOM is not required for running Functional test sets (server-side execution).
- Functional test sets are available only in ALM Edition.
- HP ALM Client on Windows 64 bit runs in WOW64 mode.

#### **Browsers**

- Microsoft Internet Explorer 8 32 Bit
- Microsoft Internet Explorer 9 32 Bit
- Microsoft Internet Explorer 10 32 Bit
- Microsoft Internet Explorer 11 32 Bit

**Note:** For customers who have restrictions on plugins in their browsers, such as ActiveX, HP ALM can be loaded in the HP ALM Explorer Add-In. For more information on downloading and installing the Add-In, see the *HP Application Lifecycle Management Installation and Upgrade Guide.* 

HP ALM (12.20) Page 20 of 165

Office Suites	<ul> <li>Microsoft Office 2010 SP2 32 Bit</li> <li>Microsoft Office 2010 SP2 64 Bit</li> <li>Microsoft Office 2013 SP1 32 Bit</li> <li>Microsoft Office 2013 SP1 64 Bit</li> </ul>

Other Configuration Settings	<ul> <li>Screen Resolution (Minimum): 1024x768</li> <li>DPI Setting: 100%</li> </ul>

## **ALM Web Client Supported Environments**

The following table lists all supported ALM Web client configurations.

HP ALM (12.20) Page 21 of 165

## Operating System

- Microsoft Windows 7 SP1 32 Bit
- Microsoft Windows 7 SP1 64 Bit
- · Microsoft Windows 8 32 Bit
- · Microsoft Windows 8 64 Bit
- Microsoft Windows 8.1 32 Bit
- Microsoft Windows 8.1 64 Bit
- Red Hat Enterprise Linux 6.4 64 Bit
- Red Hat Enterprise Linux 6.5 64 Bit
- Red Hat Enterprise Linux 7.0 64 Bit
- Oracle Enterprise Linux 6.4 64 Bit
- Oracle Enterprise Linux 6.5 64 Bit
- Red Hat Enterprise Linux 7.0 64 Bit
- Ubuntu 12.04 LTS
- Apple Mac OS X (On Macbook Pro only)

HP ALM (12.20) Page 22 of 165

#### **Browsers**

- Microsoft Internet Explorer 10 32 Bit (On Microsoft Windows only)
- Microsoft Internet Explorer 10 32 Bit (On Microsoft Windows only)
- Microsoft Internet Explorer 11 32 Bit (On Microsoft Windows only)
- Microsoft Internet Explorer 11 64 Bit (On Microsoft Windows only)
- Google Chrome 38 32 Bit (On Microsoft Windows and Apple Mac OS only)
- Google Chrome 38 64 Bit (On Microsoft Windows and Apple Mac OS only)
- Mozilla Firefox 33 32 Bit (On Microsoft Windows, Linux OS only)
- Mozilla Firefox 33 64 Bit (On Microsoft Windows, Linux OS only)
- Apple Safari 6.1 (On Mac OS only)

Chrome and Firefox Web browsers: ALM Web Client supports the current version and the previous version as the supported base versions for each patch. For example, if at the time of the ALM patch release, the current browser version is 30, then the supported browser versions are 29 and 30.

HP also supports all subsequent versions of Chrome and Firefox browsers. If there is a break in functionality caused by a subsequent version of Chrome or Firefox, we will provide a remediation plan via a knowledge base (KB) article.

HP ALM (12.20) Page 23 of 165

Virtual Environments	<ul> <li>Citrix XenApp 6.0 or higher</li> <li>Microsoft Terminal Services</li> <li>Remote Desktop Services</li> <li>Note: HP ALM is certified to work with Citrix XenApp, Microsoft Terminal Services and Remote Desktop Services. Other Configuration Settings	<ul> <li>Screen Resolution: 1024x768 (minimum); 1920 x 1200 (maximum)</li> <li>DPI Setting: 100%,125%</li> </ul>

## HP ALM Lab Service for Remote Test Execution System Requirements

The following table lists the system requirements for installing HP ALM Lab Service for remote test execution:

Processor	CPU Type: Intel Core, Pentium, AMD or compatible Speed: 2 GHz or higher recommended, 1 GHz minimum
Memory (RAM)	Minimum: 1GB Note: Actual memory requirements depend on the number of add-ins.
Disk Space	Minimum: 1GB Note: You must also have an additional 120 MB of free space on the system disk.

HP ALM (12.20) Page 24 of 165

Operating System	The supported operating systems for ALM Lab Service are derived from the operating systems of other tools, such as Unified Functional Testing (UFT), Business Process Testing (BPT), and VAPI XP. For more information on the supported operating systems, see your product documentation.
Operating Systems Supporting Auto Login	<ul> <li>Windows 7 (SP1) 32 or 64 bit</li> <li>Windows Server 2008 R2 (SP1) 64 bit</li> </ul>

# HP ALM Performance Center System Requirements

This section describes the system requirements for installing ALM for Performance Center, and Performance Center components.

#### **Performance Center Server Configurations**

This section describes the system requirements for installing a Performance Center Server.

Processor	CPU Type:: Intel Core, Pentium, Xeon, AMD or compatible Speed: 2 GHz or higher recommended, 1 GHz minimum.
Memory (RAM)	Minimum: 4GB
Available Hard Disk Space	Minimum: 5 GB
Screen Resolution	<ul> <li>Microsoft Windows: 1280 x 1024 or higher</li> <li>Mac OS: 1280 x 800 or higher</li> </ul>

HP ALM (12.20) Page 25 of 165

Operating System	Windows Server 2008 R2 (SP1) 64 bit (Recommended)
	Windows Server 2012 64 bit
	Windows Server 2012 R2 64 bit
Browser	<ul> <li>Microsoft Internet Explorer 9, 10, 11 32-bit (On Microsoft Windows only)</li> </ul>
	Google Chrome 38 (On Microsoft Windows only)
	Apple Safari 6.1 (On Mac OS only)
Web Server	IIS 7.5, 8.0 or 8.5

### **Recommended ALM and Performance Center Configurations**

The following table lists the recommended configuration for Performance Center server components. They should be used along with the "Recommended ALM Server-Side Environments" on page 15.

Performance Center Server Operating System	Windows 2008 R2 (SP1) 64 bit
Host Operating System	Windows 2008 R2 (SP1) 64 bit

### **Host and Windows Standalone Load Generator Configurations**

The following table lists the system requirements for installing a Performance Center Host and a standalone Load Generator on Windows.

Processor	CPU Type: Intel Core, Pentium, Xeon, AMD or compatible	
	<b>Speed:</b> 2 GHz or higher recommended , 1.6 GHz minimum	

HP ALM (12.20) Page 26 of 165

Memory (RAM)	Recommended: 4 GB or higher Minimum: 2GB
Free Disk Space	Minimum: 40 GB
Operating System	Windows Server 2012 R2 64-bit
	Windows Server 2008 R2 64-bit
	Windows 7 SP1 32 and 64-bit
	Windows 8.1 64-bit

### **Linux Standalone Load Generator Configurations**

The following table lists the supported operating systems and CPU types for installing a standalone Load Generator on Linux systems:

Processor	CPU Type: Intel Core, Pentium, Xeon, AMD or compatible Speed: 1.6 GHz or higher recommended
Operating System	<ul> <li>Red Hat Linux Enterprise Linux 5.8 or 6.4, 32 bit</li> <li>Red Hat Linux Enterprise Linux 5.8 or 6.4, 64 bit</li> </ul>
	<ul> <li>Ubuntu Server 10.04 LTS, 64 bit</li> <li>Ubuntu Server 12.04 LTS, 64 bit</li> </ul>
	<ul> <li>Oracle Enterprise Linux 5.8 UEK, 64 bit</li> <li>Oracle Enterprise Linux 6.4 UEK, 64 bit</li> </ul>
	<ul> <li>SUSE SLES (Linux Server Enterprise), 64-bit</li> <li>Amazon Linux AMI 2012.03 or later, 32 or 64 bit</li> </ul>
	<b>Note:</b> Oracle Enterprise Linux versions are supported as long as they are compatible with the supported versions of Red Hat Linux.

HP ALM (12.20) Page 27 of 165

Memory (RAM)	Recommended: 4 GB or higher Minimum: 1 GB
Free Disk Space	Minimum: 500 MB

## Standalone VuGen and Standalone Analysis Configurations

The following table lists the system requirements for installing Standalone VuGen and Standalone Analysis:.

Processor	<b>CPU Type:</b> Intel Core, Pentium, Xeon, AMD or compatible <b>Speed:</b> 2 GHz or higher recommended, 1.6 GHz minimum.	
Memory (RAM)	Recommended: 4 GB or higher Minimum: 2 GB	
Free Disk Space	Minimum: 40 GB	
Screen Resolution	<b>Minimum</b> : 1024 x 768	
Operating System	<ul> <li>Windows 7 (SP1) 32 and 64-bit</li> </ul>	
	Windows 8.1 64 bit	
	Windows Server 2008 R2 (SP1) 64 bit	
	Windows Server 2012 R2 64 bit	
Browser	Microsoft Internet Explorer 8, 9, 10, 11 32-bit

### **MI Listener System Requirements**

This following table lists the system requirements for the MI Listener.

Processor	CPU Type: Intel Core, Pentium, Xeon, AMD or compatible Speed: 2 GHz minimum, 4 GHz or higher recommended	
Memory (RAM)	Minimum: 2 GB Recommended: 4 GB or higher	
Operating System		
Free Disk Space	Minimum: 40 GB	

HP ALM (12.20) Page 29 of 165

## Administration

The list of available site parameters can be found with the ALM 12.20 manuals on the HP Software Support web site (https://softwaresupport.hp.com).

HP ALM (12.20) Page 30 of 165

## Workflow

## Reference for ALM Events

This section contains an alphabetical reference of the ALM event functions and subroutines. It includes the event name, description, syntax, type (Function or Sub), the value returned by a function, and the entities for which the event procedure is available.

The following event functions are available:

Function Name	When the Function is Triggered
"ActionCanExecute" on page 33	before performing a user action
"Attachment_CanDelete" on page 36	before deleting an attachment
"Attachment_CanOpen" on page 36	before opening an attachment
"Attachment_CanPost" on page 37	before updating an attachment
"CanAddTests" on page 38	before adding tests to a test set
"CanCustomize" on page 39	before opening Customization window
"CanDelete" on page 39	before deleting an object from the server
"CanLogin" on page 42	before a user logs in to the project
"CanLogout" on page 43	before a user logs out of the project
"CanPost" on page 43	before posting an object to the server
"CanRemoveTests" on page 46	before removing tests from a test set
"CanAddComponentsToTest" on page 38	before adding business components to a test of type Flow or Business-Process
"CanAddFlowsToTest" on page 38	before adding flows to a test of type Business-Process

HP ALM (12.20) Page 31 of 165

Function Name	When the Function is Triggered
"CanRemoveComponentsFromTest" on page 45	before removing business components from a test of type Flow or Business-Process
"CanRemoveFlowsFromTest" on page 45	before removing flows from a test of type Business-Process
"CanDeleteGroupsFromTest" on page 42	before deleting groups from a test of type Flow or Business-Process
"CanReImportModels" on page 45	before importing business models
"DefaultRes" on page 46	before resetting project defaults
"FieldCanChange" on page 48	before changing a field value
"GetDetailsPageName" on page 51	before displaying Defect Details dialog box
"GetNewBugPageName" on page 52	before displaying Add Defect dialog box (for backward compatibility)
"GetNewReqPageName" on page 53	before displaying New Requirement dialog box (for backward compatibility)
"GetReqDetailsPageName" on page 53	before displaying Requirement Details dialog box (for backward compatibility)

## The following event subroutines are available:

Subroutine Name	When the Subroutine is Triggered
"AddComponentToTest" on page 34	a component has been added to a test of type Flow or Business-Process
"AfterPost" on page 35	an object has been posted to the server
"Attachment_New" on page 37	an attachment is added
"DialogBox" on page 47	a dialog box is opened or closed
"EnterModule" on page 47	user switches modules

HP ALM (12.20) Page 32 of 165

Subroutine Name	When the Subroutine is Triggered
"ExitModule" on page 47	user exits a module
"FieldChange" on page 49	a field value changes
"MoveTo" on page 54	user changes focus
"MoveToComponentFolder" on page 56	user moves to the specified component folder in the business component tree (for backward compatibility)
"MoveToFolder" on page 56	user clicks a folder in the test sets tree (for backward compatibility)
"MoveToSubject" on page 57	user clicks a subject in the test plan tree (for backward compatibility)
"New" on page 57	an object is added
"RemoveComponentFromTest" on page 59	user removes a component from a test of type Flow or Business-Process
"RunTests" on page 59	user clicks <b>Run</b> in the Test Lab module (provided that Sprinter is not installed and none of the tests is automated)
"RunTests_Sprinter" on page 59	user clicks <b>Run</b> in the Test Lab module (provided that Sprinter is installed and at least one test is automated)
"RunTestSet" on page 60	user clicks <b>RunTest Set</b> in the Test Lab module
"RunTestsManually" on page 60	user clicks <b>Run &gt; Run Manually</b> in the Test Lab module

## ActionCanExecute

This event is triggered before ALM performs an action that has been initiated by the user, to check whether the action can be executed.

HP ALM (12.20) Page 33 of 165

You can add code to this event procedure to perform actions when the user has initiated a particular action, or to prevent the action from being executed in specific cases. For example, see "Example: Controlling User Permissions" on page 92.

Syntax	ActionCanExecute(ActionName) where ActionName is the action that the user has initiated. Actions are in the format context.action.	
	<b>Note:</b> The previous format for this event is supported for purposes of backward compatibility. We recommend you use ActionCanExecute instead.	
	User-defined actions start with the prefix UserDefinedActions.	
Туре	Function	
Returns	True or False	
Availability	ActionCanExecute (all modules)	

**Tip:** To obtain the name of an action, see the sample code on "Action Object" on page 63.

## AddComponentToTest

This event is triggered when the user adds a component to a test of type Flow or Business-Process in the Test Script tab.

**Version Control:** Changing components checked in or checked out by another user, using the AddComponentToTest event, is not supported.

Syntax	AddComponentToTest
Туре	Sub
Availability	AddComponentToTest

HP ALM (12.20) Page 34 of 165

## **AfterPost**

This event is triggered after an object has been posted to the server.

Project fields should not be changed after they have been posted, because then the new value is not stored in the database.

Syntax	<entity>_AfterPost</entity>
Туре	Sub
Availability	• AnalysisItem_AfterPost
	• AnalysisItemFolder_AfterPost
	• Baseline_AfterPost
	• Bug_AfterPost
	• BusinessModel_AfterPost
	• BusinessModelFolder_AfterPost
	• BusinessModelPath_AfterPost
	• Component_AfterPost
	• ComponentFolder_AfterPost
	• Cycle_AfterPost
	• DashboardFolder_AfterPost
	• DashboardPage_AfterPost
	• Library_AfterPost

• TestConfiguration_AfterPost
• TestFolder_AfterPost
• TestSet_AfterPost
• TestSetFolder_AfterPost

## Attachment\_CanDelete

This event is triggered before ALM deletes an attachment from the server, to check whether that attachment can be deleted.

Syntax	Attachment_CanDelete(Attachment)	
	where <b>Attachment</b> is the <b>IAttachment</b> interface. For more information, refer to the <i>HP ALM Open Test Architecture API Reference</i> .	
Туре	Function	
Returns	True or False	
Availability	Attachment_CanDelete (all modules)	

## Attachment\_CanOpen

This event is triggered before ALM opens an attachment from the server, to check whether the attachment can be opened.

HP ALM (12.20) Page 36 of 165

Syntax	Attachment_CanOpen(Attachment)
	where <b>Attachment</b> is the <b>IAttachment</b> interface. For more information, refer to the <i>HP ALM Open Test Architecture API Reference</i> .
Туре	Function
Returns	True or False
Availability	Attachment_CanOpen (all modules)

# Attachment\_CanPost

This event is triggered before ALM updates an existing attachment on the server, to check whether the attachment can be updated.

Syntax	Attachment_CanPost(Attachment) where Attachment is the IAttachment interface. For more information, refer to the HP ALM Open Test Architecture API Reference.
Туре	Function
Returns	True or False
Availability	Attachment_CanPost (all modules)

# Attachment\_New

This event is triggered when an attachment is added to ALM.

Syntax	Attachment_New(Attachment)
	where <b>Attachment</b> is the <b>IAttachment</b> interface. For more information, refer to the <i>HP ALM Open Test Architecture API Reference</i> .
Туре	Sub
Availability	Attachment_New (all modules)

HP ALM (12.20) Page 37 of 165

# CanAddComponentsToTest

This event is triggered before ALM adds business components to a test of type Flow or Business-Process, to check whether the specified components can be added.

Syntax	CanAddComponentsToTest(Components)
	where <b>Components</b> is an array of component IDs.
Туре	Function
Returns	True or False
Availability	CanAddComponentsToTest

#### CanAddFlowsToTest

This event is triggered before ALM adds flows to a test of type Business-Process, to check whether the specified flows can be added.

Syntax	CanAddFlowsToTest(Flows)
	where <b>Flows</b> is an array of flow IDs.
Туре	Function
Returns	True or False
Availability	CanAddFlowstoTest

#### CanAddTests

This event is triggered before ALM adds tests to a test set, to check whether the specified tests can be added.

Syntax	<entity>_CanAddTests(Tests)</entity>
	where <b>Tests</b> is an array of Test IDs.
Туре	Function

HP ALM (12.20) Page 38 of 165

Returns	True or False
Availability	TestSet_CanAddTests

## CanCustomize

This event is triggered when a user attempts to open the Customization window, to check whether the specified user can customize the specified project.

Syntax	CanCustomize(DomainName, ProjectName, UserName)
	where <b>DomainName</b> is the domain name, <b>ProjectName</b> is the project name, and <b>UserName</b> is the user name.
Туре	Function
Returns	True or False
Availability	CanCustomize (all modules)

#### CanDelete

This event is triggered before ALM deletes an object from the server, to check if the object can be deleted.

Syntax	<entity>_CanDelete(Entity)</entity>
Туре	Function
Returns	True or False
Availability	AnalysisItem_CanDelete
	• AnalysisItemFolder_CanDelete
	• Baseline_CanDelete
	• Bug_CanDelete
	• BusinessModel_CanDelete

HP ALM (12.20) Page 39 of 165

- TestSet\_CanDelete
- TestSetFolder\_CanDelete

HP ALM (12.20) Page 40 of 165

#### Additional Syntax for Backward Compatibility

For purposes of backward compatibility, the following syntaxes are also available for certain objects. However, we recommend you use CanDelete instead.

