Documentation Updates

The title page of this document contains the following identifying information:

- Software Version number, which indicates the software version.
- Document Release Date, which changes each time the document is updated.
- Software Release Date, which indicates the release date of this version of the software.

To check for recent updates or to verify that you are using the most recent edition of a document, go to: http://h20230.www2.hp.com/selfsolve/manuals

This site requires that you register for an HP Passport and sign in. To register for an HP Passport ID, go to: http://h20229.www2.hp.com/passport-registration.html

Or click the New users - please register link on the HP Passport login page.

You will also receive updated or new editions if you subscribe to the appropriate product support service. Contact your HP sales representative for details.

Support

Visit the HP Software Support Online web site at: http://www.hp.com/go/hpsoftwaresupport

This web site provides contact information and details about the products, services, and support that HP Software offers.

HP Software online support provides customer self-solve capabilities. It provides a fast and efficient way to access interactive technical support tools needed to manage your business. As a valued support customer, you can benefit by using the support web site to:

- Search for knowledge documents of interest Submit and track support cases and enhancement requests
- Download software patches
- Manage support contracts Look up HP support contacts
- Review information about available services
- Enter into discussions with other software customers
- Research and register for software training

Most of the support areas require that you register as an HP Passport user and sign in. Many also require a support contract. To register for an HP Passport ID, go to:

http://h20229.www2.hp.com/passport-registration.html

To find more information about access levels, go to:

http://h20230.www2.hp.com/new_access_levels.jsp

HP Software Solutions Now accesses the HPSW Solution and Integration Portal Web site. This site enables you to explore HP Product Solutions to meet your business needs, includes a full list of Integrations between HP Products, as well as a listing of ITIL Processes. The URL for this Web site is http://h20230.www2.hp.com/sc/solutions/index.jsp

Administrating HP 00

This document is for the HP OO system administrator and deals with advanced configuration tasks that take place externally from the Central UI.

For administrative tasks that are performed in the Central UI, see the HP OO Central User Guide.

For example, for instructions on how to set up the system configuration under the Central **System Configuration** tab, see the *HP OO Central User Guide*.

Initial Administration Tasks

This section includes administration tasks that you will generally perform once, while setting up HP OO after installation.

Setting the System Locale in central-wrapper.conf	5
Change the MS SQL Collation Language or the central-wrapper.conf Language for Content	6
Adjusting the Logging Levels	6
Configuring LWSSO Settings	7
Changing the Service Name and Description	8

Setting the System Locale in central-wrapper.conf

If your HP OO system is localized, you will need to set the properties to reflect the system locale, in the **central-wrapper.conf** file.

- 1. Open the **central-wrapper.conf** file in a text editor (located under <**installation_ folder**>/central/conf).
- 2. Edit the following properties:

```
set.LANG=
set.LC_ALL=
set.LANGUAGE=
wrapper.java.additional.<x>=-Duser.language=
wrapper.java.additional.<x>=-Duser.country=
```

For example, for Japanese:

set.LANG=ja_JP

set.LC_ALL=ja_JP

3. Save the central-wrapper.conf file.

Change the MS SQL Collation Language or the centralwrapper.conf Language for Content

When HP OO Central was installed, there was an option to select a supported language in addition to English. This language is used as the MS SQL collation language, if relevant, and for content. This language support is required if, for example, you need to ping a server that is configured in Japanese. You can change this language by editing the **central-wrapper.conf** file.

- 1. Open the **central-wrapper.conf** file in a text editor (located under <**installation_ folder**>/central/conf).
- 2. Edit the language property. For example, change wrapper.lang=en_US to wrapper.lang=ja_JP.
- 3. Save the central-wrapper.conf file.

Adjusting the Logging Levels

It is possible to adjust the granularity of the information that is provided in the log, separately for regular logging, deployment, and execution.

The granularity options are:

- INFO Default logging information
- DEBUG More logging information
- WARN Less logging information
- ERROR Less logging information

To adjust the granularity in the logging:

- 1. Open the log4j.properties file (under /<installation_folder>/central/conf/log4j.properties).
- 2. Replace INFO with DEBUG, WARN or ERROR in the following place in the log4j.properties file.

