Documentation Updates

The title page of this document contains the following identifying information:

- Software Version number, which indicates the software version.
- Document Release Date, which changes each time the document, is updated.
- Software Release Date, which indicates the release date of this version of the software.

To check for recent updates or to verify that you are using the most recent edition of a document, go to: www.hp.com/go/livenetwork. This site requires that you register for an HP Passport and sign in. To register for an HP Passport ID, go to: http://h20229.www2.hp.com/passport-registration.html

Or click the New users - please register link on the HP Passport login page.

Support

Visit the HP Software Support Online website at: https://softwaresupport.hp.com

This website provides contact information and details about the products, services, and support that HP Software offers.

HP Software online support provides customer self-solve capabilities. It provides a fast and efficient way to access interactive technical support tools needed to manage your business. As a valued support customer, you can benefit by using the support website to:

- Search for knowledge documents of interest
- Submit and track support cases and enhancement requests
- Download software patches
- Manage support contracts
- Look up HP support contacts Review information about available services
- Enter into discussions with other software customers
- Research and register for software training

Most of the support areas require that you register as an HP Passport user and sign in. Many also require a support contract. To register for an HP Passport ID, go to:

http://h20229.www2.hp.com/passport-registration.html

To find more information about access levels, go to:

http://h20230.www2.hp.com/new_access_levels.jsp

HP Software Solutions Now accesses the HPSW Solution and Integration Portal website. This site enables you to explore HP Product Solutions to meet your business needs, includes a full list of Integrations between HP Products, as well as a listing of ITIL Processes. The URL for this website is http://h20230.www2.hp.com/sc/solutions/index.jsp

Best practices for configuring rule sets

This section describes the best practices and recommendations for configuring some of the rule sets. Rules sets can enable Service Manager to perform tasks automatically. For example, Service Manager can automatically assign a record to the most applicable group based on a preset rule set.

Configure assignment rules

Service Manager uses assignment rules to automatically distribute records, such as tasks, to the most appropriate groups or individuals for processing. You can configure the assignment rules with different conditions. For example, you can set a rule so that a record is automatically assigned to a group that handles the associated service, or you can set a rule so that a record is automatically assigned to an individual who has the lightest workload.

The following sections provide detailed information about the best practices of configuring assignment rules:

- Configure assignment rules for groups
- Configure assignment rules for individuals

Configure assignment rules for groups

You can configure group assignment rules so that a record can be automatically assigned to a specific group or a group that handles the associated service. The assignment rules can be configured either by using the Assignment form or by using JavaScript.

Assign to a group that handles the associated service

In Service Manager, a record is always associated with a service, so you can usually assign the record to the Config Admin group or the Support Groups of the service.

Service Manager follows the following logic to decide the assignment group:

• If the service has only the Config Admin group, and no Support Groups are set, the Config Admin group of the service is used.

- If the service has both the Config Admin group and the Support Groups, then the assignment depends on the assignment type you specify for the rule:
 - If the assignment type is **Automatic take first**, the Config Admin group of the service is used.
 - If the assignment type is Manual let the user choose, a list that combines the Config Admin group and the Support Groups of the service is shown to the operator for selection.

Note: If this rule is triggered by the system, the assignment type **Automatic - take first** is used even when you have selected **Manual - let the user choose** as the assignment type. This means that the Config Admin group of the system is used.

The configuration interface is as follows:

Assignment	
Create a rule that assigns the ticket.	
Rule Description • Assi Condition	Edit
Assignment Type	Automatic - take first Manual - let the user choose Individual Assignment:
Default Group Group Field Name + A	Assignment Rule Assignment Group None
Assignment Rule	Attected Service
Fixed Set Using Javascript	Assign To Coordinator Fixed
	Set Using Javasoript
	0k Cancel

Assign to a specific group

You can use the **Fixed** assignment rule to enable Service Manager to automatically assign a record to a specific group.

The conditions of this rule allow you to make group assignment based on locations or categories. For example, in the out-of-box configuration, the request task assignment rule is based on categories. Two assignment rules are configured in the rule set "rmtask.init.assignment.set": One is for the Purchase category, and the other is for other categories, as shown below:

ule Set				
ID Available as action Name	 rmtask.init.assignment.set Initialize assignment group and assignee for request task 	Table name	HP Proprietary requestTask	⊕,
Rules				
Rules Rule Description			Add Rule	
Rule Description	hase category (when (Assigned Group in CurrentRecord = NULL AND (Category in Curre		Add Rule Add Group	

For the Purchase category, the system assigns to the group "Stock Managers":

Assignment

Create a rule that assigns the ticket.		
Rule Description Condition	CurrentRecord = "Purchase"))	Non-Purchase category IULL AND (Category in CurrentRecord I= NULL AND Category in Edit
Assignment Type Group Assignment: Default Group Group Field Name Assignment Rule Service Based Fixed Set Using Javascript	Automatic - take first SUPPORT ADMIN C Assigned Group Stock Managere C	Manual - let the user choose Individual Assignment: Assignment Rule None Assign To Group Member Assignment Time Field Name, Update Date Assign To Coordinator Fixed Set Using Javascript
		Assignee Field Name Assigned To
		Ok Cancel

For the other categories, the system assigns to the group "SUPPORT ADMIN":

As	si	qn	m	en	t

Create a rule that assigns the ticket	L	
Rule Description	Request Task Assignment Rule for I	Purchase category
Condition	(Assigned Group in CurrentRecord = N CurrentRecord = "Purchase"))	ULL AND not (Category in CurrentRecord I+ NULL AND Category in
		Edit
Assignment Type	Automatic - take first	O Manual - let the user choose
Group Assignment:		Individual Assignment:
Default Group	SUPPORT ADMIN	Assignment Rule
Group Field Name	Assigned Group	O None
Assignment Rule		Assign To Group Member Round Robin
Service Based		Assignment Time Field Name, Update Date
Fixed	* SUPPORT ADMIN	
Set Using Javascript		Assign To Coordinator
		Fixed
		 Set Using Javascript
		Assignee Field Name Assigned To
		Assigned To

Use JavaScript to configure assignment rules for groups

In addition to using the configuration forms to configure assignment rules for groups, you have the flexibility to use JavaScript to implement your assignment rules. In JavaScript, you can use the groupValue variable to specify an assignment group or a combination of groups.

Configure assignment rules for individuals

You can configure assignment rules for individuals so that a record can be automatically assigned to a specific individual for processing. The assignment rules can be configured either by using the Assignment form or by using JavaScript.

You can configure the assignment rules so that a record can be automatically assigned to the following individuals:

- None: Do not assign to any individual
- A member of the assigned group: The member can be decided in a round robin manner or based on the workload of the group members
- Coordinator of the assigned group
- A specific assignee

Assign in a round robin manner

In the round robin manner, the system checks the latest assignment time of the members in a group, and then assigns the record to the member who has the earliest assignment time.

If you have a huge number of records to be assigned in Service Manager, follow these guidelines to avoid possible performance issues:

• **Only take recent assignments into account.** By default, the value of 60 days is set while you add assignment rules in the round robin manner. You can adjust the value based on your needs. If this value is set to 60 days, it means that only assignments within the most recent 60 days are considered; assignments before 60 days are ignored. If the value is set to 0, it means there is no assignment time restriction; all the assignments of the members are considered.

Assignment			
	Create a rule that assigns the ticket.		
	Rule Description Condition	* Assignment	Edit
	Assignment Type	Automatic - take first	Manual - let the user choose
	Group Assignment:	* Alert Name	r Individual Assignment: Assignment Rule
	Default Group	E Q	○ None
	Assignment Rule		Assign To Group Member * Round Robin
	Service Based		Assignment Time Field Name *
	Fixed		Take recent 60 day's assignments into account
	Set Using Javascript		Assign To Coordinator
			Fixed
			Set Using Javascript
			Assignee Field Name *
			OK Cancel

• Create index on the assignment time field and the assignee field of the corresponding table. This can avoid full table scans and thus can increase the query speed. At run time, the calculation SQL is as follows:

```
select [assignee field], max([assign time field]) time from [ticket file] where
[assign time field] >= [assigned time restriction] and [assignee field] isin
[members in group] group by [assignee field] order by time
```

Assign based on workload

You can use the Number of Assigned Tickets assignment type to configure the assignment rules so that a record can be assigned based on people's workload. The system checks the number of working records of all the members in a group and then assigns the record to the member who has least working records.

To avoid possible performance issues for this assignment type, follow these guidelines:

• Only take open records into account. Usually you need to append the query that filters out records other than the open records. You can use the Query Editor to edit the query string. In the example below, the query string "flag~=false" is appended.

Query Editor(p	robsummary)			×
Match all of the	ne following conditions			+ =
Flag	Not Equals	Value	False	- [] +
			D	one Cancel

Assignment

eate a rule that assigns the ticket.
le Description • Assignment
signment Type Automatic - take first Automat
Assignee Field Name Assignee

In addition, you can further narrow down the filter result. For example, if you plan to take only the open and critical records into account, you can append to the query string as shown below:

Match all of the	following conditions			+ 7
lag	Not Equals	Value	False	+ = -
riority	Equals	Value	1 - Critical	+ 1 -

 Create index on the assignee field and the fields of the appended query. This can avoid full table scans and can thus increase the query speed. At run time, the calculation SQL is as follows: select [assignee field], count(*) ncnt from [ticket file] where [assignee field] isin [members in group] and [the appended query string] group by [assignee field] order by ncnt

Use Javascript to configure assignment rules for individuals

In addition to using the configuration forms to configure assignment rules for individuals, you have the flexibility to use JavaScript to implement your assignment rules. In JavaScript, you can use the assigneeValue variable to specify an assignee or a combination of assignees.

Perform automatic operations with Run Action rules

You can use the Run Action rules to enable Service Manager to perform automatic cross table or module operations. For example, you can set the rules so that the solution of an incident can be copied to the interaction from which the incident is escalated.

Service Manager supports three types of the Run Action rules:

- Run Action rules on related records
- Run Action rules on other records
- Run Action rules on the current record

Configure Run Action rules on related records

You can configure the Run Action rules to enable Service Manager to perform automatic operations on related records. The relationship of the related records is usually maintained by the Related Records functionality.

For example, when an incident is resolved, you might want to copy the incident resolution to the related interaction from which the incident is escalated. In this case, you can configure the Run Action rules with these steps:

- 1. Define a rule set on the source table
- 2. Define a rule set on the target table

3. Configure the rule set on the source table into an appropriate workflow

Define a rule set on the source table

To copy the incident resolution, you can define a rule set on the source table "probsummary" that stores incident records. The rule set definition form is as follows:

ule Set			
ID	* im.resolve.copyToInteration		HP Proprietary
Available as action		Table name	probsummary 🖸
Name	* Copy incident resolution to Interaction		
Rules			
Rule Description		•	Add Rule
Run Action to copy so	lution		Add Group
			Edit Rule/Group
			Remove Rule/Group
			Move Up
			Move Down

In addition to the above configuration, you also need to perform the following tasks:

- Select Related Records for the "Run Action on" field
- Select **Escalate From Interaction** for the "Relation Type" field. This means the target related record is the interaction from which the current incident is escalated.
- Select **sd.copyIncidentSolution** for the "Run Rule Set" field. This rule set is executed against the related interaction.
- Select **Save** for the "Action after Rule Set" field. The rule set is saved for the related interaction.