• The syntax for tests or test subject folders:

Syntax	Test_CanDelete(Entity, IsTest)
	where:
	■ Entity is the test or subject folder.
	■ If IsTest is True, Entity refers to an ITest object.  If IsTest is False, Entity refers to an ISubjectNode object.  For more information on ITest and ISubjectNode, refer to the HP ALM Open Test Architecture API Reference.
Туре	Function
Returns	True or False
Availability	Test_CanDelete

• The syntax for test sets or test set folders:

Syntax	TestSet_CanDelete(Entity, IsTestSet)
	where:
	■ Entity is the test set or test set folder.
	■ If IsTestSet is True, Entity refers to an ITestSet object.  If IsTestSet is False, Entity refers to an ITestSetFolder object. For more information on ITestSet and ITestSetFolder, refer to the HP ALM Open Test Architecture API Reference.
Туре	Function
Returns	True or False
Availability	TestSet_CanDelete

HP ALM (12.20) Page 41 of 165

• The syntax for business components or business component folders:

Syntax	<ul> <li>Component_CanDelete(Entity, IsComponent)</li> <li>where:</li> <li>■ Entity is the component or component folder.</li> <li>■ If IsComponent is True, Entity refers to an IComponent object.</li> <li>If IsComponent is False, Entity refers to an IComponentFolder object. For more information on IComponent and IComponentFolder, refer to the HP ALM Open Test Architecture API Reference.</li> </ul>
Туре	Function
Returns	True or False
Availability	Component_CanDelete

# CanDeleteGroupsFromTest

This event is triggered when a user removes groups from a test of type Flow or Business-Process, to check whether the specified groups can be removed.

Syntax	CanDeleteGroupsFromTest(Groups)
	where <b>Groups</b> is an array of group IDs.
Туре	Function
Returns	True or False
Availability	CanDeleteGroupsFromTest

# CanLogin

This event is triggered to check whether the specified user can log in to the specified project.

HP ALM (12.20) Page 42 of 165

Syntax	CanLogin(DomainName, ProjectName, UserName)	
	where <b>DomainName</b> is the domain name, <b>ProjectName</b> is the project name, and <b>UserName</b> is the user name.	
Туре	Function	
Returns	True or False	
Availability	CanLogin (all modules)	

# CanLogout

This event is triggered to check whether the current user can log out of the current project.

Syntax	CanLogout
Туре	Function
Returns	True or False
Availability	CanLogout (all modules)

#### CanPost

This event is triggered before ALM posts an object to the server, to check whether the object can be posted.

You can add code to this event procedure to prevent an object from being posted in specific cases. For example, see "Example: Object Validation" on page 88.

Syntax	<entity>_CanPost</entity>
Туре	Function
Returns	True or False
Availability	AnalysisItem_CanPost
	• AnalysisItemFolder_CanPost

- TestSet\_CanPost
- TestSetFolder\_CanPost

HP ALM (12.20) Page 44 of 165

• TestSetTests\_CanPost (does not appear in the Scripts Tree)

#### CanRelmportModels

This event is triggered when attempting to import the specified business process models that already exist in ALM, to check if the business process models can be reimported.

Syntax	<entity>_CanReImportModels(Models)</entity>
	where <b>Models</b> is an array of Model IDs.
Туре	Function
Returns	True or False
Availability	CanReImportModels

# ${\tt CanRemoveComponentsFromTest}$

This event is triggered when a user removes components from a test of type Flow or Business-Process, to check whether the specified components can be removed.

Syntax	CanRemoveComponentsFromTest(Components)
	where <b>Components</b> is an array of component IDs.
Туре	Function
Returns	True or False
Availability	CanRemoveComponentsFromTest

#### CanRemoveFlowsFromTest

This event is triggered when a user removes flows from a test of type Business-Process, to check whether the specified flows can be removed.

HP ALM (12.20) Page 45 of 165

Syntax	CanRemoveFlowsFromTest(Flows)
	where <b>Flows</b> is an array of flow IDs.
Туре	Function
Returns	True or False
Availability	CanRemoveFlowsFromTest

#### CanRemoveTests

This event is triggered to check whether the specified tests can be removed from a test set.

Syntax	<entity>_CanRemoveTests(Tests)</entity>
	where <b>Tests</b> is an array of Test Instance IDs.
Туре	Function
Returns	True or False
Availability	TestSet_CanRemoveTests

#### **DefaultRes**

This function is used to determine the default return value for ALM functions, such as FieldCanChange. All ALM workflow functions call this function (unless explicitly omitted by user) to determine the default return value. DefaultRes can be used to quickly replace the default return values of all ALM workflow functions.

Syntax	DefaultRes
Туре	Function
Returns	True or False
Availability	DefaultRes (all modules)

HP ALM (12.20) Page 46 of 165

#### DialogBox

This event is triggered when a dialog box is opened or closed.

Syntax	DialogBox(DialogBoxName, IsOpen)	
	where <b>DialogBoxName</b> is the name of the dialog box, and <b>IsOpen</b> indicates whether the dialog box is open.	
Туре	Sub	
Availability	DialogBox (all modules)	

**Note:** For purposes of backward compatibility, this event is also triggered using backward compatible values for defect details (**DialogBoxName="Details"**) and test instance details (**DialogBoxName="TestInstanceDetails"**). These backward compatible values are not recommended.

#### EnterModule

This event is triggered when the user enters or switches to an ALM module. It is also triggered when the user logs in to ALM.

You can add code to this event procedure to perform an action whenever the user switches to the specified module.

Syntax	EnterModule
Туре	Sub
Availability	EnterModule (all modules)

#### ExitModule

This event is triggered when the user exits the specified module.

Syntax	ExitModule
Туре	Sub

HP ALM (12.20) Page 47 of 165

Availability ExitModule (all modules)	
---------------------------------------	--

# FieldCanChange

This event is triggered before ALM changes a field value, to determine whether the field can be changed.

You can add code to this event procedure to prevent a field from being changed in specific cases. For example, see "Example: Field Validation" on page 89.

Syntax	<entity>_FieldCanChange(FieldName, NewValue)</entity>
	where <b>FieldName</b> is the name of the field and <b>NewValue</b> is the field value.
Туре	Function
Returns	True or False
Availability	AnalysisItem_FieldCanChange
	<ul> <li>AnalysisItemFolder_FieldCanChange</li> </ul>
	Baseline_FieldCanChange
	• Bug_FieldCanChange
	• BusinessModel_FieldCanChange
	• BusinessModelActivity_FieldCanChange
	BusinessModelFolder_FieldCanChange
	BusinessModelPath_FieldCanChange
	• Component_FieldCanChange
	ComponentFolder_FieldCanChange
	ComponentStep_FieldCanChange
	• Cycle_FieldCanChange
	DashboardFolder_FieldCanChange

HP ALM (12.20) Page 48 of 165

- TestFolder FieldCanChange
- TestSet FieldCanChange
- TestSetFolder FieldCanChange
- TestSetTests\_FieldCanChange

The code for hiding a field that depends on another field should be placed in the FieldChange event procedure (not in the FieldCanChange event procedure).

# FieldChange

This event is triggered when the value of the specified field changes.

Every change of value triggers the field change event when the field loses focus.

You can add code to this event procedure to perform an action when the value of a particular field is changed. For example, you can hide or display one field depending on

HP ALM (12.20) Page 49 of 165

the value the user enters into another field. For example, see "Example: Changing One Field Based on Another Field" on page 86.

Syntax	<entity>_FieldChange(FieldName)</entity>
	where <b>FieldName</b> is the name of the field.
Туре	Sub
Availability	AnalysisItem_FieldChange
	• AnalysisItemFolder_FieldChange
	Baseline_FieldChange
	• Bug_FieldChange
	• BusinessModel_FieldChange
	BusinessModelActivity_FieldChange
	BusinessModelFolder_FieldChange
	• BusinessModelPath_FieldChange
	• Component_FieldChange
	ComponentFolder_FieldChange
	• ComponentStep_FieldChange
	• Cycle_FieldChange
	DashboardFolder_FieldChange
	• DashboardPage_FieldChange
	• DesignStep_FieldChange
	• Library_FieldChange
	LibraryFolder_FieldChange

- TestConfiguration FieldChange
- TestFolder\_FieldChange
- TestSet\_FieldChange
- TestSetFolder\_FieldChange
- TestSetTests\_FieldChange

When a user changes a field value using the **Find/Replace** command, workflow events are not triggered. If restrictions implemented in workflow scripts are critical, consider disabling the **Replace** command for specific user groups, to ensure that your restrictions cannot be bypassed.

#### GetDetailsPageName

This event is triggered by ALM to retrieve the name of the page (tab) that has the index number specified in **PageNum** in the following dialog boxes:

- The Details dialog box for an entity
- The New <entity> dialog box for an entity

You can add code to this event procedure to customize the tab names for the Details dialog box. For example, see "Example: Changing Tab Names" on page 84.

HP ALM (12.20) Page 51 of 165

Syntax	GetDetailsPageName(PageName, PageNum)
	where <b>PageName</b> is the default page (tab) name (for example, Page 1) and <b>PageNum</b> is the page (tab) number.
	<b>Note:</b> The page number is the absolute page number, regardless of the page's relative position in relation to the other displayed pages in the dialog box.
Туре	Function
Returns	String containing the page name
Availability	GetDetailsPageName (all modules)

# GetNewBugPageName

This event is triggered by ALM to retrieve the name of the New Defect dialog box page (tab) that has the index number specified in PageNum.

You can add code to this event procedure to customize the tab names on the New Defect dialog box. For example, see "Example: Changing Tab Names" on page 84.

Syntax	GetNewBugPageName(PageName, PageNum)
	where <b>PageName</b> is the default page (tab) name (for example, Page 1) and <b>PageNum</b> is the page (tab) number.
	<b>Note:</b> The page number is the absolute page number, regardless of the page's relative position in relation to the other displayed pages in the New Defect dialog box.
Туре	Function
Returns	String containing the page (tab) name
Availability	GetNewBugPageName

**Note:** The GetNewBugPageName event is not listed in the Scripts Tree of the Script Editor. This event is triggered for backward compatibility purposes only.

HP ALM (12.20) Page 52 of 165

GetDetailsPageName should be used instead.

## GetNewReqPageName

This event is triggered by ALM to retrieve the name of the New Requirement dialog box page (tab) that has the index number specified in PageNum.

You can add code to this event procedure to customize the tab names on the New Requirement dialog box. For example, see "Example: Changing Tab Names" on page 84.

Syntax	GetNewReqPageName(PageName, PageNum)
	where <b>PageName</b> is the default page (tab) name (for example, Page 1) and <b>PageNum</b> is the page (tab) number.
	<b>Note:</b> The page number is the absolute page number, regardless of the page's relative position in relation to the other displayed pages in the New Defect dialog box.
Туре	Function
Returns	String containing the page name
Availability	GetNewReqPageName

**Note:** The GetNewReqPageName event is not listed in the Scripts Tree of the Script Editor. This event is triggered for backward compatibility purposes only. GetDetailsPageName should be used instead.

## GetReqDetailsPageName

This event is triggered by ALM to retrieve the name of the Requirement Details dialog box page (tab) that has the index number specified in PageNum.

You can add code to this event procedure to customize the tab names on the Requirement Details dialog box. For example, see "Example: Changing Tab Names" on page 84.

HP ALM (12.20) Page 53 of 165

Syntax	GetReqDetailsPageName(PageName, PageNum) where PageName is the default page (tab) name (for example, Page 1) and PageNum is the page (tab) number.
	<b>Note:</b> The page number is the absolute page number, regardless of the page's relative position in relation to the other displayed pages in the New Defect dialog box.
Туре	Function
Returns	String containing the page name
Availability	GetReqDetailsPageName

**Note:** The GetReqDetailsPageName event is not listed in the Scripts Tree of the Script Editor. This event is triggered for backward compatibility purposes only. GetDetailsPageName should be used instead.

#### MoveTo

This event is triggered when the user changes focus from one object to another.

You can add code to this event procedure to perform actions when the user changes the focus. For example, see "Example: Presenting a Dynamic Field List" on page 89.

**Tip:** When moving from one object to another in a tree, the MoveTo event is not triggered. However, it is possible to trigger the event for Requirement trees. For details, see the **ENABLE\_ENTITY\_SELECTION\_TREE\_REQ\_MOVE\_TO** site parameter.

Syntax	<entity>_MoveTo</entity>

# MoveToComponentFolder

This event is triggered when the user moves to the specified component folder in the business component tree.

Syntax	MoveToComponentFolder(Folder)
	where <b>Folder</b> is the <b>IComponentFolder</b> interface. For more information, refer to the <i>HP ALM Open Test Architecture API Reference</i> .
Туре	Sub
Availability	MoveToComponentFolder

**Note:** The MoveToComponentFolder event is not listed in the Scripts Tree of the Script Editor. This event is supported for purposes of backward compatibility. We recommend you use ComponentFolder\_MoveTo event instead.

#### MoveToFolder

This event is triggered when the user moves to the specified test set folder in the test sets tree.

Syntax	MoveToFolder(Folder)
	where <b>Folder</b> is the <b>ISysTreeNode</b> interface. For more information, refer to the <i>HP ALM Open Test Architecture API Reference</i> .
Туре	Sub

HP ALM (12.20) Page 56 of 165

Availability	MoveToFolder
--------------	--------------

**Note:** The MoveToFolder event is not listed in the Scripts Tree of the Script Editor. This event is supported for purposes of backward compatibility. We recommend you use MoveToFolder instead.

# MoveToSubject

This event is triggered when the user moves to the specified subject in the test plan tree.

Syntax	MoveToSubject(Subject)	
	where <b>Subject</b> is the <b>ISysTreeNode</b> interface. For more information, refer to the <i>HP ALM Open Test Architecture API Reference</i> .	
Туре	Sub	
Availability	MoveToSubject	

**Note:** The MoveToSubject event is not listed in the Scripts Tree of the Script Editor. This event is supported for purposes of backward compatibility. We recommend you use MoveToSubject instead.

#### New

This event is triggered when an object is added to ALM.

You can add code to this event procedure to perform an action when a new object is added. For example, see "Example: Customizing a Defects Module Dialog Box" on page 81.

Syntax	<entity>_New</entity>
Туре	Sub

HP ALM (12.20) Page 58 of 165

TestSetFolder_New	
-------------------	--

# RemoveComponentFromTest

This event is triggered when the user removes a component from a test of type Flow or Business-Process in the Test Script tab.

**Version Control:** Changing components checked in or checked out by another user, using the RemoveComponentFromTest event, is not supported.

Syntax	RemoveComponentFromTest
Туре	Sub
Availability	RemoveComponentFromTest

#### RunTests

This event is triggered when the user clicks the **Run** button to run tests in the Test Lab module, provided that Sprinter is not installed and none of the tests is automated.

Syntax	RunTests(Tests)	
	where <b>Tests</b> is an array of Test Instance IDs.	
Туре	Sub	
Availability	RunTests	

### RunTests\_Sprinter

This event is triggered:

- When the user clicks the Run arrow and chooses Run with Sprinter to run tests in the Test Lab module.
- When the user clicks the **Run** button to run tests in the Test Lab module, if Sprinter is installed and all the tests are manual.

HP ALM (12.20) Page 59 of 165

Syntax	RunTests_Sprinter(Tests)	
	where <b>Tests</b> is an array of Test Instance IDs.	
Туре	Sub	
Availability	RunTests_Sprinter	

#### RunTestSet

This event is triggered when the user clicks the **RunTest Set** button to run a test set in the Test Lab module.

Syntax	RunTestSet(Tests)	
	where <b>Tests</b> is an array of Test Instance IDs.	
Туре	Sub	
Availability	RunTestSet	

# RunTestsManually

This event is triggered when the user clicks the **Run** arrow and chooses **Run Manually** to run tests in the Test Lab module.

Syntax	RunTestsManually(Tests)	
	where <b>Tests</b> is an array of Test Instance IDs.	
Туре	Sub	
Availability	RunTestsManually	

HP ALM (12.20) Page 60 of 165

# Chapter 2: Workflow Object and Property Reference

Workflow scripts can reference HP Application Lifecycle Management (ALM) objects to obtain information and to change project values. They can also use properties that return information about the current module and dialog box. This section lists the ALM objects and properties that are available to workflow scripts.

## **About ALM Objects and Properties**

Workflow scripts can obtain information, make decisions based on that information, and change values in the project based on those decisions.

You can obtain information such as the user group to which the current user belongs, and the value of a field, by accessing objects such as the **User** object or the **Field** object.

You can also obtain information about the active module and active dialog box using workflow properties. For more information on these properties, see "ALM Properties" on page 70.

Your script can change the value of a field or field list. To do so, the script modifies the **Value** property or the **List** property of the appropriate **Field** object.

The following table lists the ALM objects that are available when you write a script.

Object	Description	
Actions	The list of actions that are available. See "Actions Object" on the next page.	
Action	The <b>Action</b> object is handled by the <b>Actions</b> object. See "Action Object" on page 63.	
Fields	Includes the objects that provide access to specific fields. See "Fields Objects" on page 64.	
Field	The <b>Field</b> object is handled by the <b>Fields</b> objects. See "Field Object" on page 66.	

HP ALM (12.20) Page 61 of 165

Object	Description		
Lists	Includes the lists that are available in an ALM project. See "Lists Object" on page 68.		
TDConnection	Provides access to open test architecture (OTA) objects. See "TDConnection Object" on page 69.		
User Includes the properties of the current user. This object available in all modules. See "User Object" on page 6			

Note: In some cases, a function returns the object itself instead of the ID property of the object. For example, after the following statement has been executed, testsetf is a reference to a TestSetFolder object:

Set testsetf = TestSet\_Fields("CY\_FOLDER\_ID").Value.

For each ALM object, this section lists the properties of the object. The list includes the property name, a description, and the data type of the property. It indicates whether the property is read-only (R) or whether your script can modify it (R/W).

**Version Control:** After enabling version control for a project, you should review all its workflow scripts and make adjustments for each checked in entity. This includes the following entities: **Req, Test, Resource**, and **Component**. For each checked in entity that includes a **Post** function in its script, you must modify the script. To modify, add a **Checkout** function before every **Post** function. Making this modification prevents the Check Out dialog box from opening each time a call to a **Post** function is made. For more information about the Post and Checkout functions, see the *HP ALM Open Test Architecture Reference*.

## **Actions Object**

You can use the **Actions** object to manipulate toolbar buttons, menu commands, and dialog boxes.

The **Actions** object has the following property:

Property	R/W	Туре	Description
Action	R	Object	Allows access to every action in a list. The index for this property is the action name.

HP ALM (12.20) Page 62 of 165

#### **Action Object**

You can use the **Action** object to verify whether a button or command is enabled, checked, or visible. You can also use it to execute actions.

For example, to set the Defect Details dialog box to open automatically when the user moves from one defect to another in the Defects Grid, place the following code in the Bug MoveTo event procedure:

```
Set NewDefectAction=Actions.Action("Defects.DefectDetails")
NewDefectAction.Execute
```

To obtain the name of an action, add the following lines to the ActionCanExecute event procedure, perform the action, and note the action name that is printed in the message:

```
Sub ActionCanExecute(ActionName)
On Error Resume Next
MsgBox "You have performed an action named: " & ActionName
On Error GoTo 0
End Sub
```

This object has the following properties:

Property	R/W	Туре	Description
Checked	R/W	Boolean	Indicates whether an action is checked in ALM.
Enabled	R/W	Boolean	Indicates whether an action is enabled. A disabled action cannot be invoked by the user, but can be invoked from the workflow script.
Visible	R/W	Boolean	Indicates whether an action is visible in ALM.

