

# **HPE Data Protector**

Software Version: 9.07

## **Granular Recovery Extension User Guide for Microsoft SharePoint Server, Exchange and VMware**

Document Release Date: June 2016  
Software Release Date: June 2016

## Legal Notices

### Warranty

The only warranties for Hewlett Packard Enterprise Development LP products and services are set forth in the express warranty statements accompanying such products and services. Nothing herein should be construed as constituting an additional warranty. HPE shall not be liable for technical or editorial errors or omissions contained herein.

The information contained herein is subject to change without notice.

### Restricted Rights Legend

Confidential computer software. Valid license from HPE required for possession, use or copying. Consistent with FAR 12.211 and 12.212, Commercial Computer Software, Computer Software Documentation, and Technical Data for Commercial Items are licensed to the U.S. Government under vendor's standard commercial license.

## Documentation Updates

The title page of this document contains the following identifying information:

- Software Version number, which indicates the software version.
- Document Release Date, which changes each time the document is updated.
- Software Release Date, which indicates the release date of this version of the software.

To check for recent updates or to verify that you are using the most recent edition of a document, go to:  
**<https://softwaresupport.hp.com>**

This site requires that you register for an HPE Passport and sign in. To register for an HPE Passport ID, go to: **<https://hpp12.passport.hp.com/hppcf/createuser.do>**

Or click the **Register** link at the top of the HPE Software Support page.

You will also receive updated or new editions if you subscribe to the appropriate product support service. Contact your HPE sales representative for details.

## Support

Visit the HPE Software Support Online web site at: **<https://softwaresupport.hp.com>**

This web site provides contact information and details about the products, services, and support that HPE Software offers.

HPE Software online support provides customer self-solve capabilities. It provides a fast and efficient way to access interactive technical support tools needed to manage your business. As a valued support customer, you can benefit by using the support web site to:

- Search for knowledge documents of interest
- Submit and track support cases and enhancement requests
- Download software patches
- Manage support contracts
- Look up HPE support contacts
- Review information about available services
- Enter into discussions with other software customers
- Research and register for software training

Most of the support areas require that you register as an HPE Passport user and sign in. Many also require a support contract. To register for an HPE Passport ID, go to:

**<https://hpp12.passport.hp.com/hppcf/createuser.do>**

To find more information about access levels, go to:

**<https://softwaresupport.hp.com/web/softwaresupport/access-levels>**

**HPE Software Solutions Now** accesses the HPESW Solution and Integration Portal Web site. This site enables you to explore HPE Product Solutions to meet your business needs, includes a full list of Integrations between HPE Products, as well as a listing of ITIL Processes. The URL for this Web site is **<http://h20230.www2.hp.com/sc/solutions/index.jsp>**

Identifying the Advanced GRE Web Plug-in version .....	145
Chapter 20: Troubleshooting .....	147
Before you begin .....	147
Debugging .....	147
Enabling debugging option .....	147
Known issues and workarounds .....	148
Mounting virtual machine disks .....	148
Inability to browse a virtual machine disk .....	149
Issues after removing the extension .....	149
VMware VirtualCenter Management Webservices service is not running .....	150
RSA certificates with keys that are less than 1024 bits long are blocked .....	150
Remote installation of VMware Granular Recovery Extension Web Plug-In ends unexpectedly .....	151

VMware Granular Recovery Extension Web Plug-In installation fails ..... 152

Mounting of LVM logical volumes fail when browsing VMware GRE on Linux ..... 152

VMware Granular Recovery Extension tab is missing ..... 153

VMware Granular Recovery Extension tab is missing with vCenter Server plug-in disabled ..... 153

HPE Data Protector cannot add any Granular Recovery Extension component .... 154

Local installation workaround ..... 154

Monitor displays request removed by administrator ..... 155

Overwritten files issues ..... 155

Missing VIX API libraries ..... 156

Insufficient permission in the Host Operating System ..... 156

Authentication failure or insufficient permission in the Guest Operating System ..... 157

Viewing partitions on selected disk ..... 157

Presentation failed ..... 157

Cached recovery fails ..... 158

Restore session stops after some time ..... 158

The VMware GRE session is unresponsive ..... 159

VMware GRE file recovery could not access network share ..... 159

Resizing the browser window causes an error and reloads the page ..... 159

Browsing for Recovery throws an error message ..... 160

While performing a Recovery operation a session time-out occurs ..... 160

Time difference exists between the backup sessions on the Data Protector GUI and vSphere web client ..... 160

Unable to expand a folder for browsing ..... 161

Expanding a partition for browsing throws an error ..... 161

vSphere web interface becomes greyed out ..... 161

Error message appears while browsing for LVM disks ..... 161

Error message appears when registering the Advanced GRE Web Plug-in ..... 162

The message "VIX API is not installed" re-appears although VIX API is installed ..... 162

Shared folders/directories created on Media Agent host system are not removed ..... 163

While browsing a Smart Cache in the Advanced GRE Web Plug-in you may see mount errors on agent time-out. .... 164

VEPA backup to a Smart Cache fails on a Windows 2008 system. .... 164

Browse and recovery problems with folders containing special characters ..... 164

Unable to browse the disk ..... 165

Unable to view existing requests in Recover Files page of GRE Web Plug-in ..... 165

VMware vSphere Web Client hangs ..... 166

Error message appears while browsing for LVM disks on SLES 12 mount proxy host . 166

The VMware GRE session of large volumes from Smart Cache devices may fail ..... 167

Recovery fails on Virtual Machine ..... 167

VMware Granular Recovery Extension intermittently fails to recover files and folders . 167

The Granular Recovery Extension operation to StoreOnce Catalyst fails, when Data Protector process dpfs is not initialized ..... 168

Backup session performed with "No Logs" option is not eligible for GRE or Live Migrate and Power On from StoreOnce Catalyst ..... 168

Data consistency issues during cached GRE operations ..... 168

# Part 1: Microsoft SharePoint Server and the Granular Recovery Extension

This part of the guide describes Data Protector Granular Recovery Extension for Microsoft Office SharePoint Server 2007, Microsoft SharePoint Server 2010, and Microsoft SharePoint Server 2013 (**Microsoft SharePoint Server**).

This part includes the following chapters:

[Introduction](#)

[Installation](#)

[Configuration](#)

[Backup](#)

[Recovery](#)

[Command Line Interface](#)

[Troubleshooting](#)

# Chapter 1: Introduction

A part of the information provided in this document is also available in a custom Help collection that the HPE Data Protector Granular Recovery Extension for Microsoft SharePoint Server adds to the basic Microsoft SharePoint Server Help. The collection contains Granular Recovery Extension-related topics. You can access them by clicking the Help icon in a Granular Recovery Extension context of the Central Administration site.

## Backup

Back up Microsoft SharePoint Server data using one of the following backup solutions:

- HPE Data Protector Microsoft SharePoint Server 2007/2010/2013 integration
- HPE Data Protector Microsoft SharePoint Server VSS based solution
- HPE Data Protector Microsoft SQL Server integration
- HPE Data Protector Microsoft Volume Shadow Copy Service integration

## Recovery

The benefits of the HPE Data Protector Granular Recovery Extension are the following:

- **recovery granularity**

The smallest object that you can restore with the backup solution is a Microsoft SQL Server database (**content database**), which may contain data of multiple websites. In contrast, the smallest object that you can recover with HPE Data Protector Granular Recovery Extension is an individual website item, for example: a Calendar item, a Calendar, a Tasks item, a Team Discussion item, a document, a shared document, a folder, a list, a library, an announcement, a form, a reporting template, an object's metadata, and a document workflow.

- **integration into Microsoft SharePoint Server Central Administration**

Granular Recovery Extension is fully integrated into the Microsoft SharePoint Server Central Administration. This empowers Site Collection Administrators to perform recovery of single items independently or with minimal interference of backup administrators.

- **recovery of multiple sites**

Accidental deletion of a site is no longer an issue, even if you cannot use the recycle bin to recover your site. Granular Recovery Extension can recover an entire site with multiple subsites.

- **ease of search**

The Granular Recovery Extension advanced and quick search helps you find the item you need to recover. This search system checks object's metadata, enabling you to filter your search by document type, author, date and so on. Objects are displayed in object tree browser.

- **recovery to different locations**

The Granular Recovery Extension enables recovery to different destinations, for example you can recover your objects to different sites, different farms, and to filesystem.

## Chapter 2: Installation

Install the MS SharePoint Granular Recovery Extension on the Microsoft SharePoint Server Central Administration system, to recover individual Microsoft SharePoint Server objects.

The "Microsoft SharePoint Server Clients - Data Protector Granular Recovery Extension for Microsoft SharePoint Server" section in the *HPE Data Protector Installation Guide* provides prerequisites and other details necessary for installing the Data Protector Granular Recovery Extension for Microsoft SharePoint Server.

## Chapter 3: Configuration

This section describes the configuration steps that you need to follow. Not following these steps may lead to failure in recovering your objects.

### Verifying the configuration of the Recovery Web Application

#### Procedure

1. Open the Central Administration webpage and click the **Application Management** tab.
2. Under Application Security, click **Authentication providers** and click **Default**.
3. Ensure that the settings for the Recovery Web Application are the same as the default settings of the Central Administration Application.

### Configuring HPE Data Protector user rights

#### Procedure

1. Launch the Data Protector GUI (**Data Protector Manager**).
2. In the Context list, select **Users**.
3. Ensure the user account under which the Windows SharePoint Services Timer service is running is assigned the Data Protector `Start restore and See private objects` user rights.

### Data Protector user rights

**Note:** The `See private objects` user right is useful in case you created your backup specification configured with access type private, and backup object owner. This is either the account under which the backup was executed or the account specified in the **Ownership** backup option. If this user account is different than the user account under which the Windows SharePoint Services Timer service is running, the private backup objects are not accessible in the Recovery Cache Management.

## Configuring HPE Data Protector backup specifications

- Ensure the option **track the replica for instant recovery** is not selected, when you create VSS transportable backup.
- To prevent Data Protector from backing up content databases that are in the Granular Recovery Cache Management (in other words, to prevent Data Protector from backing up the same content databases twice), proceed with the following, depending on your configuration:
  - If the same Microsoft SQL Server instance is used by both Microsoft SharePoint Server and HPE Data Protector Granular Recovery Extension:

When you create backup specifications, select individual content databases, and not the client, Microsoft SQL Server instance, or Microsoft Volume Shadow Copy Writer.

The content databases restored by HPE Data Protector Granular Recovery are named *OriginalName\_DataProtectorSessionID*. See "Selecting content databases" below.

### Selecting content databases

**Note:** If you have a backup specification with individual content databases selected, each time a Farm Administrator adds a new content database, you need to include the newly-added content database in the backup specification.

- If a separate Microsoft SQL Server instance is used for granular recovery purposes, specify this system as the destination Microsoft SQL Server for the Import From Backup procedure. Ensure that this system is excluded from the backup specification.

## Verifying the configuration of Internet Information Services application pools

The same Microsoft SharePoint Server user account is used by both the **Recovery Web Application** and **SharePoint Central Administration v3/v4** application pools.

To be able to recover items to a filesystem, verify if the user specified in these application pools is granted enough permission. Ensure this user is granted full control of the filesystem.

To verify which user account is configured in the **Recovery Web Application** or **SharePoint Central Administration** (v3 for Microsoft Office SharePoint Server 2007 or v4 for Microsoft SharePoint Server 2010/2013) application pools:

1. Connect to the Microsoft SharePoint Server Central Administration system.
2. In the Start menu, click **Control Panel**, **Administrative Tools**, and **Internet Information Services (IIS) Manager**.
3. Depending on the operating system version, proceed as follows:

**Windows Server 2008 or Windows Server 2012:**

- a. Open the Application Pools page.
- b. Right-click an application pool and click **Advanced Settings**.
- c. Under Process Model, verify the Identity of the Microsoft SharePoint Server user account.

**Windows Server 2003:**

- a. Expand **Application Pools**.
- b. Right-click an application pool and click **Properties**.
- c. Click the **Identity** tab, select the **Configurable** option, and verify the selected Microsoft SharePoint Server user account.

## Chapter 4: Backup

Back up Microsoft SharePoint Server data as described in your backup solution documentation.

For more information on the HPE Data Protector backup solutions, see:

- *HPE Data Protector Integration Guide*
- *HPE Data Protector Zero Downtime Backup Integration Guide*

**Note:** Granular Recovery Extension for Microsoft SharePoint Server uses the same procedure for recovery of different objects. The recovery procedure does not depend on the backup type.

### Considerations

- It is recommended to restore content databases bigger than 10 GB from VSS transportable backup.
- If you have configured VSS transportable backup using ZDB to disk+tape, Granular Recovery Extension for Microsoft SharePoint Server selects the content database version from disk for restore. This backup type does not require additional disk space and is adequate for bigger content databases, taking less time to complete the restore session.

## Chapter 5: Recovery

Each site has its data stored in a Microsoft SQL Server database (**content database**). Therefore, to recover site items, follow this basic procedure:

1. **Import**
  - a. **Restore**

Restore the content database from backup to a temporary location on a Microsoft SQL Server system.
  - b. **Mount**

Present the restored content database (**recovery content database**) to the Microsoft SharePoint Server. This creates a temporary site (**recovery site**).
2. **Recover**

Transfer site items from the recovery site to the original site, or to another location of your choice.
3. **Dismount**

Dismount the recovery content database from the Microsoft SharePoint Server. Optionally, delete the database from the disk.

## Launching the HPE Data Protector Granular Recovery Extension GUI

### Procedure

1. Log on to the Microsoft SharePoint Server Central Administration system under a Microsoft SharePoint Server **Farm Administrator** user account.
2. Connect to the Central Administration webpage.
3. A Microsoft Office SharePoint Server 2007 specific step: click the **Operations** tab.
4. Look for **HPE Data Protector Granular Recovery Extension**:

#### HPE Data Protector Granular Recovery Extension links

5. Click **Granular Recovery Cache Management**. The Recovery Cache Management page is displayed.

The Granular Recovery Cache shows which recovery content databases are currently mounted to the Microsoft SharePoint Server. In the beginning, the Granular Recovery Cache is empty. See "[Recovery Cache Management \(empty\)](#)" below.

### Recovery Cache Management (empty)

The screenshot shows the 'Granular Recovery Cache Management' interface. The top navigation bar includes 'Site Actions', 'Granular Recovery Cache Management', a 'Give Feedback' button, and the user name 'User'. Below the navigation bar are icons for 'Import from Backup', 'Import from Filesystem', 'Import Jobs Status', 'Remove Content Database', 'Start Recovery', and 'Help'. The left sidebar lists various administration tasks such as 'Central Administration', 'Application Management', 'System Settings', 'Monitoring', 'Backup and Restore', 'Security', 'Upgrade and Migration', 'General Application Settings', and 'Configuration Wizards'. The main content area is divided into two sections: 'Content Databases' and 'Sites'. The 'Content Databases' section shows the message 'No content database available in recovery cache.' The 'Sites' section is currently empty.

"[Recovery Cache Management with a content database mounted](#)" below shows available functionality of the Recovery Cache Management when a content database is already mounted. For a high-level description of the functionality, see "[Granular Recovery Cache Management](#)" on the next page.

### Recovery Cache Management with a content database mounted

The screenshot shows the 'Granular Recovery Cache Management' interface with a content database mounted. The top navigation bar and left sidebar are identical to the previous screenshot. The main content area shows the 'Content Databases' section with a table listing the mounted database. The 'Sites' section is also populated with original and recovery site URLs.

Content Database	Backup Version	Content Database Size	Added	Expires On	Added By
WSS_Content	2010/09/16-2	49.0 MB	9/16/2010 3:42:13 PM	10/7/2010 3:42:13 PM	user

Original Site URL	Recovery Site URL
http://apno/	http://apno:38000/1
http://apno/sites	http://apno:38000/sites

## Granular Recovery Cache Management

<ul style="list-style-type: none"> <li> <b>Import From Backup</b>                      After you have backed up your content database with an HPE Data Protector backup solution, use <b>Import From Backup</b> to restore the database to a temporary location and to mount the database to the Microsoft SharePoint Server.                      For details, see <a href="#">"Importing content databases from backup" on the next page.</a> </li> </ul>	<ul style="list-style-type: none"> <li> <b>Import From Filesystem</b>                      If you have restored the content database to the filesystem, use <b>Import From Filesystem</b> to mount the content database to the Microsoft SharePoint Server.                      For details, see <a href="#">"Importing content databases from the filesystem" on page 26.</a> </li> </ul>
<ul style="list-style-type: none"> <li> <b>Import Job Status</b>                      This enables you to monitor import jobs (importing a content database from backup or from filesystem) status.                      For details, see <a href="#">"Monitoring granular recovery import jobs" on page 38.</a> </li> </ul>	<ul style="list-style-type: none"> <li> <b>Remove from Recovery Cache</b>                      This dismounts a recovery content database from the Microsoft SharePoint Server (removes the content database from the Granular Recovery Cache) and removes the database files from the disk.                      For details, see <a href="#">"Removing content databases from the cache" on page 37.</a> </li> </ul>
<ul style="list-style-type: none"> <li> <b>Start Recovery</b>                      Use this to browse and recover objects that are stored in a recovery content database.                      Note that this is also available for Site Collection Administrators from the original site:  <b>Microsoft SharePoint Server 2007/2010:</b>  <b>Site Actions &gt; Site Settings &gt; Granular Recovery</b>  <b>Microsoft SharePoint Server 2013:</b>  <b>Settings icon &gt; Site Settings &gt; Granular Recovery</b>                      For details, see <a href="#">"Executing Perform content recovery tasks" on page 29</a> and <a href="#">"Recovering site items" on page 30.</a> </li> </ul>	<ul style="list-style-type: none"> <li> <b>Original Site URL</b>                      The link to the original site.                 </li> <li> <b>Recovery Site URL</b>                      The link to the recovery site.                 </li> </ul>

## Importing content databases from backup

### Prerequisites

On the destination Microsoft SQL Server system, you need enough disk space for the content database that you want to import.