Note: You can select "Do nothing", "save" or one of the back end transitions for this field.

• The back end transition list is retrieved from all the workflows of the current related record file based on your selected relation type. At run time, if some of the workflows do not have your selected back end transition, the corresponding transition is not run.

For example, suppose you have a Change file "cm3r" and it meets the following conditions:
Relation type: You have selected "Caused Changes" as the relation type.

- Workflows: Based on the selected relation type, there are two workflows for the Change file: "Normal Change" and "Standard Change".
- Back end transitions: The "Normal Change" workflow has the back end transition "event.close", whereas the "Standard Change" workflow does not.

In this case, if you select the action "Backend Transition: event.close", and if at run time there are two related caused changes: One for "Normal Change" and the other for "Standard Change", the back end transition is only run on the "Normal Change" workflow, not on the "Standard Change" workflow.

- You are suggested to use the same back end transition name in different workflows if these backend transitions follow the same business logic.
- While a back end transition is selected from the list, the interface is updated to indicate to which workflows the transition applies and to which it does not apply.

The form on which you can perform these tasks is shown below:

Run Action on Record

Please choose the back end tran	sition and the rule sets for the chosen records filtered by query editor.
Rule Description	* Run Action to copy solution
Condition	
	Edit
Run Action on	Related Records Other Records Current Record
Relation Type	* Escalate From Interaction
Filter Record by	
	Edit Query
Run Rule Set	sd.copyIncidentSolution
Action after Rule Set	* Save
	Ok Cancel

Define a rule set on the target table

You need to define a rule set on the target table. This rule set is used as the value of the "Run Rule Set" field when you define the rule set on the source table. In this example, you define the rule set "sd.copyIncidentSolution" on the target table "incidents" that stores the interaction records.

Rule Set				
ID Available as action Name	 ★ sd.copyIncidentSolution ↓ Set Interaction resolution by copying from Incident 	Table name	HP Proprietary] •
Rules				
Rule Description		्	Add Rule	
Set Solution via JavaSo	ript		Add Group	
		I	Edit Rule/Group	
		I	Remove Rule/Group	
		I	Move Up	
			Move Down	

You need to configure a Set Field rule in this rule set to append the resolution of the incident to the resolution field of the interaction. To do this, you can use JavaScript, in which you can refer to the current source record as srcRecord and the original copy of the source record (before any changes are made by the user) as oldSrcRecord. The system only supports invoking the current rule from the Run Action rule at run time. The JavaScript of this example is as follows:

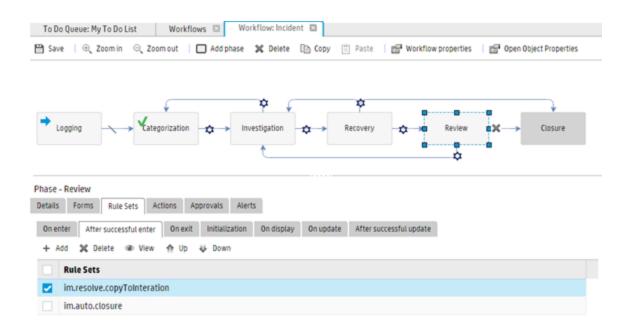

```
value = record.resolution.toArray().concat( ["Copy resolution from Incident " +
srcRecord.number + " on " + new Date() + ":"], srcRecord.resolution.toArray());
```

In JavaScript, the current record and the original copy of the record are also referred as record and oldRecord. In this example, they are the current interaction record and original interaction record.

Set Field				
	Set Field Value with the Value	e defined via JavaScript.		
	Rule Description	Set Solution via JavaScript		
	Condition			
		Edit		
	Field Name	* Solution	~	
	This script should set the	e variable "value" to the desired value for the f	lield.	
		ion.toArray().concat(["Copy resolution from Inci "], srcRecord.resolution.toArray());	dent * • <u>srcRecord.numb</u>	<u>er</u> +
	4			
			Ok	Cancel

Configure the rule set on the source table into an appropriate workflow

In this example, you can configure the rule set into the **After successful enter** event of the Review phase of the Incident workflow. This means only after the incident record is resolved, the rule set is triggered.

Note: The Run Action rule is executed in a sequential manner, which means the configured rule sets and actions of each related record are called one after another. If one of the rule sets and actions fails, for example, one of the related record is locked by another user, the whole execution stops and returns with a failure result. If you want the system to handle the failed execution on related records caused by record locking, you can combine the Run Action rules and the Run Scheduled Action rules. For details, see Combine the Run Action rules and the Run Scheduled Action rules.

Configure Run Action rules on other records

You can configure the Run Action rules to enable Service Manager to perform automatic operations on other records. The relationship of the records is built by manually defined query string. For example, you might want to sync up the status of an incident to its relevant incident tasks, that is to say, if the incident is suspended, the relevant incident tasks should be suspended as well.

To configure Run Action rules on other records, follow these steps:

- 1. Define a rule set on the source table
- 2. Define a rule set on the target table
- 3. Configure the rule set on the source table into an appropriate workflow

Define a rule set on the source table

In this example, you can define the rule set on the source table "probsummary" that stores incident records:

ID	im.suspend.syncToTask		HP Proprietary	
Available as action		Table name	probsummary	0
Name	Sync the Incident suspend status to tasks			
hiles		0	Add Dula	
Rule Description			Add Rule	
Run Action to sync pendin "Suspended"))	g status (when (Status in CurrentRecord = "Suspended" AND Status in S	avedRecord !=	Add Group	
			Edit Rule/Group	
			Remove Rule/Group	
			Move Up	
			Move Down	

In addition to the above configuration, you also need to configure the Run Action rules in the rule set as follows:

- Select **Other Records** for the "Run Action on" field.
- Select **imTask** for the "Table Name" field. This means the target records are incident tasks.
- Use the Query Editor to configure the Filter Record as shown below. The only incident task that belongs to current incident record is included.

Query E	litor(imTask)			×
Mat	ch all of the following conditions			+ 1
Parent In	cident Equals	CurrentRecord (probsummary)	Incident ID	+ 1 -
			Done	Cancel

- Select im.task.syncSuspendFromParent for the Run Rule Set field. This rule set is executed against the related incident task.
- Select Save for the "Action after Rule Set" field. The save action is executed against the related incident task.

Note: You can select **Do nothing**, **Save**, or one of the back end transitions for this field.

- The back end transition list is retrieved from all the workflows of the selected record file. Similar to Configure Run Action rules on related records, at run time, if some of the other records do not have your selected back end transition, the corresponding transition is not run.
- You are suggested to use the same back end transition name in different workflows if these back end transitions follow the same business logic.
- While a back end transition is selected from the list, the interface is updated to indicate to which workflows the transition applies and to which it does not apply.

The form on which you can perform these tasks is shown below:

Run Action on Rec	ord	
	Please choose the back end transit	ion and the rule sets for the chosen records filtered by query editor.
	Rule Description	Run Action to sync pending status
	Condition	(Status in CurrentRecord = "Suspended" AND Status in SavedRecord != "Suspended")
		Edit
	Run Action on	Related Records Other Records Current Record
	Table Name	• imTask 🖌
	Filter Record by	(Parent Incident = Incident ID in CurrentRecord)
		Edit Query
	Run Rule Set	im.task.syncSuspendFromParent 📑 🔍
	Action after Rule Set	• Save
		Ok Cancel

Define a rule set on the target table

You need to define a rule set on the target table. This rule set is used as the value of the "Run Rule Set" field when you define the rule set on the source table. In this example, you define the rule set "im.task.syncSuspendFromParent" on the target table "imTask" that stores the incident task records.

ule Set			
ID Available as action Name	im.task.syncSuspendFromParent Sync suspend to this task from Parent Incident	Table name	HP Proprietary
Dule Dessistion			Add Rule
Rule Description Set Status via JavaSc	ript		Add Group
			Edit Rule/Group
			Remove Rule/Group
			Move Up
			Move Down

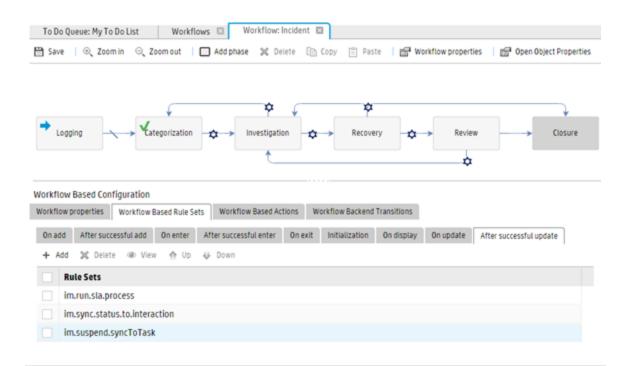

You need to configure a Set Field rule to change the status of the incident task to the value of "Suspended". To do this, you can use JavaScript, in which you can refer to the current source record as srcRecord and the original copy of the source record (before any changes are made by the user) as oldSrcRecord. The system only supports invoking the current rule from the Run Action rule at run time.

Set Field				
	Set Field Value with the V	Value defined via JavaScript.		
	Rule Description	* Set Status via JavaScript		
	Condition			
		Edit		
	Field Name	* Status	~	
	This script should set	the variable "value" to the desired value for	the field.	
	value="Suspended"	·,		
			Ok	Cancel

In JavaScript, the current record and the original copy of the record are also referred as record and oldRecord. In this example, they are the current incident task record and original incident task record.

Configure the rule set on the source table into an appropriate workflow

In this example, you can configure the rule set into the **After successful update** event of the incident workflow, which means when the status of the incident record is changed to "Suspended", the rule set is triggered.

Note: The Run Action rule is executed in a sequential manner, which means the configured rule sets and actions of each related record are called one after another. If one of the rule sets and actions fails, for example, one of the related record is locked by another user, the whole execution stops and returns with a failure result. If you want the system to handle the failed execution on related records caused by record locking, you can combine the Run Action rules and the Run Scheduled Action rules. For details, see Combine the Run Action rules and the Run Scheduled Action rules.

Configure Run Action rules on the current record

You can configure the Run Action rules to enable Service Manager to perform automatic operations on the current record. Usually this rule type can be used to easily expose a back end transition call as an action. To expose a back end transition configured in a workflow, you can use JavaScript or RAD calls as well. However, that approach is not quite user-friendly. By using the Run Action rules, you can easily expose the back end transitions. For details about calling back end transitions, see the Workflow back end transitions section in Configure a workflow.