#### The **Action** object includes the following method:

Method	Description
Execute	Executes the action.

When a workflow script invokes an action using the **Execute** method of the **Action** object, the workflow events that would be triggered if a user initiated the action from a dialog box are by default not triggered. Therefore, when using **Action.Execute**, you must ensure that you do not bypass the site policies you are enforcing with workflow events.

HP ALM (12.20) Page 63 of 165

To enable workflow events to be triggered from within a dialog box, set the value of the **AllowReentrancy** flag to **true**. To restore the default settings, so that these events are not triggered, set the value of the **AllowReentrancy** flag to **false**. For example, to set the Add Defect dialog box to open automatically when a user enters the Defects module, place the following code in the **EnterModule** event procedure:

AllowReentrancy=true
Set NewDefectAction=Actions.Action("Defects.DefectDetails")
NewDefectAction.Execute
AllowReentrancy=false

If the value of the **AllowReentrancy** flag is set to **false**, the dialog box opens as usual, but workflow customizations will not work in the dialog because the workflow events for the dialog box are not triggered.

**Caution:** Consider carefully the implications of setting the value of this flag to **true**. If you set the value of the flag to **true**, you enable a function to call another function which may call the original function. This can cause an endless loop. This can also occur when functions call internal functions which call the original function.

# Fields Objects

You can use the following objects in workflow scripts to access the fields of ALM modules:

Object	Description
AnalysisItem_Fields	Provides access to the fields of the reports and graphs in the Dashboard module.
AnalysisItemFolder_ Fields	Provides access to the fields of the report and graph folders in the Dashboard module.
Baseline_Fields	Provides access to the fields of the baselines in the Libraries module.
Bug_Fields	Provides access to the fields of the defects in the Defects module and the Manual Runner dialog box.
Component_Fields	Provides access to the fields of components in the Business Components module.

HP ALM (12.20) Page 64 of 165

Object	Description
ComponentStep_ Fields	Provides access to the fields of component steps in the Business Components module.
Cycle_Field	Provides access to the fields of cycles in the Releases module.
DashboardFolder_ Fields	Provides access to the fields of dashboard page folders in the Dashboard module.
DashboardPage_ Fields	Provides access to the fields of dashboard pages in the Dashboard module.
DesignStep_Fields	Provides access to the fields of the design steps in the Test Plan module.
Library_Fields	Provides access to the fields of the libraries in the Libraries module.
LibraryFolder_ Fields	Provides access to the fields of the library folders in the Libraries module.
Release_Fields	Provides access to the fields of the releases in the Releases module.
ReleaseFolder_ Fields	Provides access to the fields of the release folders in the Releases module.
Req_Fields	Provides access to the fields of the Requirements module.
Resource_Fields	Provides access to the fields of the resources in the Test Resources module.
ResourceFolder_ Fields	Provides access to the fields of the resource folders in the Test Resources module.
Run_Fields	Provides access to the fields of the test runs in the Manual Runner dialog box.
Step_Fields	Provides access to the fields of the steps in the Manual Runner dialog box.

HP ALM (12.20) Page 65 of 165

Object	Description
Test_Fields	Provides access to the fields of tests in the Test Plan module.
TestSet_Fields	Provides access to the fields of the test sets in the Test Lab module.
TestSetTest_Fields	Provides access to the fields of the test instances in the Test Lab module.

For example, to set a certain property for all fields in the **Req\_Fields** object, you can refer to each field by its ID number (**Req\_Fields.FieldById**). To set all fields to be visible (**IsVisible**) in a dialog box, you can use the following code:

These objects have the following properties:

Property	R/W	Туре	Description
Count	R	Long	Returns the number of fields in the current object.
Field (FieldName)	R	Object	Accesses the fields by field name or field label.
FieldByld (FieldID)	R	Object	Accesses the fields by the field ID number.

**Tip:** To avoid errors if your script attempts to access a non-active or a non-existing field, include **On Error Resume Next** in the script.

# Field Object

You can use the **Field** object to access the properties of an entity field.

HP ALM (12.20) Page 66 of 165

For example, to display a message box when a user does not have permission to change a value in the **Status** field, you can use the following code:

Msgbox "You do not have permission to change "\_
& "Bug\_Fields.Field("BG\_STATUS").FieldLabel field."

#### The **Field** object has the following properties:

Property	R/W	Туре	Description
FieldLabel	R	String	The displayed label of the field.
FieldName	R	String	The logical name of the field.
IsModified	R	Boolean	Specifies whether the value was modified.
IsMultiValue	R	Boolean	Specifies whether the field can contain multiple values from a lookup list.
IsNull	R	Boolean	Specifies whether the field value is absent.
IsReadOnly	R/W	Boolean	Specifies whether the field is read-only.
IsRequired	R/W	Boolean	Specifies whether a field value is required. This enables you to override field customization information. To modify the <b>IsRequired</b> property of a field, the <b>IsVisible</b> property must be True. Changes to <b>IsRequired</b> are ignored if the field is not visible.  Users must always enter a value for a field that is set as required by the workflow. This applies whether they are modifying an existing record or adding a new record, and even if the field is already empty.
IsVisible	R/W	Boolean	Specifies whether the field is displayed.
List	R/W	List	Sets or retrieves the field list attached to a field of type lookup list.
PageNo	R/W	Integer	Sets or retrieves the page (tab) on which the field is displayed in the New Defect and Defect Details dialog boxes.

HP ALM (12.20) Page 67 of 165

Property	R/W	Туре	Description
Value	R/W	Variant	Sets or retrieves the value of the field.
ViewOrder	R/W	Integer	Sets or retrieves the order in which the fields are displayed in the New Defect and Defect Details dialog boxes. You must set the value for every field in the dialog box.

# Lists Object

You can use the **Lists** object to limit field input to a specific list of values.

For example, to set the list in the **Planned Closing Version** field, depending on the **Project** field value, you can use the following code:

For more information, see "Example: Presenting a Dynamic Field List" on page 89.

The **Lists** object can be used only with fields that are defined as the **Lookup List** type or the **String** type in Project Customization of project entities.

The **Lists** object has the following properties:

Property	R/W	Туре	Description
List	R	ISysTreeNode	Accesses the ALM lists.

**Note:** When workflow customization has been used to change a list of values for a field that has transition rules defined, the field may only be modified in a way that satisfies both the workflow script and the transition rules.

HP ALM (12.20) Page 68 of 165

#### **TDConnection Object**

In workflow scripts, the only objects that are available are the objects of the module in which the code is written and a limited number of global objects. One of the global objects is the **TDConnection** object. **TDConnection** provides access to the open test architecture (OTA) objects.

You can use the **TDConnection** object to access objects from other modules, and to access general session parameters. You can access **TDConnection** properties in any procedure, from any module.

For more information about the **TDConnection** object, and a list of **TDConnection** properties, refer to the *HP ALM Open Test Architecture API Reference*.

# **User Object**

You can access the **User** object to retrieve the user name of the current user and to check whether the user belongs to a particular user group. You can retrieve or modify the first and last name of the user.

For example, to have a message box open when the user has project administrator permissions, use the following code:

For more information, see "Example: Changing a Field Based on the User Group" on page 87, and "Example: Controlling User Permissions" on page 92.

To access user properties that cannot be accessed by the **User** object, you can use the **TDConnection** object of the ALM open test architecture (OTA).

The **User** object has the following properties:

Property	R/W	Туре	Description
FullName	R/W	String	Sets or retrieves the first and last name of the current user.
IsInGroup (GroupName)	R	Boolean	Checks whether or not the current user is a member of a predefined/user-defined group.

HP ALM (12.20) Page 69 of 165

Property	R/W	Туре	Description
UserName	R	String	Returns the user name used when logging in to ALM.

# **ALM Properties**

You can use the **ActiveModule** and **ActiveDialogName** properties to obtain information about the active module and dialog box.

This section includes:

# ActiveModule Property

The **ActiveModule** property returns the name of the active ALM module. The following values can be returned:

- Releases
- Libraries
- Analysis
- Dashboard
- Requirements
- Business Models
- Test Resources
- Business Components
- Test Plan
- Test Lab
- Test Runs
- Defects

HP ALM (12.20) Page 70 of 165

#### **Example**

To open a message box displaying the module name when you move to a new module, use the following code:

```
Sub EnterModule
On Error Resume Next
msgbox "You have just entered the " & ActiveModule & _
" module."
On Error GoTo 0
End Sub
```

#### ActiveDialogName Property

The **ActiveDialogName** property returns the name of the active dialog box.

#### **Example**

To open a message box displaying the dialog box name when you open a new dialog box, use the following code:

```
Sub DialogBox(DialogBoxName, IsOpen)
On Error Resume Next
msgbox "You have just opened the " & ActiveDialogName & _
" dialog box."
On Error GoTo 0
End Sub
```

HP ALM (12.20) Page 71 of 165

# Workflow Examples and Best Practices

# About the Workflow Examples

The workflow examples presented in this section perform several types of tasks. The following table lists the examples that illustrate each type of task.

Workflow Task	See Examples
dialog box customization	"Example: Customizing a Defects Module Dialog Box" on page 81
	"Example: Changing Tab Names" on page 84
field value automation	"Example: Adding a Template to a Memo Field" on page 86
	"Example: Changing One Field Based on Another Field" on page 86
	"Example: Changing a Field Based on the User Group" on page 87
data validation	"Example: Object Validation" on page 88
	"Example: Field Validation" on page 89
dynamic field customization	"Example: Presenting a Dynamic Field List" on page 89
	"Example: Changing Field Properties when a Field Changes" on page 91
user permission control	"Example: Controlling User Permissions" on page 92
functionality	"Example: Adding Button Functionality" on page 92
error handling	"Example: Error Handling" on page 93

HP ALM (12.20) Page 72 of 165

Workflow Task	See Examples
using OTA to obtain session parameters	"Example: Obtaining Session Properties" on page 94
sending mail	"Example: Sending Mail" on page 94
using the <b>Settings</b> object	"Example: Storing the Last Values Entered" on page 96
copying values between modules	"Example: Copying Field Values to Another Object" on page 98

## Best Practices for Writing Workflow Scripts

This section describes best practices for writing workflow scripts and making sure the scripts run as expected. In addition to the best practices provided in this section, you can refer to the Microsoft Developer Network VBScript Language Reference at <a href="http://msdn.microsoft.com/en-us/library/">http://msdn.microsoft.com/en-us/library/</a>.

The following best practices are described in this section:

#### **General VBScript Tips and Best Practices**

- "Checking Value Types Before Use" on the next page
- "Anticipating Full Evaluation of Logical Expressions" on page 75
- "Defining Default Behavior for Select Case and If-Then-Else Statements" on page 76
- "Setting Return Values in Functions" on page 78

#### **ALM Workflow Tips and Best Practices**

- "Making Sure that Entity Properties Are Set Before an Entity Comes into Focus" on page 78
- "Check if a Dialog Box is Open" on page 79
- "Avoid Defining Duplicate Subroutines" on page 80

HP ALM (12.20) Page 73 of 165

#### Checking Value Types Before Use

VBScript is a "weakly-typed" programming language. This means that you can create, use, and access data values without initially declaring their types. However, certain operations can be performed only on values of a specific type. Therefore, it is important to check the type of the data before performing any operations on them.

Values of different types behave differently in different statements. Object value behavior is even more unpredictable because the behavior depends on the object's implementation. For example, the object in the call **<entity>\_CanDelete(Entity)** can either be text or a subject node.

#### Recommendations

To avoid unpredictable results:

• Check value types before use, especially for object types. When checking an object type, also check that the object has the properties you access.

**Note:** In the examples provided in this chapter, only object types are checked before use.

- Assume as little as possible—do not assume that a value is of a certain type. Write scripts that can handle all possibilities by using Else statements and Select Case statements.
- Always check parameter types before use with various VBScript functions, such as IsArray, IsDate, IsNull, IsEmpty, IsNumeric, and IsObject.
- Do not assume an object's default property is of a specific type; the type can vary from object to object.
- Use VBScript built-in conversion functions to achieve a degree of type safety.
- When working with objects, check that the value you receive is neither Null or Empty by calling the IsNull and IsEmpty functions.

HP ALM (12.20) Page 74 of 165

#### Examples

For the purposes of the following examples, assume the field values are declared as in the table below.

Field Values	Туре
<pre>Bug_Fields["BG_BUG_ ID"].Value</pre>	Integer
<pre>Bug_Fields["BG_ SUMMARY"].Value</pre>	String
Bug_Fields["BG_ SUBJECT"].Value	Object implementing the ISysTreeNode interface

In the following example, statement usage is correct. The integer is converted to a string.

```
If Bug_Fields["BG_BUG_ID"].Value = "10" Then...
```

In the following example, statement usage is correct. The strings are comparable.

```
If Bug_Fields["BG_SUMMARY"].Value = "some text" Then...
```

In the following example, statement usage is incorrect. This code can work only when the value of BG\_SUBJECT field is neither Empty or Null. VBScript also assumes that this objects's default value (meaning, the default property) is either of string type or is comparable with the string type, which is not always the case.

```
If Bug Fields["BG SUBJECT"].Value = "My Tests" Then...
```

## Anticipating Full Evaluation of Logical Expressions

The VBScript programming language does not short-circuit evaluation of Boolean conditions. VBScript evaluates all the terms in a Boolean logical expression, even if the expression can be established as True or False without evaluating all its terms. For example, in the following example, both <statement1> and <statement2> are evaluated, even if <statement1> resolves to False:

```
<statement 1> AND <statement 2>
```

HP ALM (12.20) Page 75 of 165

#### Recommendations

To avoid errors, check that all values and objects are not Null before attempting to use them.

#### Examples

The following examples:

- demonstrate incorrect and correct usage of logical expressions
- take into consideration how logical expressions are evaluated

#### **Incorrect Usage**

value. Name is evaluated even when its value is Null. This causes an error.

#### **Correct Usage**

The code is correct on the condition that value is an object that contains the Name property. The code runs without errors.

## Defining Default Behavior for Select Case and If-Then-Else Statements

Unpredictable results can occur when no default action is defined for Select Case statements or If-Then-Else statements.

HP ALM (12.20) Page 76 of 165

#### Recommendations

To avoid unpredictable results, always define default behavior when using Select Case of If-Then-Else statements.

#### Example

The following are examples of incorrect and correct ways to define default behavior for situations not covered by the existing Select Case and If-Then-Else statements.

#### **Incorrect Usage**

The author of this subroutine intends for the BG\_USER\_01 field to be visible only if the status of the defect is Open, New, or Reopen. However, if the IsVisible property of a Closed or Fixed defect was set to True prior to the instance of this subroutine, that Closed or Fixed defect will also be visible. This is because there is no case statement defined specifically for Closed and Fixed defects.

#### **Correct Usage**

This subroutine effectively handles all possible cases.

HP ALM (12.20) Page 77 of 165

#### Setting Return Values in Functions

If a function ends without a return value, unpredictable and inconsistent results may occur. Also, it is difficult to debug behavior if a return code is not set.

#### Recommendations

To avoid unpredictable results, set a default return value at the beginning of each function.

## Making Sure that Entity Properties Are Set Before an Entity Comes into Focus

It is common practice to set entity properties (such as IsVisible, IsRequired, and List) when creating or modifying a new entity (New or FieldChanged). When writing ALM workflow scripts, it is also important to set entity properties when the entity comes into focus (meaning, when the user navigates to that entity in the ALM graphical user interface). When an entity comes into focus, the MoveTo event is called.

If entity values are not set in the MoveTo event, the end user experience is unpredictable—for example, incorrect values might be displayed in drop-down lists.

#### Recommendations

To avoid unpredictable results, such as a drop-down list not containing the most up-to-date set of values:

- Make sure that all entity properties are set in the MoveTo event—not just in the New or FieldChanged events.
- Isolate entity properties customization code into a separate routine and call that routine from all relevant events.

Example

HP ALM (12.20) Page 78 of 165

The following table provides an example of how to make sure that properties of a defect are set appropriately when the defect is in focus—and not just when it is modified or added.

```
Sub SetupBugFields(Context1, Context2)
    ' Code for customizing defect properties is entered here,
    ' such as set IsVisible, IsRequired, IsReadonly, Label, List...
    If Context1="Focus" Then
          ' Code for handling the focus event is entered here
    ElseIf Context1="FieldChange" Then
            If Context2="RQ USER 01" Then
                ' Code for handling the FieldChange event
                ' is entered here
            ElseIf Context2="RQ REQ STATUS" Then
                ' ... Enter your code here
            Else
                ' ... Enter your code here
            End If
  End If
End Sub
Sub Req FieldChange(FieldName)
    If FieldName = "RQ REQ STATUS" Then
        SetupBugFields("FieldChange", FieldName)
    Else
          ...Enter your code here
    End If
End Sub
Sub Req MoveTo
        SetupBugFields("Focus")
End Sub
```

## Check if a Dialog Box is Open

It is helpful to track whether a dialog box is open before performing certain actions. For example:

- Dialog boxes do not need to be refreshed but grid displays do.
- Certain workflow events are not allowed when a dialog box is open.

The DialogBox event can be used to track the visibility of dialog boxes.

HP ALM (12.20) Page 79 of 165

#### Recommendations

To avoid unpredictable results, determine if a dialog box is open before any events occur.

#### Example

The following example checks whether the dialog box for creating a new defect is open. This is relevant because the BG\_USER\_01 field can only be modified for a new defect. If a different dialog box is open, such as the dialog box for editing a defect, the BG\_USER\_01 field cannot be modified.

```
' Declare a global variable for each dialog box of interest
Dim NewDefectDialogIsOpen
' Initialize the global variable
NewDefectDialogIsOpen = False
Sub DialogBox(DialogBoxName, IsOpen)
    If DialogBoxName="New Bug" Then
        NewDefectDialogIsOpen = True
    Else
        NewDefectDialogIsOpen = False
    End If
End Sub
Function Bug_FieldCanChange(FieldName, NewValue)
' Initialize the function's return value to avoid
' unpredictable behavior.
Bug FieldCanChange = True
' The BG_USER_01 field can only be modified for a new defect.
If FieldName="BG_USER_01" Then
    If NewDefectDialogIsOpen Then
        Bug FieldCanChange = True
    Else
        Bug FieldCanChange = False
    End If
End If
End Function
```

## Avoid Defining Duplicate Subroutines

If you define a subroutine in one section and then add another subroutine with the same name in another section, the subroutines will conflict. One of them will be ignored.

HP ALM (12.20) Page 80 of 165

**Example:** If you define the subroutine, **MySub**, in the Test Lab module script section, and then define another subroutine, MySub, in the Manual Runner script section, one of your defined subroutines will be ignored.

#### Recommendations

To avoid unpredictable conflicts when defining subroutines, always check if another subroutine with the same name already exists in your project.