For example:

log.level=INFO

execution.log.level=DEBUG

```
deployment.log.level=DEBUG
```

Configuring LWSSO Settings

When you install HP OO 10.10 or later, if you choose to upgrade the LWSSO settings from HP OO 9.x, these LWSSO settings will be migrated, but LWSSO will be disabled in HP OO 10.x, even if it was previously enabled in HP OO 9.x.

When you enable LWSSO afterward, you may receive warnings under certain scenarios. To clear the warnings from the log, follow the steps below to set the management URL property using the fully qualified domain name.

Central and RAS Installed on the Same Machine

When Central and a RAS are installed on the same machine, and the LWSSO settings are enabled, you must set the management URL property using the fully qualified domain name.

- 1. Stop the RAS process.
- 2. In the ras/conf/ras-wrapper.conf file, change

```
wrapper.java.additional.<x>=-Dmgmt.url=<protocol>://localhost:<port>/oo
```

to

```
wrapper.java.additional.<x>=-
Dmgmt.url=<protocol>://<FullyQualifiedDomainName>:<port>/oo
```

3. Start the RAS process.

RAS Installed on a Different Machine

When the RAS is installed on a different machine from the Central and LWSSO settings are enabled, you must specify the management URL of the Central with the fully qualified domain name during the RAS installation, instead of the IP address.

Connecting Another Application to Central Through LWSSO

When connecting another application to Central through LWSSO, you must specify the management URL of the Central with the fully qualified domain name.

- 1. Stop the Central process.
- 2. In the central/conf/central-wrapper.conf file, change

```
wrapper.java.additional.<x>=-Dmgmt.url=<protocol>://localhost:<port>/oo
```

to

wrapper.java.additional.<x>=Dmgmt.url=<protocol>://<FullyQualifiedDomainName>:<port>/oo

3. Start the Central process.

For information about setting up LWSSO in Central, see "Setting Up Security – LWSSO" in the HP OO Central User Guide.

Changing the Service Name and Description

If you want to change the service name and description from the default values, you can edit these in the **central-wrapper.conf** file.

Note: This procedure can be applied to a RAS as well. Just replace the word "Central" with "RAS". For example, use **ras-wrapper.conf**, **ras\conf**, and so on.

- 1. Stop the Central service.
- 2. Navigate to the central/bin directory. The default is C:\Program Files\Hewlett-Packard\HP Operations Orchestration.
- 3. Run uninstall-central-service.bat.
- 4. Verify that the service is uninstalled.
- 5. Navigate to the **central**\conf directory.
- 6. Make a copy of the central-wrapper.conf file.

Note: This step is an optional step used for saving the original configuration, so that you have a backup if a rollback is required or if the modified file becomes unusable in any way.

7. Edit the central-wrapper.conf file, by modifying the following lines to suit your needs:

wrapper.name wrapper.displayname wrapper.description For example:

Name of the service

wrapper.name=HPOOCentral

Display name of the service wrapper.displayname=HP Operations Orchestration Central # Description of the service wrapper.description=HP 00 Central is the run time environment of HP 00. It is used for running flows, monitoring the various runs, and generating reports.

8. Run install-central-as-service.bat.

- 9. Verify that the service is installed with the new names and description.
- 10. Start the new Central service.

Recurring Administration Tasks

This section includes administration tasks that you may need to perform periodically or in response to a situation that occurs.

Encrypting Passwords	. 10
Obfuscating Passwords	11
Changing the Database Password	. 11
Changing the Database IP	. 11
Changing the Hostname/IP of Central or RAS	. 12
Backing Up HP OO	13
Adjusting the Timing of Quartz Jobs	13
Changing the URL of a Central/Load Balancer on the RAS Side	14
Setting up Disaster Recovery	15
Planning for Disaster Recovery	
Performing Disaster Recovery	15
Data Cleanup (Purging)	16
System Tuning	16

Encrypting Passwords

- 1. Locate the encrypt-password script, in <installation_folder>/central/bin.
- 2. Run the script with the -e -p <password> option, where password is the database password.

The encrypted password should appear as follows:

{ENCRYPTED}<some_chars>.

Important! After using the encrypt-password script, clear the command history.

This is because, on a Linux OS, the password parameter will be stored in cleartext under /**\$USER/.bash_history** and accessible by the history command.