For example, in the out-of-box incident workflow, there is a back end transition "close.any.time" that can move the incident to the Closure phase whatever current phase is. The back end transition is shown as follows:

To Do Queue: My To Do List W	orkflows 🖾 Workflow: Incident		
💾 Save 🔍 Zoom in 🔍 Zoom out	t 🔲 Add phase 🔉 Delete [) Copy 📋 Paste 🚰 Workflo	w properties 🔰 🚰 Open Object Properties
ç		¢	
Logging Kategoriza	tion 🕁 Investigation 🚽	Recovery	Review
			¢
Vorkflow Based Configuration			
Workflow properties Workflow Based Ru	ule Sets Workflow Based Actions	Workflow Backend Transitions	
Workflow properties Workflow Based Ru + Add 🖌 Edit 💢 Delete 🏫 Up		Workflow Backend Transitions	
		Vorkflow Backend Transitions Condition	Rule Set

To be able to invoke the transition, you need to first add a rule set that contains the Run Action rule, and then mark this rule set as **Available as action**, as shown below:

ule Set			
ID	* im.close.anyway		HP Proprietary
Available as action	✓	Table name	probsummary 🔍
Name	close the Incident anyway		
Rules			
Rule Description		•	Add Rule
Run Action			Add Group
			Edit Rule/Group
			Remove Rule/Group
			Move Up
			Move Down

In addition, you also need to configure the Run Action rules in rule set as follows:

- Select Current Record for the "Run Action on" field
- Keep the "Run Rule Set" field empty
- Select Backend Transition:close.any.time for the "Action after Rule Set" field. The save action is
 executed against the current incident record.

Note: You can select Do nothing, Save, or one of the back end transitions.

- The back end transition list is retrieved from all the workflows of the selected record file. Similar to Configure Run Action rules on related records, at run time, if some of the other records do not have your selected back end transition, the corresponding transition is not run.
- You are suggested to use the same back end transition name in different workflows if these back end transitions follow the same business logic.
- While a back end transition is selected from the list, the interface is updated to indicate to which workflows the transition applies and to which it does not apply.

The form on which you can perform these tasks is shown below:

Run	Act	ion	on	Rec	ord
-----	-----	-----	----	-----	-----

Please choose the back end transition and the rule sets for the chosen records filtered by query editor.					
Rule Description	• Run Action				
Condition					
	Edit				
Run Action on	Related Records Other Records Other Records Current Record				
Filter Record by					
Run Rule Set	e c				
Action after Rule Set	Backend Transition:close.any.time This backend transition applies to following workflows: Incident.				
	Ok Cancel				

Upon completing all the above configurations, you can expose the rule set as an action by adding it to the workflow level actions:

Work	kflow Based Configuration						
World	kflow properties Workflow Based	Rule Sets Workflow Based Actio	Workflow Backend Transition	15			
+ /	Add 🕜 Eolt 🛠 Delete 🔶	Up 🕹 Down					
	Id	Action	Location	Optio	Action Condition	Action when complete	Requires lock
	Close Anyway	close the incident anyway 🔽 🔍	More Options List 🐱		(the "Expert" value in the "Incide 🔂	~	
	ce.acknowledge	Acknowledge Case Exchange	More Options List Update	Cano	ei		false
	Solution Matching	Incident matching	More Options List	316	SL.tableAccess.update and		false

Note: Only expose such actions to specific persons or operations. For example, you can expose it to the person who has the Expert permission on the Incident area by setting the security level with the Action Condition. If you want to make it available only to a Web Service call, set your Action Condition accordingly.

Configure Run Scheduled Action rules

You can configure the Run Scheduled Action rules to enable Service Manager to perform scheduled automatic operations on the current record. This rule can be used in situations like automatic record closure.

For example, you might want the system to automatically close the incidents that were resolved seven days ago. To do that, first define a rule set with the Run Scheduled Action rules. You can define the rule set on the table "probsummary" that stores incident records, as shown below:

Rule Set			
ID Available as action Name		Table name	HP Proprietary
Rules Rule Descriptio	n	•	Add Rule
	ion (when (Priority in CurrentRecord = "4" OR Prio	prity in	Add Group
			Edit Rule/Group
			Remove Rule/Group
			Move Up
			Move Down

In addition to the above configurations, you also need to configure the Run Scheduled Action rules in this rule set as follows:

• Set the conditions as follows. This only takes the low priority incidents into account.

ondition Edit	or				>
Match any of the	e following conditions				+ =
CurrentRecord	Priority	Equals	Value	4 - Low	+ = -
CurrentRecord	Priority	Equals	Value	3 - Average	+ = -

At run time, only when the condition is matched, this rule is executed to generate a scheduled record

with the class of "scheduledAction". Note that this rule type introduces a new back end scheduler process named "Scheduled Action processor", which checks for the schedule records and executes them.

- Select Use field in record + interval for the Calculation Type field
- Select Resolved Time for the Calc Field field

Note: Make sure the resolve time of the incident is set correctly while the incident is resolved, because the schedule execution time is calculated based on the value of that field.

- Set **7 00:00:00** for the Calc Interval field. This means the scheduled action is executed after seven days.
- Set the Action Condition as follows. The condition is checked when the scheduled time arrives. In this
 example, it is seven days after the incident is resolved. Only when the status of the incident is still
 Resolved, and the priority is still low at the time, the action is executed; otherwise the action is
 ignored.

Match all of the	following conditions				+ 1
UrrentRecord	Status	Equals	Value	Resolved	+ = -
Match any of the	e following conditions				+ 1 -
urrentRecord	Priority	Equals	Value	3 - Average	+ 5 -
urrentRecord	Priority	Equals	Value	4 - Low	+

- Keep the Run Rule Set field empty
- Select Backend Transition:close.any.time for the "Action after Rule Set" field. The save action is
 executed against the current record by the back end scheduler process when the scheduled time
 arrives.

Note: You can select **Do nothing**, **Save**, or one of the back end transitions.

- The back end transition list is retrieved from all the workflows of the selected record file. Similar to Configure Run Action rules on related records, at run time, if some of the other records do not have your selected back end transition, the corresponding transition is not run.
- You are suggested to use the same back end transition name in different workflows if these backend trasitions follow the same business logic.
- While a back end transition is selected from the list, the interface is updated to indicate to which workflows the transition applies and to which it does not apply.

The form on which you can perform these tasks is shown below:

Run Scheduled Action on Record

Please choose the back end tra	nsition and the rule sets to run when the scheduler is triggered.
Rule Description	Run Scheduled Action
Condition	(Priority in CurrentRecord = "4" OR Priority in CurrentRecord = "3")
	Edit
Calculation Type	Use field in record + interval Use javascript to set variable actionExecutionTime
Calc Field	* Resolved Time
Calc Interval	 7 00:00:00
Action Condition	(Status in CurrentRecord = "Resolved" AND (Priority in CurrentRecord = "3" OR Priority in CurrentRecord = "4")) Edit
Run Rule Set	
Action after Rule Set	Backend Transition:close.any.tir Source And Transition applies to following workflows: Incident.
	0k Cancel

Note: The Run Scheduled Action rule does not support selecting work schedule and time zone in this release.

To make the Run Scheduled Action rules work at run time, make sure the back end processor "Scheduled Action processor" is started, as shown below:

To Do Queue: My To Do List	Select startup record 🖾

Combine the Run Action rules and the Run Scheduled Action rules

In Service Manager, the Run Action rules are executed in a sequential manner. Take the related records as an example, if one of the rules sets or actions against the related records fails, the whole execution stops and return a failure result. To ensure successful execution, you can combine the Run Action rules and the Run Scheduled Action rules, so that the execution can be scheduled if it fails due to record locking.

In the out-of-box configuration, when the status of an incident changes, the status of the related interaction also changes accordingly. To achieve this, a rule set "im.sync.status.to.interaction" is configured in the "After successful update" event of the Incident workflow, as shown below:

To Do Que	eue: My To Do Li	51 10	orkflows 🛛	3 Workf						
Save	🔍 Zoom in	⊖ Zoom ou	Ad	dd phase 🗦	Colete []	Copy 📋 Past	e 🗗 W	orkflow properti	ies 👉 Ope	n Object Properties
→		¥.			¢ ,	¢				
Loggin	ng	Categoriza	tion 🌣	Invest	tigation 式	Recover	у Ф	-> Review	N	Closure
					t			\$		
	Based Configura	ition kflow Based Ri	le Sets	Workflow Bas	ed Actions	Norkflow Backend	Transitions			
		kflow Based R		Workflow Bas successful er		Norkflow Backend	Transitions On display	On update	After successf	ul update
Vorkflow pr	After successful	kflow Based Ri	ter After					On update	After successf	ul update
On add + Add	After successful	kflow Based Ri add On en	ter After	successful en				On update	After successf	ul update
Norkflow pr On add + Add Rut	After successful	kflow Based Ri add On en View 🏫	ter After	successful en				On update	After successf	ul update

This rule set is configured on the "probsummary" table that stores incident records:

ule Set			
ID Available as action	Im.sync.status.to.interaction	Table name	HP Proprietary
Name	Sync Status to Interaction		
Rules			
Rule Description		0	Add Rule
Sync Interaction Status (whe	n (Expression: problem.status in \$L.file~=problem.status in \$L.file.	save))	Add Group
			Edit Rule/Group
			Remove Rule/Group
			Move Up
			Move Down

In addition, you also need to configure the Run Action rules in the rule set as follows:

- Name the condition something like "Sync Interaction Status", which makes it easy for you to understand the purpose of the condition
- Select Related Records for the "Run Action on" field
- Select **Escalate From Interaction** for the "Relation Type" field. This means the target related record is the interaction from which incident is escalated.
- Select **sd.sync.status.from.escalation** for the "Run Rule Set" field. This rule set is executed against the related interaction. To handle the operation failure on locked interaction, this rule set must contain the Run Scheduled Action rule.
- Select **Do nothing** for the "Action after Rule Set" field. Actions like the save operation on target records are configured in the "sd.sync.status.from.escalation" rule set.

The form on which you can perform these tasks is shown below:

Rule Description		Please choose the back end tran
Edit Run Action on Related Records Other Records Current Record Relation Type Escalate From Interaction Filter Record by Edit Query Edit Query Run Rule Set sd.sync.status.from.escalation Sd.sync.status.from.escalation 		Rule Description
Run Action on Related Records Other Records Current Record * Escalate From Interaction Filter Record by Edit Query Run Rule Set * sd.sync.status.from.escalation	SL.file.save)	Condition
Relation Type • Escalate From Interaction Filter Record by Run Rule Set • sd.sync.status.from.escalation		
Edit Query Run Rule Set	O Current Record	Run Action on
Edit Query Run Rule Set Sd.sync.status.from.escalation		Relation Type
Run Rule Set sd.sync.status.from.escalation		Filter Record by
Action after Rule Set Do nothing		Run Rule Set
		Action after Rule Set
Ok	Ok Cano	

After defining the rule set on the source table, you need to define the rule set on the target table. The rule set on the target table is used as the value of the "Run Rule Set" field when you define the rule set for the source table. In this example, you define the rule set "sd.sync.status.from.escalation" on the target table "incidents" that stores the interaction records:

ule Set			
ID Available as action Name	sd.sync.status.from.escalation Sync Status From other Module	Table name	HP Proprietary
Rule Description			Add Rule
Sync Interaction Status From	Escalation (when Always)		Add Group
			Edit Rule/Group
			Remove Rule/Group
			Move Up
			Move Down

In this rule set, a Scheduled Action rule is configured to sync up the status of the incident and the status of the interaction. The configuration is as follows:

- Specify the scheduled execution time as the current time by using JavaScript. This ensures the schedule is executed as early as possible, that is, it is executed the next time the back end scheduler "Scheduled Action processor" is activated.
- Select **Escalate From Interaction** as the Relation Type. This means the target related record is the interaction from which the incident is escalated.
- Specify the Action condition to call a JavaScript method
 StatusSyncServiceBeanWrapper.callBeanMethod("setSyncStatus",\$L.file). All the main logic is included in this JavaScript method.
 - If status synchronization is needed and successful, this method returns true, and then the Save action is executed.
 - If status synchronization is not needed, this method returns false, and then the Save action is ignored automatically.
- Keep the Run Rule Set field empty.
- Select **Save** for the "Action after Rule Set"field. While the record is saved, if it is locked, the saving operation fails, and a schedule record is rescheduled instead of being deleted.