### Considerations

- If a site already exists in the Recovery Cache Management, and you perform an Import From Filesystem session for the same site, the URL changes as follows:
  - `http://computer.company.com:38000/OriginalNameSequenceNumber`
  - `http://computer.company.com:25884/SequenceNumber`  
(root site)
- If the original site does not exist in the Recovery Cache Management, the site URL does not change.
- If a root site does not exist, the Recovery Cache Management uses an empty string during the restore session, and the URL of the root site changes to:  
`http://computer.company.com:25884/SequenceNumber`
- If the site URL exceeds 260 characters, the import of two backup versions is not possible.
- If the destination path exceeds 260 characters, recovery is not possible. Please select a different location.

### Procedure

1. In the Recovery Cache Management page, click **Import From Backup**. The Site Collection Selection page is displayed. Select the content database of the site you want to recover and click **Continue**.

### Site Collection Selection page

<a href="#">← Back</a> <a href="#">→ Continue</a>			
Site URL	Site Name	Content Database	Web Application Name
<b>http://apno/</b>		<b>WSS_Content</b>	<b>SharePoint - 80</b>
http://apno/	sites/user	WSS_Content	SharePoint - 80
http://apno:23902/		SharePoint_AdminContent_0a8c5c49-3c69-4838-aad0-760edd06b87e	
http://apno:23902/	sites/Help	SharePoint_AdminContent_0a8c5c49-3c69-4838-aad0-760edd06b87e	

- In the Backup Version Selection page, select the content database version that you want to restore and click **Continue**.

### Backup Version Selection page

<a href="#">← Back</a> <a href="#">→ Continue</a>					
Name	Created Date	Size	Type	Method	Media
<b>2010/04/13-2</b>	<b>4/13/2010 3:46:47 PM</b>	<b>31.5 MB</b>	<b>Full</b>	<b>MSVSS</b>	<b>TAPE</b>

- The Content Database Recovery page is displayed:

### Content Database Recovery page

<a href="#">← Back</a> <a href="#">▶ Import content database</a>	
<b>Restore Settings</b>	
SQL server:	<input type="text" value="APNO\SharePoint"/>
Restore path:	<input type="text" value="C:\Restore"/>

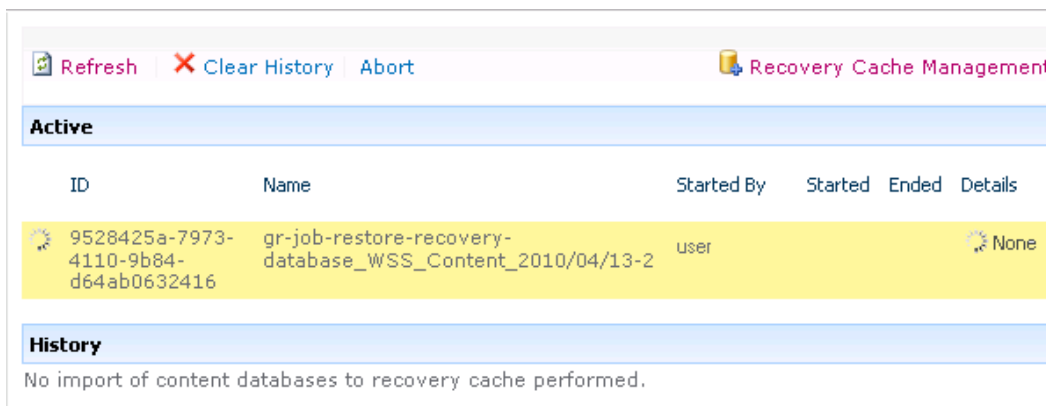

In the **SQL Server** drop-down list, select the destination Microsoft SQL Server instance. You can change the default restore location by specifying a new path. The default is C: \Restore.

**Note:** If your Microsoft SQL Server is configured in a cluster, ensure that the restore location resides on the Microsoft SQL Server cluster shared disk.

Click **Import content database**.

- Optionally, to monitor job status, click **Continue**. The Granular Recovery Import Job Status page is displayed:

### Monitoring job status

Refresh Clear History Abort Recovery Cache Management

**Active**

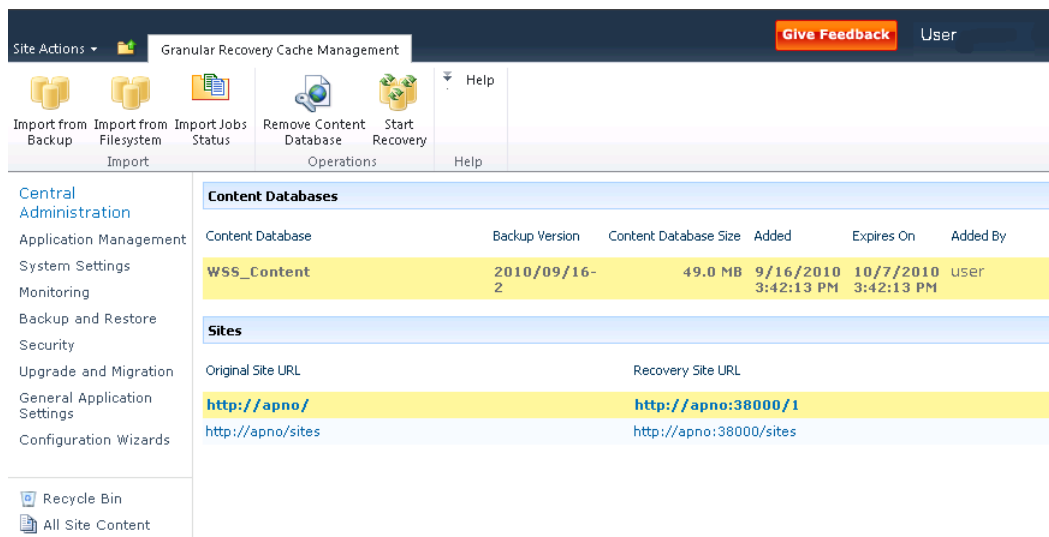

ID	Name	Started By	Started	Ended	Details
9528425a-7973-4110-9b84-d64ab0632416	gr-job-restore-recovery-database_WSS_Content_2010/04/13-2	user			None

**History**

No import of content databases to recovery cache performed.

- Click **Recovery Cache Management** to return to that page.  
 The content database is mounted to the Microsoft SharePoint Server.

### Recovery Cache Management

**Content Databases**

Content Database	Backup Version	Content Database Size	Added	Expires On	Added By
WSS_Content	2010/09/16-2	49.0 MB	9/16/2010 3:42:13 PM	10/7/2010 3:42:13 PM	user

**Sites**

Original Site URL	Recovery Site URL
http://apno/	http://apno:38000/1
http://apno/sites	http://apno:38000/sites

**Note:** Once the content database is mounted to the Microsoft SharePoint Server, a **Perform content recovery** task is assigned to the Site Collection Administrator.  
 For details, see "[Executing Perform content recovery tasks](#)" on page 29.

## Importing content databases from the filesystem

### Prerequisites

- The content database must be restored to the filesystem.
- The user account under which the Windows SharePoint Services Timer (Microsoft Office SharePoint Server 2007), SharePoint 2010 Timer (Microsoft SharePoint Server 2010), or SharePoint

Timer Service (Microsoft SharePoint Server 2013) service is running must be granted full control permission for the content database.

## Considerations

- The Microsoft SQL Server Database Primary Data Files and all transaction log files cannot be imported from a network share.
- If a site already exists in the Recovery Cache Management, and you perform an Import From Filesystem session for the same site, the URL changes as follows:
  - `http://computer.company.com:38000/OriginalNameSequenceNumber`
  - `http://computer.company.com:25884/SequenceNumber`  
(root site)
- If the original site does not exist in the Recovery Cache Management, the site URL does not change.
- If a root site does not exist, the Recovery Cache Management uses an empty string during the restore session, the URL of the root site changes to:  
`http://computer.company.com:25884/SequenceNumber`

## Procedure

1. On the Recovery Cache Management page, click **Import From Filesystem**.
2. On the Enter content database data page, specify the location of the Microsoft SQL Server Database Primary Data File *AbsolutePath.mdf* and all transaction log files *AbsolutePath.ldf*. Click **Add**.

Click **Continue**.

### Specifying content database files

Central Administration > Enter content database data  
Specify database files

← Back | → Continue

**Database File Location**

Database file path:  Add

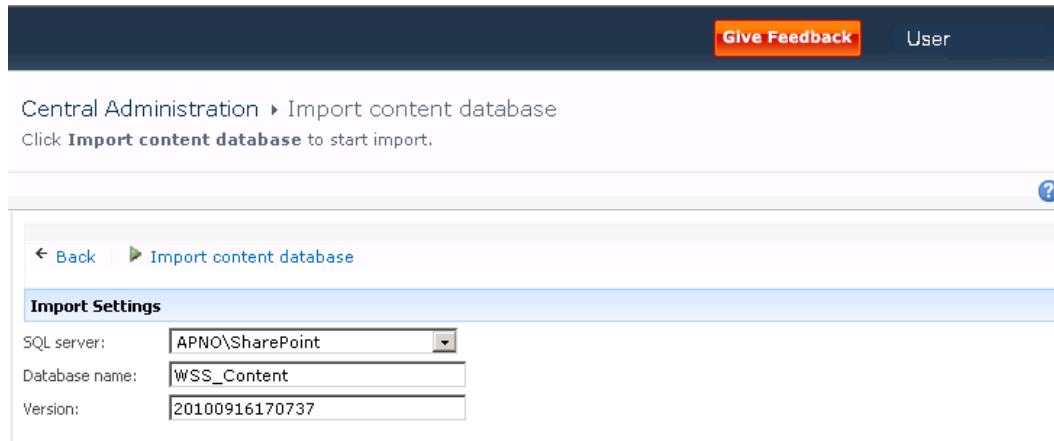

**Database Files**

File path

C:\Restore\2010-09-16-2\C\Program Files\Microsoft Office Servers\14.0\Data\MSSQL10.SHAREPOINT\MSSQL\DATA\WSS_Content.mdf	Remove
C:\Restore\2010-09-16-2\C\Program Files\Microsoft Office Servers\14.0\Data\MSSQL10.SHAREPOINT\MSSQL\DATA\WSS_Content_log.LDF	Remove

3. In the **SQL Server** drop-down list, select the destination Microsoft SQL Server instance.

### Importing a content database from filesystem

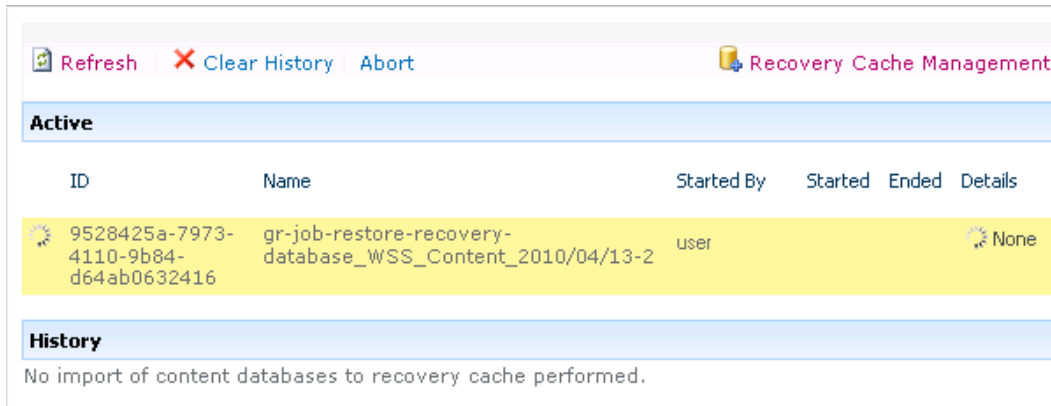

The content database name and version are filled in automatically. Optionally, you can edit the database name and version to better suit your needs.

Click **Import content database**.

- Optionally, to monitor job status, click **Continue**.

The Granular Recovery Import Job Status page is displayed:

### Monitoring job status

- Click **Recovery Cache Management** to return to that page.

The content database is mounted to the Microsoft SharePoint Server.

## Recovery Cache Management

The screenshot shows the 'Recovery Cache Management' interface. At the top, there are navigation options: 'Site Actions', 'Granular Recovery Cache Management', 'Give Feedback', and 'User'. Below this are icons for 'Import from Backup', 'Import from Filesystem', 'Import Jobs Status', 'Remove Content Database', and 'Start Recovery'. A 'Help' button is also present.

The main content area is divided into two sections:

- Content Databases:** A table with columns: Content Database, Backup Version, Content Database Size, Added, Expires On, and Added By. One row is highlighted:
 

Content Database	Backup Version	Content Database Size	Added	Expires On	Added By
WSS_Content	2010/09/16-2	49.0 MB	9/16/2010 3:42:13 PM	10/7/2010 3:42:13 PM	user
- Sites:** A table with columns: Original Site URL and Recovery Site URL. Two rows are highlighted:
 

Original Site URL	Recovery Site URL
http://apno/	http://apno:38000/1
http://apno/sites	http://apno:38000/sites

On the left side, there is a 'Central Administration' menu with options like 'Application Management', 'System Settings', 'Monitoring', 'Backup and Restore', 'Security', 'Upgrade and Migration', 'General Application Settings', and 'Configuration Wizards'. At the bottom left, there are 'Recycle Bin' and 'All Site Content' options.

**Note:** Once the content database is mounted to the Microsoft SharePoint Server, a Perform content recovery task is assigned to the Site Collection Administrator.

For details, see "[Executing Perform content recovery tasks](#)" below.

## Executing Perform content recovery tasks

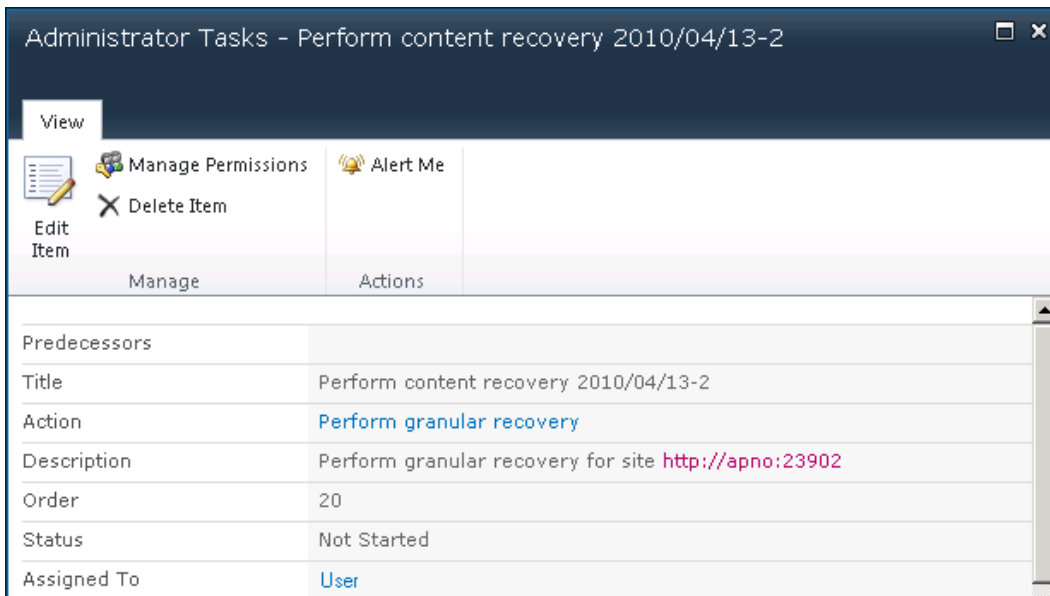

### Prerequisites

- The content database must be mounted to the Microsoft SharePoint Server, by "[Importing content databases from backup](#)" on page 24 or by "[Importing content databases from the filesystem](#)" on page 26.
- You must be a **Site Collection Administrator** of the site you want to recover. For more information on how to add a user to the Site Collection Administrator group, see the Microsoft SharePoint documentation.

### Perform content recovery task

<input type="checkbox"/>	Type	Title	Action	Associated Service	System Task	<input type="checkbox"/>	Assigned To	Status	Order	Due Date
<input type="checkbox"/>		Perform content recovery 2010/09/17 -3	Perform granular recovery			<input type="checkbox"/>	User	Not Started	20	10/8/2010

## Perform content recovery link

## Procedure

1. Click the link in the Perform content recovery task. The Browse and Select Objects page is displayed.
2. Proceed with the "[On the Browse and Select Objects page, select the site items that you want to recover.](#)" on page 33.

## Recovering site items

### Prerequisites

- On all the front-end Web Server systems, you need enough disk space for the site items that you plan to recover. The default location is C:\Recovery. To change the default path, see "[Changing HPE Data Protector Granular Recovery Extension settings](#)" on page 39.
- You must be a **Site Collection Administrator** of the site you want to recover. For more information on how to add a user to the Site Collection Administrator group, see the Microsoft SharePoint documentation.
- The recovery content database must be mounted to the Microsoft SharePoint Server.
- If the original site no longer exists, create a site collection without a template and with the same language as the original site. Use the **Overwrite Existing** recovery mode. You must be a **Farm Administrator** of the site you want to recover in the Recovery Cache Management. If you have a sub site in the recovered site, quick links, top navigation bar are relocated at the end of the lists.
- Ensure that the site URL length does not exceed 260 characters:  
If you use the **Rename if Exists** recovery mode, the URL length should not exceed 255 characters.