## Workflow Examples

### Example: Customizing a Defects Module Dialog Box

This example shows how you can customize the field layout and other field properties in the Add Defect dialog box. You can create similar code to arrange the layout of the Defect Details dialog box.

This example illustrates a solution that customizes field properties for all user groups. You can also use the script generators to customize the layout of the Defects module dialog boxes. If you use the script generators, you must perform customization separately for each user group.

This example involves the following procedures:

- SetFieldApp is a general purpose procedure that receives a field name and its
  properties as parameters, and assigns the properties to the field. See "SetFieldApp"
  on the next page.
- FieldCust\_AddDefect calls SetFieldApp for each field in the Add Defects dialog box, to set the properties of the field. For some of the fields, FieldCust\_ AddDefect checks the user group to which the current user belongs, and customizes the field properties accordingly. A call to FieldCust\_AddDefect is placed in the Bug\_New event procedure. See "FieldCust\_AddDefect" on the next page.

**Note:** To implement this example, you can run the **Add Defect Field Customization** script generator and then modify the resulting scripts.

HP ALM (12.20) Page 81 of 165

- Rename the generated function WizardFieldCust\_Add to FieldCust\_ AddDefect and modify it as necessary. (Before you modify a generated script, you must rename it so that it is not overwritten the next time you run the script generator.)
- The script generator places a call to WizardFieldCust\_Add in the event procedure Bug\_New.Change this to FieldCust\_AddDefect.
- The function SetFieldApp is generated when you run the script generator. You do not need to rename or modify this function.

#### Set FieldApp

The subroutine SetFieldApp receives a field name and its properties as parameters, and assigns the properties to the field.

The subroutine assigns the following field properties: field visibility, whether the field is required, the number of the page (tab) on which the field should be displayed, and the view order (from left to right and from top to bottom).

Add a call to the subroutine SetFieldApp in the user-defined function FieldCust\_ AddDefect. For more information on this function, see "FieldCust\_AddDefect" below.

```
Sub SetFieldApp(FieldName, Vis, Req, PNo, VOrder)
   On Error Resume Next
   With Bug_Fields(FieldName)
        .IsVisible = Vis
        .IsRequired = Req
        .PageNo = PNo
        .ViewOrder = VOrder
   End With
   PrintError "SetFieldApp"
   On Error GoTo 0
End Sub
```

#### FieldOust\_AddDefect

The user-defined function FieldCust AddDefect calls the function SetFieldApp.

HP ALM (12.20) Page 82 of 165

The function first sets all fields to be invisible, not required, and to appear on page 100 at location 0. This ensures that if you add a new field using the **Project Entities** link on the Project Customization window, the layout will not be changed.

Add a call to FieldCust\_AddDefect in the Bug\_New event procedure so that it will be triggered when a user adds a new defect:

```
Sub Bug_New FieldCust_AddDefect End Sub
```

First, the code handles the fields that are common to all user groups. It uses conditional statements for the fields that will appear in the dialog box only for specific user groups, or that will have different properties for different users.

```
Sub FieldCust AddDefect
       On Error Resume Next
        ' Initialize the fields of the defect
        For i= 0 To Bug Fields.Count -1
            SetFieldApp Bug Fields.FieldByID(i).FieldName,
            False, False, 100, 0
        Next
       ViewNum = 0
        PageNum = 0
       ' Set fields that are in common for all user groups
        SetFieldApp "BG BUG ID", True, True, PageNum, ViewNum
       ViewNum = ViewNum + 1
        SetFieldApp "BG_DESCRIPTION", True, False, PageNum, ViewNum
       ViewNum = ViewNum + 1
        SetFieldApp "BG SUMMARY", True, True, PageNum, ViewNum
       ViewNum = ViewNum + 1
        SetFieldApp "BG_DETECTED_BY", True, True, PageNum, ViewNum
       ViewNum = ViewNum + 1
        SetFieldApp "BG_DETECTION_DATE", _
        True, True, PageNum, ViewNum
       ViewNum = ViewNum + 1
        SetFieldApp "BG DETECTION VERSION", True, True, PageNum,
       ViewNum
        ViewNum = ViewNum + 1
        SetFieldApp "BG SEVERITY", True, True, PageNum, ViewNum
       ViewNum = ViewNum + 1
        SetFieldApp "BG_PRIORITY", True, True, PageNum, ViewNum
       ViewNum = ViewNum + 1
```

HP ALM (12.20) Page 83 of 165

```
SetFieldApp "BG_PROJECT", True, False, PageNum, ViewNum
        ViewNum = ViewNum + 1
        SetFieldApp "BG_REPRODUCIBLE", True, False, PageNum, ViewNum
        ViewNum = ViewNum + 1
        SetFieldApp "BG STATUS", True, False, PageNum, ViewNum
        ViewNum = ViewNum + 1
        ' Set fields that are different for different user groups.
        ' Since one user can belong to multiple user groups,
        ' or none of these groups, there is no need for an Else statement.
        If User.IsInGroup("Developer") Then
            SetFieldApp "BG_PLANNED_CLOSING_VERSION", True, False, _
            PageNum, ViewNum
            ViewNum = ViewNum + 1
            SetFieldApp "BG_PLANNED_FIX_TIME", True, False, PageNum, _
            ViewNum
            ViewNum = ViewNum + 1
        End If
        If User.IsInGroup("QATester") Then
            PageNum = PageNum + 1
            SetFieldApp "BG_USER_01", True, False, PageNum, ViewNum
            ViewNum = ViewNum + 1
            SetFieldApp "BG USER 02", True, False, PageNum, ViewNum
            ViewNum = ViewNum + 1
        End If
        SetFieldApp "BG_ACTUAL_FIX_TIME", True, False, PageNum, _
        ViewNum
        ViewNum = ViewNum + 1
        PrintError "FieldCust AddDefect"
        On Error GoTo 0
End Sub
```

## Example: Changing Tab Names

You can change the names of the tabs on the Add Defect dialog box. This example sets the tabs to General, Environments, and Business Case.

Add the following code to the GetNewBugPageName event procedure, which is triggered before ALM opens the Add Defect dialog box. To change the tab names on the

HP ALM (12.20) Page 84 of 165

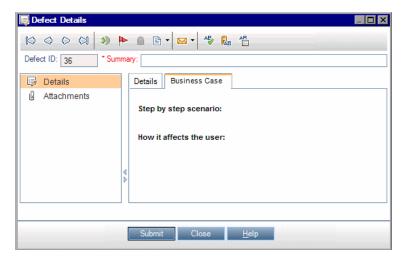

Defect Details dialog box, add similar code to the Defects\_GetDetailsPageName event procedure.

```
Sub Bug_New
      On Error Resume Next
               Bug_Fields.Field("BG_ACTUAL_FIX_TIME").PageNo = 1
               Bug_Fields.Field("BG_ESTIMATED_FIX_TIME").PageNo = 2
       On Error GoTo 0
End Sub
Function GetDetailsPageName(PageName,PageNum)
On Error Resume Next
if ActiveDialogName = "New Bug" then
       Select case PageNum
               case "1"
                       GetDetailsPageName="General"
               case "2"
                       GetDetailsPageName="Environments"
               case else
                       GetDetailsPageName="Business Case"
       End Select
end if
On Error GoTo 0
End Function
```

HP ALM (12.20) Page 85 of 165

#### Example: Adding a Template to a Memo Field

You can use workflow scripts to add a default template to a memo field. This example adds text to a memo field called **Business Case** to display the following template:

Perform this customization by placing the HTML code for the text into the **BG\_USER\_25** field when a defect is added. This example assumes that the user-defined field **BG\_USER\_25** stores a business case string.

Add the code to the Bug\_New event procedure, which is triggered when a user adds a new defect.

```
Sub Bug_New
          On Error Resume Next
          Bug_Fields("BG_USER_25").value = _
          "<html><body><b>Step by step scenario:</b>" & _
          "<br><br><br><br>How it affects the user:</b></body></html>"
          PrintError "Bug_New"
          On Error GoTo 0
End Sub
```

#### Example: Changing One Field Based on Another Field

This example demonstrates how you can change a field value based on the value entered into another field.

For example, you can cause defects to be assigned to user alex\_qc when UI Suggestion is typed into the Category field, and to user alice\_qc when Security Issues is typed.

HP ALM (12.20) Page 86 of 165

The example assumes that the user-defined field **BG\_USER\_05** is used to store the category. When the **Category** field is changed in the Defects module, the **BG\_ RESPONSIBLE** field is assigned the appropriate value.

Add the code to the Bug\_FieldChange event procedure so that it is triggered when a user changes a field value for a defect.

```
Sub Bug_FieldChange(FieldName)
On Error Resume Next
If FieldName = "BG_USER_05" then
Select case Bug_Fields("BG_USER_05").Value
case "UI Suggestion"
Bug_Fields("BG_RESPONSIBLE").value="alex_qc"
case "Security Issue"
Bug_Fields("BG_RESPONSIBLE").value="alice_qc"
Case Else
Bug_Fields("BG_RESPONSIBLE").value="non-assigned"
End Select
End If
PrintError "Bug_FieldChange"
On Error GoTo 0

End Sub
```

#### Example: Changing a Field Based on the User Group

This example demonstrates how you can change a field value according to the user group of the user entering the defect.

In this example, the user-defined field **BG\_USER\_01** is a detection mode field in which the user who detected the defect can enter the way in which it was discovered. Possible values are Formal testing, Informal testing, and BTW.

The example sets the value of the detection mode field to BTW when a defect is opened by a user who is not in the QA Tester group. If the defect is opened by a user who is in the QA Tester group, the default value Formal testing is set.

Add the code to event procedure Bug\_New, so that it is triggered when a defect is added.

```
Sub Bug_New
On Error Resume Next
If not User.IsInGroup("QATester") then
Bug_Fields("BG_USER_01").Value = "BTW"
Else
```

HP ALM (12.20) Page 87 of 165

```
Bug_Fields("BG_USER_01").Value = "Formal testing"
End If
PrintError "Bug_New"
On Error GoTo 0
End Sub
```

## **Example: Object Validation**

This example demonstrates how you can perform validations of all fields by using the CanPost event procedure. For example, this code segment ensures that a user cannot reject a defect without adding a comment.

In this example, a user may not post a defect where the defect status (**BG\_STATUS**) has been changed to Rejected unless some explanatory text has been typed in the **R&D Comment** field (**BG\_DEV\_COMMENTS**).

Add the code to the <code>Bug\_CanPost</code> event procedure so that the check is performed when the user attempts to submit the defect.

```
Function Bug CanPost
        ' Initialize the function's return value
        ' to avoid unpredictable behavior.
        Bug CanPost = False
        On Error Resume Next
        If Bug_Fields("BG_STATUS").IsModified and _
        Bug_Fields("BG_STATUS").Value = "Rejected" and _
        not Bug_Fields("BG_DEV_COMMENTS").IsModified then
            Bug CanPost = False
            msgbox "You must enter a comment when rejecting a defect."
        Else
            Bug CanPost = True
        End If
        PrintError "Bug_CanPost"
        On Error GoTo 0
End Function
```

HP ALM (12.20) Page 88 of 165

#### Example: Field Validation

This example demonstrates how to validate a single field value. For example, the following code segment shows how you can ensure that a user in a specific group cannot lower the priority of a defect.

In this example, if the user is in the QATester group and the **BG\_PRIORITY** field is being modified, the new value of the **BG\_PRIORITY** field cannot be lower than the current value.

This example assumes that in the **Priority** field list for the project, lower priorities come first when the values are sorted in ascending order. For example, the list meets this requirement if the elements are as follows: 1-Low, 2-Medium, 3-High.

Add the code to the Bug\_FieldCanChange event procedure so that it is triggered when the user attempts to change a defect field value.

```
Function Bug FieldCanChange(FieldName, NewValue)
        ' Initialize the function's return value
       ' to avoid unpredictable behavior.
        Bug FieldCanChange = True
        On Error Resume Next
        If User.IsInGroup("QATester") and FieldName ="BG PRIORITY"
        Then
            If NewValue < Bug_Fields("BG_PRIORITY").Value then</pre>
                Bug FieldCanChange = False
                msgbox "You do not have permission to lower " _
                & "defect priority."
            Else
                Bug FieldCanChange = True
            End If
        Else
            ' Enter your code here.
        End If
        PrintError "Bug FieldCanChange"
        On Error GoTo 0
End Function
```

## Example: Presenting a Dynamic Field List

This example demonstrates how you can present a different field list in a field, depending on the value of another field.

HP ALM (12.20) Page 89 of 165

The user-defined function SW\_SetLists\_Environment checks the value of the **Environment Specification** field and assigns the appropriate field list to the **Environment Type** field.

This example assumes that the field lists have been defined in the project.

**Note:** To use workflow scripts to change or create lists that can be assigned to fields, you must use the Open Test Architecture (OTA) interface.

Add code to the Bug\_MoveTo event procedure so that the user-defined function SW\_ SetLists\_Environment is called when the user changes focus in the defects module.

```
Sub Bug_MoveTo()
On Error Resume Next
SW_SetLists_Environment
PrintError "Bug_MoveTo"
On Error GoTo 0
End Sub
```

Add code to the Bug\_FieldChange event procedure so that the user-defined function SW\_SetLists\_Environment is called when a user changes the value of the **Environment Type** field in the Defects module.

```
Sub Bug_FieldChange(FieldName)
On Error Resume Next
If FieldName = "BG_USER_01" then
SW_SetLists_Environment
Else
' Enter your code here.
End If
PrintError "Bug_FieldChange"
On Error GoTo 0
End Sub
```

The user-defined function SW\_SetLists\_Environment checks the value of the **Environment Specification** field (**BG\_USER\_02**) and assigns the appropriate field list to the **Environment Type** field (**BG\_USER\_01**).

HP ALM (12.20) Page 90 of 165

```
Case "Database Type"

listName = "Database Type"

Case "Operating System"

listName = "Platform"

Case "Web Server"

listName = "Web Server"

Case Else

listName = "Environment Specification"

End Select

Bug_Fields("BG_USER_02").List = Lists(listName)

PrintError ("Set Environment List")

On Error GoTo 0

End Sub
```

## Example: Changing Field Properties when a Field Changes

This example demonstrates how you can change the properties of a field when a different field is changed.

In this example, if the status of the defect (**BG\_STATUS**) is changed to Closed, the user must provide a value in the field **Closed in Build (BG\_CLOSING\_VERSION)**.

Add the code to the Bug\_FieldChange event procedure, to make the **Closed in Build** field a required field if the status is changed to Closed.

```
Sub Bug_FieldChange(FieldName)
On Error Resume Next
If FieldName= "BG_STATUS" then
If Bug_Fields("BG_STATUS").value="Closed" then
Bug_Fields("BG_CLOSING_VERSION").IsRequired=True
Else
Bug_Fields("BG_CLOSING_VERSION").IsRequired=False
End If
Else
' Enter your code here.
End If
PrintError "Bug_FieldChange"
On Error GoTo 0

End Sub
```

HP ALM (12.20) Page 91 of 165

#### Example: Controlling User Permissions

This example demonstrates how you can prevent members of specific user groups from performing an action.

The code allows a user to replace a defect field value only if the user belongs to the Admin user group.

Add the code to the ActionCanExecute event procedure so that the check is performed when a user attempts to execute an action.

```
Function ActionCanExecute(ActionName)

' Initialize the function's return value

' to avoid unpredictable behavior.

ActionCanExecute = False

On Error Resume Next

If ActionName = "UserDefinedActions.BugReplaceAction1" _

And Not User.IsInGroup("Admin") then

ActionCanExecute = False

msgbox "You do not have permission to perform this action"

Else

ActionCanExecute = True

End If

PrintError "ActionCanExecute"

On Error GoTo 0

End Function
```

### Example: Adding Button Functionality

This example opens a calculator when a user clicks a button defined with action name Calculator.

Add the code to the ActionCanExecute event procedure, so that it is triggered when a user initiates an action.

For information about the **Wscript.Shell** object, refer to the Microsoft documentation. To access help for the VBScript language, choose **Help > VBScript Home Page** in the Script Editor.

HP ALM (12.20) Page 92 of 165

```
On Error Resume Next

If ActionName = "UserDefinedActions.Calculator" Then

Set shell = CreateObject("Wscript.Shell")

shell.Run "Calc"

Set shell = Nothing

End If

ActionCanExecute = DefaultRes

PrintError "ActionCanExecute"

On Error GoTo 0

End Function
```

## **Example: Error Handling**

This example demonstrates how you can display a standard error message. Error handling should be added to each workflow script that you write, because errors that are not detected by the workflow code can cause the user's browser to crash.

The user-defined function PrintError receives the name of the calling procedure as a parameter. If an error has occurred, PrintError prints out the error number, description and severity, and the name of the procedure in which the error occurred.

You do not need to create an **Err** object, because it is intrinsic to VBScript. For more information about the **Err** object, refer to the Microsoft documentation.

The following code segment illustrates how you can add error handling to your subroutines.

HP ALM (12.20) Page 93 of 165

The following code segment illustrates how you can add error handling to your functions.

```
Function <function_name>()
On Error Resume Next
...
[Your code here]
...
PrintError "<function_name>"
End Function
```

### **Example: Obtaining Session Properties**

This example demonstrates how to use the **TDConnection** object to obtain the properties of the current session. Add the code to the procedure where these properties are needed. The properties do not depend on each other, so each of the properties can be retrieved separately.

The following are examples of session properties:

```
TDConnection.ServerName
TDConnection.ServerTime
TDConnection.DomainName
TDConnection.ProjectName
User.UserName
```

Note that there is no need to use **TDConnection** to retrieve the user name because the workflow has a predefined **User** object. For more information, see "TDConnection Object" on page 69.

The example below tests the first five characters of the server URL to determine whether the user is connected to the server using HTTP or HTTPS:

## Example: Sending Mail

These examples demonstrate how to use the **TDConnection** object to send mail when a defect is submitted, and to send mail when a field value changes in the Test Plan

HP ALM (12.20) Page 94 of 165

module.

#### Sending Mail when a Defect is Submitted

This example sends mail when a defect is submitted.

Add a call to the SendDefect procedure in the Bug AfterPost event procedure.

**Note:** If the SendDefect procedure is called before the defect is submitted, the values that were changed in the current modification will not be included. The database is updated with the new values only after the defect is posted.

```
Sub SendDefect (iObjectId, strTo, strCc, strSubject, strComment)
On Error Resume Next
Dim objBugFactory, objBug
Set objBugFactory = TDConnection.BugFactory
Set objBug = objBugFactory.Item(iObjectId)
objBug.Mail strTo, strCc, 2, strSubject, strComment
Set objBug = Nothing
Set objBugFactory = Nothing
PrintError "SendDefect"
On Error GoTo 0

End Sub
```

The constant 2 in the call to objBug. Mail indicates that the history should be included with the mail. For a list of the constants that can be used to customize email, refer to the tagTDMAIL\_FLAGS enumeration in the *HP ALM Open Test Architecture API Reference*. In workflow scripts, use numeric constants and not the enumeration values.