Note: Variables, which are referred to as srcRecordfor the current source record and as oldSrcRecord for the original source record in JavaScript, are not supported if the Run Scheduled Action rules are used.

Run Scheduled Action on Record

Please choose the back end trans	sition and the rule sets to run when the scheduler is triggered.
Rule Description	Sync Interaction Status From Escalation
Condition	Always
	Edit
Calculation Type	Use field in record + interval Use javascript to set variable actionExecutionTime

	Edit
Run Rule Set	e c
Action after Rule Set	• Save

Ok

Cancel

Best practices for configuring task planner

Task Planner enables you to schedule tasks in HP Service Manager modules such as Change Management or Request Management. This section provides information about the best practices for using the Task Planner. For example, you can configure shared information across multiple tasks, or you can use record context to drive workflows.

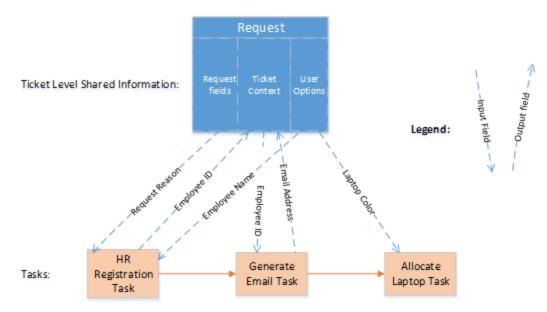

Configure shared information across tasks

You can use Task Planner to configure information shared by multiple tasks.

The following three types of information from a record can be shared by the tasks of a record:

- Record fields, for example, the request fields or the change fields
- User selections, which are input by the end user when they use Service Manager
- Record context, which are fields defined in Task Planner. The values of these fields are populated during task implementation and then shared across the tasks of a record.

The following diagram demonstrates how these three types of information of a Request is shared among its tasks.

E dis Constant

Each task can have its own input and output data. The input fields are used to receive data from other tasks, and can trigger the execution of the current task. The output fields are used to populate shared data to the record during task execution, and the data can then be shared by other tasks.

You can launch the Record Context (Ticket Context) definition page from the Task Planner. The page is shown as follows:

File Name 4	¢ Id	\$ Label	٥	Type 🗢	Addi Type Info	۰	Table Field Na 🕈	File Id	Value
requestModel	license	License		string				Software Packa	h
requestModel	software	Software		configurationitem				Software Packa	h
requestModel	Version	Version		string				Software Packa)

On the definition page of the Task Planner, you can configure the input and output fields. The Record Context fields of a record can be used as the input or output fields of a task, and the output fields can be used in subsequent tasks as the input fields.

🗶 Cancel 🛱 Save 8	Exit 🗎 Save + Add Tas	k 🔍 Zoomin	⊖, Zoom out	🖽 Auto Layout	× Delete	Ticket Context	Refresh
Order Software	© Contraction Con	ł					
Task-Properties Input:	Parent File [Affected Service] ³⁰	Parent File [Title	e) ³⁴ Parent File	[Project id] ³⁶			ଷା.
Output:	Ticket Context [Software] [™]	Ficket Context [Ve	rsion] [≫] Ticket (ontext [License] ³⁰			© <mark>.</mark>

The following Task Context page shows the run-time result of a task, which contains the input and output fields/values. The input fields are read-only, while the output fields can be edited with appropriate values that can be populated to the next task later.

Process Designer Tailoring Best Practices Guide (Codeless Mode) Best practices for configuring task planner

Use record context fields in Condition Editor

The Condition Editor does not support using the value of a record context field directly as part of the condition, so you have to manually retrieve the value and put it into a Service Manager variable, and then you can use this variable in Condition Editor.

For example, if you want to use the record context field "employeeType" as part of the condition in the Request workflow, you need to execute the following JavaScript code before your condition is evaluated:

vars["\$L.ticketcontext.license"] = lib.c.\$("#taskPlannerService").getTicketContextFieldValue("request", record.number, "employeeType");

Or you can use the JavaScript below in the Request Task workflow:

vars["\$L.ticketcontext.license"] = lib.c.\$("#taskPlannerService").getTicketContextFieldValue("request", record.parent_request, "employeeType");

Finally, you can configure the condition to something in the Condition Editor as shown below:

+ 5
+ 1 -

Use predefined additional task fields

When you plan a task in Task Planner, you might want to use fields that are not available in the out-ofbox configuration. In this case, you can define new fields for Task Planner at the object level or category level.

For example, in the following screenshot you can see that a field is defined at the object level – if you do not specify any value for the Task Category Name field, the field is defined at the object level, which applies to all category tasks.

File Name:	requestTask					
Task Category Name	s		B Q			
Add Field	d E	dit Field	Delete Field			
Field Name	Is Mandatory?	Is Record Type?	Reference Table	Reference Field	Reference Query	
Planned Lead Time	No	No				

And as shown in the following screen shot, if you specify a value for the Task Category Name field, the field is defined at the category level, which applies only to this task category.

File Name:	requestTask					
Task Category Nam	e: Purchase		B <			
Add Field	d E	dit Field	Delete Field			
Field Name	Is Mandatory?	Is Record Type?	Reference Table	Reference Field	Reference Query	0
Ship To Location	Yes	Yes	location	location.full.name		

At run time, the predefined fields at both the object level and the category level are merged together and displayed in Task Planner. If a field is defined at both levels, the definition at the category level is used. Process Designer Tailoring Best Practices Guide (Codeless Mode) Best practices for configuring task planner

After being defined, the predefined additional task fields are displayed at the bottom of the Task-Properties tab. Your entered data is inserted into the task that is created in Task Planner.

Assignment Rule:	Initialize assignment group and assignee for request task	
Mark as required	d/Set properties as read-only	
Planned Lead Time:	The format of duration should be DDD HH:MM:SS, DDD and SS is optional	
Ship To Location*:		

Plan appropriate number of tasks in a same open phase

When you define a task plan, you can specify the "Open in Phase" field of a task, which means this task is created at run time when the workflow of the record moves to the phase. Currently all the tasks you plan with the same "Open in Phase" value are created immediately when the record moves to the corresponding phase.

Too many tasks for a phase may result in decreased performance. For example, if you plan more than 10 tasks, the operator might feel obvious performance downgrade when he moves the record to that phase. To ensure the best performance, it is recommended that no more than 10 tasks are automatically started once a phase is entered.

Note: The performance of generating tasks in Task Planner is not only affected by the number of planned tasks, but also by the business logic you plan for task creation. The more complex and time-consuming the logic is, the more performance downgrade you might encounter.

Best practices for using the Condition Editor

The Condition Editor enables you to build a condition without any knowledge of programming languages. Conditions always evaluate to True or False. When a condition evaluates to True, the system runs the rule or applies an action that the condition controls. This section provides information about the best practices of using the Condition Editor.

Use cross-table fields in Condition Editor

Cross-table fields, which are defined by a reference record, are the fields of related tables. The table relationship is maintained by the Relation Manager in Service Manager. You can use cross-table fields in Condition Editor to configure various conditions.

To configure the cross-table fields as part of a condition, you can select the cross-table field names in Condition Editor. However, using cross-table fields might be time-consuming because the system needs to prepare the variable of the reference record at run time. For example, an incident record has the field "Contact", which refers to the Contact record. You can configure the Rule condition to use the Location of the Contact record directly, as shown below:

n JavaScript	Please enter the JavaScript to run. You can set the returnCode, message, mogType and curso Position variables to indicate if the validation is successful, message to display and cursor for	cut.
	Rule Description * Run JavaScript Validation	
	Condition Editor X	
	Retch all of the fullowing conditions (+	
	ContentRecord Contect-Contect-Localia Value Asia + + + -	
	Done Cancel	
	Ok	Cancel

At run time, the expression is evaluated to something as follows:

location in \$L.file.contact.name.contacts.contact.name="Asia"

The variable \$L.file.contact.name.contacts.contact.name is prepared by the rule engine.

If you use the Condition in your own scenario, make sure to invoke the JavaScript method below at run time before evaluating the condition expression, which automatically prepares the cross-table reference record for you:

```
lib.Workflow.initVarForCondition(conditionXml);
```

Use user option fields in Condition Editor

You can configure the User Option fields as part of a condition by specifying the names and values of the user option fields in Condition Editor.

However, using the user option fields might be time-consuming because the system needs to prepare variables for the user option fields at run time. For example, you configure to use the User Option as part of a task condition in Task Planner as follows:

HR Re	gistration		e NT Account	► Laptop Installa	tion		
		Condition Edi	tor				×
		Match all of t	he following conditions				+ 5
		UserOption	EmployeeType	Equals	Value	Regular	+ 5 -
Task-Properties	input-Output						
Title*:	HR Registral						
Task Category*:	Labor						
Open In Phase*:	Fulfillment						
Task Template:						Done	Cancel
Task Condition:	(\$L.UO.Empt	oyeeType = "Regula	0		19		
Assignment Rule:					~		
Mark as require	d/Set propertie	s as read-only					
Planned Lead Time:	The format of	f duration should be	DDD HH:MM:SS, DDD and	SS is optional			

At run time, the expression is evaluated to something as follows:

\$L.UO.EmployeeType="Regular"

The variable \$L.UO.EmployeeType is prepared by the system.

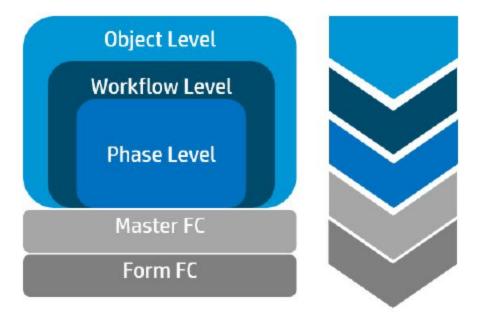

If you use the condition in your own scenario, make sure that you invoke the JavaScript method below at run time before evaluating the condition expression, which automatically prepares the user option variable for you:

```
lib.Workflow.initVarForCondition(conditionXml);
```

Note: The instance data of a user option is stored as a string value in the file userOption, and thus at run time, when the user option value is evaluated, it is also treated as a string value.