## Supported items

You can recover the following Microsoft SharePoint Server items with the HPE Data Protector Granular Recovery Extension:

- Libraries:
  - Document library
  - Wiki page library
  - Report library
  - Asset library
  - Picture library
  - Translation Management Library
- Communication:
  - Announcements
  - Contacts
  - Discussion board
- Tracking:
  - Links
  - Calendar
  - Tasks
  - Project tasks
  - Issue tracking
  - Survey
- Custom List
- User Information List
- Pages and Sites:
  - Page
  - Site
  - Publishing pages
  - Sites with a blog template: Posts, Comments, Categories

- Sites with a meeting template: Meetings, Agenda, Attendees, Decision, Meeting Objective, Text Box, Things To Bring, Home Page Library

**Note:** Granular recovery of SharePoint lists that are customized with a custom ID value (greater than 10000) is supported. However, the success of granular recovery depends on the extent of list customization.

## Considerations

- If the data to be recovered already exists at the destination, depending on the recovery mode, note the following:
  - **Rename if Exists** : Files and folders items are recovered with different names, *OriginalName\_DPGRE\_Timestamp*.  
For example, suppose that on November 17, 2012 at 10:59:35 you start a recovery of the file `wizard.txt`. The file is recovered with the name `wizard_DPGRE_20121117-105935.txt`.  
Other items (for example, form templates, documents and tasks items) are not recovered, and not renamed to the original location.  
List items cannot be renamed as part of the recovery.
  - **Leave Existing** : Items are not recovered, the existing items remain the same in the target location.
  - **Overwrite Existing** : Items are recovered with the original names, replacing the existing. For example, the existing Microsoft SharePoint Server items (Document Library) are overwritten with those from the backup data. Only lists and sites are not overwritten.
- If the data to be recovered does not exist at the destination, it is recovered with the original name.
- If the List items (Announcement, Contact, Link, Calendar, or Task) are recovered to other location, or to other farm twice, depending on the recovery mode:
  - **Overwrite Existing** : the List items are duplicated with the same names and different IDs. Delete the items with the same names.
  - **Rename if Exists** : the List items are renamed even though these kinds of items do not support renaming.
- If discussion items, with attachments and replies, or surveys with responses are recovered with the **Overwrite Existing** recovery mode, the items are overwritten but the attachments, replies, or responses are not recovered. To avoid data loss, delete the attachments, replies, or responses before starting your recovery session.
- Multiple recovery sessions can be performed in parallel, except if the same items are selected for recovery.
- Multiple farm administrators and site collection administrators can browse objects in parallel.
- To recover a document workflow status ensure you create a template and association at the destination site. Workflow status can be recovered only in case of recovery to the original location and if original item exists.

- Workflow history cannot be recovered.
- Unique user permissions of an item are not recovered. The recovered item inherits permissions of the destination container type where it is recovered to.
- To recover a site collection or subsite, you need to manually create the destination site collection or subsite. Destination must be of the same template as that of site collection or subsite being recovered and the **Overwrite Existing** recovery mode must be used.

## Procedure

1. On the Recovery Cache Management page, select the content database and the sites you want to recover. Note that a content database may contain data of multiple sites.

**Tip:** To recover items from multiple sites, hold **Ctrl** while selecting specific sites under Sites, and then click **Start Recovery**. You can also hold **Shift** while selecting a group of sites under Sites, and then click **Start Recovery**.

### Selecting a content database and multiple sites for recovery

The screenshot shows the 'Granular Recovery Cache Management' interface. It features a top navigation bar with 'Site Actions', 'Give Feedback', and 'User'. Below the navigation bar are icons for 'Import from Backup', 'Import from Filesystem', 'Import Jobs Status', 'Remove Content Database', 'Start Recovery', and 'Help'. A left sidebar lists various administration tasks like 'Central Administration', 'Application Management', 'System Settings', etc. The main content area displays two tables:

Content Databases					
Content Database	Backup Version	Content Database Size	Added	Expires On	Added By
WSS_Content	2010/09/16-2	49.0 MB	9/16/2010 3:42:13 PM	10/7/2010 3:42:13 PM	User

Sites	
Original Site URL	Recovery Site URL
<a href="http://apno/">http://apno/</a>	<a href="http://apno:38000/1">http://apno:38000/1</a>
<a href="http://apno/sites/">http://apno/sites/</a>	<a href="http://apno:38000/sites/">http://apno:38000/sites/</a>

**Note:** Alternatively, you can start a recovery session:

- By connecting to the original website.  
**Microsoft SharePoint Server 2007/2010:** In the **Site Actions** menu, select **Site Settings**.  
**Microsoft SharePoint Server 2013:** Click the **settings icon** and select **Site Settings**.  
 On the Site Settings page, look for HPE Data Protector Granular Recovery Extension. Click **Granular Recovery**.
- By performing site tasks. For details, see "[Executing Perform content recovery tasks](#)" on page 29.

2. On the Browse and Select Objects page, select the site items that you want to recover.

### Selecting site items

Search this site...

**Note:** All items can be previewed by clicking on the item name.

**Tip:** To select multiple list view items, hold **Ctrl** while selecting specific items. Alternatively, you can hold **Shift** while selecting a group of items.

### Advanced search

Central Administration > Browse and Select Objects  
 Select items for recovery.

Search this site...  

[Continue](#)  Quick Search  List View

**Search Criteria**

**Find documents with...**

All of these words:

The exact phrase:

Any of these words:

None of these words:

**Narrow the search...**

Result type:

**Add property restrictions...**

Where the Property...  Equals  And  [Add Property...](#)

**Tip:** You can filter the items using the **Advanced search**. For example, in **Result type**, select **Microsoft Office Word documents**. In **Add properties restriction**, select a property and click **Search**.

For details about the advanced and quick search, see the *Microsoft SharePoint Server Help*.

To select multiple list view items, hold **Ctrl** while selecting specific items. Alternatively, you can hold **Shift** while selecting a group of items.

Click **Continue**.

3. On the Recovery Objects page, the selected site items are displayed.

**Note:** The **Recovery mode** drop-down list offers the following options:

- **Rename if Exists** : Items such as files and folders are recovered with a new name *OriginalName\_DPGRE\_Timestamp*.
- **Leave Existing** : Items are not recovered, the existing items remain the same in the target location.
- **Overwrite Existing** : Recovered items replace the existing items.

**Tip:** When recovering recurring events, for example, weekly team meetings in Calendars, before selecting the **Overwrite Existing** recovery mode, ensure the deletion of all the recurring events.

## Recovering site items

Central Administration > Recovery Objects  
Click **Start Recovery** to recover the selected items.

Search this site...

**Start Recovery** **Back**

**Recovery Settings**

Recovery Mode:

Temporary Path:

**Items for Recovery**

Status	Type	Name	Info	Created By	Size	Log
		Central Administration/Announcements	<input type="text" value="Original Location"/>	User	39.8 KB	
		Central Administration/Shared Documents	<input type="text" value="Original Location"/>	User	63.7 KB	

**Status**

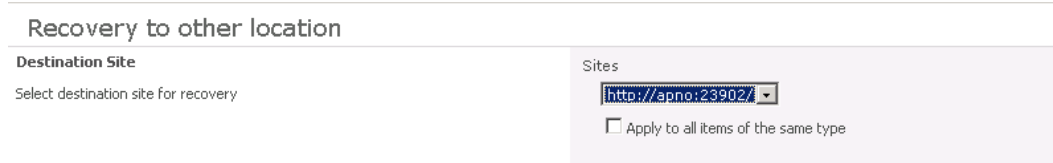

The **Temporary Path** option specifies which location on your Microsoft SharePoint Server system to use for recovery.

**Note:** The **Info** drop-down list specifies the recovery destination:

- **Original Location** : The item is recovered to the original location in the original site. The option is not available for the recovery of sites or subsites with the `Rename If Exists`.
- **Other Location** : The item is recovered to a different site or a different location in the original site. Use this location, if the original site no longer exists.
- **Other Farm** : The item is recovered to a different destination farm.
- **Filesystem** : The item is recovered to a directory in your filesystem. This option is available only for files and folders.

- If you select **Other Location**, the Recovery to other location dialog box is displayed.

#### Recovering site items to another location

In the Site drop-down list, select the destination site.

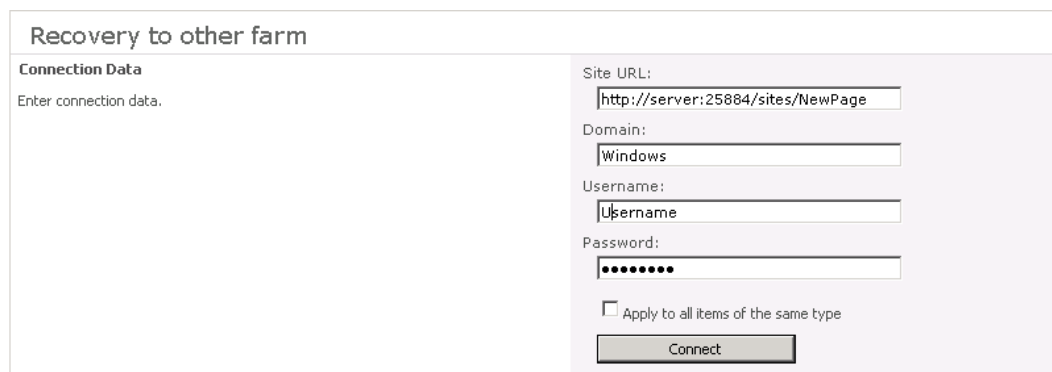

If you select the **Apply to all items of the same type** option, items of the same type (for example, calendar items) are recovered to the same location.

Click **OK**.

**Tip:** The sites listed in the Recovery to other location dialog box are those for which you have enough permission. For example, if you are a Site Collection Administrator, you need to be granted the read configuration database right.

- If you select **Other Farm**, the Recovery to other farm dialog box is displayed.

#### Recovering site items to another farm

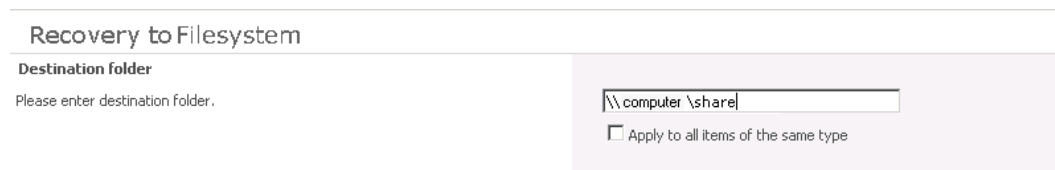

Specify the destination farm and which Windows domain user account to use.

If you select the **Apply to all items of the same type** option, items of the same type (for example, calendar items) are recovered to the same farm.

Click **Connect**.

- If you select **Filesystem**, the Recovery to Filesystem dialog box is displayed.

### Recovering site items to a network share

In **Path**, specify the destination directory.

When specifying a network share as a destination, ensure that:

- Read, write, and change permissions are granted to the user that starts the recovery session.
- All necessary permissions are granted to the network share. Grant the same permissions specified for the user account configured in the **Web Recovery Application** and **SharePoint Central Administration v3/v4** application pools. For details, see ["Verifying the configuration of Internet Information Services application pools" on page 18](#).
- The share is accessible from the system where the Windows SharePoint Services Web Application (Microsoft Office SharePoint Server 2007) or Microsoft SharePoint Foundation Web Application (Microsoft SharePoint Server 2010/2013) is running, in which the recovery session was started.

When specifying a folder as a destination, ensure that:

- The folder is accessible from the system where the Windows SharePoint Services Web Application (Microsoft Office SharePoint Server 2007) or Microsoft SharePoint Foundation Web Application (Microsoft SharePoint Server 2010/2013) is running.
- Read, write, and change permissions are granted to the user that starts a recovery session.

If you select the **Apply to all files and folders** option, all files and folders are recovered to the same directory.

Click **OK**.

4. Click **Start Recovery**.

Once the recovery completes, you can find the recovered items at the specified destination.

## Removing content databases from the cache

### Procedure

Content databases are available for three weeks, after that they are removed from the cache automatically. To manually remove the content database from the Recovery Cache, proceed as follows:

1. On the Recovery Cache Management page, select which content database to remove, and click **Remove From Recovery Cache**. The Remove From Recovery Cache page is displayed.
2. To keep the content database files on the disk, clear the **Delete files from disk** option.

Click **Remove**.

## Removing a content database

Central Administration > Remove Content Database  
Click **Remove** button to remove listed content databases.

< Cancel | X Remove

Content Database Info		
Name	Version	Size
WSS_Content	2010/09/17-3	49.0 MB

**Remove Options**

Delete files from disk

## Monitoring granular recovery import jobs

### Procedure

1. Connect to the Central Administration webpage.
2. A Microsoft Office SharePoint Server 2007 specific step: click the **Operations** tab.
3. Look for **HPE Data Protector Granular Recovery Extension**, and click **Granular Recovery Job Status**. The Granular Recovery Import Jobs page is displayed.
4. Once you start a content database import session, HPE Data Protector Granular Recovery Extension starts monitoring the import job progress.

## Monitoring an import job progress

Central Administration > Granular Recovery Import Job Status  
 Click **Refresh** to update jobs list.

Refresh Clear History Abort Recovery Cache Management

**Active**

ID	Name	Started By	Started	Ended	Details
1021ebca-05b3-4637-9a90-27e9069e5111	gr-job-restore-recovery-database_WSS_Content_2010/04/13-2	user			None

**History**

Status	ID	Name	Started By	Started	Ended	Details
✓	93a17a01-0ec4-421b-8b7d-4778ecec0a14	gr-job-restore-recovery-database_WSS_Content_2010/09/16-2	user	9/16/2010 3:40:22 PM	9/16/2010 3:42:13 PM	<ul style="list-style-type: none"> <li>✓ Checking disk space</li> <li>✓ Restoring</li> <li>✓ Mounting</li> <li>✓ Creating recovery cache</li> <li>✓ remove job</li> <li>Starting</li> <li>✓ recovery cache content source crawl</li> <li>Posting recovery tasks to site collection administrators</li> </ul>

Optionally, after the recovery job is finished and you no longer need the job statuses, click **Clear History**.

To stop the operation in progress, click **Abort**.

## Changing HPE Data Protector Granular Recovery Extension settings

During a granular recovery session, a content database is first restored to a temporary location on the selected Microsoft SQL Server system (default: C:\Restore).

Before the site items are recovered, they are copied to a temporary location on a Microsoft SharePoint Server system (default: C:\Recovery).

### Procedure

1. To change these default locations, connect to the Central Administration webpage.
2. A Microsoft Office SharePoint Server 2007 specific step: click the **Operations** tab.  
 Look for **HPE Data Protector Granular Recovery Extension**, and click **Granular Recovery Settings**.
3. On the Granular Recovery Settings page, enter a new restore location or temporary recovery

location and click **OK**.

### Changing Granular Recovery settings

<b>Product Version</b> View Granular Recovery Extension version.	Version 6.11.28.1500
<b>Default SQL Server for Import</b> Select default SQL Server for import of content database.	SQL server <input type="text" value="APNO\SharePoint"/>
<b>Restore Location</b> Specify path on SQL server to which selected content database will be restored during import from backup.	Path <input type="text" value="C:\Restore"/> Example: c:\Restore
<b>Temporary Location for Recovery</b> Specify path for temporary files created during recovery.	Path <input type="text" value="C:\Recovery"/> Example: c:\Recovery

## Chapter 6: Command line reference

Use the `HP.SharePoint.GranularRecovery.CLI.exe` command line tool that is located in:

### Microsoft Office SharePoint Server 2007:

`C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\12\BIN`

### Microsoft SharePoint Server 2010:

`C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\14\BIN`

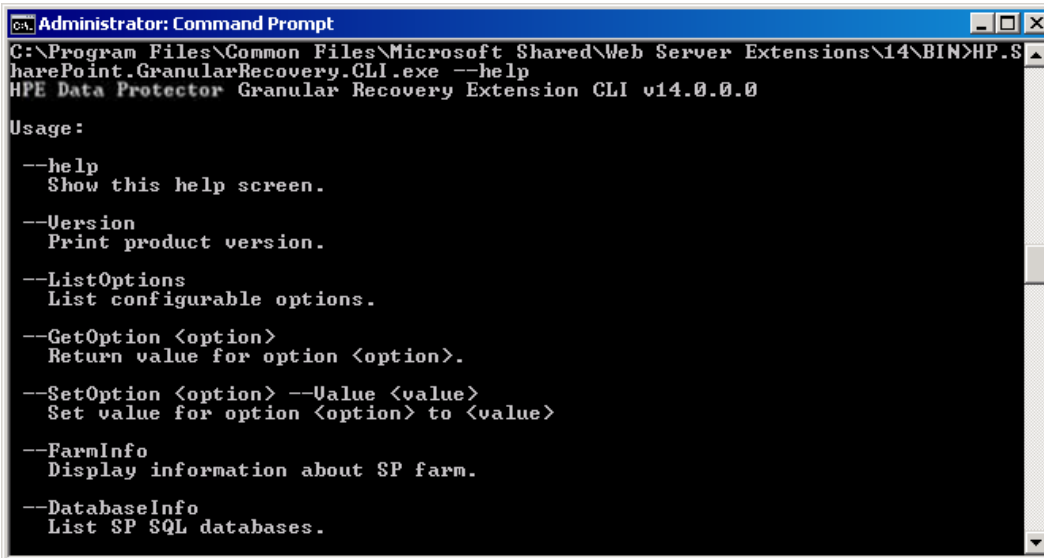

### Microsoft SharePoint Server 2013:

`C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\15\BIN`

To display descriptions of options and their usage, run:

```
HP.SharePoint.GranularRecovery.CLI.exe --help.
```

### Retrieving the command line help

```
Administrator: Command Prompt
C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\14\BIN>HP.SharePoint.GranularRecovery.CLI.exe --help
HPE Data Protector Granular Recovery Extension CLI v14.0.0.0

Usage:
  --help
    Show this help screen.

  --Version
    Print product version.

  --ListOptions
    List configurable options.

  --GetOption <option>
    Return value for option <option>.

  --SetOption <option> --Value <value>
    Set value for option <option> to <value>

  --FarmInfo
    Display information about SP farm.

  --DatabaseInfo
    List SP SQL databases.
```

**Note:** In the examples below, `HP.SharePoint.GranularRecovery.CLI.exe` is omitted for simplicity.

## Examples

### Restoring a content database from Data Protector backup

- To list all the backup versions of your content database named `WSS_Content_054a5bfa-f23c-49b8-8f78-e0b3ce00b193`, specify:

```
--ListBackupVersions --ContentDB=WSS_Content_054a5bfa-f23c-49b8-8f78-e0b3ce00b193
```

## Monitoring jobs progress

- To list all the jobs that have been started of your content database, specify:  
`--ListJobs`
- To start a restore job by importing the content database from the backup version "2010/04/20-4" to the default restore location C:\Restore, specify:

```
--StartImportJob  
--ContentDB WSS_Content_054a5bfa-f23c-49b8-8f78-e0b3ce00b193  
--BackupID "2010/04/20-4" --Server computer  
--Instance OFFICESERVERS --TargetLocation C:\Restore
```

**Note:** To successfully import the content database when your Microsoft SQL Server is installed with the default instance, replace OFFICESERVERS with one of the following:

- the instance name
- DEFAULT
- MSSQLSERVER

You can also leave the instance name empty to ensure that Data Protector uses its correct name.