#### Sending Mail when a Test Plan Module Field Value Changes

The example below demonstrates mail notification when the value of the status field is changed in the Test Plan module.

The code is added to the Test\_FieldChange event procedure. It constructs a subject and comment for the email, and calls a user-defined function, SendTest. SendTest sends mail from the Test Plan module. You can code SendTest similarly to the SendDefect subroutine shown in "Sending Mail when a Defect is Submitted" above.

```
Sub Test_FieldChange(FieldName)
On Error Resume Next
Dim strSubject, strComment
```

HP ALM (12.20) Page 95 of 165

## Example: Storing the Last Values Entered

This example shows how to use the **TDConnection** object to implement persistent data between actions. The lifetime of a variable in a routine is only for the routine run. Therefore, persistent data must be stored if it must be available later. It is recommended that you use the ALM API to store persistent data whenever possible instead of using external objects, files, or the registry.

In this example, a user-defined function SW\_KeepLastValue uses the **Settings** object to save the values typed into the fields **BG\_DETECTION\_VERSION**, **BG\_USER\_01**, and **BG\_USER\_03** when a user posts a defect. These values are retrieved and assigned as default values when this user adds a new defect.

The user-defined function is called with the SET action from Bug\_CanPost, before a new defect is posted by the user. The values in the fields are stored.

The function is called with the GET action from the Bug\_New event procedure. When a user adds a new defect, the values stored in the fields for this user are entered into these fields.

HP ALM (12.20) Page 96 of 165

Depending on the action passed as a parameter, the user-defined function SW\_ KeepLastValue stores the values of the fields in the common settings table for the current user, or reads the values from the **Settings** object and assigns the values to the appropriate fields.

```
Sub SW KeepLastValue(action)
Dim tdc, vals, flds
Dim uset, pairs, pair
Dim bld
On Error Resume Next
        bld = ""
        Set tdc = TDConnection
        Set uset = tdc.UserSettings
        If action = "SET" Then
            flds = Array("BG_DETECTION_VERSION", _
            "BG_USER_01", "BG_USER_03")
            vals = ""
            For i = 0 To UBound(flds)
                If vals <> "" Then vals = vals & ";"
                vals = vals & flds(i) & "=" & _
                Bug Fields(flds(i)).Value
            Next
            'Open category KeepLValueSetting
            uset.Open ("KeepLValueSetting")
            'Setting KeepValueFields in category KeepLValueSetting
            uset.Value("KeepValueFields") = vals
            uset.Close
        End If 'SET
        If action = "GET" Then
            uset.Open ("KeepLValueSetting")
            vals = uset.Value("KeepValueFields")
            If vals <> "" Then
                pairs = Split(vals, ";")
                For i = 0 To UBound(pairs)
                    pair = Split(pairs(i), "=")
                    If UBound(pair) = 1 Then
                        Select Case pair(0)
                            Case "BG_USER_03"
                                bld = pair(1)
```

HP ALM (12.20) Page 97 of 165

```
Case Else
                                If Bug Fields(pair(0)).Value = "" Then
                                   Bug_Fields(pair(0)).Value = pair(1)
                                End If
                        End Select
                        If Bug_Fields("BG_DETECTION_VERSION").Value _
                        And bld <> "" Then
                            SW SetLists VersionsBuilds
                            "BG_DETECTION_VERSION", _
                            "BG USER 03"
                            Bug Fields("BG USER 03").Value = bld
                            If Err.Number <> 0 Then Err.Clear
                        End If 'Bug_Fields
                    End If 'UBound(pair)
                Next
            End If 'vals <> ""
        End If 'GET
        uset.Close
        PrintError ("Keep Last Value (" & action & ")")
        On Error GoTo 0
End Sub
```

### Example: Copying Field Values to Another Object

This example shows how to use the **TDConnection** object to copy the value from the **Build Number** field of a Run (**RN\_USER\_02**) to the **Last Ran On Build** field of a Test in a Test Set (**TC\_USER\_03**).

Add the code to the Run AfterPost event procedure.

```
Sub Run_AfterPost
    On Error Resume Next
    Dim tdc
    set tdc = TDConnection
    Dim TSFact 'As TestSetFactory
    Set TSFact = tdc.TestSetFactory
    Dim TstSet 'As TestSet
    Set TstSet = TSFact.Item(Run_Fields("RN_CYCLE_ID").Value)
    MsgBox TstSet.Name
    Dim TSTestFact 'As TSTestFactory
    Set TSTestFact = TstSet.TSTestFactory
```

HP ALM (12.20) Page 98 of 165

```
Dim TSTst 'As TSTest
    Set TSTst = _
    TSTestFact.Item(Run_Fields("RN_TESTCYCL_ID").Value)
    MsgBox TSTst.Name

TSTst.Field("tc_user_03").value = _
    Run_Fields("RN_USER_02").Value
    TSTst.Post

PrintError ("Run_AfterPost")
    On Error GoTo 0
End Sub
```

HP ALM (12.20) Page 99 of 165

## Installation

## Prerequisites

## **Pre-Installation Checklist**

Review and verify the following checklist before installing ALM. This checklist outlines the information that you must supply during the installation process. For detailed prerequisite information, see the chapters in this part that are relevant to your installation.

Check	Information Required
Installation Machine	Operating system version
	CPU type
	Free disk space
	Free memory
	For the list of supported system environments, refer to the <i>Readme</i> .
	<b>Note:</b> The supported environment information in the <i>Readme</i> is accurate for the ALM12.20 release, but there may be subsequent updates. For the most up-to-date supported environments, refer to the HP Software Web site using the following URL: https://hpln.hp.com/page/alm-qc-enterprise-technical-specifications.

HP ALM (12.20) Page 100 of 165

Check	Information Required
Setup Paths	<ul><li>Installation path</li><li>Deployment path</li></ul>
	<ul> <li>Note:</li> <li>You can accept the default paths offered by the Installation and Configuration wizards, or enter alternative paths.</li> <li>The installation path must not include folders with accented characters (for example, ä, ç, ñ).</li> <li>The installation path and the deployment path cannot contain non-English characters.</li> <li>You must have full permissions on the installation and deployment directories.</li> </ul>

Check	Information Required
Existing ALM/Quality	If there is an existing Site Administration schema, provide the following information for the existing version:
Center Installation	ALM/Quality Center version
	ALM/Quality Center host
	Confidential data passphrase
	Database server name
	Database administrator user name
	Database administrator password
	Site Administration database schema name
	Site Administration database schema password
	Repository folder location
	Site administrator user name
	Site administrator password
Repository	Repository folder location

## Prerequisites: Windows Operating Systems

## System Configurations: Windows

Verify that your server machine meets the ALM system configurations. For the recommended and supported system configurations for your ALM server machine, refer to the *Readme*.

**Note:** The supported environment information in the *Readme* is accurate for the ALM 12.20 release, but there may be subsequent updates. For the most up-to-date supported environments, refer to the HP Software Web site using the following URL: https://hpln.hp.com/page/alm-qc-enterprise-technical-specifications.

HP ALM (12.20) Page 103 of 165

ALM can be deployed on a VMware ESX/ESXi server according to the VMWare guest operating system compatibility matrix.

#### Required Permissions: Windows

Verify that you have the required permissions to install ALM on a server machine.

**Note:** Some permissions require access to the **ProgramData** folder. This folder is hidden by default. To show hidden files and folders, perform the relevant steps for your operating system.

- If you are upgrading from a previous version of ALM/Quality Center with a remote repository, the ALM/Quality Center application server user account must have network access to the remote repository. For more information, contact your network administrator.
- You must be logged on as a local or domain user with administrator permissions.
   Your user name cannot include a pound sign (#) or accented characters (such as, ä, ç, ñ).

**Note:** All related installation operations for the same version, such as patch installations or uninstalling ALM, must be performed by the same user.

 You must disable User Account Control (UAC) during the ALM installation and configuration.

**Note:** In Windows 8, UAC cannot be completely disabled. Instead, use the **Run as Administrator** option during installation and configuration.

- The Distributed Link Tracking Client service must be stopped during the ALM installation and configuration.
- We recommend disabling anti-virus software during the ALM installation and configuration.
- You must have the following file system and registry key permissions:
  - Full read permissions to all the files and directories under the directory in which ALM is installed. The installation directory path is specified by the user during installation. By default, ALM writes the installation files to: C:\Program

HP ALM (12.20) Page 104 of 165

#### Files\HP\HP Application Lifecycle Management.

 Full read, write, and execute permissions to the directory on which ALM is deployed. The deployment directory is specified by the user during installation. By default, ALM is deployed in C:\ProgramData\HP\ALM.

**Note:** Due to a Windows limitation, the deployment directory cannot be on a mapped drive.

Full read and write permissions to the repository directory, which contains the sa and qc directories. The repository path is specified by the user during installation. By default, it is located under the ALM deployment directory. For more information on the repository, refer to the HP Application Lifecycle Management Administrator Guide.

**Note:** Due to a Windows limitation, the repository path cannot be on a mapped drive.

- Full read permissions to the system root (%systemroot%) directory. If you do not have these permissions, you can still install ALM, but you cannot install any patches.
- Full read and write permissions to the installation and configuration log files directory. Installation and configuration log files are written to C:\ProgramData\HP\ALM\log.
- Full read and write permissions to all the keys under
   HKEY\_LOCAL\_MACHINE\SOFTWARE\Mercury Interactive.

## **Clustering: Windows**

Check with your system administrator whether you are installing ALM on a single node or as a cluster.

If you are installing ALM on cluster nodes, verify which machine to use as the first node to start the installation and the number of machines you should use. This depends on the number of users and availability considerations.

HP ALM (12.20) Page 105 of 165

#### When installing on additional nodes:

- ALM version. You must install the same version of ALM on all nodes.
- **Operating System.** You must install the same version of the operating system, including all patches, updates, or hot fixes, on all nodes.
- **Site Administration schema.** All nodes must point to the Site Administration schema.
- **Database details.** Configure all nodes with the same database information.
- Confidential Data Passphrase. You must use the same Confidential Data Passphrase on all nodes.
- Repository path. All nodes must point to the repository path that is defined on the
  first node. It is important that you enter the repository path using the exact same
  characters on all nodes. For example, you cannot have the path on the first server
  node defined as c:\alm\repository and on additional nodes defined as
  \\server1\c\$\alm\repository—the \\server1\c\$\alm\repository path must appear
  on every node.

#### **ALM Repository Path: Windows**

The location of the repository directory is specified by the user during installation. The default location is: **C:\ProgramData\HP\ALM\repository**. You must have full control permissions to the ALM repository path as described in "Required Permissions: Windows" on page 104.

**Note:** Due to a Windows limitation, the repository path cannot be on a mapped drive.

# Prerequisites: Linux/Oracle Solaris Operating Systems

## System Configurations: Linux

Verify that your server machine meets the ALM system configurations. For the recommended and supported system configurations for your ALM server machine, refer

HP ALM (12.20) Page 106 of 165

to the Readme.

**Note:** The supported environment information in the *Readme* is accurate for the ALM12.20 release, but there may be subsequent updates. For the most up-to-date supported environments, refer to the HP Software Web site using the following URL: https://hpln.hp.com/page/alm-qc-enterprise-technical-specifications.

Consider the following for implementing ALM configurations:

- Verify that you have a supported kernel by running uname -a.
- ALM can be deployed on a VMware ESX/ESXi server according to the VMWare guest operating system compatibility matrix.

#### Installing ALM for Non-Root Users

By default, the ALM installer for the Linux operating systems requires a root user.

If you are unable to work with ALM using the root user because of security concerns, speak to your system administrator about using a non-root user with sudo permissions to install and run ALM.

**Note:** Installing ALM as non-root user without sudo permissions is not supported and causes installation problems.

To use a non-root user with sudo permissions to install and run ALM:

**Note:** The **sudo** package is included by default on some systems. These instructions assume that sudo is installed on the target machine. If sudo is not included by default, it can be downloaded and installed from <a href="http://www.gratisoft.us/sudo/download.html">http://www.gratisoft.us/sudo/download.html</a>.

- 1. Create an ALM\_Admin user.
- 2. Edit the **sudoers** file to grant sudo permissions to the **ALM\_Admin** user within the ALM installation directory. This allows the **ALM\_Admin** user to run the installation file with root privileges.

HP ALM (12.20) Page 107 of 165

#### **Example**

If the administrator decides that the ALM installation directory is /user/Install/ALM, the following line should be added to the sudoers file: gcadmin ALL=NOPASSWD:/user/Install/ALM

- 3. Check if the /var/opt/HP folder exists. If it does not exist, create it.
- Give the ALM\_Admin user Read/Write/Execute permissions to the /var/opt/HP folder.
- 5. Move the ALM installation file to the installation directory, /user/Install/ALM.
- 6. Use the **ALM\_Admin** user to run the installation script and start ALM.

## Required Permissions: Linux

The following permissions are required:

- Verify that you have the required permissions to install ALM on a server machine.
- If you are upgrading from a previous version of ALM/Quality Center with a remote repository, the ALM/Quality Center application server user account must have network access to the remote repository. For more information, contact your network administrator.
- Your user name cannot include a pound sign (#) or accented characters (such as, ä, ç, ñ).

**Note:** All related installation operations for the same version, such as patch installations or uninstalling ALM, must be performed by the same user.

- To install ALM, you must have the following file system permissions:
  - Full read, write, and execute permissions for all the files and directories under the directory on which ALM is installed. The installation files are used for configuring the server. By default, the ALM installation files are written to: /var/opt/HP/HP\_ALM\_Server.
  - Full read, write, and execute permissions to the directory on which ALM is deployed. The deployment directory is specified by the user during installation. By default, ALM is deployed on: /var/opt/HP/ALM.

HP ALM (12.20) Page 108 of 165

- Full read, write, and execute permissions to the repository directory, which contains the sa and qc directories. The repository path is specified by the user during installation. By default, it is located under the ALM deployment directory. For more information on the repository, refer to the HP Application Lifecycle Management Administrator Guide.
- Full read, write, and execute permissions to the installation and configuration log files directory. Installation and configuration log files are written to: /var/opt/HP/ALM/log.
- Full read, write, and execute permissions to the file delivery logs. The log files are written to: /var/log.
- If the file repository is located on a remote machine:
  - On the file server machine, share the file repository directory so that the user running the installation is the owner of the files.
  - On the ALM machine, or on each cluster node, create a mount directory that points to the file repository directory.

## Minimum Disk Space Requirements

The following partitions have minimum disk space requirements:

- Installation path (default is /root/alm). Requires at least enough free space to
  accommodate the size of ALM after it has been installed. The approximate size of an
  installation is 1.2GB, though the exact amount of space may vary from installation
  to installation.
- **Deployment path (default is /var/opt/HP/ALM).** Requires at least enough free space equal to the space on the installation DVD, approximately 800MB. A copy of the installation is stored in this partition.
- /tmp. Requires a large amount of free space. The exact amount cannot be specified as this partition is also consumed by the operating system. It is advisable that the amount of free space is equal in size to ALM after it has been installed, which is approximately 1.2GB.

Also, the User Process Resource Limits must be set to 4096. Edit **/etc/profile** and add the following line at the end of the file:

ulimit -n 4096

HP ALM (12.20) Page 109 of 165

## Clustering: Linux

Check with your system administrator whether you are installing ALM on a single node or as a cluster.

If you are installing ALM on cluster nodes, verify which machine to use as the first node to start the installation and the number of machines you should use. This depends on the number of users and availability considerations.

When installing on additional nodes:

- ALM version. You must install the same version of on all nodes.
- **Operating System.** You must install the same version of the operating system, including all patches, updates, or hot fixes, on all nodes.
- **Site Administration schema.** All nodes must point to the Site Administration schema.
- **Database details.** All nodes must be configured with the same database information.
- Confidential Data Passphrase. You must use the same Confidential Data Passphrase on all nodes.
- Repository path. You must mount the file system repository before you start the
  installation process. The mount should not use any cache mechanisms. For details,
  contact your network administrator.

All nodes must mount the shared file server with the same mount name. For example, if the file server is **some.server.org**, and it is mounted on **/mnt/some\_server** on the first node, it should be mounted with **/mnt/some\_server** on all nodes.

## **ALM Repository Path: Linux**

The location of the repository directory is specified by the user during installation. The default location is: /var/opt/HP/ALM/repository. You must have full control permissions to the ALM repository path as described in "Required Permissions: Linux" on page 108.

HP ALM (12.20) Page 110 of 165

# Prerequisites: Oracle Database Servers

# Connecting ALM to an Oracle Database Server

# User Permissions for Connecting ALM to an Oracle Database Server

## Database Administrative User Privileges

Following are the privileges required by the ALM database administrative user. Additional explanations about these privileges can be found in the notes at the end of the table.

Privilege	Description
CREATE SESSION WITH ADMIN OPTION (1)	ALM uses this privilege to connect to the database as the ALM database administrative user.
CREATE USER	Required to create a new project user schema when creating a new ALM project.
DROP USER	When deleting an ALM project, ALM attempts to remove the Site Administration database schema from the database server. If there is an insufficient privileges error, ALM ignores the error and requests that the user notify the database administrator to delete (drop) the database user schema.
CREATE TABLE WITH ADMIN OPTION (1)	Required for granting this permission to a newly created ALM project user schema.
CREATE VIEW WITH ADMIN OPTION <sup>(1)</sup>	Required to create views for ALM projects.

HP ALM (12.20) Page 111 of 165

Privilege	Description		
CREATE TRIGGER WITH ADMIN OPTION (1)	Required to create triggers for ALM projects. ALM uses database triggers to collect change history for specific tables.		
CREATE SEQUENCE WITH ADMIN OPTION <sup>(1)</sup>	Required to create sequences for ALM projects.		
CREATE PROCEDURE WITH ADMIN OPTION <sup>(1)</sup>	Required to create stored packages for ALM projects. ALM uses packages to collect change history for specific tables.		
CTXAPP ROLE WITH ADMIN OPTION <sup>(1)</sup>	Enables ALM to use the Oracle text searching feature. This role exists only if the Oracle text search component was installed and enabled on the database server.		
SELECT ON DBA_FREE_ SPACE <sup>(2)</sup>	Required to check free space on the database server prior to creating a new Site Administration database schema or a new project.		
SELECT ON SYS.DBA_ TABLESPACES (2)	Required to collect a list of tablespaces that exist on the database server prior to creating a new Site Administration database schema or a new project.		
SELECT ON SYS.DBA_ USERS <sup>(2)</sup>	Required to verify the existence of specific database project users. For example, you might want to verify the existence of an Oracle CTXSYS user before creating a new ALM project.		
SELECT ON SYS.DBA_ REGISTRY (2)	Required to verify that the text search component is installed on the database server.		
SELECT ON SYS.DBA_ ROLES <sup>(2)</sup>	Required to verify that the text search role (CTXAPP) is installed on the database server.		