Consider rule set execution order

A rule set contains a list of rules that you may run against a record. Rules implement business logic to drive a workflow or a process. In Service Manager, you can define rule sets at the object level, workflow level, or phase level. The rule sets defined at different levels are executed in order. For example, rule sets defined at the object level are executed first. The following diagram illustrates this execution order (from top to bottom):

For each action in Service Manager, such as creating a record, rule sets defined at different levels might be executed. The following table provides a high level view of the execution order of these rule sets:

Action	Execution order of the rule sets (from left to right)
Create a record	On add, On enter, Format control (add), After successful add, After successful enter, Format control (subroutine after add), Initialization, Format control (initial), On display, Format Control (display)
Update a record	On update, Format control (update), After successful update, Format control (subroutine after update), Initialization, Format control (initial), On display, Format control (display)

Action	Execution order of the rule sets (from left to right)
Search and access a record	Initialization, Format control (initial), On display, Format control (display)
Fill, find, screen-redraw	On display, Format control (display)
Move from one phase to anotherClose record (inactive)	On exit (global + old phase), Transition, On enter (global + new phase), Format control (update), Format control (subroutine after update), Initialization, Format control (initial), On display, Format control (display)
	Note : The term "global" means rule sets defined at the object level or the workflow level.

When you define your own rule sets in Service Manager, you might need to consider the execution order of the rule sets, so that you can optimize the definition of your own rule sets accordingly.

The following tables provides a more detailed view of the execution order of the rule sets that are executed for each action. The events and their corresponding rule sets are executed from top to bottom.

Open an existing record

Best practices for tailoring Service Manager Codeless module

This chapter describes the best practices and recommendations for creating Service Manager Codeless module from scratch or for tailoring an out-of-box Service Manager Codeless module.

Create a Security module

Note: If you are going to use an existing Service Manager Codeless module rather than adding a new Service Manager Codeless module, ignore this section.

Service Manager does not include a menu entry for the Security module. To access the Security module, run the **db** command in Service Manager, and then select the secModule table to access the Security module.

Service Manager Module				
Name: Incident	Management		🖌 нр р	roprietary
License Token: Incident	Management			

If you want to add a new Service Manager Codeless module to Service Manager, you must first add a new Security module. Usually, each Service Manager Codeless module maps to a Security module. For example, if you want to add a new Service Manager Codeless Release Management module, you must also add a Release Management security module.

License	loken:													

Configure Security Areas for the module

A security area defines a specific functional area within Service Manager, such as Incident, Incident Task, or Incident Management Configuration. Each security area definition includes default rights that are copied to the role whenever a new role is created.

Usually, you must create the following Security Areas for Service Manager Codeless module:

- A Security Area that contains the default security rights and settings for tickets
- A Security Area that contains the default security rights and settings for the module's Management configuration. For example, the security rights for maintaining the Categories, Approval Definitions, and so on
- A Security Area that contains the default security rights and settings for request tasks (only if your Service Manager Codeless module includes tasks)

The default rights and settings in the Security Area are copied to new roles that are created for this area. However, the values of specific settings are inherited only if no value is specified for those settings in the role.

For example, an out-of-box Request module contains the following Security Areas:

- Request
- Request Management Configuration
- Request Tasks

Configure the Security Area settings

If you need to configure additional security rights in addition to the default rights (such as View, New, Update, Delete/Close, and Modify Template) to control a Security Area, you can modify the Security Area settings.

For example, out-of-box Request modules include a security control that determines whether users have the right to edit the task planner for a record. You can add settings such as this to the Request Area.

Configure the Security Roles

Security Roles are groups of rights in Security Areas.

Note: Security Roles replace the profiles in Service Manager Classic modules.

Out-of-box Request modules include the following Security Roles:

- Request Analyst
- Request Approver
- Request Coordinator
- Request Manager
- Request Process Owner
- Requestor

Assign Security Roles to an operator

To grant an operator the rights associated with a specific role, you must assign the Security Role to the operator.

The following screenshot demonstrates the Request module Security Roles that are assigned to Request Analysts in an out-of-box Request module.

Configure the dbdict and the data policy

Name	Туре	Comments		
category	yory character If your workflow is based on a category, this field stores the catego the record. Ignore this field if your workflow is based on an object.			
		This field is automatically filled by the Process Designer framework in the following situations:		
		• A record is created by the document.new RAD script.		
		• A record's category is changed by the document.chgCat RAD script.		
current.phase	character	This field indicates the current workflow phase of the record.		
		This field is automatically filled by the Process Designer framework when the workflow phase changes.		
record.active	logic	This field indicates whether this record is active or not. Usually, a record is set to inactive after it is closed, canceled, or withdrawn.		
		This field is automatically filled by the Process Designer framework based on the value of the "Records in this phase are active" phase property on the target phase when the workflow phase changes.		
		For more information about the "Records in this phase are active" workflow phase property, see the TODO," section.		

Process designer framework requires the following fields in dbdict and datadict.

Note: If you are already using other field names in your dbdict to achieve the same purposes, add alias fields to them with the above field names.

In the data policy, you must set the Area for the current file. This enables you to use the following variables to check whether a user can access a record. The variables are calculated based on the new, view, update, and delete folder settings from this Area, according to the Security Roles assigned to the current user:

- \$L.tableAccess.new
- \$L.tableAccess.view
- \$L.tableAccess.update
- \$L.tableAccess.delete

- \$L.tableAccess.expert
- \$L.tableAccess.admin

For example, out-of-box Request modules include the following mapping between files and Security Areas:

• Request (the Request record table) maps to the "Request" Security Area

As soon as the area is set, every access against this object is controlled by the security settings of that Security Area.

Enable a Document Engine object to use Process Designer

To enable Document Engine objects to use Process Designer, you must configure the following fields:

Profile application

Set this field to **secRoleBasedAccess** to replace the profile-based security application with the new

role-based security application.

- Profile variable Set this field to **\$L.env**.
- Category table name Specify the category table name if your module uses this concept.

• Phase table name

If you store additional phase information (other than the Workflow Phase) in a table, specify the table name. Otherwise, leave this field empty.

Master format control

Leave this field empty if you do not use master format control any more.

Note: Although format control is still supported with the Process Designer framework, we recommend that you convert all business logic into rule sets instead of format control.

Workflow Location

An object in Service Manager Codeless module is always associated with a workflow or workflows. Select one of the following options to configure the workflow location:

- By Object (if the object has only one workflow)
- By Category (if the object has several workflows, and each category is associated with a workflow)

Note: If you use categories, your category table must contain a field called "workflow" in the dbdict. If the workflow is stored in another field in this category table, the workflow will not work.

File name: Common name:	Request	Jnique key:	number 🔍

	1	Workflow Location:	By Category 🖌
Workgroup fields:	assigned.group	Configure Object	t Based Rule Sets and Actions

Object-based rule sets and actions

Object-based rules and actions help to reduce duplicated definitions. Instead of defining them for each workflow, you can define them at the object level, and they will apply to all workflows that are available for an object.

For more information, see "Configure rule sets and actions" on page 84.

Configure a workflow

To create a new workflow, you can create one from scratch or copy an existing workflow.

If you copy an existing workflow, you must enter the information that is described in the following table.

Field	Description
New workflow name	The name of the new workflow
Copy rule sets?	 Determines whether the rule set that are used by the workflow are also copied. Out-of-box rule sets are marked as "HP Proprietary" and are read-only. However, copied rule sets are editable. Select this option if you want to customize rule sets. Do not select this option if you want to use the out-of-box logic.
	Note: We recommend that you use the out-of-box rule sets as far as possible, as this facilitates the upgrade process and enables you to benefit from any future enhancements to out-of-box rule sets.
Rule set prefix	If you copy the rule sets, you must specify a prefix for the copied rule sets. The format new rule set name is <i><prefix>.<the name="" original="" rule="" set=""></the></prefix></i>

Clone a Workflow

	l as the prefix for new rule sets if they are to be copied as v
New workflow name:	* My Incident
Copy rule sets?	
Rule set prefix:	* mycompany

Workflow Properties

We recommend that you add a description of the workflow in the Workflow properties tab of the workflow editor, as this provides guidance to operators when they work on records that follow the workflow.

Categorization	Recovery Closure
Workflow properties Workflow Based Rule Sets Workflow Based Action	Workflow Backend Transitions
Workflow name*	Description
Incident	Font 🔄 🖪 7 🖞 🚋 🗛 🗛 🗄 🗄 🗄 🚳 🙈
Table name*	^ν οτε · · · · · · · · · · · · · · · · · · ·
probsummary	This is the incident workflow in our company. The detailed reference model can be found under the following link.
HP Proprietary	http://www.hp.com

When a description is entered into this field, that description is displayed when operators hover the mouse over the workflow in the workflow viewer of a record.

Workflow Attachments - 0 file(s) attached
This is the incident workflow in our company. The detailed reference model can be found under the following link.

Workflow-based rule sets and actions

Workflow-based rules and actions help to reduce duplicated definitions. Instead of defining them for each workflow phase, you can define them at the workflow level, and they will apply to all workflow phases.

For more information, see "Configure rule sets and actions" on page 84.

Workflow backend transitions

Workflow phases are connected by transitions to move from one phase to another phase, however if you want to move to one phase from whatever current phase is, you can use backend transition to achieve it.

For example, the Incident workflow in out-of-box systems includes a backend transition that moves an Incident record to the Closure phase.

lorkflow Based Con Vorkflow properties	Workflow Based Rule Sets	Workflow Based Actions	Workflow Backend Transition	15
+ Add / Edit	🗶 Delete 🏫 Up 🦊		Condition	Rule Set
Activit	1071		condition	Nute Set

You can invoke backend transitions by using the following methods:

- By using the Run Action rule (for more information, see "Perform automatic operations with Run Action rules" on page 8)
- By using the Run Scheduled Action rule (for more information, see "Configure Run Scheduled Action rules" on page 23)
- By using the se.view.engine, RAD application, as demonstrated by the following image.

P	Parameter Values	
\$	見.file	
	_wfE:close.any.time"	
	4	\$L.file "_wfE:close.any.time"

• By using a JavaScript, as demonstrated by the following image.

```
// with PD(Incident), do backend WF transition close
rc = this.scFile.do&ction("_wfE:close.any.time");
```

RAD Application:

Configure workflow phases

Workflow phases show the state of a record in the workflow and enforce the business logic that must occur in order for the record to move to the next phase. Transitions are used to move from one phase to another phase.

The workflow editor graphical interface enables you to add a phase to an existing workflow. You can add a phase and configure its properties from scratch,or you can clone an existing phase if you want to create a phase that has similar information (such as same form name, rule sets, or other attributes) to an existing phase.