- Suppose you want to start a restore job by importing the content database from a filesystem to the Microsoft SharePoint Server to the default restore location C:\Restore.

If the Microsoft SQL Server Database Primary Data File is WSS\_Content\_054a5bfa-f23c-49b8-8f78-e0b3ce00b193.mdf and the SQL Server Transaction log file is WSS\_Content054a5bfa-f23c-49b8-8f78-e0b3ce00b193\_log.LDF, specify:

```
--StartImportJob  
--ContentDB WSS_Content_054a5bfa-f23c-49b8-8f78-e0b3ce00b193  
--BackupID "2010/04/20-4" --Server computer  
--Instance OFFICESERVERS  
--Files="C:\Restore\WSS_Content_054a5bfa-f23c-49b8-8f78-e0b3ce00b193.mdf";"C:\Restore\WSS_Content054a5bfa-f23c-49b8-8f78-e0b3ce00b193_log.LDF"  
--TargetLocation C:\Restore
```

## Verifying target location disk space size

- To check the available disk space on the default restore location C:\Restore, specify:  
`--QueryServerInfo --Server computer --Instance OFFICESERVERS --TargetLocation C:\Restore`

This also lists the location of all content database files in the tree structure.

## Listing content databases

- To list all content databases in the Recovery Cache including the backup versions, specify:  
`--ListCache --All`
- To list detailed information of the content databases, specify:  
`--ListCache --Verbose`

## Removing restore jobs

- To delete all the restore job statuses, specify:  
`--DeleteAllJobs Confirm`
- To delete a specific restore job, specify:  
`--DeleteJob=JobID`

## Recovering a site item to the original site

- Suppose you want to recover the site item `/Shared Documents/Document.txt` that was backed up from the site `http://computer.company.com:25884/sites/AnikyB`. Suppose the recovery site is `http://computer.company.com:38000/sites/AnikyB`. To recover the item to the original location, specify:

```
--Recover
--Source http://computer.company.com:38000/sites/AnikyB
--Destination http://computer.company.com:25884/sites/AnikyB
--TempLocation="C:\Recovery"
--Items "/Shared Documents/Document.txt"
```

The recovery session finishes and the following message is displayed:

```
recovery ended, object status:
  object: [/Shared Documents/Document.txt]
  destination: [/Shared Documents/Document_MOSSGR_24032010-024302.txt]
  status: Finished
  status details: [recovered to [http://computer.company.com:
                    25884/sites/AnikyB//Shared Documents]]
```

## Recovering a site item to another location

- To recover the site item `/Shared Documents/Document.txt` to My Documents, specify:  
`--Recover`  
`--Source http://computer.company.com:38000/sites/AnikyB`  
`--Destination http://computer.company.com:25884/sites/AnikyB`

```
--TempLocation="C:\Recovery"  
--Items "/Shared Documents/Document.txt:/My Documents"
```

## Removing content databases from the cache

- To remove a database from the cache, specify:  
`--RemoveFromCache --ContentDB DatabaseName --BackupID BackupID`
- To remove all the content databases from the cache, specify:  
`--RemoveFromCache --All`

## Removing content databases from disk

- To delete a content database from the disk after you have removed it from the cache, specify:  
`--RemoveFromCache --ContentDB DatabaseName --DeleteFiles`

## Setting content database automatic removal

Content databases remain available for 21 days (default retention period), afterwards they are removed from the cache.

- To display the time (number of days) a content database remains available before it is removed from the cache, specify:  
`--GetOption RecoveryDatabaseAutoCleanupDays`
- To set how long a content database remains available before it is automatically removed from the cache, specify:  
`--SetOption RecoveryDatabaseAutoCleanupDays --Value number_of_days`

## Exporting items from a content database

- To export an item from a content database, specify:  
`--Export --Source source --Location path  
--Item item`
- To export items from a content database, specify:  
`--Export --Source source --Location path  
--Items item1 item2 item3`

**Note:** Workflows cannot be exported.

## Listing exported items

- To list the exported items, specify:  
`--ListExport --Location`

## Importing items from a content database

- To import an item from a content database, specify:  
`--Import --Destination destination --Location path`  
`--Item item`
- To import items from a content database, specify:  
`--Import --Destination destination --Location path`  
`--Items item1item2item3`

**Note:** Workflows cannot be imported.

## Displaying Microsoft SharePoint farm information

- To display detailed information of the farm, such as name, display name, address, type name, role, version, status and all services running in this farm, specify:  
`--FarmInfo`

## Displaying content database information

- To display content database information such as: Office Servers, Shared Services, SharePoint configuration, Share Services Search, Recovery Web Application, Shared Services Content, SharePoint Admin Content, content database name, specify:  
`--DatabaseInfo`

## Displaying a list of sites

- To display the Web Application name, the site's URL, content database name and the all the sites in this content database, specify:  
`--ListSites`

## Browsing sites

- To browse a My Site structure and items such as: Forms, Lists, Template Gallery, Master Page Gallery, Personal Documents, Shared Documents, Shared Pictures, Site Template Gallery, User Information List, and Web Part Gallery, specify:  
`--BrowseSite --Site http://ivanka/personal/anikyb`

## Displaying Granular Recovery Extension version

- To display the Granular Recovery Extension version, specify:  
`--Version`

## Chapter 7: Troubleshooting

This chapter lists general checks and verifications, plus problems you might encounter when using the Data Protector Granular Recovery Extension for Microsoft SharePoint.

- For Microsoft SharePoint troubleshooting information, see the troubleshooting sections of the Microsoft SharePoint Server parts of the *HPE Data Protector Integration Guide*.
- For general Data Protector troubleshooting information, see the *HPE Data Protector Troubleshooting Guide*.

The folder with debugs entries and logs is located in the folder:

### **Microsoft Office SharePoint Server 2007:**

C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\12\LOGS\GranularRecovery

### **Microsoft SharePoint Server 2010:**

C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\14\LOGS\GranularRecovery

### **Microsoft SharePoint Server 2013:**

C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\15\LOGS\GranularRecovery

This folder contains the files `debugs.txt`, `debugs_cliproxy.txt`, `note.txt`, and `note_cliproxy.txt`. The folder location may vary depending on where you install the Microsoft SharePoint Server.

During installation, a setup debug log is created in the `Data_Protector_program_data\tmp\shp_gre_setup.txt` file.

## Troubleshooting Known Issues and Workarounds

### Installation reports a warning "No full read permissions"

#### **Problem**

When installing the MS SharePoint Granular Recovery Extension component, Data Protector reports the following warning:

Windows SharePoint Services Search service has no full read permissions for all content databases.

#### **Action**

You can safely ignore the warning. However, to prevent it from appearing again, proceed as follows:

1. Open SQL Server Management Studio.
2. Under **Security**, expand **Logins**, right-click the user account under which the Windows SharePoint Services Search service is running, and click **Properties**.
3. In the Properties dialog box, click **User Mapping**. Select all content databases and assign the following two database roles to the user:
  - db\_owner
  - WSS\_Content\_Application\_Pools
4. Click **OK** to apply the changes.

## Remote installation fails

### Problem

When installing the MS SharePoint Granular Recovery Extension component remotely, the session fails with an error similar to the following:

```
[Critical] ClientName Post-installation script for the MS SharePoint Granular Recovery Extension failed with the output: CreateProcessWithLogonW failed, trying LogonUser/CreateProcessAsUser, GetLastError(): 1326 LogonUser failed, GetLastError(): 1326
```

### Action

Make sure that the user account under which Data Protector tries to connect to the Microsoft SharePoint Server system (for example, the Farm Administrator) has been assigned the Allow log on locally policy:

1. On the Microsoft SharePoint Server system, open **Administrative Tools** and then **Local Security Policy**.
2. Under Security Settings, expand **Local Policies** and then click **User Rights Assignment**.
3. Right-click the **Allow log on locally** policy, click **Properties**, and add the user.
4. Click **OK** to apply the changes.

## An import job fails - Insufficient user rights

### Problem

After performing an Import From Backup, the Granular Recovery Import Job Status page reports a failed status in the Restoring phase.

## Restore fails with not enough user rights

Central Administration ▶ Granular Recovery Import Job Status  
Click **Refresh** to update jobs list.

Refresh Clear History Abort Recovery Cache Management

**Active**  
No import of content database to recovery cache is in progress.

**History**

Status	ID	Name	Started By	Started	Ended	Details
	1021ebca-05b3-4637-9a90-27e9069e5111	gr-job-restore-recovery-database_WSS_Content_2010/04/13-2	user	9/16/2010 4:25:37 PM	9/16/2010 4:26:58 PM	Checking disk space Restoring - Restore failed.

### Action

Ensure the user account under which the Windows SharePoint Services Timer service is running is assigned the `Data ProtectorStart restore`, and the `See private objects user rights`. For example, if the Windows SharePoint Services Timer service is the one running under the `Network Service` account:

1. Launch the Data Protector GUI (**Data Protector Manager**).
2. In the Context list, select **Users**. Right-click the user group that has the `Start restore` and the `See private objects user right` enabled, and click **Add/Delete Users**.

The `Network Service` user account should be configured with the following properties:

- Name: `Network Service`
- Domain/Group: `NT Authority`
- Client system: `Any`

For details, see "[Configuring HPE Data Protector user rights](#)".

## An import job fails - Insufficient disk space

### Problem

After performing an `Import From Backup`, the Granular Recovery Import Job Status page reports `Not enough space available` and the Details column reads `Checking disk space`.

## Restore fails with not enough disk space

Refresh Clear History Recovery Cache Management

ID	Name	Started By	Started	Ended	Details

### Action

The root cause of the problem is that there is no Internet access and the HPEData Protector Granular Recovery Extension signature verification may take quite some time to complete. Perform the following:

- Ensure you have Internet access.
- Disable the signature verification:

To disable the HPE Data Protector Granular Recovery Extension signature verification, proceed as follows:

- a. Locate the `cliproxy.exe` and the `HP.Sharepoint.GranularRecovery.CLI.exe` files in the Microsoft SharePoint Server BIN folder. By default, the BIN folder is located in the following directory:

#### Microsoft Office SharePoint Server 2007:

C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\12

#### Microsoft SharePoint Server 2010:

C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\14

#### Microsoft SharePoint Server 2013:

C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\15

- b. In the BIN folder, create the configuration files `cliproxy.exe.config` and `HP.Sharepoint.GranularRecovery.CLI.exe.config` with the following content:

```
<?xml version="1.0" encoding="utf-8" ?><configuration>  
  <runtime>  
    <generatePublisherEvidence enabled="false"/>  
  </runtime></configuration>
```

## Recovery session fails

### Problem

If you start a recovery session by connecting to the original website, the following message is displayed:

```
No recovery available for this site http://computer:25884/sites/User! Please contact Granular Recovery Administrator for further info!
```

### Action

The root cause of the problem is that the content database is not in the cache. Perform an import job.

## Granular Recovery Cache Management link is not accessible from My Sites - Manage Farm Features

### Problem

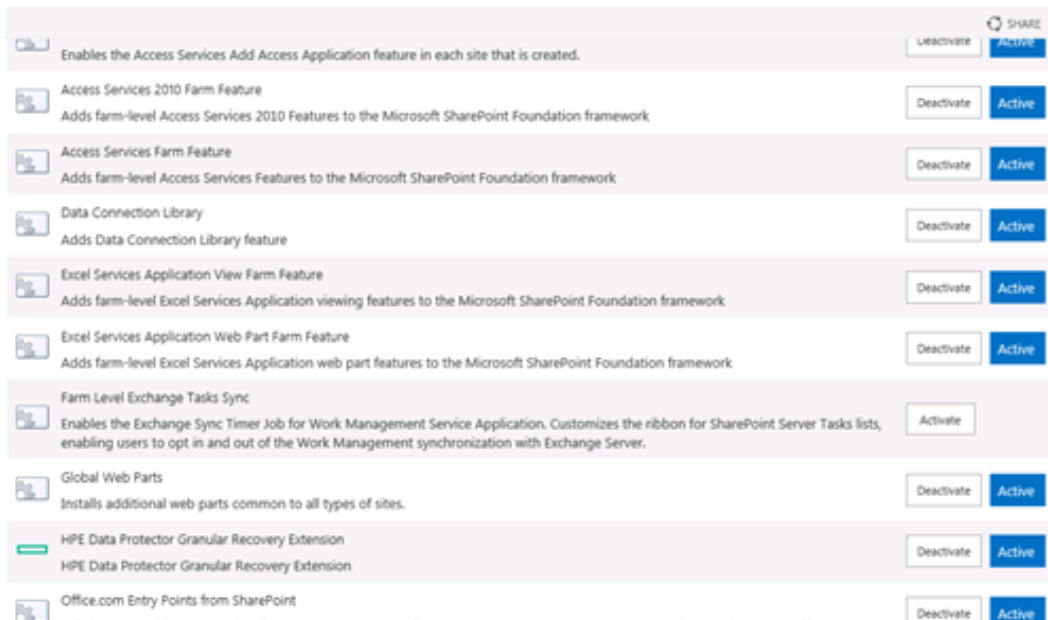

After you create a new site collection or a new web application and then back up your new site collection, you cannot access the Granular Recovery Cache Management link from My Sites (**Site Actions > Site Settings > Granular Recovery** for Microsoft SharePoint Server 2007/2010 or **settings icon > Site Settings > Granular Recovery** for Microsoft SharePoint Server 2013). The following message is displayed:

```
GR resource files are missing in site's "App_GlobalResources" folder.
```

### Action

1. Open **Central Administration** as follows:  
**Microsoft Office SharePoint Server 2007:**  
Click the Operations Tab and under Global Configuration, select **Manage Farm Features**.  
**Microsoft SharePoint Server 2010/2013:**  
Under System Settings, select **Manage Farm Features**.
2. By the HPE Data Protector Granular Recovery Extension, click **Deactivate**. The Warning page is displayed, click the **Deactivate this feature** link. Return to Manage Farm Features. By the HPE Data Protector Granular Recovery Extension, click **Activate**.

## Manage Farm Features deactivating HPE Data Protector Granular Recovery Extension

## Granular Recovery Cache Management link is not accessible from My Sites - Read permission

### Problem

After you create a new site collection or a new web application and then back up your new site collection, you cannot access the Granular Recovery Cache Management link from My Sites (**Site Actions > Site Settings > Granular Recovery** for Microsoft SharePoint Server 2007/2010 or **settings icon > Site Settings > Granular Recovery** for Microsoft SharePoint Server 2013). The message "Access denied." is displayed. The following debug entry is displayed:

```
[6 - Fatal] FATAL debugs - Recovery.aspx: OnPreInit: - Exception: Thread was being aborted.
```

### Action

Application pool users of every web application in the farm must be granted the Read permissions on the Recovery Web Application. To grant the Read permission to application pool user accounts:

1. Connect to the Microsoft SharePoint Server Central Administration system as follows:  
**Microsoft Office SharePoint Server 2007:**  
Click **Application Management**, under Application Security, and click **Policy for Web Application**.  
**Microsoft SharePoint Server 2010/2013:**  
Under Application Management, select **Manage web applications**, select **Recovery Web Application**, and click **User Policy**, the Policy for Web Application is displayed.
2. If a user does not exist in the Policy for Web Application, click **Add Users**. In the Add Users page,

select **All Zones** and then click **Next**. Enter application pool users, select **Full Read - Has full read-only access** and then click **Finish**.

If a user exists in the Policy for Web Application, select the user and then click **Edit Permission of Selected Users**. In the Edit Users page, select **Full Read - Has full read-only access** and then click **Save**.

### Granting Full Read permission

Zone	User Name	Display Name
(All zones)	NT AUTHORITY\LOCAL SERVICE	NT AUTHORITY\L

**Permission Policy Levels**  
Choose the permissions you want these users to have.

Permissions:

- Full Control - Has full control.
- Full Read - Has full read-only access.
- Deny Write - Has no write access.
- Deny All - Has no access.

**Choose System Settings**  
System accounts will not be recorded in the User Information lists unless the account is directly added to the permissions of the site. Any changes made by a system account will be recorded as made by the system instead of the actual user account.