HP ALM (12.20) Page 112 of 165

Privilege	Description
SELECT ANY TABLE WITH ADMIN OPTION (1)	Required for various administrative operations when upgrading the Site Administration database schema during installation using the copy and upgrade method, and for enhancing performance when copying a project that has the
and	same source and target database server.
INSERT ANY TABLE	

#### Note:

- (1) An ALM database administrative user must have privileges with Admin Option.
- (2) The SELECT ON SYS privileges can be given directly by the table owner, or through a database application role. To avoid giving these privileges each time, you can grant this role to the ALM database administrative user. The recommended name for this role is QC\_SELECT\_ON\_SYS\_OBJECTS. You can create this role using the qc\_sys\_db\_\_\_oracle.sql example script, which is located in the \Utilities\Databases\_scripts directory on the installation DVD. You should run this script before you run the qc\_admin\_db\_\_\_oracle.sql script.

## Project User Privileges

When creating a new project, ALM creates a project user schema. This user schema hosts all the tables that are used by the project for storing and retrieving data. Following are the required privileges for an ALM project user schema:

Project User Schema Privilege	Description
QUOTA UNLIMITED ON <default tablespace=""></default>	Required for creating database objects that are owned by the ALM project user schema. This privilege allows users to create tables in the default tablespace. It replaces the <b>UNLIMITED TABLESPACE</b> system privilege that gave users system privileges to create tables in any tablespace, including the <b>SYSTEM</b> tablespace.

HP ALM (12.20) Page 113 of 165

Project User Schema Privilege	Description
CREATE SESSION	ALM uses this privilege to connect to the database user schema to perform required operations. For example creating database objects such as tables, and using them to insert, retrieve, and delete data.
• CREATE TABLE	For a description of these privileges, see "Database Administrative User Privileges" on page 111.
• CREATE VIEW	
• CREATE TRIGGER	
• CREATE SEQUENCE	
• CREATE PROCEDUR E	
• CTXAPP Role	

**Tip:** The installation DVD contains an example script that describes the recommended permissions required for the ALM database project user schema. This script contains information and does not need to be run. It is located at **\Utilities\Databases\_scripts\qc\_project\_db\_oracle.sql**.

# Site Administration Database Schema Considerations: Oracle

Be aware of the following schema name and password considerations:

HP ALM (12.20) Page 114 of 165

The default Site Administration database schema name is qcsiteadmin\_db. If you
want to rename the schema, you can change the name when configuring the ALM
installation.

**Note:** The Site Administration database schema name can only contain English characters or numbers.

- You can create your own ALM user password for accessing the Site Administration database schema.
- If there is an existing Site Administration database schema, you can create a copy of the existing schema and upgrade the copy. This enables you to work with ALM 12.20 and previous versions of ALM/Quality Center simultaneously.

**Note:** This scenario does not apply to working with Performance Center projects. After you upgrade LAB\_PROJECT, you must then upgrade Performance Center projects before they can be used.

# Oracle RAC Support

Oracle RAC is a way to enhance Oracle database availability and scalability, allowing it to interact with more than one database instance.

#### ALM RAC support includes:

- Load balancing between Oracle instances.
- Failover between all specified Oracle RAC nodes at initial connection.

#### ALM RAC support does not include:

• TAF (Transparent Application Failover) support. A user failing to complete a request upon an Oracle instance crash is required to perform the activity again with a working Oracle instance.

#### To enable Oracle RAC support:

 Verify that a file containing information of Oracle database addresses is saved on your ALM machine. The file is named tnsnames.ora. The file should contain information similar to the following examples:

HP ALM (12.20) Page 115 of 165

 a. This first example shows an RAC TNS Alias using all cluster nodes in the ADDRESS sub-section and a sample of utilizing the Load balance and Failover features:

b. This second example shows an RAC TNS Alias using Single Client Access Name (SCAN). This enables Oracle 11gR2 clients to connect to the database with the ability to resolve multiple IP addresses, reflect multiple listeners in the cluster and handle public client connections. For more information on working with RAC SCAN, refer to the Oracle documentation.

2. Verify that you have the address of the TNS server to which ALM should refer, for example, OrgRAC.

HP ALM (12.20) Page 116 of 165

# Prerequisites: Microsoft SQL Database Servers Connecting ALM to a Microsoft SQL Database Server

## Verify the following:

Database type and version	Verify that ALM supports your database type and version. For the list of supported databases, refer to: refer to the <i>Readme</i> .
	Note: The supported environment information in the <i>Readme</i> is accurate for the ALM12.20 release, but there may be subsequent updates. For the most up-to-date supported environments, refer to the HP Software Web site using the following URL: https://hpln.hp.com/page/alm-qc-enterprise-technical-specifications.
Database server name	Verify the name of the database server.
Database user permissions	Verify that you have the database permissions required to connect ALM to the Microsoft SQL database server (not applicable for Windows Authentication). For a list of required permissions, see "User Permissions for Connecting ALM to a Microsoft SQL Database Server" on the next page.

HP ALM (12.20) Page 117 of 165

Site Administration database schema	To install ALM on an existing Site Administration database schema (second node or upgrade), you must have:  The existing database schema name and the database
	administrator permissions required to connect ALM to the database server.
	Full read/write permissions on the existing repository.
	ALM must have access to the previous Site Administration schema repository path.
	<ul> <li>Full read/write permissions for the ALM user to the previous schema repository path.</li> </ul>
	The Confidential Data Passphrase that was used to create the existing schema.
	For schema name and password considerations, see "Site Administration Database Schema Considerations: SQL" on page 120.
Text Search	Verify that the text search component is installed on the server, even if you do not intend to use it.

# User Permissions for Connecting ALM to a Microsoft SQL Database Server

To connect ALM to a Microsoft SQL database server, the installing database user must have sufficient permissions to perform certain administrative tasks in SQL.

HP ALM (12.20) Page 118 of 165

If you have the SQL **sa** login, you can use it to install ALM. If you are unable to use the SQL **sa** login due to security reasons, it is recommended that your database administrator create an ALM database administrative login, for example **td\_db\_admin**, with the specific privileges required to install ALM.

The **td\_db\_admin** login must have the Database Creators role. You must also grant the **td\_db\_admin** login the Security Administrators role. This allows the **td\_db\_admin** login to create and add the **td** user with only those privileges required for running ALM, and to run the Maintain Project activities, such as Verify, Repair, and Update.

To create an ALM database administrative login on a Microsoft SQL Server:

- 1. Open the **SQL Server Management Studio**.
- 2. In the **Object Explorer** pane, under the ALM database server, expand the **Security** folder.
- 3. Right-click the **Logins** folder, and select **New Login**.
- 4. Type **td\_db\_admin** as the login name, and select the authentication type (enter password if necessary).
- 5. Click the **Server Roles** tab, and select the **dbcreator** and **securityadmin** options.
- 6. Click OK.

To test the ALM database administrative login after connecting via this login (SQL Server Authentication):

1. Verify the select sysdatabases table permission in the master database:

```
SELECT name FROM sysdatabases where name=<db_name>
```

2. Verify the **create database** permission:

```
CREATE DATABASE <dbName> -- the database name must not already exist
```

3. Verify the **drop database** permission:

```
DROP DATABASE <database_name> -- the database name must exist
```

HP ALM (12.20) Page 119 of 165

4. Verify the select syslogins permission:

```
SELECT COUNT(*) FROM master..syslogins WHERE name=<dbOwnerName>
```

**Note:** The **dbOwnerName** must be set to **td**.

To test the ALM database administrative login permissions after connecting via this login (Windows Authentication):

1. Verify the **change database context** permission:

```
USE <dbName>
```

2. Verify the create database permission:

```
CREATE DATABASE <dbName> -- the database name must not already exist
```

3. Verify the select on syslogins permission:

```
SELECT COUNT(*) FROM master..syslogins WHERE name='<dbOwnerName>'
```

4. Verify the select on **sysusers** permission:

```
SELECT COUNT(*) FROM master..sysusers WHERE name='<dbOwnerName>'
```

# Site Administration Database Schema Considerations: SQL

Be aware of the following schema name and password considerations:

The default Site Administration database schema name is qcsiteadmin\_db. If you
want to rename the schema, you can change the name when configuring the ALM
installation.

**Note:** The Site Administration database schema name can only contain English characters or numbers.

HP ALM (12.20) Page 120 of 165

- You can create your own ALM user password for accessing the Site Administration database schema.
- If there is an existing Site Administration database schema, you can create a copy of the existing schema and upgrade the copy. This enables you to work with ALM 12.20 and previous versions of ALM/Quality Center simultaneously.

**Note:** This scenario does not apply to working with Performance Center projects. After you upgrade LAB\_PROJECT, you must then upgrade Performance Center projects before they can be used.

# Prerequisites: Miscellaneous

## License File

Verify that you have the ALM license file.

To activate your license, visit the HP Software Licensing Portal (http://www.hp.com/software/licensing) and enter your Entitlement Order Number.

The license file has a .dat file extension by default. Make a note of where you save the file, as during the ALM configuration process you need to specify a path to it.

If you do not have a license, visit the HP Software Licensing Portal and click the **Contact Licensing Support** link.

## Security Passphrases

Verify that you have passphrases for confidential data and communication security encryption.

For secondary cluster nodes, verify that you have the confidential data encryption passphrase that you used to install the primary cluster.

When upgrading from an ALM 11.00 or later version of the Site Administration database schema, you must use the same confidential data passphrase as was used for the previous installation.

**Performance Center:** You must use the same communication security passphrase for the ALM and Performance Center server configurations.

HP ALM (12.20) Page 121 of 165

## Mail Server Information

A mail server enables ALM users to send emails to other users in a project. You select which server to use as part of the installation configuration process.

Before installing ALM, decide which mail server to use. Ask your system administrator for assistance. If you are using an SMTP Server, check that you have the SMTP Server name and port. The installer checks that the specified mail server name and port are valid and that the mail server is running.

# **Conflicting Applications**

To work with ALM, you may need to disable conflicting applications that are running on the ALM machine. For a list of these applications, see HP Software Self-solve knowledge base article KM176429 (http://h20230.www2.hp.com/selfsolve/document/KM176429). (Requires HP Passport sign-in credentials.)

Prerequisites: Client-side

**System Configurations** 

## Required Software

The following must be installed on client machines:

Microsoft .NET Framework 4.0 or 4.5

## Additional Considerations

The following considerations must also be taken into account:

If you are integrating ALM with other HP testing tools, you must modify the DCOM permissions on your client machine. For more information, see HP Software Self-solve knowledge base article KM187086
 (http://h20230.www2.hp.com/selfsolve/document/KM187086). (Requires HP Passport sign-in credentials.)

HP ALM (12.20) Page 122 of 165

**ALM Edition:** Modifying DCOM permissions is not required for running Functional test sets (server-side test execution).

- You can work with the ALM client using a remote desktop.
- For customers using remote or mass distribution mechanisms, ALM client components can be deployed locally on client machines by running a self-extracting msi file. You build the msi file by running the HP ALM Client MSI Generator, available from the HP Application Lifecycle Management Add-ins page (Help > Add-ins).

# Permissions Required to Download ALM Client Components

To enable ALM to work with HP testing tools as well as various other integrations and third-party tools, you need to log in to the client machine with administrator privileges. These privileges are required to install the HP ALM Client Registration add-in, which you use to register ALM client components and Site Administration client components on your client machine.

#### **File System Permissions**

You must have the following file system permissions:

- Full read and write permissions on the HP\ALM-Client deployment folder. This is located at %ALLUSERSPROFILE%.
- Full read and write permissions to the Temp (%TEMP% or %TMP%) directory. The installer program writes installation and log files to this directory. This is generally located at C:\Users\<usename>\AppData\Local\Temp.

## Internet Explorer Configuration

Before you download Application Lifecycle Management on a client machine, you must perform the following configurations to the Internet Explorer browser on the client machine.

- Configure the Custom Level security settings. The Custom Level security setting should be configured for the specific zone of the ALM server.
- Set Internet Explorer as the default Web browser. This ensures that external links to ALM entities can open in ALM.

HP ALM (12.20) Page 123 of 165

#### To configure security settings on the client machine:

- In Internet Explorer, select Tools > Internet Options. The Internet Options dialog box opens.
- 2. Click the **Security** tab. The Web content zone of the ALM server (Internet or Local intranet) is automatically selected. Click **Custom Level**.
- 3. In the Security Settings dialog box, configure the following settings:

#### **Under .NET Framework-reliant components:**

- Set Run components not signed with Authenticode to Enable.
- Set Run components signed with Authenticode to Enable.

#### Under ActiveX controls and plug-ins:

- Set Run ActiveX controls and plug-ins to Enable.
- Set Download signed ActiveX controls to Enable or Prompt.

**Note:** You do not need to enable **Download signed ActiveX controls** if you install the ALM client using the HP ALM Client MSI Generator Add-in. This allows you to install all ALM modules on a client machine without downloading them through a browser.

#### 4. On Windows 7:

- It is suggested that you add the ALM server site to the Trusted Sites security zone. This is not mandatory.
- Disable the Protected Mode for the Trusted Sites security zone.
- 5. Click OK.

#### To set Internet Explorer as the default web browser:

- In Internet Explorer, select Tools > Internet Options. The Internet Options dialog box opens.
- 2. Click the **Programs** tab.
- 3. Under **Default web browser**, make sure that Internet Explorer is set as the default browser. If not, click the **Make default** button.

HP ALM (12.20) Page 124 of 165

# Enabling User Account Control (UAC)

If you enable UAC on a Microsoft Windows 7, 2008R2, or 2012 operating system, be aware of the following considerations:

- To register ALM client components, you must run Internet Explorer as the administrator.
- To register ALM client components on a shared location of a client machine, you must run Internet Explorer as the administrator.
- Administrator permissions are required to run the ClientMSIGenerator.exe file. In addition, you must run the .exe file as the administrator.
- Administrator permissions are required to run the ALM Tray Icon.

HP ALM (12.20) Page 125 of 165

# Troubleshooting the ALM Installation

# Disabling Validation Checks for the Installation Wizard

The ALM Installation Wizard automatically performs validation checks to verify that particular system configurations requirements are met. If the ALM configuration does not complete due to a failed validation, you can fix the problem or disable selected validation checks, and rerun the installation.

#### Note:

- You should disable validation checks only if you decide to take responsibility for the ALM server installation.
- To resolve failures that occur during the ALM Installation Wizard, see "Checking the Installation and Configuration Log Files" on page 132, or "ALM Installation Already Exists" on page 133.
- For troubleshooting tips on database validations, see "Database Validator Fails" on page 133.

To disable configuration validators and rerun the ALM Installation Wizard in Linux:

**Note:** These instructions also apply when running the Windows silent installation.

- 1. In the ALM installation directory, locate the **validations.xml** file, which is near the installation executable ( **ALM\_installer.bin**).
- Edit the validations.xml file by changing the validation value from true to false as required. Following is an example of the file with all configuration validators active.

HP ALM (12.20) Page 126 of 165

3. Save the file and rerun the installation.

### **Configuration Validators**

Validator	Checks	To Disable
os	Checks that the operating system is supported.  For the list of supported system environments, refer to the <i>Readme</i> .	<os enabled="false" /&gt;</os 
	Note: The supported environment information in the <i>Readme</i> is accurate for the ALM12.20 release, but there may be subsequent updates. For the most up-to-date supported environments, refer to the HP Software Web site using the following URL: https://hpln.hp.com/page/alm-qc-enterprise-technical-specifications.	

HP ALM (12.20) Page 127 of 165

Validator	Checks	To Disable
memory	Checks that the customer machine has at least x GB of memory (x is defined by the threshold value, the default is 8 GB).	<memory enabled="false" /&gt;</memory 
installation_ disk_space	Checks that the installation location has at least x GB of free disk space (x is defined by the threshold value, the default is 8 GB).	<installation_ disk_space enabled="false" /&gt;</installation_ 
	Note: This validation is related only to the installation location. If the installation fails because of a lack of free space in the temporary folder, changing the threshold value or disabling this validation does not affect the failure.	
sa-schema	Checks Site Administration database settings.	<sa-schema enabled="false" /&gt;</sa-schema 
db	Checks database connectivity.	<db enabled="false" /&gt;</db 
mail	Checks that the mail server is valid.	<mail enabled="false" /&gt;</mail 
license-key	Checks the license file key.	<li><li>license-key enabled="false" /&gt;</li></li>
repository	Checks that the repository folder is accessible, and has sufficient space.	<repository enabled="false" /&gt;</repository 
sa-user	Checks site administrator user settings.	<sa-user enabled="false" /&gt;</sa-user 

HP ALM (12.20) Page 128 of 165

Validator	Checks	To Disable
security	Checks encryption passphrases.	<security enabled="false" /&gt;</security 
alm- services	Checks Windows service settings.	<alm-services enabled="false" /&gt;</alm-services 
web-server	Checks that the HTTP port and web server deployment folder is accessible, and has sufficient space	<web-server enabled="false" /&gt;</web-server 

# To disable configuration validators and rerun the ALM Installation Wizard in Windows:

**Note:** These instructions do not apply when running the Windows silent installation. For Windows silent installation, follow the Linux instructions above.

- 1. In the ALM installation directory, locate the **validations.xml** file, which is near the installation executable ( **ALM\_installer.exe**).
- 2. Edit the **validations.xml** file by changing the validation value from **true** to **false** as required. Following is an example of the file with all configuration validators active.

HP ALM (12.20) Page 129 of 165

3. Only the following configuration validators are used in the Windows installation wizard:

Validator	Checks	To Disable
os	Checks that the operating system is supported.  For the list of supported system environments, refer to the <i>Readme</i> .	<os enabled="false" /&gt;</os 
	Note: The supported environment information in the <i>Readme</i> is accurate for the ALM12.20 release, but there may be subsequent updates. For the most up-to-date supported environments, refer to the HP Software Web site using the following URL: https://hpln.hp.com/page/alm-qc-enterprise-technical-specifications.	
memory	Checks that the customer machine has at least x GB of memory (x is defined by the threshold value, the default is 8 GB).	<memory enabled="false" /&gt;</memory 

HP ALM (12.20) Page 130 of 165

Validator	Checks	To Disable
installation_ disk_space	Checks that the installation location has at least x GB of free disk space (x is defined by the threshold value, the default is 8 GB).	<installation_ disk_space enabled="false" /&gt;</installation_ 
	Note: This validation is related only to the installation location. If the installation fails because of a lack of free space in the temporary folder, changing the threshold value or disabling this validation does not affect the failure.	
db	Checks database connectivity.	<db enabled="false" /&gt;</db 

- 4. Save the file and rerun the installation.
- 5. On the Installation Summary page, before clicking **Done**, edit the **run\_configuration.bat** file, located under the <installation folder>, to disable validations.