Phase properties

When you create or configure a phase, you must configure the following properties.

Field	Description
Phase Order	The Phase Order field provides each phase with a numerical order within a workflow. These numbers are used in calculations for Response Service Level Targets (SLTs) and similar metrics, so that the number and timestamps of entries and exits from specific phases can be tracked. For example, a Process Target calculation can determine the time of entry to the final phase, and therefore determine whether a breach has occurred. As a best practice, you should specify your starting phase as 1, and your closing phase as the highest number. We also recommend that these numbers should be roughly sequential from phase to phase. However, some workflows may loop multiple times through a sequence or take divergent paths.
Name	The name of the phase. You cannot modify it after you save current workflow.

Display name	The display name of the phase.
Table name	The selected table name during workflow creation. You cannot modify it.
Form Edit condition	If the condition evaluates to true for a user, that user can edit the form. If it does not, the form is read-only.
Records in this phase are active	Select the check box if you want the records in this phase to be active. The "record.active" record field is set to "true" when the record is moved to this phase. Usually, this option is not selected for end phases (such as "Closure," "Cancel," or "Withdraw," and is selected for all other phases.
Make this the first phase	Select this option if you want this phase to be the first phase. Usually you set the "Logging" phase as the first phase.
Make this the default	Select this option if you want this phase to be the default phase.
phase	Note: If the current phase of a record is set to a phase that does not exist in the current workflow, it will be moved to the default phase. This may occur if a phase is removed from a workflow or if data is imported from another source that did not share the same workflow. Or, if you change the category of a record, this record will be moved to the default phase.
Additional Phase Information	Select this option to open the Extended Phase Information page to modify the phase information.
	 Note: Only the Change Management module supports this feature. You cannot edit or delete a phase name from the Extended Phase Information page or the cm3rcatphase.main form. Change Management workflows have unique workflow phases but they will share change phases if the workflow phases have the same name. For example, if Workflow 1 and Workflow 2 each have a phase named "Build and Test," they will share the same change phase record.

Phase-based rule sets and actions

Phase-based rules and actions apply only to the current phase. For more information, see

"Configure rule sets and actions" on page 84.

Alerts

You can use alerts to configure phases, however we recommend that you use the Run Scheduled Action rule instead.

For more information about the Run Scheduled Action rule, see "Configure Run Scheduled Action rules" on page 23.

Configure transitions between workflow phases

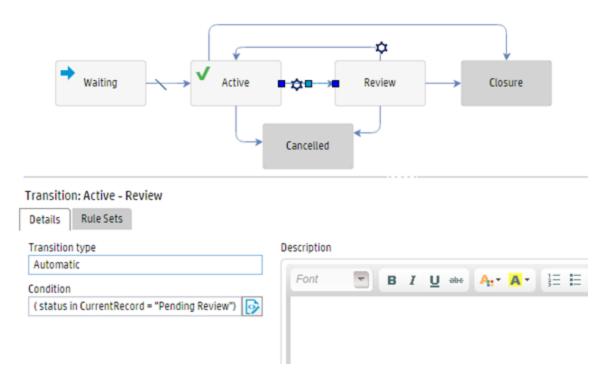

Process Designer workflow transitions occur when a record moves from one phase to another phase. Transitions can happen manually, automatically, or by default.

Automatic transitions

An automatic transition moves the workflow to another phase based on data in the workflow record. The transition occurs when the configured condition is met.

Usually, if your workflow is status driven, you can use automatic transitions and configure the status as the condition of this transition.

In the following example, when the record is in the "Active" phase and its status is set to "Pending Review," the record moves automatically to the "Review" phase when the record is saved.

We recommend that you add descriptions to automatic transitions. These are displayed to the operator to help guide their work.

Manual transitions

A manual transition requires the operator to perform an action to move a record from one phase to another. This type of transition, in which an operator must press a button or otherwise trigger an action, is a manual transition.

Usually, if your workflow is actions driven, you can use manual transitions so that operators move the workflow phase manually. You can also use manual transitions in a status-driven workflow if you still want to move to a specific phase manually.

We recommend that you add descriptions to manual transitions. These are displayed to the operator to help guide their work.

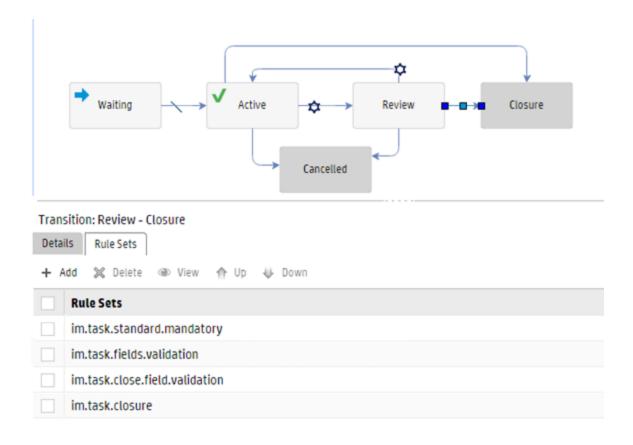

You can configure whether the record is saved before the transition occurs by selecting the "Save record prior executing the transition" option. Usually, if a manual transition needs to trigger the same events as a save operation (for example, to perform the same validation of a save operation), and if you do not want to configure duplicate validation Rule Set on this manual transition, you select this option.

For example, the following image shows a typical manual transition in which the target phase is the "Closure" phase. Therefore, the "Save record prior executing the transition" option is selected.

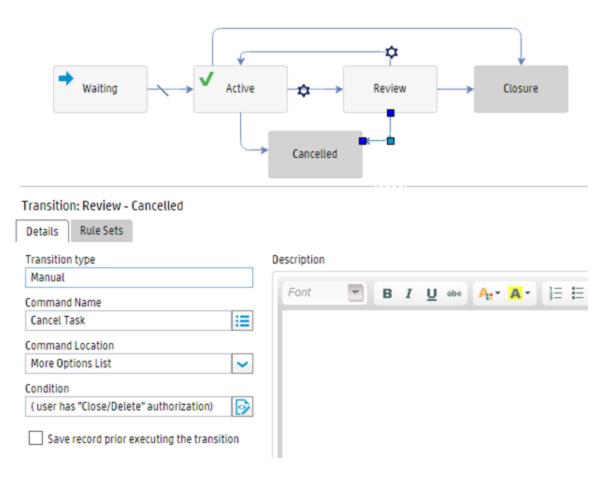

→ Waiting Active	¢
	Cancelled
Transition: Review - Closure	
Details Rule Sets	
Transition type	Description
Manual	
Command Name	Font B I U abe A: A
Close Task	
Command Location	
Tray 🗸	
Condition	
(user has "Close/Delete" authorization)	
Save record prior executing the transition	

This transition uses the following rule set:

- The "im.task.close.field.validation" rule set is needed specifically for this close operation.
- These common mandatory and validation rules are triggered when the record is saved before the transition occurs.
- Only configure rule sets in transitions if they are absolutely necessary to move from one phase to another. Common mandatory rules and validation rules are already configured for the beginning phase (the "Review" phase in the following image), and do not need to be configured in the transition. We do not recommened that you configure rules that are triggered in the different "events."

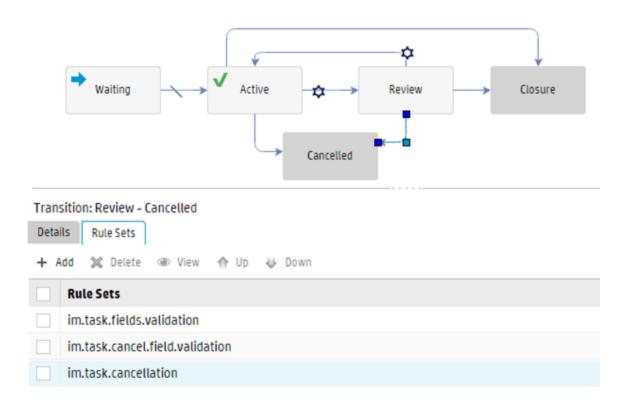

The following image shows an example manual transition in which the target phase is the "Canceled" phase. Therefore, the "Save record prior executing the transition" option is cleared.

This transition uses the following rule sets:

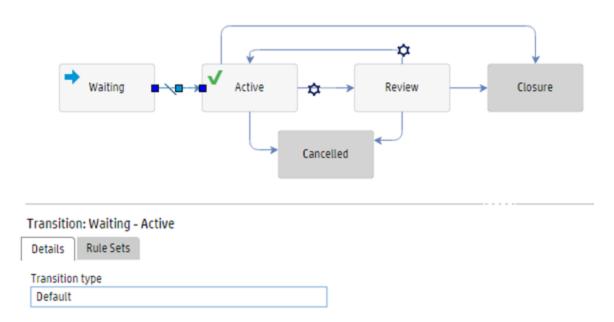

- The only common field validation used is the "im.task.fields.validation" rule set.
- The "im.task.cancel.field.validation" rule set is needed specifically for this close operation.

Use Default Transition

A default transition is a special case that moves the workflow automatically only when no other automatic transition conditions are satisfied.

If your "Logging" (or first) and default phases are not the same phase, you can use a default transition between the "Logging" phase and the default phase.

Forms

You can configure workflows so that a specified form is displayed when that a record moves to a specified phase.

You can user the following methods to specify the form that is displayed:

- In the **Forms** tab in the workflow editor, set the form that is displayed by default in the **Default Display form** field. This form is used when no conditional display forms are displayed.
- In the Forms tab in the workflow editor, configure forms that are displayed when certain conditions are met by clicking Add in the Conditional/Additional Forms section, and selecting Display Form in the Type drop-down list.

Reset Condition	+ Add 3C Delete @ View
Recalculate Condition	Approval name
	Build Authorization (CAB)

To do this, make the following configurations in the **Approvals** tab of the object definition record:

- To determine whether the document engine triggers the approval mechanism, set the value of the **Approval condition** field to "true," or set a specific condition.
- To set the file that contains the approval status, type the file name in the Approval status field.

- To set the conditions under which all existing approvals for a record are deleted and regenerated, enter a condition in the **Reset condition** field.
- To set the conditions under which the approvals are recalculated without first deleting the existing approvals, enter a condition in the **Recalculate condition** field.

Note: The reset con	dition takes priority ov	ver the recalculate condi	tion.

Recalculate approvals if:	evaluate(nullsub(parse(str(approvalsReca	ic in \$L.wfPhase), 2), false))		
Reset approvals if:		t.phase in SL.file.savel) or evaluate(<u>nulisub</u> (pars	e(str(approvalsReset in \$1,.wtPhase), 2).	, falsel)

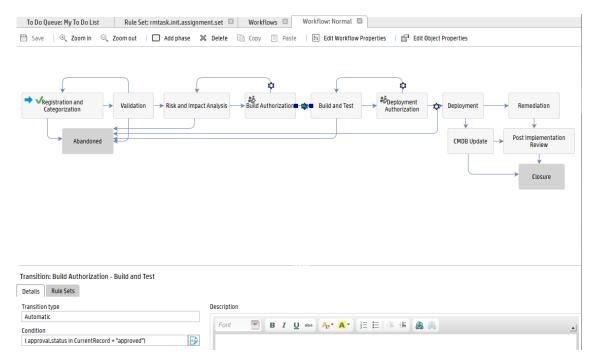

Note: Usually, the recalculate and reset conditions in the object record are configured as follows:

Recalculate approvals if:	evaluate(nullsub(parse(str(approvalsRecalc in \$L.wfPhase), 2), false))
Reset approvals if:	hot (same(current.phase in SL.file, current.phase in SL.file.save)) or evaluate(nullsub(parse(str(approvalsReset in SL.wfPhase), 2), false))

For more information about making further changes to approvals, see the Service Manager Help.