Account operates as System

Save Cancel

## HPE Data Protector Granular Recovery Extension is not available on a newly created Web Application

### Problem

After you added a new Web Application or a new Front-end Web Server to the farm where HPE Data Protector Granular Recovery Extension is already installed, the Site Collection Administrator may have problems with accessing the Granular Recovery Extension user interface. HPE Data Protector Granular Recovery Extension is not available on the newly created Web Applications.

### Action

1. Open **Central Administration** as follows:

**Microsoft Office SharePoint Server 2007:**

Click the Operations Tab and under Global Configuration, select **Manage Farm Features**.

**Microsoft SharePoint Server 2010/2013:**

Under System Settings, select **Manage Farm Features**.

2. By the HPE Data Protector Granular Recovery Extension, click **Deactivate**. The Warning page is displayed, click the **Deactivate this feature** link. Return to Manage Farm Features. By the HPE Data Protector Granular Recovery Extension, click **Activate**.

## Import from backup or from filesystem fails

### Problem

Import from backup or from filesystem ends with an error Checking disk space – Unknown error occurred. This problem may occur if Microsoft SQL prerequisites are not met on one or more systems in the farm.

### Action

Make sure that all prerequisites are installed. In case you had to install the missing packages, restart SharePoint Timer service and IIS on the updated clients.

## Changing default recovery settings fails

### Problem

When starting the recovery process, you cannot change the default recovery settings, for example, the recovery location. As the default recovery settings are configured in the pop-up windows, the problem can be caused by the enabled pop-up blocker in your browser.

### Action

Disable any pop-up blocker software in your browser.

## Recovery fails with "Unknown error has occurred, contact administrator." error message

### Problem

Recovery fails with "Unknown error has occurred, contact administrator." error message and in the debug.log there is a debug line logged "System.ServiceModel.FaultException: There was an exception running the extensions specified in the config file. --> Maximum request length exceeded."

It happens as the size of the item being recovered exceeds the maximum allowed content length of a request body.

### Action

Navigate to %ProgramFiles%\Common Files\Microsoft Shared\web server extensions\15\TEMPLATE\LAYOUTS\web.config file and increase the maximum allowed content length on every remote farm's Web Front End (WFE) by adding the following code:

```
<location path="GranularRecovery/RemoteFarm.aspx">
<system.web>
<!-- maxRequestLength is in kilobytes (KB) -->
<httpRuntime maxRequestLength="102400"/>
</system.web>
<system.webServer>
<security>
<requestFiltering>
<!-- maxAllowedContentLength is in bytes (B) -->
<requestLimits maxAllowedContentLength="104857600"/>
</requestFiltering>
</security>
</system.webServer>
</location>
```

**Note:** The code added is an example for setting the limit to 100 MB. If you need to recover files greater than 100 MB, you need to set values in the code accordingly.

## Slow response of the command line interface

### Problem

You can notice slow response of the HPE Data Protector Granular Recovery Extension command line interface. For example when you run the HP.Sharepoint.GranularRecovery.CLI.exe --help command, the command takes from 10 seconds to several minutes to display the usage. The root cause of the problem is the HPE Data Protector Granular Recovery Extension signature verification which may take quite some time to complete.

### Action

To disable the HPE Data Protector Granular Recovery Extension signature verification, proceed as follows:

1. Locate the cliproxy.exe and the HP.Sharepoint.GranularRecovery.CLI.exe files in the Microsoft SharePoint Server BIN folder. By default, the path of the BIN folder is:

**Microsoft Office SharePoint Server 2007:**

C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\12\BIN

**Microsoft SharePoint Server 2010:**

C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\14\BIN

**Microsoft SharePoint Server 2013:**

C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\15\BIN

2. In the BIN folder, create the configuration files `cliproxy.exe.config` and `HP.Sharepoint.GranularRecovery.CLI.exe.config` with the following content:

```
<?xml version="1.0" encoding="utf-8"
 ?><configuration><runtime><generatePublisherEvidence
 enabled="false"/></runtime></configuration>
```

## Slow response of the graphical user interface

### Problem

You can notice slow response of the HPE Data Protector Granular Recovery Extension GUI. For example when importing a content database from backup or from filesystem. The import job might fail, due to a time-out. The root cause of the problem is the HPE Data Protector Granular Recovery Extension signature verification which may take too long to complete.

### Action

To disable the HPE Data Protector Granular Recovery Extension signature verification, proceed as follows.

1. Locate the `cliproxy.exe` and the `HP.Sharepoint.GranularRecovery.CLI.exe` files in the Microsoft SharePoint Server BIN folder. By default, the path of the BIN folder is:

**Microsoft Office SharePoint Server 2007:**

C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\12\BIN

**Microsoft SharePoint Server 2010:**

C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\14\BIN

**Microsoft SharePoint Server 2013:**

C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\15\BIN

2. In the BIN folder, create the configuration files `cliproxy.exe.config` and `HP.Sharepoint.GranularRecovery.CLI.exe.config` with the following content:

```
<?xml version="1.0" encoding="utf-8" ?><configuration>
  <runtime>
    <generatePublisherEvidence enabled="false"/>
  </runtime></configuration>
```

## The Data Protector service is not running

### Problem

When performing an import from filesystem session, the following message is displayed: Required Data Protector service is not running!

### Action

1. Open Control Panel, double-click **Administrative tools**, and double-click **Services**.  
Find the Data Protector services, right-click the disabled service, and click **Start** to enable it.
2. In the Backup Version Selection page, click **Back** to finish your session.

## The restoring - Mount Request Pending status

### Problem

When performing an import from backup session, the status **Restoring - Mount Request Pending** is displayed on the Granular Recovery Import Job Status page.

### Action

1. Launch the Data Protector GUI (Data Protector Manager).
2. In the Monitor context, check for any mount requests. Confirm the mount requests and restart the backup session.
3. Once the backup session is finished, perform an import from backup session again.

## Subfolders are not recovered to original location

### Problem

When recovering a folder with subfolders the parent folder is recovered but its subfolders are not.

### Action

After you delete a folder, Microsoft SharePoint Server places this folder in the Site Collection Recycle bin. To recover your folder and its subfolders to original location using Granular Recovery Extension:

1. In the Site Collection Recycle bin, select the folder and click Delete Selection.
2. Perform a recovery session of your folder again.

## Granular Recovery Extension component installation fails

### Problem

Installing HPE Data Protector with the HPE Data Protector Granular Recovery Extension component enabled fails.

### Action

To manually install the HPE Data Protector Granular Recovery Extension without using standard HPE Data Protector installation procedure:

1. Log on to the Microsoft SharePoint Server Central Administration system under a Microsoft SharePoint Server **Farm Administrator** user account.
2. In the Start menu, right-click **Command Prompt** and select **Run as Administrator**.
3. Change the current directory to the *Data\_Protector\_home\bin* directory where the files from the self-extracting archive were extracted during the product installation process.
4. Run `grm_install.bat` to install the HPE Data Protector Granular Recovery Extension solution.

## Granular Recovery Extension removal fails

### Problem

After HPE Data Protector deinstallation, the HPE Data Protector Granular Recovery Extension is not removed from the system.

### Action

To manually remove the HPE Data Protector Granular Recovery Extension without using standard HPE Data Protector removal procedure:

1. **Microsoft Office SharePoint Server 2007:**  
Start Microsoft PowerShell v2.0 or higher using the SharePoint system account.  
**Microsoft SharePoint Server 2010/2013:**  
Start SharePoint 2010/2013 Management Shell using the SharePoint system account.
2. From the *Data\_Protector\_home\bin* directory, run:  
`grm_check.ps1`

## Installation ends unexpectedly on a farm with multiple servers on Central Administration

### Problem

On a farm with multiple servers on Central Administration, the installation of the HPE Data Protector Granular Recovery Extension ends unexpectedly.

### Action

Ensure that the following service is enabled on Central Administration:

#### Microsoft Office SharePoint Server 2007:

Windows SharePoint Services Web Application

#### Microsoft SharePoint Server 2010/2013:

Microsoft SharePoint Foundation Web Application

## Enabling Central Administration Services

The screenshot shows the 'Services on Server' page in SharePoint 2010. The page title is 'Central Administration > Services on Server'. Below the title, there is a description: 'Use this page to start or stop instances of services on servers in the farm'. The page includes a navigation menu on the left with categories like 'Central Administration', 'Application Management', 'System Settings', etc. The main content area displays a table of services with columns for 'Service', 'Status', and 'Action'. The 'Central Administration' service is highlighted in blue, indicating it is the current selection.

Service	Status	Action
Access Database Service	Started	Stop
Application Registry Service	Started	Stop
Business Data Connectivity Service	Started	Stop
Central Administration	Started	Stop
Claims to Windows Token Service	Stopped	Start
Document Conversions Launcher Service	Stopped	Start
Document Conversions Load Balancer Service	Stopped	Start
Excel Calculation Services	Started	Stop
Lotus Notes Connector	Stopped	Start
Managed Metadata Web Service	Started	Stop
Microsoft SharePoint Foundation Incoming E-Mail	Started	Stop
Microsoft SharePoint Foundation Sandboxed Code Service	Stopped	Start
Microsoft SharePoint Foundation Subscription Settings Service	Stopped	Start
Microsoft SharePoint Foundation Web Application	Started	Stop
Microsoft SharePoint Foundation Workflow Timer Service	Started	Stop

# Part 2 - Microsoft Exchange and the Granular Recovery Extension

This part of the guide describes the Data Protector Granular Recovery Extension for Microsoft Exchange Server 2010 and Microsoft Exchange Server 2013 (hereafter both referred to as **Microsoft Exchange Server** unless differences are pointed out).

This part includes the following chapters:

[Introduction](#)

[Installation](#)

[Configuration](#)

[Backup](#)

[Recovery](#)

[Command Line Interface](#)

[Troubleshooting](#)

## Chapter 8: Introduction

The Granular Recovery Extension for Microsoft Exchange Server (**the extension**) does not provide you with any backup solution. Use the Data Protector Microsoft Exchange Server 2010 integration to back up Microsoft Exchange Server 2010 mailbox and public folder databases or Microsoft Exchange Server 2013 mailbox databases (**databases**). Use the extension to restore Microsoft Exchange Server mailbox database files and to recover Microsoft Exchange Server single items or complete mailboxes.

Thus, the extension enables you to recover individual mailbox items, such as e-mail folders, calendar, contacts, or notes, with no need to recover the whole Microsoft Exchange Server mailbox or the entire mailbox database.

### Granular Recovery Extension Documentation set

- **Electronic PDF format**

The HP Data Protector Granular Recovery Extension User Guide for Microsoft Exchange Server provides information specific to this extension:

- For detailed information about Data Protector specifics, see the Data Protector [Documentation set](#).
- For detailed information about Microsoft Exchange Server specifics, refer to the official Microsoft Exchange Server documentation.

- **Help**

To complete the information presented in this guide available in the electronic PDF format, the Granular Recovery Extension for Microsoft Exchange Server provides the context-sensitive (F1) Help integrated in the Microsoft Management Console (MMC). The Help explains the pages and options available in the Granular Recovery Extension Graphical User Interface (GUI). You can access the Help by pressing F1, or by clicking the question mark (? Help) in the action pane.

## Accessing the Help

## Backup

The Granular Recovery Extension for Microsoft Exchange Server does not provide you any backup solution. Back up your Microsoft Exchange Server databases using the HP Data Protector Microsoft Exchange Server 2010 integration.

- the HP Data Protector Microsoft Exchange Server 2010 integration
- the HP Data Protector Microsoft Volume Shadow Copy Service integration

For more information on the HP Data Protector Microsoft Exchange Server backup solution, see the *HPE Data Protector Integration Guide*.

## Restore and recovery

The extension offers you the following benefits:

- **Recovery granularity**

The smallest Microsoft Exchange Server object that you can restore is a database. After the restore you can browse individual Microsoft Exchange Server mailbox items, such as e-mail folders, calendar, contacts, or notes. Thus, you can select to recover the entire database or the desired mailbox items only.

- **Multiple restore requests**

You can receive multiple restore requests concurrently.

- **Recovery of multiple mailboxes**

You can recover multiple mailboxes concurrently.

- **Recovery to different locations**

You can recover Microsoft Exchange Server items to:

- the original location in a mailbox
- a different location:
  - a different mailbox
  - a Personal Folders file (.pst)  
You can recover your Microsoft Exchange Server items to a Microsoft Office Outlook client located on a different Microsoft Exchange Mailbox Server without the extension's component installed, by using a Personal Folders file (.pst).
  - a different Mailbox Server node without the extension's component installed

- **Easy to search**

You can filter your Microsoft Exchange Server items by specifying the e-mail subject, author, date, terms in the attachments name, or even terms in the message body of e-mail messages. The Microsoft Exchange Server items can be searched before the recovery process is started. This way you can preview all the Microsoft Exchange Server items which will be recovered.

- **Secure operation of the extension**

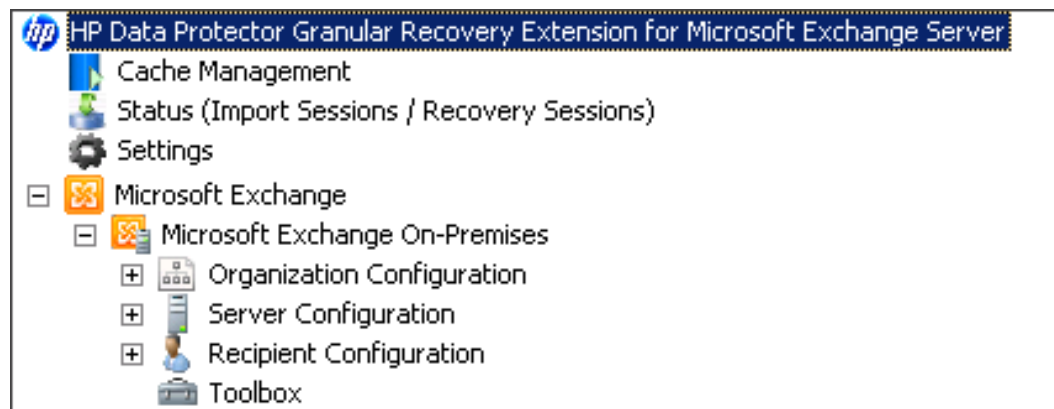

To restore and recover Microsoft Exchange Server items, you (as a Microsoft Exchange Server administrator) must be assigned the start\_restore user right by a Data Protector backup administrator.

For detailed information, see the "[Configuring user account for the Granular Recovery Extension](#)".

- **Microsoft Management Console (MMC) snap-in**

The extension's Graphical User Interface (GUI) is a Microsoft Management Console (MMC) snap-in integrated with the Exchange Management Console (EMC). You can find the extension's entry point above the EMC entry point (Microsoft Exchange icon) in the console tree.

#### The Granular Recovery Extension entry point

The integration eases switching between managing Exchange tasks and performing Granular Recovery Extension tasks such as requesting restores, starting recovery sessions, and so on.

## Chapter 9: Installation

The Data Protector Granular Recovery Extension for Microsoft Exchange Server is used to recover individual Microsoft Exchange Server mailbox items. Depending on the configuration of your Microsoft Exchange Server environment, you may need to install the corresponding Data Protector component on single or multiple Microsoft Exchange Server systems.

The "Microsoft Exchange Server clients -Data Protector Granular Recovery Extension for Microsoft Exchange server" section of the HPE Data Protector Installation Guide provides the details necessary for installing the Data Protector Granular Recovery Extension for Microsoft Exchange Server.

# Chapter 10: Configuration

This chapter describes the configuration steps that you need to follow.

## Meeting Data Protector configuration requirements for the Granular Recovery Extension

### Configuring the Granular Recovery Web service port

The Granular Recovery Web service establishes communication using the TCP/IP 60000 port number. If other service is using this port number, configure the Granular Recovery Web service to use an alternative port number:

1. Without starting the extension, search for the following Windows Registry key: HKEY\_LOCAL\_MACHINE\SOFTWARE\Hewlett-Packard\OpenView\OmniBackII\Plugins\exchgre.
2. Edit the key `Client port` and enter the new port number.
3. Update the IIS configuration to have the new port value for the Granular Recovery Web service by running the command:

```
IISWeb /create Web Service web site pathwebsite name/b new port number
```

Where:

*Web Service web site path* is the root path for the Granular Recovery Web service web site. The default path `C:\inetpub\wwwroot`.

*website name* is the web site hosted by the Granular Recovery Web service.

*new port number* is the new port number on which Granular Recovery Web service establishes communication.

For example:

```
IISWeb /create c:\inetpub\wwwroot "HP MS Exchange GRE" /b 8000
```

### Configuring user account for the Granular Recovery Extension

Configure your Granular Recovery Extension (GRE) user account with the following user rights and privileges:

#### Data Protector user rights

Make sure you have the following Data Protector user rights assigned:

1. Open the Data Protector GUI (**Data Protector Manager**).
2. Create a new user group to be used by the extension, for example, `GRE_Microsoft_Exchange_Server`.

For details on adding user groups, see the *HPE Data Protector Help* index: "adding, user groups".