Validator	Checks	To Disable
Existing installation	Checks if an older version of ALM or Quality Center is installed.	- wPreviousInstallationValidator
License file	Checks license file key.	-wLicenseTypeValidator
Security passphrases	Checks encryption passphrases.	-wEncryptionStepValidator
Mail server	Checks that the mail server name is valid.	wMailServerValidator

HP ALM (12.20) Page 131 of 165

Validator	Checks	To Disable
Database settings	Checks Site Administration database settings.	-wSaSchemaValidator
Site administrator	Checks site administrator user settings.	-wSiteAdminUserValidator
repository folder	Checks that the repository folder is accessible, and has sufficient space.	-wRepositoryValidator

6. Save the run\_configuration.bat file and click Done to continue the installation.

# Checking the Installation and Configuration Log Files

If you encounter problems installing ALM, check for errors in the following log files:

### **Windows File Delivery Logs**

Log	Path	
Install Completed	<installation folder="">\log</installation>	
Install Failed	on the desktop:  HP_Application_Lifecycle_Management_Install_ <mm_dd_yyy< td=""></mm_dd_yyy<>	
	hh_mm_ss>.log	

### **Linux File Delivery Logs**

Log	Path
Install Completed	<installation folder="">/log</installation>
Install Failed	in the user's home folder:
	HP_Application_Lifecycle_Management_Install_ <mm_dd_yyyy_hh_mm_ss>.log</mm_dd_yyyy_hh_mm_ss>

HP ALM (12.20) Page 132 of 165

#### **Application Logs**

Log	Path
Configuration logs	Windows. <alm deployment="" folder="">\log</alm>
	<ul> <li>Linux. <alm deployment="" folder="">/log</alm></li> </ul>
Site Administration database schema creation logs	Windows. <alm deployment="" folder="">\log\sa</alm>
	<ul> <li>Linux. <alm deployment="" folder="">/log/sa</alm></li> </ul>

# **ALM Installation Already Exists**

If an error message displays during the installation indicating that an ALM installation already exists, uninstall the existing ALM installation and remove all traces of it from the server machine.

**Note:** If user avatars are lost after a server upgrade, see HP Software Self-solve knowledge base article KM00819485

(http://h20230.www2.hp.com/selfsolve/document/KM00819485). (Requires HP Passport sign-in credentials.)

## **Database Validator Fails**

During the ALM Server configuration, the database validator performs the following checks:

- Check that the input parameters are correct.
- Check that the Site Administration database schema name was provided.
- Check whether the same authentication type was used as the one used in the previous installation.

#### Perform the following steps:

HP ALM (12.20) Page 133 of 165

- 1. Check whether the parameters are correct:
  - Read the error message that displays during installation and try to understand and resolve the problem from the root cause.
  - For further clarifications, check with your database administrator.
  - If no error was found and you are sure that the parameters are correct, disable the DB parameters validator. For details, see "Disabling Validation Checks for the Installation Wizard" on page 126.
- 2. Check that the Site Administration Database Schema name was provided:
  - a. Open a database query tool.
  - b. Make sure the **PROJECTS** table exists in the Site Administration Database Schema. This table does not exist in the project schema.
- 3. To check the authentication type of a previous installation:
  - a. Navigate to C:\Program Files\HP\ALM\_Server on Windows, and opt/HP/HP\_ ALM\_Server on Linux and open the application folder.
  - b. Extract the contents of **qcbin.war** into a temp file, and open the **siteadmin.xml** file in a text editor.
  - c. Search for the **native** property. If its value is set to **Y**, Windows authentication was used. Make sure that the new installation uses the same authentication type (Microsoft SQL Server authentication or Windows authentication) as the previous installation.

# Monitoring ALM Server Fails

When running one of the Java-based tools to monitor ALM you receive the following message:

"Not enough storage is available to process this command."

This problem is caused because the JVM running the ALM Server is running with a service account.

Choose one of the following solutions, depending on which tool you are running:

HP ALM (12.20) Page 134 of 165

• jmap and jstack. See the suggestion in the following link:

http://stackoverflow.com/questions/906620/jstack-and-not-enough-storage-is-available-to-process-this-command

You will be required to download the pstools tool from the following address:

http://technet.microsoft.com/en-us/sysinternals/bb897553

• jconsole and jvisualvm. Download the following tool from the following address:

http://www.iopus.com/guides/srvany.htm

Also refer to the following Microsoft article: http://support.microsoft.com/kb/137890

HP ALM (12.20) Page 135 of 165

# Upgrade Preparation Troubleshooting

## **General Validation**

# Supported Database Version

The verification process checks that the project schema is stored in a supported database server. If the verification process detects that the database server version is not supported, it displays a warning. For details about the database servers versions supported by ALM, refer to the *Readme*.

**Note:** The supported environment information in the *Readme* is accurate for the ALM12.20 release, but there may be subsequent updates. For the most up-to-date supported environments, refer to the HP Software Web site using the following URL: https://hpln.hp.com/page/alm-gc-enterprise-technical-specifications.

### Valid Database User Schema Name

The upgrade mechanism does not support databases that include special characters in the database name. If the verification process finds special characters, you must remove them. For SQL databases, periods are also not supported in the database user schema name.

#### To remove special characters from database names:

- 1. Deactivate the project.
- 2. Ask your database administrator to rename the database user schema to a name that does not include special characters, or periods for SQL databases.
- 3. Remove the project from Site Administration.
- 4. Update the **Dbid.xml** file to point to the new database user schema name.

HP ALM (12.20) Page 136 of 165

- 5. Restore the project by using the updated **Dbid.xml** file.
- 6. Run the verification process again to make sure the problem is resolved.

## Mixed Table Ownership

ALM can connect to Microsoft SQL server by using SQL authentication or Windows authentication.

For each of these methods, a different user owns the tables of a project:

- **SQL** Authentication. Table owner is the user td.
- **Windows Authentication.** Table owner is the user dbo (a user mapped to the operating system user that runs the ALM server).

If you create a project with one type of authentication (for example, SQL), and then restore it with the other type of authentication (for example, Windows), these tables cannot be accessed. In this case, new tables are created with owners that are different from those of the old tables. You will not be able to work with the project. It is likely that the upgrade will fail.

To prevent this problem, the duplicate ownership validator checks that the owner of all of the tables in the project database user schema matches the connection method that ALM is using to connect to the server.

#### To fix table ownership manually, do one of the following:

• **SQL Authentication:** Run the following query to make td the table owner:

```
EXEC sp_changeobjectowner '', 'td'
```

• Windows Authentication: Run the following query to make dbo the table owner:

```
EXEC sp_changeobjectowner 'td.', 'dbo'
```

# Repository over Database Feature

The **Repository over Database** feature is not supported in Quality Center 10.00 or in ALM versions 11.00 and later.

If you use this feature in Quality Center 9.2, you should migrate the repository from the database to the file system (available from Quality Center 9.2 Patch 12) before

HP ALM (12.20) Page 137 of 165

upgrading the project to Quality Center 10.00, and then upgrade the project to ALM 11.00.

For more information about the tool for migrating the project repository from the database to the file system, see the *ReadMe* files for Quality Center 9.2 Patch 12. The verification process checks whether the project is using the **Repository over Database** feature. If the project is using the feature, the validator displays a warning.

## **Version Control Validation**

- Legacy version control projects. Integration with external version control tools is not supported in ALM12.20. Quality Center version 10.00 and ALM include a built-in version control functionality to support your projects. To work with projects from Quality Center 9.2 that use version control, you must first upgrade to ALM 11.00, migrate legacy version control data, and then upgrade to ALM12.20.
- Version control enabled projects. Version control enabled projects cannot be upgraded to ALM12.20 while there are checked out entities. The verification process checks that there are no checked out entities. If there are checked out entities, they must be checked in. To determine if there are checked out entities, see HP Software Self-solve knowledge base article KM00470884 (http://h20230.www2.hp.com/selfsolve/document/KM00470884). (Requires HP Passport sign-in credentials.)

## **Database Permissions**

To enable an upgrade to the current ALM version, the project schema requires a set of minimum required permissions. The verification process makes sure that both the project user and the administrator user have all the privileges needed to perform the upgrade.

# **Text Search Configuration**

Quality Center versions 9.0 and later support the database text search feature. However, not all databases are configured to support this feature. If your database does support text search, ALM installs the required components when creating a new project database. ALM also activates the text search for the new database. The verification process checks whether your project has the text search feature enabled, and that it is configured correctly.

HP ALM (12.20) Page 138 of 165

The verification process validates the following:

### Validity of the Text Search Configuration

The verification process checks that text search components are installed and are valid on the database server. If a database server is text search-enabled in the DB Servers tab in Site Administration, text search must also be enabled on the Oracle or SQL database server. If the verification process detects that text search is not enabled or configured incorrectly on the Oracle or SQL database server, the upgrade process does not run until you manually repair the problem.

We recommend that you ask your database administrator to reconfigure text search on the Oracle or SQL database server. Alternatively, as a workaround, you can disable text search for the database server from Site Administration.

#### To disable the text search for the database server:

1. Run the following query on your Site Administration schema:

```
update <SA Schema>.dbservers set db_text_search_enabled = null where
dbserver name = '<DB logical name>'
```

- 2. Restart the ALM server.
- 3. Run the repair process for your projects.
- 4. When the repair process completes, run the following guery:

```
update <SA Schema>.dbservers set db_text_search_enabled = 'Y' where
dbserver_name = '<DB logical name>'
```

5. Restart the ALM server.

## Only Valid Fields Configured Under "Text Search"

The verification process checks that only valid fields are defined as searchable. You can enable the text search only for specific entities, and only on fields of the type string or memo. The following entities are supported: BUG, COMPONENT, COMPONENT\_STEP, DESSTEPS, REQ, TEST, BPTEST\_TO\_COMPONENT, and CYCLE. Any other configuration could cause functionality problems during upgrade or customization. This problem is fixed automatically by the repair process.

HP ALM (12.20) Page 139 of 165

### Text Search Validation for Oracle Database Server

For an Oracle Database server, the verification process checks the following:

- Validity of Text Search Indexes. The verification process checks that database text search indexes are valid. Invalid text search indexes can cause functionality problems and even upgrade failure in ALM. If the verification process detects an invalid index, try to recreate the index by dropping it from the schema and creating it again. In Site Administration, click the Site Projects tab. Select the relevant project and click the Enable/Rebuild Text Search button. If this procedure returns an error, consult your database administrator or contact HP Support.
- Validity of Project Database User Permissions. The verification process checks that the project database user has the required permissions to work with text search. When text search is installed on the database, the role CTXAPP is created automatically. ALM requires that this role be granted to all projects database users that support text search. (ALM grants the CTXAPP role automatically when creating the project or enabling the text search for a project.) If this role is not granted to the project database user (configured to support text search), the verification process returns a warning. In these cases, ask your database administrator to grant the required role to the project database user.

### Text Search Validation for Microsoft SOL Database Server

The verification process checks that the project database user schema enables the text search feature. To work with text search on SQL project, you need to enable the text search on the database.

#### To enable text search on the database:

- Select the database from the SQL server Enterprise Manager.
- 2. Right-click the database name.
- 3. Select **Properties/Files**.
- 4. Select Use Full-Text Indexing.

## Schema Validation

The verification process helps to ensure that the project database user schema is correct and configured as expected.

HP ALM (12.20) Page 140 of 165

The verification process performs two types of schema verifications:

- Schema Correctness. Checks that the project database schema includes all of the
  required schema objects, as defined in the expected database user schema for the
  project. This verification ensures that all of the required entities exist and are
  defined as expected. It also ensures that there are no extra entities defined on top
  of the schema.
- Alignment to the current version. Notifies you about differences in the project database user schema caused by internal changes made in Quality Center or ALM. In this way, the verification process aligns the schema with the latest internal changes to the schema made in preparation for the upgrade.

The verification process displays warnings in the verification report if it finds the following:

- Extra entities defined. For example, Table, Column, Trigger, View, and Sequence.
- Differences from the expected definitions. For example, Column Size and Index Attributes.
- Missing objects.

Schema differences found by the verification process can cause upgrade failures or usage problems. As long as the verification process still finds these differences, an upgrade to the current ALM version will not start.

**Note:** Many of the schema changes can be fixed automatically by the repair process.

The following sections contain possible warnings, grouped by the different database objects, that the verification process can display in the verification report:

## **Tables**

Database tables can contain the following warnings:

#### Extra Table

The ALM schema should contain only the tables that are defined in the schema configuration file. Adding extra tables on top of the schema is not supported and might

HP ALM (12.20) Page 141 of 165

cause future problems with ALM.

**Problem:** If the verification process finds extra tables that were added manually to the schema, it generates an **Extra Table** warning.

**Note:** This problem requires manual repair. The repair process cannot fix it.

**Solution:** Do one of the following:

- Change the Schema. If you use the table, copy it to a different schema. If you do not
  use the table, delete it. Before taking either action, back up the schema and consult
  your database administrator. For details, see "Changing the Database User Schema"
  on page 159.
- Use the Exception File.

**Note:** If the project database is case sensitive, the table name must be the same in both the database and the exception file.

**Note:** Not recommended: Instruct the upgrade to ignore this problem.

## Missing Table

The verification process checks that all of the tables defined for the project schema actually exist (according to the tables of each Quality Center/ALM version).

**Problem:** If a table is missing, the verification process generates a **Missing Table** warning.

**Solution:** Do one of the following:

- See "Changing the Database User Schema" on page 159.
- Run the repair process to create the missing table. Although you can use the repair
  process to add these objects, we recommend that you contact HP Support to make
  sure that the missing objects are not just symptoms of a bigger problem.

HP ALM (12.20) Page 142 of 165

### Columns

Database columns can contain the following warnings:

#### Extra Column

The verification process checks that each table includes the required columns, as defined for the expected database user schema and version. The schema should not include extra columns. Extra columns in a table might cause upgrade failure or functionality problems.

**Problem:** If the verification process detects an extra column (that does not exist in the database user schema definitions) in one of the tables, it generates an **Extra Column** warning.

**Note:** This problem requires manual repair. The repair process cannot fix it.

**Solution:** Do one of the following:

- Change the Schema. If you have an internal implementation that requires extra table columns, move the extra columns to a different table in a different schema. If you do not use a particular column, delete it. Before taking either action, back up your schema and consult your database administrator. For a more detailed explanation, see "Changing the Database User Schema" on page 159.
- Use the Exception File.

**Note:** Not recommended: Instruct the upgrade to ignore this problem.

#### Column Size Mismatch

The verification process checks that all the table columns are defined as expected. This validation ensures that the column size matches the expected size as defined for each table column. This verification excludes user-defined fields, whose size can be customized through project customization.

Some column mismatch warnings are caused by internal changes made in Quality Center 10.00 that are fixed by the repair process automatically. For details, see "Internal Quality Center Changes" on page 150.

HP ALM (12.20) Page 143 of 165

**Problem A:** Size is bigger than expected. If the column size is bigger than expected, decrease the column size to the required size manually. Because this operation can cause data loss, it is not performed automatically by repair process.

**Note:** This problem requires manual repair. The repair process cannot fix it.

**Solution A:** Consult your database administrator to resolve this issue. For risks involved in changing the database user schema, see "Changing the Database User Schema" on page 159.

**Problem B:** Size is smaller than expected. If the column size is smaller than expected, the repair process fixes the problem automatically by increasing the column size to the expected size.

**Solution B:** Run the repair process to increase the current size to the required size.

#### Column Precision Mismatch

In an Oracle Database, "precision" is the term used to define the size of fields with the INTEGER type.

**Problem:** The verification process generates a warning if the precision defined for a certain column is smaller than expected.

**Solution:** Run the repair process to increase the current precision to the required precision.

## Column Type Mismatch

Changing a column type causes the upgrade to fail, and can cause major functionality problems.

**Problem:** The verification process generates a **Column Type** warning if the column type has changed.

**Note:** This problem requires manual repair. The repair process cannot fix it.

**Solution:** Consult your database administrator to resolve this issue. For risks involved in changing the database user schema, see "Changing the Database User Schema" on page 159.

HP ALM (12.20) Page 144 of 165

#### Column Nullability Mismatch

One of the attributes that is defined for a column is whether it can accept null values. A null is the absence of a value in a column of a row. Nulls indicate missing, unknown, or inapplicable data. If you have defined a NOT NULL or PRIMARY KEY integrity constraint for a particular column, you cannot insert rows into the column without adding a value.

**Problem:** The verification process compares the required definitions for each column in the expected database user schema to the project database user schema. If it encounters differences in the column NULL attribute definition, it generates a **Column Nullable** warning.

**Solution:** Run the repair process. The repair process runs a query to modify the column attributes to the expected attributes.

If the column includes NULL values, the repair process cannot update the column attribute to NOT NULL (if this is the required attribute) for the column. Ask your database administrator how to remove the NULL values from the column. After removing the NULL values, run the repair process again. For details, see "Changing the Database User Schema" on page 159.

### **Identity Column**

The IDENTITY property is one of the attributes defined for columns in Microsoft SQL server.

**Problem:** As part of the verification for the columns attributes, the verification process might find a column IDENTITY property that is not configured as expected.

**Note:** This problem requires manual repair. The repair process cannot fix it.

**Solution:** Change the IDENTITY property of the column to the expected configuration (according to the output from the verification process report) manually. Consult your database administrator to resolve this issue. For details, see "Changing the Database User Schema" on page 159.

### Missing Column

If a column is missing from a table, run the repair process or contact HP Support.

**Problem:** If the verification process finds that a column is missing from one of the tables, it generates a **Missing Column** warning.

HP ALM (12.20) Page 145 of 165

**Solution:** Do one of the following:

- Run the repair process to fix the problem.
- See "Changing the Database User Schema" on page 159.

### Indexes and Constraints

A database index is a data structure that improves the speed of operations in a table. You can create indexes using one or more columns, providing the basis for both rapid random lookups and efficient ordering of access to records. Database Constraints are constraints on the database that require relations to satisfy certain properties.

Database indexes and constraints can cause the following validation warnings:

#### Extra Index

The ALM schema should include only those indexes defined in the required schema configurations.

**Problem:** If the verification process finds an index that is not defined in the required schema configuration, it generates an **Extra Index** warning.

**Note:** This problem requires manual repair. The repair process cannot fix it.

**Solution:** Remove the extra indexes manually. Consult with your database administrator to resolve this issue. For details, see "Changing the Database User Schema" on page 159.

Some **Extra Index** warnings are caused by internal changes made in Quality Center 10.00. These extra indexes are no longer used by ALM, and are removed by the repair process. For details, see "Internal Quality Center Changes" on page 150.

#### Extra Constraint

The ALM schema should include only those constraints defined in the required schema configurations.

**Problem:** If the verification process finds a constraint that is not defined in the required schema configuration, it generates an **Extra Constraint** warning.

**Note:** This problem requires manual repair. The repair process cannot fix it.

HP ALM (12.20) Page 146 of 165

**Solution:** Remove the extra constraint manually. Consult with your database administrator to resolve this issue. For details, see "Changing the Database User Schema" on page 159.

#### Index Uniqueness Mismatch

A unique index guarantees that the index key contains no duplicate values. As a result, every row in the table is unique. Specifying unique indexes on ALM data tables ensures data integrity of the defined columns. In addition, it provides helpful information that is used as a query optimizer.

**Problem:** If the index uniqueness attribute does not have the expected value, the verification process generates an **Index Uniqueness Mismatch** warning.