Configure the Approval/Denial process:

Usually, transitions from phases that require approvals to move to the next phase use automatic transitions. For example, you can configure a condition that the **approval.status** field must equal "approved" for an approved record and "denied" for denied record.

In order to trigger the automatic transition after the record is approved or denied, you must configure the approval/denial process to call the se.view.engine RAD script together with the "save" action. This triggers the Process Designer record save operation, and then triggers the automatic transition which matches the condition.

Configure rule sets and actions

Rule sets enforce business logic in elements such as phases or transitions, for example checking if the user has filled in the required data or has the proper security level to perform a transition.

Actions perform a task for a phase, and refer to rule sets that are marked as "Available as Action."

Configure rule sets at various levels

You can configure rule sets in workflows at the following levels:

- At the phase level (only applies to the current phase)
- At the workflow level (applies to all phases in the workflow)
- At the object level (applies to all workflows of the object)

If you expect that a rule set will only be triggered at a specific phase, configure the rule set at the phase level. If you expect that a rule set will be triggered in all the phases of a workflow, configure the rule set at the workflow level. If you expect that a rule set will be triggered in all workflows that are associated with a specific object, configure the workflow at the object level. For example, you can move business logic that you have implemented in triggers to object-based rule sets.

Note: If a call bypasses the Document Engine, the triggers are still invoked, but the rule sets at various levels are not invoked.

Rule set are executed in the following order:

- 1. Object level
- 2. Workflow level
- 3. Phase level

For more information, see "Consider rule set execution order" on page 42.

Configure rule sets at various triggering events

Following is the typical usages:

Triggering event	Triggering action	Typical usage	Typical configured rule type	Phase level	Workflow level	Object level
On add	Runs immediately before the record is added to the database	 Set the record ID if delaying assigning record number Set default field values if they are empty Automatically assign to the best team or assignee Check the mandatory fields and variables for logging Check whether the completed fields are valid 	 Set Field from Number rule Set Field rule Assignment rule Mandatory check: Mandatory check: Set Mandatory Fields rule Mandatory variables rule Validation check: Validate Date rule Validate rext/Numbe r rule Validate against List rule Validate against Table rule 		Yes	Yes

Triggering event	Triggering action	Typical usage	Typical configured rule type	Phase level	Workflow level	Object level
After successful add	Runs immediately after the record is added to the database	 Send email to notify relevant people Send notification to notify operator with a customized message Start or stop the elapsed time of the record 	 Send HTML Email rule Send Notifications rule Start or Stop Clock 		Yes	Yes

Triggering event	Triggering action	Typical usage	Typical configured rule type	Phase level	Workflow level	Object level
On enter	Runs when the record tries to move from another phase into this phase	 Check the mandatory fields and variables for Logging Check whether the completed fields are valid Set default field values 	 Mandatory check: Set Mandatory Fields rule Mandatory Variables rule Validation check: Validate Date rule Validate Text/Numbe r rule Validate against List rule Validate against List rule Validate against List rule Set Field rule 	Yes	Yes	Yes

Triggering event	Triggering action	Typical usage	Typical configured rule type	Phase level	Workflow level	Object level
After successful enter	Runs after the record successfully moves from another phase into this phase	 Send email to notify relevant people Send notification to notify operator with customized message Start or stop the elapsed time for a situation of the record Scheduled automatic actions, forexample, automatic closure Cross-module actions 	 Send HTML Email rule Send Notifications rule Start or Stop Clock Run Scheduled Action Run Action 	Yes	Yes	Yes
On exit	Runs when the record tries to move out of this phase			Yes	Yes	Yes

Triggering event	Triggering action	Typical usage	Typical configured rule type	Phase level	Workflow level	Object level
Initialization	Runs once just before the record is displayed to the user	 Set the record ID if not delaying assigning record number Initialize the list that the current phase uses 	 Set Field from Number rule Run JavaScript rule 	Yes	Yes	Yes
On display	Runs each time the record is displayed after a user action	Initialize the variables that are used on the display form	Run JavaScript rule	Yes	Yes	Yes

Triggering event	Triggering action	Typical usage	Typical configured rule type	Phase level	Workflow level	Object level
On update	Runs immediately before the record is updated in the database	 Check the mandatory fields and variables for logging Check whether the completed fields are valid Wizard to suspend or resume a process 	 Mandatory check: Set Mandatory Fields rule Mandatory Variables rule Validation check: Validate Date rule Validate rule Validate against List rule Validate against List rule Validate against List rule Nalidate against List rule Run a Wizard 	Yes	Yes	Yes

Triggering event	Triggering action	Typical usage	Typical configured rule type	Phase level	Workflow level	Object level
After successful update	Runs immediately after the record is updated successfully in the database	 Send email to notify relevant people Send notification to notify operator with customized message Start or stop the elapsed time of the record Scheduled automatic actions, for example, automatic closure Cross-module actions 	 Send HTML Email rule Send Notifications rule Start or Stop Clock Run Scheduled Action Run Action 	Yes	Yes	Yes

Triggering event	Triggering action	Typical usage	Typical configured rule type	Phase level	Workflow level	Object level
Rule sets on Transitions	Runs when the transition occurs	 Check the mandatory fields and variables for logging Check whether the completed fields are valid Wizard to close or cancel the process for manual transition 	 Mandatory check: Set Mandatory Fields rule Mandatory Variables rule Validation check: Validate Date rule Validate rule Validate against List rule Validate against List rule Validate against List rule Validate against List rule Nalidate against List rule Nalidate against List rule Nalidate against List rule 			

For more information, see "Consider rule set execution order" on page 42.

Configure actions at various levels

Actions can be applied to individual phases.

In certain circumstances, you may want to define actions at the workflow level. For example, in cases where a certain button needed to be present in each phase of a workflow. In other cases, you may want to define actions at the object level (for example, if a certain button needs to be present in each phase of all workflows).

Migrate legacy code to Process Designer

If you are upgrading to Service Manager Codeless from Service Manager Classic, all the legacy coding technologies (format control, display option, and so on) are supported by the Process Designer framework, and you can run your system in a hybrid mode. You can also migrate your legacy technology code to Process Designer technology, which is easier to maintain.

Enable workflow

In a Service Manager Classic module, a workflow is usually configured in the category, and the category table name and phase table name are configured in the object.

Object Definition			
File name: Common name:	rootcause	Unique key:	id
Object Info Object Info Object Info		abal 🗇 Activities 🗇 Alerts	Approvals ³³ 4
Description field: Profile application: Profile variable:	rca.setup.globals 📑 🔾 \$G.rc.environment	Open state: Close state:	rca.open 🛃 🔾
Number record name: Category table name: Phase table name:	problem management P rootcausecat P rootcausephase P	List state: Default state: Search state:	db.list 2 Q rca.view 2 Q rca.search P Q
Paging table name: Master format control:	rootcause de la constante de l	Browse state: Manual states:	rc.browse
Joindef: Status field: Assigned to fields:			
Workgroup fields:	assignee.name	Workflow Location:	T

To enable the workflow, you must configure the workflow location in the object definition. If you set the location to "By Category," the workflow defined in the category record is used. If you set the location to "In Object," you must set the workflow in the object definition.

						-			-

					Workflow Locat	ion:	By Category			•
Workgroup fiel	ds:	assignment		-						
		assignment								

Configure the workflow

In a Service Manager Classic module, workflow phases are stored in the object-specific phase table, and the workflow logic is defined in the category by using the phases in sequence.

Name:	BPPM				
escription:					
Active?					
Problem Detection, Logging and categorization Problem Prioritization and Planning					
Problem Detection, Logging and categorization					
Problem Investigatio	-				
Problem Resolution	, i i i i i i i i i i i i i i i i i i i				

In Service Manager Codeless module, the workflow is configured graphically by using the Workflow Designer in the web UI. You can use this to define more complex logic between phases.

If your workflow location is set by category, the workflow name is specified in the category record:

Problem Cate	go ry		
Name:	problem	Apply To:	Problem
Active:			
Description:	incident		
Workflow:	problem 🔗 🔍	Company:	

Enable Process Designer role-based security

Service Manager Classic modules use the profile-based security model. This is enabled by using the module-specific application (for example, rca.setup.globals for Problem Management) in the object record, and set by the user in the operator table. The settings are stored in module-specific tables (for example, rcenv for Problem Management).

Object Definition			
File name: Common name:	rootcause	Unique key:	id
[Edit Common Name	I	
Object Info	♦ Revisions ♦ Variables/	Global 🗇 Activities 🔷 Alerts	
Description field:			
Profile application:	rca.setup.globals 📑 🔾	Open state:	rca.open 📑 🔍
Profile variable:	\$G.rc.environment	Close state:	🗗 🔾
Number record name:	problem management 🔗 Q	List state:	db.list 📑 🔾
Category table name:	rootcausecat 📑	Default state:	rca.view 🔗 Q

Process Designer provides a common role-base security model. This is enabled by using the secRoleBasedAccess application in the object record, and set by the user in the operator table.

Object Definition						
			_			
File name:	rootcause	Unique key:	id			
Common name:	Problem					
	Edit Common Name					
Object Info	♦ Revisions ♦ Variables/0	Blobal 🗇 Activities	Alerts	Approvals	4

Default Format: Prohibit Default A System Table?	rootcause	Record ID:	Problem id category

Migrate the Format Control to rule sets

In Service Manager Classic, business logic is mainly configured in Format Control. Process Designer uses rule sets.

Format Control still works in Service Manager Codeless, but we suggest that you move all logic from Format Control to the workflow rule sets, as follows.

Format Control	Rule set
Master Format Control "Add"	Object or workflow-based rule sets "On add"
Master Format Control "Update"	Object or workflow-based rule sets "On update"

Master Format Control "Display"	Object or workflow-based rule sets "On display"
Master Format Control "Initial"	Object or workflow-based rule sets "Initialization"
Master Format Control "Delete"	Object or workflow-based rule sets "On update"
Form level Format Control "Add"	Workflow phase-based rule sets "On Enter"
Form level Format Control "Update"	Workflow phase-based rule sets "On update"
Form level Format Control "Display"	Workflow phase-based rule sets "On display"
Form level Format Control "Initial"	Workflow phase-based rule sets "Initialization"
Form level Format Control "Delete"	Workflow phase-based rule sets "On update"

Mandatory validation

Format Control validations are defined on the master format control or the format level format control.