Obfuscating Passwords

- 1. Locate the encrypt-password script, in <installation_folder>/central/bin.
- 2. Run the script with the -o <password> option, where password is the password that you want to obfuscate.

The obfuscated password should appear as follows:

{OBFUSCATED}<some_chars>.

Important! After using this script, clear the command history.

This is because, on a Linux OS, the password parameter will be stored in cleartext under /**\$USER/.bash_history** and accessible by the history command.

Changing the Database Password

- 1. If Central is up and running, stop the Central Service.
- 2. Run the encrypt-password script with the -e -p <password> option, where password is the database password.

<install-dir>/central/bin/encrypt-password --password <plain-text-pass>

3. Copy the result. It should appear as follows:

\${ENCRYPTED}<some_chars>.

- 4. Go to the folder <installation_folder>\conf, and open the database.properties file.
- 5. Change the db.password value to the one that you copied. In a cluster, make sure to do this on each node.

Note: The password is stored encrypted, so make sure you include the {ENCRYPTED} prefix.

Changing the Database IP

This section is relevant when you need to configure HP OO to work with another database instance. All the database parameters, such as database credentials, schema name, tables, and so on, should be identical.

- 1. Edit the file <installation_folder>/central/conf/database.properties.
- 2. Look for the jdbc.url parameter. For example:

jdbc.url=jdbc\:jtds\:sqlserver\://16.60.185.109\:1433/schemaName;sendStringPara
metersAsUnicode\=true

- 3. Change the IP address\FQDN of the database server.
- 4. Save the file.
- 5. Restart Central.

Changing the Hostname/IP of Central or RAS

If the Central hostname or IP has changed:

If the hostname/IP has changed in a Central, you will need to manually update this hostname/IP address in a number of places.

- 1. Edit the file <installation_folder>/central/conf/central-wrapper.conf.
- 2. Look for the -Dmgmt.url parameter and update it with the correct hostname or IP address. For example:

-Dmgmt.url=http://[machine_name or IP]:8080/oo

3. Update the same -Dmgmt.url parameter in the file <installation_folder>/ras/conf/raswrapper.conf.

You need to perform this step for each RAS that communicates with the Central.

4. If you are using a Central certificate, generate a new Central certificate with the new FQDN.

It is not recommended to use the IP.

You will also need to replace the certificate in the Central keystore. See "Replacing the Central TLS Server Certificate" in the *HP OO Hardening Guide*.

5. If there is a load balancer link configured, update this link in Central.

Security Topolog	у
Workers Configur	ation
External URL	
URL:	URL of the load balancer, reverse proxy, or DNS load balancer
	Save

For more information, see "Setting Up Topology – Configuration" in the Central User Guide.

- 6. Restart Central and all affected RASes.
- 7. If you have configured a remote debugging session that uses the Central hostname or IP address, you will need to modify the connection URL accordingly in Studio.

For more information, see "Debugging a Remote Central with Studio" in the *Studio Authoring Guide*.

If the RAS IP has changed:

If the RAS IP is changed, this change affects the presentation in the Central URL, under **System Configuration** > **Topology** > **Workers**.

However, it does not affect functionality, because it is the RAS that connects to the Central in HP OO 10.x.

Backing Up HP 00

If you do not have a cluster, you must back up the <installation_folder>central\var\security folder.

If the Central server is ever deleted, this folder must be backed up; otherwise, it will be impossible to use the database.

Adjusting the Timing of Quartz Jobs

In the HP OO system, quartz jobs run periodically for maintenance of the system.

Each job runs for a set amount of time, and is repeated at set intervals. The following are examples of job triggers:

Trigger Name	Current Repeat Interval	What Happens
onRolling:OO_EXECUTION_ STATES_Trigger	4.5 minutes	Rolling the state tables for purging

Trigger Name	Current Repeat Interval	What Happens
queueCleanerTrigger	1 minute	Purging the queue tables
queueRecoveryTrigger	2 minutes	Checks if the system needs recovery
recoveryVersionTrigger	0.5 minute	Version counter to be used for the recovery
splitJoinTrigger	1 second	Joins finished splits
onRolling:OO_EXECUTION_ EVENTS_Trigger	12 hours	Rolling the events table for purging
Note: This trigger is deprecated.		

If you want to tweak these job timings in order to improve performance, perform the following:

Note: Any change to the timings can have a major effect on the system. Consult with your HP service representative before making any changes to these triggers.