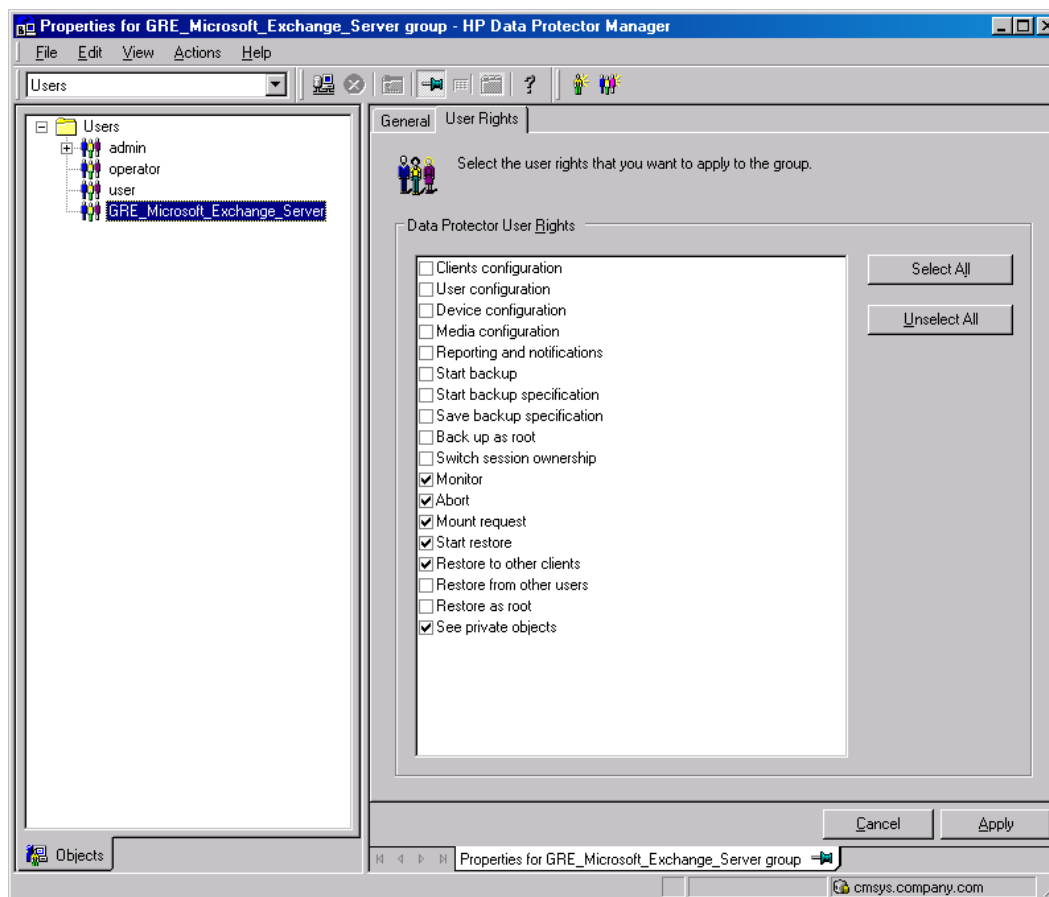

3. Assign the following Data Protector user rights to the GRE\_Microsoft\_Exchange\_Server user group:

**Monitor , Abort, Mount request, Start restore, Restore to other clients, and See private objects.**

For details on assigning Data Protector user rights, see the *HPE Data Protector Help* index: “changing, user rights”.

### Assigning Data Protector user rights to the GRE\_Microsoft\_Exchange\_Server user group

4. Each time you perform a new installation of the Granular Recovery Extension, add a Data Protector user to the GRE MS Exchange user group. Specify the following General User properties:

**Name:** SYSTEM, **Domain or UNIX Group:** NT AUTHORITY, **Client system:** *ComputerName*  
(Specify the computer name which contains the node with the Granular Recovery Extension installation).

For the detailed procedure, see the *HPE Data Protector Help* index: “adding, users”.

### Other necessary privileges

Assign the following permissions to your GRE user account:

- creating Windows Registry keys
- setting the Windows registry key values

## Privileges for executing Exchange Management cmdlet operations

To create a remote runspace for executing the Exchange Management cmdlet operations remotely, configure user credentials with specific Exchange Management roles. These operations are executed as part of Microsoft Exchange Server backup and restore operations and are necessary for successful operation of the extension.

Configure your GRE user account with the following Exchange privileges:

- a member of the specific Exchange Management built-in role groups with certain built-in management roles assigned:
  - the Organization Management role group
  - the Discovery Management role group
  - the Mailbox Import Export management role

As a member of the Organization Management role group, you are not assigned this management role by default. Assign the role to your GRE user account to be able to recover Exchange mailbox items to the original location in the original mailbox or to a Personal Folders file (.pst).

**Note:** Recovery to a .pst file requires you to create a network shared folder with read/write permissions granted to the Exchange Trusted Subsystem group.

- a member of the administrators group of the Microsoft Exchange Server system on which the extension is installed

The user credentials specified in the Remote Powershell Configuration dialog box are stored locally in the Windows Registry under the HKEY\_LOCAL\_MACHINE\SOFTWARE\Hewlett-Packard\OpenView\OmniBackII\Plugins\exchgre directory, on the Microsoft Exchange Server system on which the extension is installed.

Only user credentials (a username, password and domain name) of a single user can be stored. Each time you enter new user credentials the existing ones are overwritten. The encrypted password is stored on the Microsoft Exchange Server system on which the extension is installed.

For more information on the Exchange Management cmdlet operations and on how to assign the Exchange Management built-in management roles, see the Microsoft Exchange Server documentation.

# Chapter 11: Backup

The Granular Recovery Extension for Microsoft Exchange Server does not provide you any backup solution. Back up your Microsoft Exchange Server databases using the HP Data Protector Microsoft Exchange Server 2010 integration.

For more information on the HP Data Protector Microsoft Exchange Server backup solution, see the *HPE Data Protector Integration Guide*.

The following backup types are supported: Full, Incremental, Copy, and Differential.

The following disk-based backups are not supported:

- Microsoft Volume Shadow Copy Service (VSS) zero downtime backup (ZDB) to Disk
- VSS ZDB to Disk + Tape
- VSS ZDB instant recovery transportable

For detailed information on backup types, see the *HPE Data Protector Help* index: "backup types".

**Note:** The recovery procedure does not differ by Data Protector backup type.

# Chapter 12: Restore and recovery

## Limitations

### Data Protector Granular Recovery Extension limitations

- Databases or mailboxes encrypted by third party applications cannot be recovered.
- The **View** button in the action pane is meant for the future use. Thus, you cannot customize columns displayed in the results pane in the Cache Management and Status pages yet.
- The recovery of Public Folder mailboxes, team/site mailboxes, and linked mailboxes are not supported.
- The mount-point folder path that points to a mount volume location without a drive letter is not a supported restore location path.

### Microsoft Exchange Server limitations

- Due to Microsoft Exchange Server `Restore-Mailbox` cmdlet limitation, the items stored in the Exchange Server special folders cannot be browsed in the Granular Recovery – Recovery Settings Page:
  - using the **Recover to an existing folder** option that sets the target of the original mailbox.
  - using the **Recover into different Mailbox** option that sets the target of the different mailbox.

You can recover items where the target is a special folder only when using the option **Recovery to original location**.

- Due to the Microsoft Exchange Server limitations, the restore of Public Folder mailbox databases is not supported.
- Due to the Microsoft Exchange Server 2013 limitation in identifying the deleted team mailboxes, those mailboxes cannot be filtered out.
- Due to the lack of direct support of single mailbox item recovery by Microsoft Exchange Server 2013, the search query is formed with the supported options "subject", "From", "sent", and "Received" to narrow down the search of selected mails/items for recovery. Due to this approach, selected or unselected mails / items that match the search query are recovered.

## Considerations

### Data Protector Granular Recovery Extension considerations

- Two or more instances of the Granular Recovery Extension GUI or the GUI and the command-line interface (CLI) cannot be used at the same time.

- Any Microsoft Exchange Server operations, such as creating or deleting the Recovery Database, that are performed outside the Granular Recovery Extension (GRE) using management tools such as the Exchange Management Console, while the GRE user interface is open, are not reflected in the GRE user interface.
- Multiple restore requests for the same backup object (mailbox database) from the same backup version are processed once.
- The **Export List ...** button is displayed in the action pane, if you select the HP Data Protector Granular Recovery Extension node. The button creates a list of all the contents displayed in the console tree: Cache Management, Status (Import Sessions / Recovery Sessions) and Settings Microsoft Exchange. The list can be exported in the following formats: text, Unicode text, comma-separated value (CSV), and Unicode CSV. This functionality is provided by default by the Microsoft Management Console (MMC).
- You can perform multiple recovery requests for the same restored database.
- In the GRE wizard, you can specify search criteria to narrow the list of items which you can select for recovery. After entering some values in the Mailbox Search Criteria page, and selecting one or more items for recovery in a specific mailbox folder, any items in this folder's subfolders will also be recovered if they meet the same search criteria.
- The Search Results page displays only three levels of folders, which does not affect your restore process. If you select an item on the third level, its child items will also be restored.
- Make sure the destination folder is empty before performing restore.

**Tip:** You can specify a new restore folder in the Restore Settings page of the Import From Backup wizard, and the extension creates a new folder.

- In the Mailbox Selection page of the Import from Backup wizard, the Mailbox user names starting with non-ASCII characters are grouped under --.
- Non-ASCII characters are not supported in paths. When typing the restore path, avoid non-ASCII characters. Otherwise the restore may fail.
- If a recovery database already exists in a target location on a mailbox server, the Granular Recovery Cache keeps all the versions without deleting them.
- You can perform multiple restore requests to the same target location.
- Multiple recovery databases can be created on a mailbox server.
- The number of recovery databases is limited by the disk space available in the temporary restore location.
- The Granular Recovery Cache keeps only one recovery database (RDB) mounted per Microsoft Exchange mailbox server, even though the restored database files are still on the disk once the recovery session finishes.

On a Microsoft Exchange mailbox server, there is only one recovery database stored.

For example, in a DAG environment, each mailbox node can contain one recovery database, but only on one server there can be a mounted recovery database.

## Data Protector considerations

- The Granular Recovery Extension cannot restore or recover items from backup images created with the Data Protector Microsoft Volume Shadow Copy Service (VSS) integration.

- The Granular Recovery Extension does not support Instant Recovery (IR).

## Microsoft Exchange Server considerations

- The option of recovering data into a PST file is only available for Microsoft Exchange Server 2010 environments using Microsoft Exchange Server 2010 SP1 or a later service pack.
- Moved or deleted mailbox databases cannot be searched (the Microsoft Exchange Server known issue). However, you can recover a moved mailbox once it was moved.

Deleted mailboxes are displayed in the Import From Backup wizard, on the Import from Backup — Mailbox Selection only if the retention period is not expired. Once the retention period is reached and the deleted mailbox is no longer available in the Import From Backup wizard, re-importing the mailbox database that contains the needed mailbox is necessary.

For details, see "[Importing mailbox databases](#)".

- In the Microsoft Exchange Server 2013 environment, a combination of `New-MailboxRestoreRequest`, `Search-Mailbox`, and `New-SearchMailbox` cmdlet operations induces storage space and performance factors which cannot be avoided due to Microsoft Exchange Server limitations.
- Make sure that active databases in a standalone or DAG configuration (the GRE supported Microsoft Exchange Server configuration) have two times of a source mailbox size storage space for creating temporary mailboxes during recovery.
- Make sure that target mailboxes to which recovery items are to be stored have sufficient storage space for storing the recovered items.

## Restore and recovery flow

To restore and then recover the Microsoft Exchange Server items, follow the basic steps:

### 1. Import

#### a. Restore

The Data Protector Granular Recovery Extension uses the Data Protector Microsoft Exchange Server 2010 integration to restore the Microsoft Exchange Server databases.

#### Temporary restore location

First the Microsoft Exchange Server database files are saved to a temporary restore location. Restore the database files (.edb), checkpoint files (.chk), reserve transaction log files (.jrs), and transaction log files (.log) to the specified temporary restore location on a Microsoft Exchange Server system.

A recovery database (RDB) is created in the temporary location.

The restored files are located on the Microsoft Exchange Server system that is chosen as the restore target system. The default location is `C:\Restore`, but you can specify a different restore location.

For details, see "[Changing settings](#)".

After successful restore of mailbox databases from their backup images, the restored databases are available in the granular recovery cache.

b. **Mount**

Mount the restored database in the granular recovery cache to the Microsoft Exchange Server. Before browsing and recovering items you have to mount the restored database files.

2. **Recover**

Browse and recover the Microsoft Exchange Server items from the recovery database to the original mailbox database, or to any different location.

3. **Dismount**

Only one recovery database can remain mounted, for this reason when you no longer need to recover items from a recovery database:

- Dismount the recovery database from the Microsoft Exchange Server.

Once you dismount the recovery databases, the recovery databases are still in the Granular Recovery — Cache Management but their status are dismounted. At this point, you can still remount them if needed for another recovery session.

4. **Removal**

The recovery databases remain in the cache for 30 days (default value) or for as long as it is set in the retention time.

After the retention time expires, the database is dismounted and removed from the Granular Recovery Extension cache automatically, but the restored database files still exist in temporary restore location.

- Optionally, change the retention period. For detailed procedure, see "[Changing the retention period](#)".
- Optionally, remove the no longer needed recovery database from the cache manually before the retention period. For detailed procedure, see "[Removing databases](#)".
- The restored database files still remain in temporary restore location, you can completely remove them, by deleting the files from the temporary restore location manually.

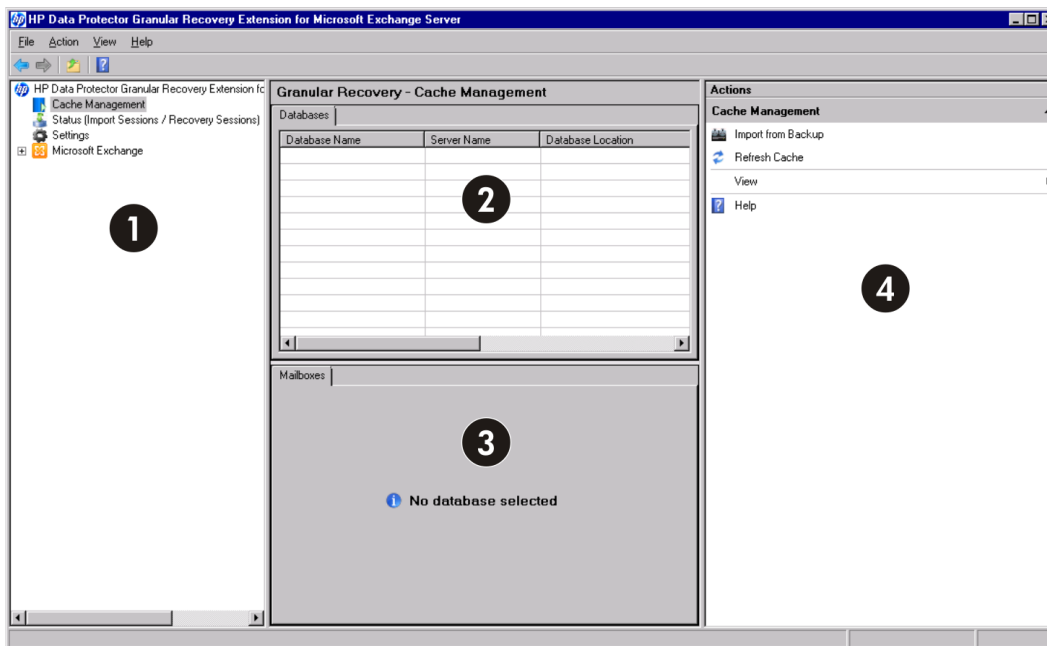

## Opening the HP Data Protector Granular Recovery Extension GUI

### To open the extension:

1. Log in to the Microsoft Exchange Server system where the Granular Recovery Extension is installed.
2. Click the **Start** button and then click the HP Data Protector Exchange GRE icon to open the extension's Graphical User Interface (GUI).

The HP Data Protector Granular Recovery Extension for Microsoft Exchange Server is started.

### Main window of the Granular Recovery Extension Graphical User Interface (GUI)

Item	Description
1	Console tree
2	Result pane
3	Work pane
4	Action pane

**Note:** In the Microsoft Exchange Server 2010 environment, the Exchange Management tasks are managed using the Exchange Management Console (EMC) accessible by clicking the Microsoft Exchange icon in the console tree of the Granular Recovery Extension Graphical User Interface (GUI).

In the Microsoft Exchange Server 2013 environment, the Exchange Management tasks are managed by using the Exchange Administration Center (EAC). The EAC has its own web based graphical user interface and cannot be accessed through the extension's Microsoft Management Console (MMC) snap-in GUI.

- In the console tree, click the **Cache Management** icon.

The empty **Granular Recovery - Cache Management** is displayed.

The remote powershell has to be configured before performing any granular recovery operations. See "[Remote powershell configuration](#)".

To import Microsoft Exchange Server databases, follow the procedure for "[Importing mailbox databases](#)".

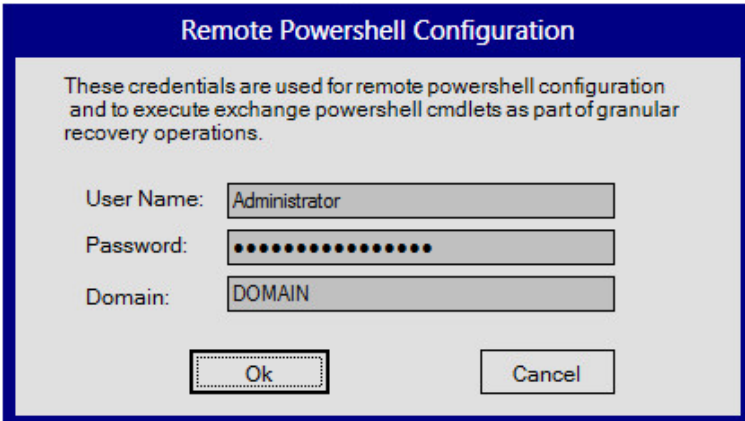

## Remote powershell configuration

Configure a user account for executing the Exchange Management cmdlet operations remotely.

For details, see "[Privileges for executing Exchange Management cmdlet operations](#)".

If no valid user credentials are specified for executing the Exchange Management cmdlet operations remotely, the Remote Powershell Configuration dialog box is displayed. Enter the required user credentials and click **OK**.