Forms Queries	Calculations JavaScript Validations Subroutines Addl Options Privileges
	Format Control Maintenance - Validations

Set Focus to	affected.item
Message ID	1503
Validation	not null(brief.description in \$file)
Message	Please provide a Title.
Comments	
Add	
the data	

To migrate validation to rule sets, you must define a rule set, set it to corresponding workflow or phase rule sets, and then add the Set Mandatory Fields rule to this rule set.

Validation against a table

To validate a field against another field in a table, you must define queries in master format control or in format level format control. You must write the code for the queries, manually create the scmessage, and indicate the ID if the message needs to be localized.

Forms	Queries	Calculations	JavaScript	Validations	Subroutines	Addl Options	Privileges
Format Control Maintenance - File Queries							
Name:	IM.u	pdate.incident				Viev	v: long
Queries							
							_
Filename		assignmen	nt				
Query		name= ass	ignment in \$fil	e			
Comments							
Add							
Update		true					
Delete							
Display							
Initial							
Required Qu	ery?	true					
Required Fie	ld Name	name					
Error Messa	ge	**+scmeg	(1004, "fc", {ass	signment in \$fil	e})		

To do this in Service Manager Codeless, you can define a Validate Against Table rule.

Validate against Table

Validate a field against a field in another table. You can also filter the data you are validating against and fill data into other fields.				
d!= NULL)				
▼				
<u>í</u>				
rmation				

Set a field value

To set a field value by using Format Control, you must define the calculations in master format control or in format level format control. Additionally, you must use a RAD expression to write the field set statement (and the condition, if necessary).

Ok

Cancel

Forms Qu	ueries	Calculations	JavaScript	Validations	Subroutines	Addl Options	Privileges

To achieve this by using a Process Designer rule set, you can define a rule set and assign it to the desired workflow or phase, and then add a Set Field rule to this rule set.

Set Field Value with	h the Value defined via JavaScript.
Rule Description	* Set Status via JavaScript
Condition	(problem.status in CurrentRecord = NULL)
	Edit
Field Name	* Status 🔍
This script shoul value="Open "	d set the variable "value" to the desired value

Run a Wizard

In Service Manager Classic, wizards are run by calling the wizard.run RAD application.

Process Name:	add.device					
Save Cursor Position?		Run Standard Proces	ss when complete?			
Run in Window?		Window Title:				
Initial Expressions	Initial Javascript 🗇 RAD 🔇	Final Expressions Final Ja	avascript 🗇 Next Process			
Expressions evaluated be	fore RAD call					
			A			
			<u>~</u>			
			×			
RAD Application:	wizard.run	Q Condition:	null(type in \$L.file)			
RAD Application:	wizard.run Parameter Names	Condition: Parameter Values	null(type in \$L.file)			
RAD Application:			null(type in \$L.file)			
RAD Application:	Parameter Names	Parameter Values	null(type in \$L.file)			
RAD Application:	Parameter Names file	Parameter Values \$L.file	null(type in \$L.file)			
RAD Application:	Parameter Names file	Parameter Values \$L.file	null(type in \$L.file)			

To do this in Service Manager Codeless, you can simply use the Run Wizard rule.

Run a Wizard

Specify the wizard to run when this rule is executed.					
Rule Description	* Run the "Incident Suspend" wizard.				
Condition	(problem.status in CurrentRecord = "Suspended" AND problem.status in SavedRecord != "Suspended")				
Wizard to run	Edit * Incident Suspend				

Ok	Cancel

Run a JavaScript

To run a JavaScript by using Format Control, you must define the JavaScript in master format control or format level format control.

Forms Queries Cal	aulations JavaScript Validations Subroutines Addl Options F	Privileges
F	ormat Control Maintenance - JavaScript	
Name: rootcause	View:	long
Add:		
Update:		-
Delete:		
Display:	true	
Initialization:		
JavaScript:		
2 vars.%rc_calendar_s 3 if (vars.%rc_calend 4 { 5 vars.%rc_calend 6 if(vars.%rc_calend	<pre>alendar show condition and url show=lib.RCCondition.isCalendarShow(vars.\$file); dar_show) dar_url=lib.RCCalendarUrl.getUrl(vars.\$file); lendar_url == null){ alendar_show = false;</pre>	*
9) •		2

To do this in Service Manager Codeless, you can define a Run Java Script rule.

Run JavaScript

Please enter the JavaScript to run. You can set the returnCode, message, messageType and cursorPosition variables to indicate if the validation is successful, message to display and cursor focus
Rule Description * Run JavaScript to calculate RC calendar
Condition
Edit
<pre>system.vars.Src_calendar_show=lib.RCCondition.isCalendarShow(system.vars.SL_file); if(system.vars.Src_calendar_url=ib.RCCalendarUrl.getUrl(system.vars.SL_file); if(system.vars.Src_calendar_url==null) { system.vars.Src_calendar_show=false; } }</pre>

Ok Cancel

Additional supported rule types

The following rule types are available in out-of-box Service Manager deployments.

Rule type	Description
Launch a URL	Call a URL to launch a web page
Call a process	Call a Service Manager process record
Case Exchange	Trigger certain activities for the Case Exchange integration
Run a wizard	Run a Service Manager wizard
Clear Fields	Clear the specified field and related fields
JavaScript Validation	Use JavaScript to perform actions and validations
Run JavaScript	Use JavaScript to perform actions and validations
Mandatory Fields	Set fields as mandatory

Rule type	Description
Mandatory Variables	Set variables as mandatory
Send Notifications	Send Service Manager notifications
Launch a Script	Launch a Service Manager script
Send HTML Email	Send an HTML Email to users or a group
Start or Stop Clock	Start and stop a Service Manager clock
Set Field	Set a field value using JavaScript
Set Field from Number	Set field based on a number record
Validate Date	Validate a date against a date range
Field Validation Against a List	Validate a field against a list (global or defined)
Validate against Table	Validate a field against a field in another table and fill data into other fields
Validate Text/Number	Validate a field against a range of text or a number in another field of same table
Field Validation Against a Table	Validate a field against a different table
Popup Message Box	Create and configure popup message boxes that appear to end users
Assignment	Automatically distribute records (such as tasks or records) to the groups and individuals who are most able to process them
Run Action	Run actions (defined by rule sets) on records that have a specified relationship to the record that triggers the rule
Run Scheduled Action	Run actions (defined by rule sets) on records after a specified length of time has passed
Group rules	Group multiple rules into a rule group with an overall condition.

Migrate the display options to actions

In Service Manager Classic, you must use display options to configure the buttons in a tray, more options list, or form.

In Service Manager Codeless, you can use actions to do this. Workflow actions and Manual workflow transitions appear in trays and more options lists as "virtual" display options, or on forms as buttons.

Display options still work in Service Manager Codeless, but we recommend that you move all display options to workflow actions. To do this, follow these steps:

- 1. Identify your custom actions in the legacy states.
- 2. Examine the Display Screen field of each state to identify how the action is used in display options.
- For each of your new custom actions, create a new rule set that calls the process (mapped to the action in the state definition) directly. The "Available as action" option in the rule sets must be selected.
- 4. Add the new actions to the workflows.

The mapping between the display action and the process is set in the state definition.

_							
S	tate Definition						
1	State:		im.view				
1	Display Screen:		apm.edit.problem 🛃 Q				
)	Initialization Process:		im.view.init				
	Format:		nullsub(\$L.format,format	in \$L.file)			
1	Input Condition (view state only):						
	Non-base methods						
	Display Action	Proce	ess Name	Condition	Save First		
	dose	im.se	t.dose	status in \$L.file~="resolved"			
	docks	im.ge	t.docks true				
	newcat	im.ne	wcat	true			
	done	im.do	ne	\$L.mode~="add"	true		
	hot.news hot.n		ews	true			
	getans.search	getar	ns.search.solution	true			
	getans.retrieve	getar	ns.retrieve.solution	true			
	getans.open	oetar	is.open	true			

The definition of the display option that uses the action contains the following settings:

- The value in the GUI option field indicates where the display option is located (tray, more option list, or button).
- The **Default Label** field defines the display name.
- The **Condition** field contains a RAD Expression that defines the security control.

Display Application Option Definition							
Screen ID: apm.edi	t.problem	Modifies Record	Action:	clone	-		
Unique ID: apm.edi	t.problem_clone			back, close, and	more are special

♦ Pre Rad Expressions ♦ Pr	e Javascript 🗇 Rad 🗇 Post Rad Expr	ressions 🗇 Post Javascript					
Expressions are evaluated after	option is selected, but before the RAD ca	all					
Swork.text=Spmc.actions SG.clone.start="yes" SG.clone.number=number in !	\$L.filed				*		

To do this by using a Process Designer action, you must first define a rule set in which the "Available as action" option is selected.

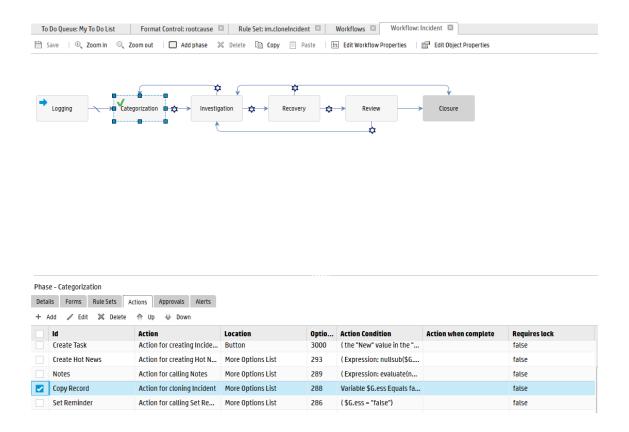

Id ◆ Name ◆ Tablename ◆ Im.clone.relation Clone incident relations probsummary im.clone.relation Action for cloning Incident probsummary
In cloneIncident Action for cloning Incident probsummary 1 to 2 of 2 I ((1)) Show 100 records per page ** Back Previous Next More Image: Show 100 records per page ** Back Previous Next More Image: Show 100 records per page ** Back Previous Next More Image: Show 100 records per page ** Back Previous Next More Image: Show 100 records per page ** Back Previous Next More Image: Show 100 records per page Rules Rule Description Add Rule Pre-Copy (when (\$Lmode != "add")) Add Rule

Pre-Copy (when (\$L.mode != "add"))
Pre-Copy (when (\$L.mode != "add"))
Add Group
Call the Clone Incident process. (when (\$L.mode != "add"))
View Rule/Group

Then, you must add a Call a Process rule to this rule set.

Call a Process					
	Please specify a SM	process to call.			
	Rule Description	* Call the Clone Incident process.			
	Condition	(\$L.mode != "add")			
		Edit			
	Process	* im.incident.clone	<u> </u>		
			Ok	Cancel	

You can use this "action-type" rule set at the workflow or phase levels.

- The Location column indicates where the display option is located (tray, more option list, or button)
- The ID column is set to the display name
- You can use the condition editor to set security controls