1. Enter the Jminix page using the URL: **{OO_HOST}:{OO_PORT}/oo/jminix**/

Note: You need Manage System Settings permission in order to enter jminix.

- 2. Open the **OO** tab. Under **MBeans**, there is an operation named **jobTriggersMBean**.
- 3. Use this operation, and enter the values on the right tab, using the name of the trigger you want to change. Use the exact same name as the table, with a new value for the repeat interval.

This changes the triggering times of the job.

Note: The events persistency mechanism is deprecated (see **onRolling:OO_EXECUTION_EVENTS_Trigger**). You can configure this job if you use the Remote Debugger.

Changing the URL of a Central/Load Balancer on the RAS Side

While the best practice is to configure the URL of a Central/load balancer via the installer, if you need to make changes to the URL after the RAS was already installed, you can do this by editing the **ras-wrapper.conf** file.

For example, this would be needed if you installed a RAS against a Central/load balancer and the Central/load balancer's FQDN changed. You will need to change Central/load balancer's URL stored at the RAS level, so that the RAS is able to communicate again with the Central/load balancer.

- 1. Stop the RAS.
- 2. Open the ras-wrapper.conf file, located under <installation folder>/ras/conf.
- 3. Edit the URL in the following line:

wrapper.java.additional.<x>=-Dmgmt.url=<http or https>://<FQDN>:<port>/oo

4. Restart the RAS.

Setting up Disaster Recovery

Planning for Disaster Recovery

To enable disaster recovery, create a secondary datacenter by replicating the following:

- Database configuration
- Schema
- HP OO configuration and security files: <installation_folder>\central\var\security and <installation_folder>\central\conf

The replication can be ongoing, using whatever means you choose, for example, disk replication or database replication.

Performing Disaster Recovery

HP OO supports cold disaster recovery, which requires a manual process to switch over from the primary datacenter to the secondary datacenter. This may be required in the case of a full or partial failure in the primary datacenter.

1. Restore the HP OO server(s) by reinstalling all nodes (Central and RAS). Use the database configuration, schema, and HP OO configuration and security files that you replicated for the secondary datacenter.

Note: You can configure the database (by editing the **database.properties** file). See the *HP OO Hardening Guide* for more information about configuring the database connection details.

2. Delete the old worker nodes in the database, which no longer exist.

- 3. Turn off HP OO in the primary datacenter.
- 4. Switch over to the secondary datacenter.

Data Cleanup (Purging)

The data cleanup APIs enable the database administrator to purge:

• Run data such as inputs, outputs, and step logs.

This is useful for customers who run large numbers of runs, which could cause the database to reach the maximum table size.

Note: This only affects the data of completed runs.

- Debugger events for remote-debug executions.
- Audit records if auditing is enabled.

By using the data cleanup APIs, you can purge the tables manually as required, or by scheduling recurrent flows that incorporate these APIs.

For more information about using the data cleanup APIs, see the HP OO API Guide.

System Tuning

If you encounter a performance issue on your HP OO system, we recommend using the HP OO *Monitoring Guide* to verify the possible root-cause of the performance issue you have encountered.

In addition, you can configure one or more of the following parameters for each Central node. The JVM and worker threads are also applicable to each RAS node.

Note: Changing any of the parameters below requires a restart of the configured node.

 JVM heap size - You can increase the initial and maximum size of the Central/RAS heap by configuring the central-wrapper.conf and ras-wrapper.conf files (located under <installation_ folder>/<central or ras>/conf/).

wrapper.java.initmemory=<value in MB>

wrapper.java.maxmemory=<value in MB>

We recommend configuring Central to 4GB and RAS to 2GB.

• Worker threads - By default, each node has 20 worker threads. If your flows have a large number of parallel or multi-instance lanes, we recommend increasing this number.

You can configure the number of worker threads in the **engine-webapp.jar** file (located under **<installation_folder>/central/tomcat/webapps/oo/WEB-INF/lib/**).

Open the JAR file and edit the numberOfExecutionThreads property in the **spring/engineContext.xml** file.

• Database connections - You can increase the number of database connections in the database.properties file (located under <installation_folder>/central/conf/).

Edit the db.pool.maxPoolSize property. We recommend changing it to 100 connections.