You cannot create a unique index, unique constraint, or PRIMARY KEY constraint if duplicate key values exist in the data. The verification process performs these data validations. If a table has duplicate values or IDs, based on the index definitions on that table, the verification process also displays the duplication in the verification report. In this case, the repair process automatically fixes the duplication problem before creating the unique index.

**Solution:** Run the repair process to fix the problem.

#### Index Clustered

In Microsoft SQL, index type can be classified as clustered or non-clustered. The verification process compares the required definitions for each index in the expected database user schema to the project database user schema.

**Problem:** If the verification process finds differences in the index clustered attribute definition, it generates an **Index Clustered** warning.

**Solution:** Run the repair process to fix the problem.

### Missing Constraint

Constraints are rules that the database enforces to improve data integrity.

**Problem:** If the verification process finds a constraint that should be defined as missing, it generates a **Missing Constraint** warning.

**Solution:** Run the repair process to fix the problem.

HP ALM (12.20) Page 147 of 165

#### Missing Index

The verification process checks that all the required indexes (as defined in the expected database user schema) exist in the projects database user schema.

**Problem:** If the verification process does not find all the required indexes in the projects database user schema, it generates a **Missing Index** warning.

**Solution:** Run the repair process to fix the problem.

### Index Changed

The verification process checks that the indexes are defined according to the expected database user schema.

**Problem:** If the verification process finds an index that is not defined according to the expected database user schema, it generates an **Index Changed** warning.

This warning can indicate the following problems:

- Function in a function-based index is different than expected.
- Index is not defined on the expected columns.

**Solution:** Run the repair process to fix the problem. The repair process removes the index, and then recreates it, based on the required definitions for this index.

### Index Order Changed

The verification process checks that the order of the columns in the index definition has not changed.

**Problem:** If the order of the columns in the index definition has changed, the verification process generates an **Index Order Changed** warning.

**Solution:** Run the repair process to fix the problem. The repair process removes the index, and then recreates it, based on the required definitions for this index.

HP ALM (12.20) Page 148 of 165

## **Triggers**

A database trigger is procedural code that is automatically executed in response to certain events on a particular table in a database.

Database triggers can contain the following warning:

#### Extra Trigger

Extra triggers can cause upgrade failures and functionality problems.

**Problem:** If the verification process finds an extra trigger, it generates an **Extra Trigger** warning.

**Note:** This problem requires manual repair. The repair process cannot fix it.

**Solution:** Before upgrading, back up your database schema and remove the extra triggers manually.

Because extra triggers can cause upgrade failures, the upgrade process cannot ignore this warning by using the Exception file. For details, see "Changing the Database User Schema" on page 159.

## Sequences

A sequence is an Oracle object that acts as a generator that provides a sequential series of numbers.

Database sequences can contain the following warnings:

### Extra Sequence

ALM schemas should contain only the sequences that are defined in the schema configuration file.

**Problem:** If the verification process finds an extra sequence, it generates an **Extra Sequence** warning.

**Note:** This problem requires manual repair. The repair process cannot fix it.

HP ALM (12.20) Page 149 of 165

**Solution:** Do one of the following:

- Change the Schema. Move the sequence to a new database user schema. Before doing so, consult with your database administrator. For details, see "Changing the Database User Schema" on page 159.
- Use the Exception File.

**Note:** Not recommended: Instruct the upgrade to ignore this problem.

#### Missing Sequence

**Problem:** If the verification process finds that one of the sequences that should be defined on the ALM schema is missing, it generates a **Missing Sequence** warning.

**Solution:** Do the following:

- Run the repair process to fix the problem.
- See "Changing the Database User Schema" on page 159.

### Incorrect Sequences

**Problem:** Sometimes the Oracle object sequence numbers become incorrect, for example, if an export of the database is done on a live activated project, in which users are still modifying tables. If the verification process finds that Oracle sequences objects are not fully synchronized with ALM schema table IDs, the verification process generates an **Incorrect Oracle sequences found** warning.

**Solution:** Run the repair process to fix the problem.

## **Internal Quality Center Changes**

**For upgrade from Quality Center 9.2:** As a result of internal changes in Quality Center 10.00, a set of updates needs to be applied to the schema as part of the preparation for the upgrade to ALM.

To apply the updates to the schema, perform the following processes:

#### Verification Process

If the verification process finds any internal differences, it generates warnings in the

HP ALM (12.20) Page 150 of 165

verification report. The repair process fixes them automatically.

The verification process checks for the following internal changes:

Туре	Problem	Element	Comment
Column	Size mismatch	COMMON_ SETTINGS.CSET_ NAME	Expected column size is 240. Actual size is 70.
Column	Size mismatch	REQ.RQ_REQ_ PRIORITY	Expected column size is 255. Actual size is 70.
Column	Size mismatch	REQ.RQ_REQ_TYPE	Expected column size is 255. Actual size is 70.
Column	Size mismatch	REQ.RQ_REQ_ AUTHOR	Expected column size is 255. Actual size is 70.
Column	Size mismatch	REQ.RQ_REQ_ PRODUCT	Expected column size is 255. Actual size is 70.
Column	Size mismatch	REQ.RQ_REQ_ REVIEWED	Expected column size is 255. Actual size is 70.
Column	Size mismatch	REQ.RQ_REQ_ STATUS	Expected column size is 255. Actual size is 70.
Index	Missing	ALL_LISTS.AL_ ABS_PATH_COV_ IDX	
Index	Missing	BUG.BG_ COMPOUND_IDX	
Index	Missing	CYCLE.CY_ FOLDER_IDX	

HP ALM (12.20) Page 151 of 165

Туре	Problem	Element	Comment
Index	Missing	REQ.RQ_REQ_ STATUS_IDX	
Index	Missing	RUN.RN_CYCLE_ IDX	
Index	Missing	STEP.ST_RUN_IDX	
Index	Missing	TEST.TS_ SUBJECT_IDX	
Index	Extra	BUG.BG_ DETECTED_BY_ LWR_IDX	
Index	Extra	BUG.BG_STATUS_ LWR_IDX	
Index	Extra	BUG.BG_ PRIORITY_LWR_ IDX	
Index	Extra	BUG.BG_ RESPONSIBLE_ LWR_IDX	
Index	Index changed	REQ_COVER.RC_ ENTITY_ID_IDX	
Index	Index changed	RUN.RN_TEST_ID_ IDX	
Index	Index changed	RUN.RN_ TESTCYCLE_IDX	
Function- based indexes - relevant only for SQL server.	Extra index	COMMON_ SETTINGS.CS_ COVER_LWR_IDX	

HP ALM (12.20) Page 152 of 165

Туре	Problem	Element	Comment
Function- based indexes - relevant only for SQL server.	Extra index	HOSTS.HOSTS_ LWR_IDX	
Function- based indexes - relevant only for SQL server.	Extra index	HOSTS_IN_GROUP. HG_COVER_LWR_ IDX	
Function- based indexes - relevant only for SQL server.	Extra index	HOST_GROUP. GH_ LWR_IDX	
Function- based indexes - relevant only for SQL server.	Extra index	USERS.US_USERS_ LWR_IDX	

### Repair Process

The repair process fixes these internal differences in the following way:

- **Column Size.** Increases the size of columns to the required size.
- **Index Definition.** Removes extra indexes. It also recreates missing indexes and indexes that were defined differently.
- Extra Function-based Indexes. Microsoft SQL Server only. Removes obsolete function-based indexes.

Before beginning the upgrade, run the repair process on each project.

HP ALM (12.20) Page 153 of 165

### **Data Validation**

## **Duplicate Values**

Some fields (or a combination of fields) must be unique in given tables. This constraint is enforced by the creation of a unique index on these fields. For example, the combination of fields TS\_SUBJECT and TS\_NAME, which represent the ID of the test's parent folder and test name, must be unique. It is not possible to create two tests with the same name under the same folder. In rare cases, a corrupted database contains duplicate values in these fields.

**Problem:** The verification process checks that all unique indexes exist (and therefore enforce unique values). If the verification process finds duplicate values, it does not permit the upgrade to run on the project.

The verification report specifies the fields in which there are duplications and number of duplicate values found, as shown below.

**Solution:** Automatic Repair. Run the repair process to automatically handle the duplicate values. The repair process renames the duplicate values to resolve the problem.

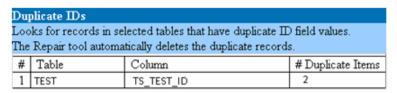

## **Duplicate IDs**

Most tables have a unique primary key, usually a unique single column. If there are duplicate values in this field, the primary key is not created.

For example, in a table called test, the column TS\_TEST\_ID represents the test ID, which is unique. In rare cases, a corrupted database contains duplicate IDs.

**Problem:** The verification process checks that all IDs in a table are unique. If it finds duplicate IDs, it does not permit the upgrade to run on the project.

The verification report specifies the fields in which there are duplicate items and values, as shown below.

HP ALM (12.20) Page 154 of 165

**Solution:** Automatic Repair. The repair process automatically deletes one of the records with a duplicate ID.

This option assumes that the entire record is duplicated, and that the duplicated record is not accessible from the ALM user interface. Because there can be exceptions, we recommend that you use this option only after verifying manually that this record deletion will not cause data loss.

### Tree Inconsistencies

The verification process checks four different entity trees (hierarchical representation of entities):

- Test Plan tree
- Business Components tree
- · Requirement tree
- Test Lab tree

The verification process checks that the data in the tree tables is correct.

**Caution:** Do not manually fix any problems related to tree data. The repair process fixes them automatically.

**Problem:** The verification process checks for the following types of problems:

- **Corrupted Path.** This is an internal ALM field that contains a string that represents the order of each node in the tree.
- Wrong Number of Children. This is an internal ALM field that contains the number of children for each node in the tree.
- **Orphan Records in Trees.** By definition, orphan records do not have parent records. As a result, you cannot access them through the ALM user interface.

**Solution:** Automatic Repair. Run the repair process to automatically fix any problems related to tree data.

Caution: Before beginning the automatic repair, review each orphan record

HP ALM (12.20) Page 155 of 165

carefully. If the verification process finds an orphan record, it deletes it (and all its descendants) from the tree automatically.

### **Views**

Database views can contain the following warning:

#### Extra Views

ALM schemas should contain only the views that are defined in the schema configuration file.

**Problem:** If the verification process detects extra views that were added manually to the schema, it displays an **Extra Views** warning. Adding extra views on top of the schema is not supported and could cause problems.

**Note:** This problem requires manual repair. The repair process cannot fix it.

**Solution:** Do one of the following:

- Change the Schema. If you use the view, copy it to a different schema. If you do not
  use the view, delete it. Before taking either action, back up your schema and consult
  your database administrator. For details, see "Changing the Database User Schema"
  on page 159.
- Use the Exception File.

**Note:** Not recommended: Instruct the upgrade to ignore this problem.

## **Orphaned Entities**

The verification process checks for entity data that is missing corresponding parent data. For example, the following entities might be missing corresponding test configurations or test criteria:

- Test configuration coverage
- Criteria coverage

HP ALM (12.20) Page 156 of 165

- Run criteria
- Runs
- Test instances

**Caution:** Do not manually fix any problems related to orphaned entities. The repair process fixes them automatically.

**Problem:** In version-controlled projects, deleting a test configuration or test criteria did not delete corresponding entities after checking in. This caused incorrect coverage calculation.

**Solution:** Automatic Repair. Run the repair process to automatically fix any problems related to orphaned entities created by this problem.

## Missing Entities

The verification process checks for data that is missing. For example, the following entities might be missing:

- Test configurations
- Test criteria

**Caution:** Do not manually fix any problems related to missing entities. The repair process fixes them automatically.

**Problem:** The upgrade process can detect that certain entities are missing based on information that exists in related tables.

**Solution:** Automatic Repair. Run the repair process to automatically fix any problems related to missing entities created by this problem.

## Missing Lists and/or List Values

The verification process checks that all of the fields of List type are associated with a list.

**Problem:** If a list and/or its values are missing, the verification process generates a warning about missing lists or missing list values.

HP ALM (12.20) Page 157 of 165

#### **Solution:**

Run the repair process to create the missing list and/or its values.

Missing lists are re-created with the name: **AUTO\_GENERATED\_LIST\_NAME\_< unique\_ number>** 

After running the repair process, do the following in **Customization > Project Lists**:

- Rename any lists whose names are prefixed by AUTO\_GENERATED\_LIST\_NAME\_.
- If necessary, add any list values that are missing.

**Tip:** Although you can use the repair process to add these objects, we recommend that you contact HP Support to make sure that the missing objects are not just symptoms of a bigger problem.

## **Encrypted Values**

Some fields are saved in the database in an encrypted state. Encryption is done using confidential data passphrases.

**Note:** This is an issue with Performance Center and Lab Management projects.

**Problem:** The verification process checks that all encrypted data can be decrypted with the current confidential data passphrases. If the verification process finds encrypted values that cannot be decrypted, the project is not upgraded.

The verification report specifies the fields that cannot be decrypted.

**Solution:** If verifying the LAB\_PROJECT fails due to a problem with the Confidential Data Passphrase, do one of the following:

- Make sure that the same Confidential Data Passphrase is defined on the original server on which the LAB\_PROJECT was located, as well as on the server to which it is being restored.
- Perform the following steps:
  - a. In Site Administration: Before attempting to verify the LAB\_PROJECT again, navigate to the **Lab Management** tab and clear all encrypted field values from the project by running the following queries:

HP ALM (12.20) Page 158 of 165

For a Microsoft SQL Database

```
update td.LAB_DIAGNOSTICS_SERVERS set DIAG_SVR_PASSWORD = "

update td.LAB_AUT_HOSTS set AUTHOST_PASSWORD = "

ALTER TABLE td.LAB_HOSTS DISABLE TRIGGER ALL

update td.LAB_HOSTS set HOST_PASSWORD = "

ALTER TABLE td.LAB_HOSTS ENABLE TRIGGER ALL
```

For an Oracle Database

```
update <schema name>.LAB_DIAGNOSTICS_SERVERS set DIAG_SVR_
PASSWORD = ''
update <schema name>.LAB_AUT_HOSTS set AUTHOST_PASSWORD = ''
update <schema name>.LAB_HOSTS set HOST_PASSWORD = ''
```

- b. Proceed with the verify, repair, and upgrade of your LAB\_PROJECT.
- c. Login to Lab Management and update the passwords of the AUT Hosts, Diagnostics Server and Standalone Unix Load Generators. For information on working in Lab Management, refer to the *HP ALM Lab Management Guide*.

# Changing the Database User Schema

This section describes the problems that require manual repair (cannot be fixed automatically by the repair process), and recommends solutions for these problems. If you encounter any of the problems mentioned below, consult with your database administrator or contact HP Support for further guidelines to resolve these problems before upgrading.

The stability of the new database upgrade component depends on the database user schema validity. We recommend that you not use the Exception file to change the database user schema.

This section includes:

HP ALM (12.20) Page 159 of 165

## Missing Database Objects

Missing database objects can be symptoms of a bigger problem.

**Problem:** Missing database objects (for example, tables and indexes) can yield unexpected and unwanted behavior.

**Solution:** Although you can use the repair process to add these objects, we recommend that you contact HP Support to make sure that the missing objects are not just symptoms of a bigger problem.

## Missing List Warning

User-defined fields of List type must be associated with lists.

**Problem:** If a list is missing for a user-defined field, the verification process generates a **Missing List** warning.

**Solution:** Contact HP Support for instructions on changing the data type of the user-defined field from List to String in the SYSTEM\_FIELD table.

Caution: Contact HP Support before attempting to fix the problem manually.

### **Sequences Warning**

An internal mechanism manages IDs and other system numerators. The table SEQUENCES holds the name of the table or other entity whose numeration is being tracked as well as its highest current value.

**Problem:** If one of the records is missing in this table, or if one of the values is incorrect, the verification process generates a **Sequences** warning.

**Solution:** The repair process fixes the problem automatically.

**Caution:** We strongly recommend that you not attempt to fix the problem manually.

HP ALM (12.20) Page 160 of 165

## Changed Database Objects

Any of the following cases is defined as a Changed Database Object:

- Data type of a column was changed
- Length of a column was changed
- Nullability of a column was changed
- Column is defined as identity although it should not be defined as such, or vice versa

**Problem:** A changed column data type can result in incorrect behavior on the server side.

**Solution:** To avoid this behavior, make sure that you have resolved all data type and length concerns before beginning the upgrade.

#### For every changed database object that is found, do the following:

- Create a new column with the required attributes as originally defined by the ALM server.
- 2. Move the data from the old column to the new one.

If you cannot move the data (for example, move strings to numeric columns, or move large data to smaller fields), contact HP Support.

- 3. Remove the old column.
- 4. Rename the new column to the original column name.

### Extra Database Objects

ALM has various customization options. One option is to add user-defined fields (UDFs). You can add a UDF by using either the project customization user interface or through OTA (Open Test Architecture).

**Problem:** Any other addition to the database user schema (for example, defining extra objects on top of ALM schema) can result in a failure, such as the following:

Name Conflict. If the later version happens to include a name that you added for a
proprietary database object (for example, a table, view, or column), the two names
will be in conflict.

HP ALM (12.20) Page 161 of 165

- Copy and Synchronize Failure. If the database user schema contains extra or missing database objects, some ALM mechanisms for copying and synchronizing might fail.
- **Extra Triggers.** If the database contains extra triggers, some update operations might fail.

#### **Solution:**

#### For each extra database object that is found, perform the corresponding solution:

Move extra columns to newly created tables.

To make sure a new table has a one-to-one relationship with the original table, define the primary key of the new column in the new table with the value of the primary key of the original column in the original table.

Move extra tables to a different database user schema.

These extra tables include those tables created above. You might need to amend the proprietary application data access of these tables. You can still access these tables from within the ALM database connection by specifying the full name.

#### **Examples:**

Oracle

<schema name>.

SOL Server

<database name>.td.

To be able to see these tables, you must grant the necessary permissions for the database user schema.

Move extra views to a different database user schema.

Like extra tables, these views can be moved to a different database user schema. In addition, you must grant reading permissions to the newly created database user schema on the database user schema objects.

 Remove referential integrity between customer database objects and ALM database objects.

HP ALM (12.20) Page 162 of 165

This removal includes no data loss.

• Remove extra triggers before the upgrade, and, only if truly necessary, restore them after the upgrade.

No data loss is involved. The upgrade process includes data upgraders that perform some data manipulations (for example, removing duplicate values, fixing tree structures, and so on).

Your triggers will not be invoked on these update events.

As a result, you need to do the following:

- a. Ask HP Support for information about the data upgrader activity.
- b. Review the information about the data upgrader activity.
- c. Decide on which proprietary updates you need to perform.
- Remove extra indexes.

You can log all indexes before the upgrade, and (only if necessary) restore them after the upgrade. No data loss is involved.

 Oracle Database only: Move extra sequences to a newly created database user schema.

To access the extra sequences from the database user schema, you must grant ALM the required permissions. When moving these sequences, set them to start with the number they reached at the time of the move.