### Remote powershell configuration

**Remote Powershell Configuration**

These credentials are used for remote powershell configuration and to execute exchange powershell cmdlets as part of granular recovery operations.

User Name: Administrator

Password: ●●●●●●●●●●●●

Domain: DOMAIN

Ok Cancel

## Importing mailbox databases

### Prerequisites

- Make sure sufficient disk space is available on the target Exchange Mailbox Server.

### Considerations

- The Granular Recovery Extension cannot restore or recover items from backup images created with the Data Protector Microsoft Volume Shadow Copy Service (VSS) integration.
- The Data Protector Granular Recovery Extension does not support Instant Recovery (IR).

### Limitations

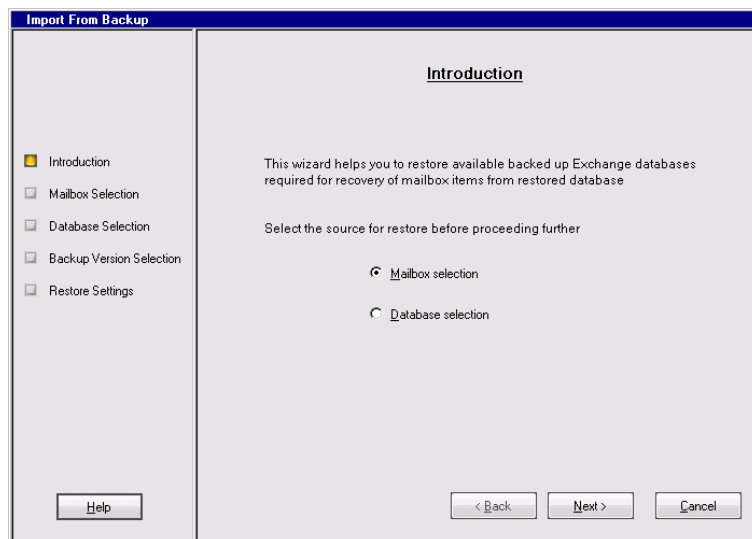

- In the Mailbox Selection page of the Import from Backup wizard, the deleted mailbox database names can be identified by the suffix @@Deleted in the mailbox display name. However, if there are more mailbox databases with the same display name, only one entry is displayed. To be able to import other mailboxes with the same name, contained in the database, use the Database selection page instead of Mailbox selection page.
- Deleted mailboxes are no longer displayed after the expiration of the retention period.
- If a mailbox is moved from a standalone environment to new standalone environment, an import from backup can be performed in the original environment. The backup version displayed is the one that still contains the mailbox in the original standalone environment.

## Procedure

Before browsing and recovering items, you have to import databases:

1. In the console tree, click the **Cache Management** icon. The **Granular Recovery Cache Management** page is displayed in the results pane.
2. In the action pane under the Cache Management node, click **Import from Backup**. The Import From Backup wizard is displayed.

### Selecting a restore object

3. In the Introduction page, select a backup source:
  - To import only a specific mailbox, select **Mailbox selection** and click **Next**. The Mailbox Selection page is displayed.

**Tip:** **Mailbox selection** is especially useful if the mailbox database is unknown.

### Selecting a desired mailbox

- i. Specify the mailbox user name, and click **Next**.
  - ii. The Backup Version Selection page is displayed. Select the backup data you want to restore and click **Next**.
- To import a complete database and all the mailboxes contained in the database, select **Database selection** and click **Next**.

**Note:** The database selection for restore can be useful if, for any reason, the mailbox you want to recover is not visible in the Mailbox Selection page.

### Selecting a mailbox database

- i. The Database Selection page is displayed. Select the database you want to restore and click **Next**.
- ii. The Backup Version Selection page is displayed. Select the backup version you want to restore and click **Next**.

### Selecting a backup version

- The Restore Settings page is displayed. Confirm or adjust the values of the Database Name, Server Name, and the Restore Location.

### Adjusting the restore settings

The screenshot shows the 'Import From Backup' wizard with the 'Restore Settings' page selected. The left pane shows a navigation menu with 'Restore Settings' highlighted. The main area contains the following fields and options:

- Database Name :** my\_mailbox\_database
- Server Name :** exchsrvsys1.company.com (with a 'Browse' button)
- Restore Location :** C:\Exchange\_restore\_folder (with a 'Browse' button)  
( Path to store database ) ( for e.g., C:\Restore )
- Unmount Recovery Database if one is already mounted

Below the fields, there is a note: "Click 'Finish' to start importing Databases" and "Status can be checked by clicking on 'Granular Recovery Status (Import sessions / Recovery Sessions)' node on the left pane of the Main Window". At the bottom, there are buttons for 'Help', '< Back', 'Finish', and 'Cancel'.

Make sure that the destination folder is empty before performing restore.

**Tip:** You can specify a new restore folder in the Restore Settings page of the Import From Backup wizard and the extension creates a new folder.

5. Optionally, you can dismount a recovery database if one already exists in the Granular Recovery Cache Management on the server specified in the Restore Settings page. Select the option and click **Finish**.
6. To monitor the restore session, in the console tree click **Status (Import Sessions / Recovery Sessions)**. The Granular Recovery Status (Import Sessions / Recovery Sessions) page is displayed.
7. To stop the restore session, click **Abort Sessions**.

### Imported database as displayed in the GUI

## Mounting databases

### Prerequisites

- Make sure the mailbox database files are restored (imported) in the Granular Recovery — Cache Management.

### Procedure

After importing the mailbox database (once the restore process is finished), mount the database manually.

To mount the mailbox database manually:

1. In the console tree, select the Cache Management node.
2. In the results pane, select the database you want to mount.

## Selecting a database

3. In the action pane under the Databases node, click **Mount Recovery Database**.

Once the database is mounted, in the work pane, the mailbox display name, size, and the last logged on username are displayed.

## Starting recovery

### Prerequisites

- Make sure the recovery database from which you want to recover Microsoft Exchange Server single items is mounted.

### Limitations

- If you select contact items and mail items in the Search Results page, and recover them in one session, the contact items will not be recovered. You must select and recover the contact items separately.
- If several mailboxes with the same display name were disabled at the time of the backup and no other connected mailboxes in the database had the same display name, two deleted mailboxes are displayed in the Mailbox selection page after import, one with the suffix `@@Deleted` and one without. If the Granular Recovery Extension does not find the `@@Deleted` suffix and the mailbox was deleted, the **Mailbox Personal Folder** option is disabled in the Mailbox Search Criteria page. The `@@Deleted` suffix is not appended to the name of the deleted mailbox if there is no other mailbox with the same display name.

### Procedure

To recover Microsoft Exchange Server single items:

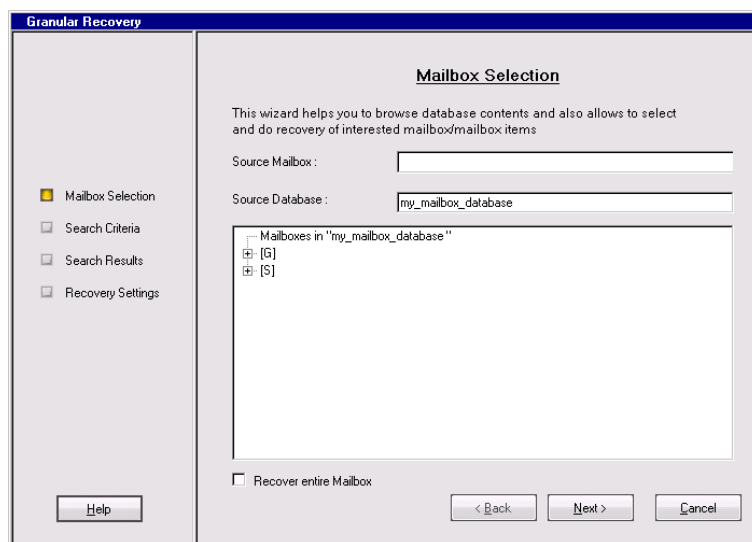

1. In the console tree, select the Cache Management node. In the results pane, select the recovery database from which you want to recover.
2. In the action pane under Databases, click **Start Recovery**.

**Tip:** A shortcut access to any action button, for example **Start Recovery**, is to right-click the database in the Granular Recovery—Cache Management.

3. In the Mailbox Selection page, select the mailbox for recovery. Optionally, to restore a complete mailbox folder, select the **Restore entire Mailbox** option.

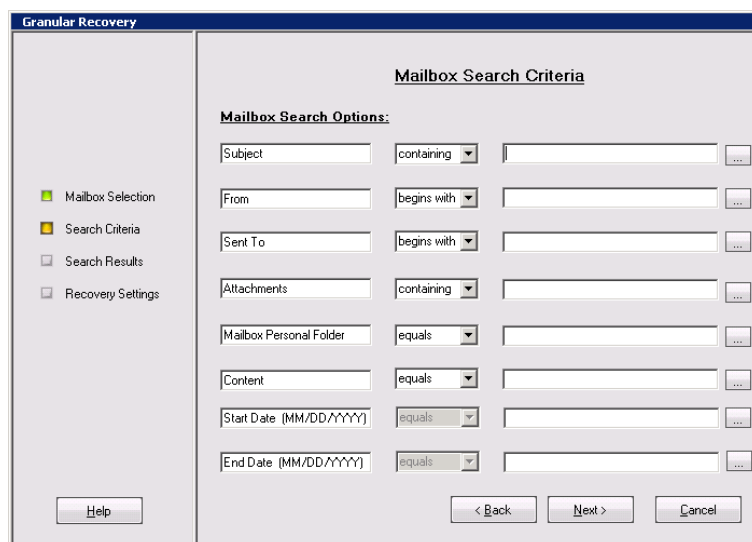

Click **Next**. The Mailbox Search Criteria page is displayed.

### Selecting a mailbox

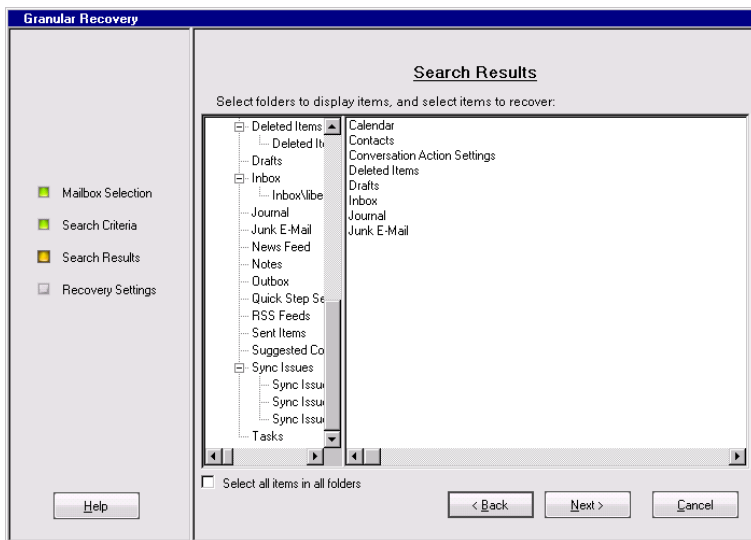

4. Filter e-mails by subject, author, recipient, attachment term, personal folder, or e-mail content, and click **Next**.

### Specifying the search criteria

5. In the Search Results page, select a folder from the mailbox. The items are displayed in a table.

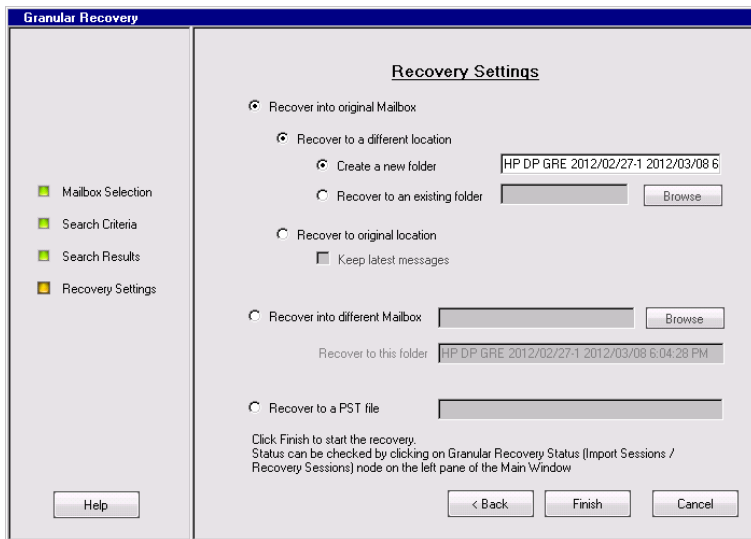

### Selecting an item for recovery

Select the item you want to recover and click **Next**. The Recovery Settings page is displayed.

**Tip:** You can select multiple items by holding **Ctrl** or **Shift** button.

### Specifying the target location

**Tip:** If **Keep latest messages** is not selected, the items are overwritten.

- Specify the target recovery location: an existing Exchange Server mailbox or the name of the PST file to be created during recovery.

**Tip:** When you recover items to an existing folder of the mailbox, only the folders you created are displayed. Special folders, such as Inbox, Drafts, Sent Items, Deleted Items, Junk E-mail, Outbox, RSS Feeds, Sync Issues, Conversation History, Tasks, Calendars, and Contacts, cannot be set as a target, therefore are not displayed. Clicking the Browse button of **Recover to an existing folder** or, the Browse button of the **Recover into different Mailbox**

does not display special folders. Only **Recover to original location** can recover items to special folders.

The PST file folder must be accessible from the Exchange Server system.

To use a remote system or current server, enter the path to the network shared folder in the following (UNC) format:

```
\\SystemName\FolderShareName\Filename.pst
```

**Note:** Make sure the local system user account performing the recovery has read and write permissions set on the network share folder in order to create a PST file. If the folder is located on a remote server system, the Data Protector MS Exchange Granular Recovery Extension component does not need to be installed on the remote system.

Click **Finish** to start the recovery operation and close the wizard.

## Dismounting databases

### Prerequisites

- Make sure the recovery database you want to dismount is mounted.

### Considerations

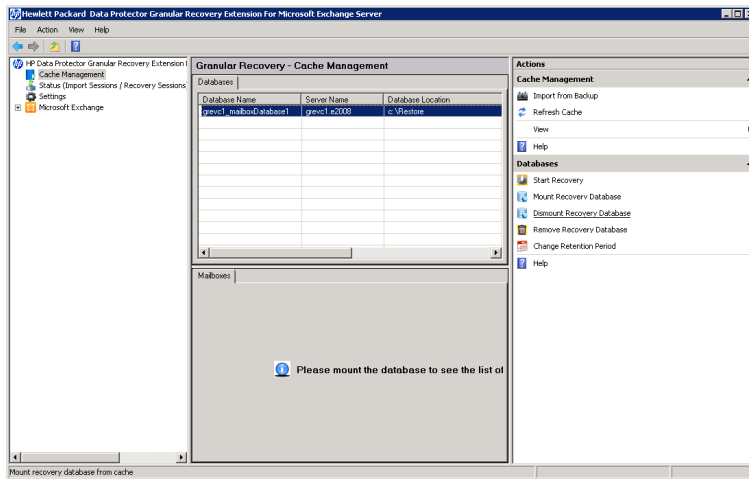

- Only one recovery database can stay mounted. For this reason, when you want to recover single items, or complete mailboxes from a different backup version or from a different mailbox database, you have to first dismount the mailbox database already presented to the Microsoft Exchange Server, the one displayed in the Granular Recovery Cache Management.

After the restore process is finished, the selected database is mounted in the Granular Recovery Cache Management. The mounted database is displayed in the results pane.

To dismount no longer needed databases from the Granular Recovery Cache Management:

1. In the console tree, select the Cache Management node. The Granular Recovery Cache Management page is displayed.
2. In the results pane, select the database. In the action pane under the Databases node, click **Dismount Recovery Database**.

## Clicking Dismount

3. The confirmation dialog box is displayed. Click **Yes**. The database is dismounted, the mailbox information is no longer displayed in the work pane.

## Removing databases

### Prerequisites

- Make sure the recovery database you want to remove from the disk is restored.

### Considerations

- The restored mailbox database is available in the Granular Recovery — Cache Management for 30 days (default value). After the retention period the database is deleted automatically.

### Procedure

To remove no longer needed databases manually from the Granular Recovery — Cache Management and from the temporary restore location on the disk:

1. In the console tree, select the Cache Management node. The Granular Recovery Cache Management page is displayed.
2. In the results pane, select the database. In the action pane under the Databases node, click **Remove Recovery Database**.

## Removing a database

3. The confirmation dialog box is displayed. Click **Yes**. The database is removed from the temporary restore location.

## Changing settings

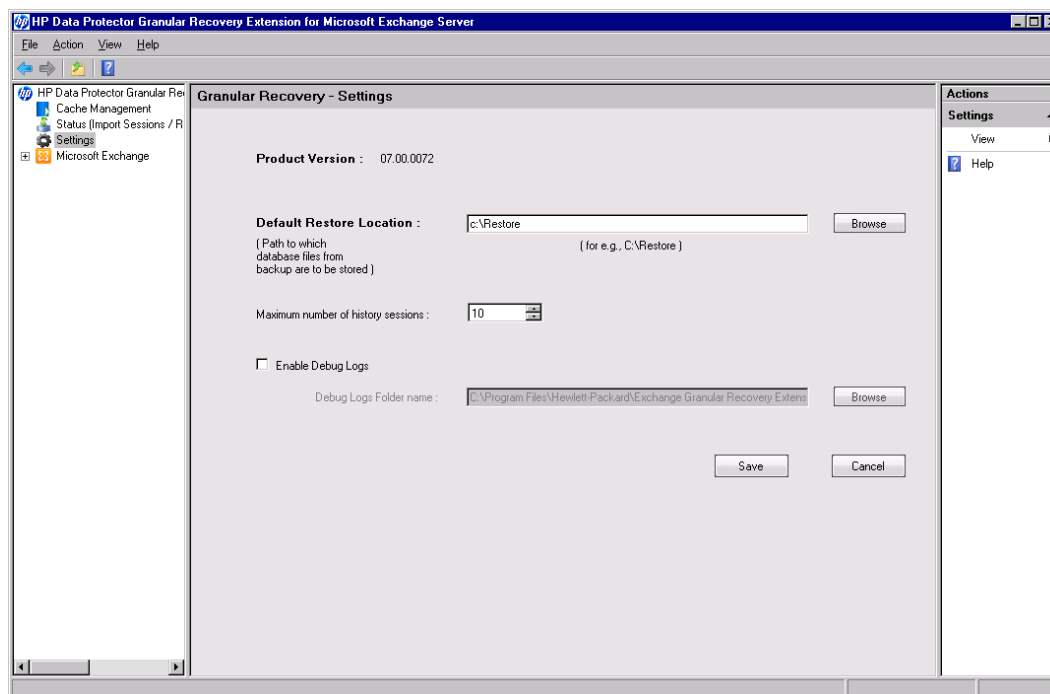

After the restore session is completed, the database files (.edb), checkpoint files (.chk), reserve transaction log files (.jrs), and transaction log files (.log) are copied to the temporary restore location c:\restore.

### Procedure

To change the default settings of the extension:

1. In the console tree, click the **Settings** icon. The **Granular Recovery Settings** page is displayed in the results pane.
2. The temporary restore location is set to c:\restore (default). To change the temporary restore location, specify the new path by typing or browsing the new directory.
3. To set how many completed sessions (restore and recovery sessions) are displayed in the Granular Recovery Status page, specify the maximum number of history sessions.
4. To enable debugging of the Granular Recovery extension, select **Enable debug logs**. To change the default location of the debug files: type the new location, or specify a new location by clicking **Browse**, and click **Save**.

## Changing default settings

## Changing the retention period

### Prerequisites

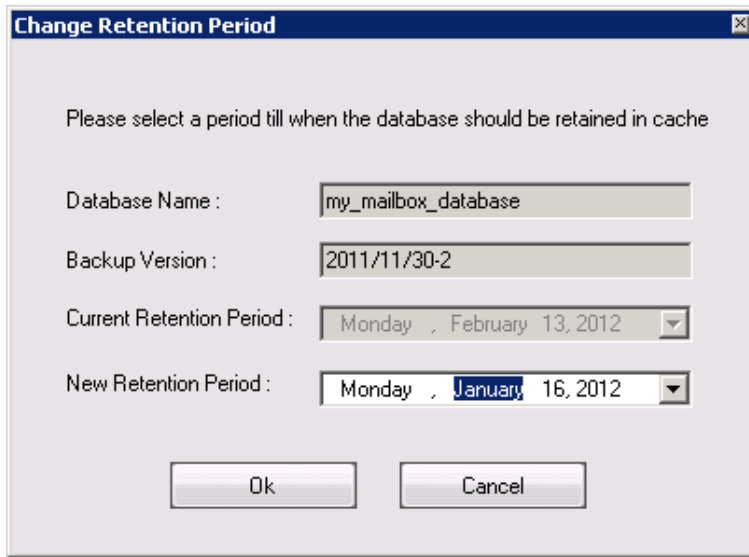

- Make sure the mailbox database is available in the granular recovery cache.

### Procedure

The retention period of the mailbox databases is 30 days. After the expiration date the databases are removed from the cache automatically. To change the default value:

1. In the results pane, select the database.
2. In the action pane under the Databases node, click **Change Retention Period**. The Change Retention Period dialog box is displayed.
3. In the New Retention Period drop-down list, select the new date in the calendar.

### Changing retention period

The image shows a dialog box titled "Change Retention Period" with a close button in the top right corner. The dialog contains the following fields and controls:

- Text: "Please select a period till when the database should be retained in cache"
- Database Name:
- Backup Version:
- Current Retention Period:  (dropdown arrow)
- New Retention Period:  (dropdown arrow)
- Buttons: "Ok" and "Cancel"

## Chapter 13: Command line reference

The Data Protector Granular Recovery Extension for Microsoft Exchange Server offers a command line interface which you can use instead of the GUI.

### Prerequisites

Configure a user account for executing the Exchange Management cmdlet operations remotely by using the command `--Config`, providing Username, Password, and Domain. The remote powershell has to be configured before performing any granular recovery operations using the CLI commands.

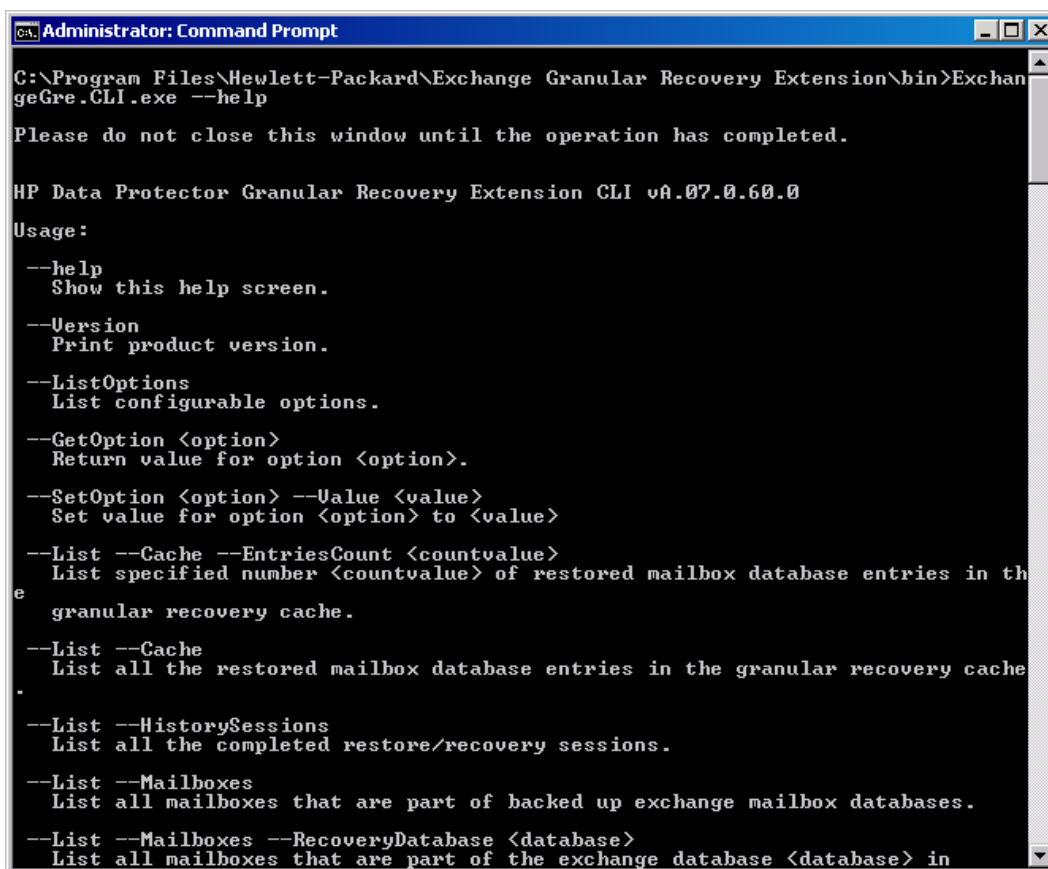

For details, see "[Privileges for executing Exchange Management cmdlet operations](#)".

**Note:** If no valid user credentials are specified for remotely executing the Exchange Management cmdlet operations, the command displays an error message.

The command `ExchangeGre.CLI.exe` is located in the installation directory of the extension:

`C:\Program Files\Hewlett-Packard\Exchange Granular Recovery Extension\bin`

### Retrieving the command line help

```
Administrator: Command Prompt
C:\Program Files\Hewlett-Packard\Exchange Granular Recovery Extension\bin>ExchangeGre.CLI.exe --help
Please do not close this window until the operation has completed.

HP Data Protector Granular Recovery Extension CLI vA.07.0.60.0

Usage:
--help
  Show this help screen.
--Version
  Print product version.
--ListOptions
  List configurable options.
--GetOption <option>
  Return value for option <option>.
--SetOption <option> --Value <value>
  Set value for option <option> to <value>
--List --Cache --EntriesCount <countvalue>
  List specified number <countvalue> of restored mailbox database entries in the granular recovery cache.
--List --Cache
  List all the restored mailbox database entries in the granular recovery cache.
--List --HistorySessions
  List all the completed restore/recovery sessions.
--List --Mailboxes
  List all mailboxes that are part of backed up exchange mailbox databases.
--List --Mailboxes --RecoveryDatabase <database>
  List all mailboxes that are part of the exchange database <database> in
```

## Description

ExchangeGre.CLI.exe is the command line interface of the Granular Recovery Extension for Microsoft Exchange Server. You can use it to perform queries, to restore, mount, recover, and dismount databases, to recover single items, and set different recovery options.

For a detailed description of available options see ["Options"](#).

**Note:** The command line interface and the graphical user interface cannot be used at the same time.

## Options

### Available Options

Option	Description
--Version	Displays the version of the extension.
--Help	Displays the usage synopsis for the ExchangeGre.CLI.exe command.
--List {--Cache   --HistorySessions   --Mailboxes[--RecoveryDatabase RecoveryDatabaseName]   --BackupVersions[--MailboxDB MailboxDatabaseID   --MailboxMailboxName]   --AllBackupDatabases}	<p>The --List option lists various information about the Granular Recovery Cache, mailboxes, sessions, and so on.</p> <p>The --Cache option lists the information of the restored mailbox databases in the Granular Recovery Cache Management:</p> <p>The database name, the Recovery Database ID with the granular recovery time stamp, for example RDB_ExchangeGRE_dpexchange5_2011-11-15_1, the server name, the status of the mailbox database (mounted or dismounted), and the backup version and the size of the database. With the --Verbose option you can see more details such as the database location (the directory to where the database files are restored), the date the database was restored, and the date of the expiration when the retention period is over the database is dismounted from the Granular Recovery Cache Management.</p> <p>The --HistorySessions option displays 10 restore and recovery sessions by default, with the following information: session ID, Name, Type Start Time, End time, and status (completed or failed).</p> <p>The --Mailboxes option displays all the mailbox names from the backed up Microsoft Exchange mailbox databases.</p>

Option	Description
	<p>The --BackupVersions option displays all backup versions available for a recovery database with information about the name, data of backup creation, the size of the backup, type of the backup, the method used to perform the backup, and the media type; as well as all backup versions of a recovery database of a specific mailbox.</p> <p>The --AllBackupDatabases option displays all the backup databases names.</p>
<p>--Details--                      Session <i>SessionID</i></p>	<p>Displays details of the specified session.</p>
<p>--ListOptions   --                      GetOption <i>OptionName</i>   --                      SetOption <i>OptionName</i> --                      Value <i>Number</i></p>	<p>The --ListOptions option displays the available options.</p> <p>The --GetOption <i>OptionName</i> option retrieves the value of a specified option.</p> <p>The --SetOption <i>OptionName</i> --Value <i>Number</i> option applies a value to a specified option.</p> <p>The following options are available:</p> <ul style="list-style-type: none"> <li>• The DebugFolder option displays the path of the debug files when the EnableDebugLogging option is set to 1.</li> <li>• The RestoreLocation option displays the directory where the restored mailbox database files are located.</li> <li>• The MaxHistorySessionsNumber option displays how many latest restore and recovery sessions are displayed under the History Tab of the Status page the extension.</li> </ul>
<p>--Remove {--                      Sessions <i>SessionID</i>                      [<i>SessionID...</i>]   --                      AllSessions   --                      RecoveryDatabase  <i>DatabaseName</i>--                      Server <i>ComputerName</i>}</p>	<p>The --Remove option removes the following items:</p> <ul style="list-style-type: none"> <li>• The --Sessions <i>SessionID</i> [<i>SessionID...</i>] option removes the specified sessions.</li> <li>• The --AllSessions option removes all the recovery sessions from the Granular Recovery Cache.</li> <li>• The --RecoveryDatabase <i>DatabaseName</i> --Server <i>ComputerName</i> option removes a specified recovery database, or a mailbox database from the Granular Recovery Cache but not the disk.</li> </ul>
<p>{--Mount   --Dismount} -                      -RecoveryDatabase  <i>RecoveryDatabaseName</i></p>	<p>Mounts or dismounts the recovery database specified by --RecoveryDatabase <i>RecoveryDatabaseName</i>.</p>
<p>--Search {--                      Mailbox <i>MailboxName</i>   --                      Cache--                      Mailbox <i>MailboxName</i>--                      MailboxDB <i>DatabaseName</i>}</p>	<p>Lists the mailbox user name and the database name in a backup or in the Granular Recovery Cache Management.</p>

Option	Description
<pre>--StartSession--Restore --DismountRDB [true   false]--MailboxDB DatabaseName--BackupID BackupVersion--Server ComputerName-- TargetLocation TargetFolderPath</pre>	<p>Restores mailbox databases, making them available for mount and then recovery.</p> <p>The --DismountRDB option controls whether the restore session dismounts any already mounted database in the Granular Recovery Cache Management. Available values are true or false.</p>
<pre>--StartSession-- Recovery--SrcMailbox SourceMailboxName-- RecoveryDatabase RecoveryDatabaseName-- MailboxDB DatabaseName {--RecoverWholeMailbox   --Filter [FILTER_ OPTIONS]}-- RecoveryTargetType [ORG_ MAILBOX   DIFF_MAILBOX   PST]</pre>	<p>Recovers complete mailboxes or single items.</p> <p>The --SrcMailbox option defines the mailbox from which the data is recovered. The --RecoveryDatabase option defines the Recovery Database named with the granular recovery time stamp, for example RDB_ExchangeGRE_dpexchange5_2011-11-15_1. The --MailboxDB option defines the mailbox database from which the recovery is performed. You can choose to recover a complete mailbox database by using the --RecoverWholeMailbox option, or filter the items using the --Filter option.</p> <p>Different recovery target locations are selected with the --RecoveryTargetType option:</p> <p><b>ORG_MAILBOX</b></p> <p>OrgLocation--KeepLatestMsg [true   false] [RECOVERY_OPTIONS]</p> <p>If the OrgLocation option is specified, the recovery is performed to the original mailbox. If the --KeepLatestMsg option is set to true, the recovery session does not overwrite new messages.</p> <p><b>DIFF_MAILBOX</b></p> <p>DiffMailbox [RECOVERY_OPTIONS] --  TargetMailboxMailboxName</p> <p>If the DiffMailbox option is specified, the recovery is performed to another location, not the original location of items. If the --TargetMailboxMailboxName option is specified the recovery is performed to the new location specified by the MailboxName.</p> <p><b>PST</b></p> <p>If the pst option is specified, the items are recovered to a .pst file, specified with --PSTFileNamePSTFileNameWithPath.</p> <p><b>RECOVERY_OPTIONS</b></p> <p>The following options can be used to modify the recovery session:</p> <p>The --DiffLocation option sets the new location for the recovered items. The --CreateNewFolderNewFolderName option recovers items to a new location in a different folder than the original item's</p>

Option	Description
	<p>location (specified by Default).</p> <p>The <code>--ExistingFolderFolderName</code> uses an existing folder in the mailbox as a target for the recovered items.</p> <p><b>FILTER_OPTIONS</b></p> <p>You can filter your mailbox items by using the following filtering options:</p> <ul style="list-style-type: none"><li>• The <code>Subject="Term"</code> options filters the subject of the e-mails. You can list more than one term by separating them with colons (:), for example <code>Subject="Report:Proposal"</code>, where the search terms are "Report" and "Proposal".</li><li>• The <code>Contents="Term"</code> option searches the body of the e-mails for a specific term.</li><li>• The <code>Attachments="Term"</code> option searches the attachments for a specific term.</li><li>• The <code>Senders="SenderName"</code> option searches your mailbox for an author, or group list of the e-mail.</li><li>• The <code>Recipients="RecipientName"</code> option searches the receiver of the e-mail.</li><li>• The <code>Folders="FolderName"</code> option searches for a name of a folder in the mailbox.</li><li>• The <code>StartDate="Date"</code> and the <code>EndDate="Date"</code> options filters the dates when the messages were sent and received.</li></ul>

## Examples

**Note:** In the examples below, `ExchangeGre.CLI.exe` is omitted for simplicity.

### Changing Granular Recovery Extension settings

To list available options for the granular recovery extension, specify:

```
--ListOptions
```

To get the value of the option "EnableDebugLogging", specify:

```
--GetOption EnableDebugLogging
```

To set the value for the option "EnableDebugLogging" to "1", specify:

```
--SetOption EnableDebugLogging --Value 1
```

## Restoring a mailbox database from Data Protector backup

To list the backup databases, specify:

```
--List --AllBackupDatabases
```

To import a mailbox database from the Data Protector backup session with the ID 2011/09/08-5 to the temporary restore location c:\restore, specify:

**Microsoft Exchange 2010 Server :**

```
--StartSession --Restore --DismountRDB false --MailboxDB DatabaseName --BackupID  
2011/09/08-5 --Server computer.company.com --TargetLocation "c:\Restore"
```

## Listing mailbox database information

To list mailbox database information, such as database name, recovery database ID, server name, mount status, backup version and its size for all database entries in the granular recovery cache, specify:

```
--List --Cache
```

To list more specific details about the recovery sessions such as mailbox database name, server name, location of the restored database files, database ID, mount status, backup version, size of the database, retention period, specify:

```
--List --Cache --Verbose
```

To list mailbox database information for 20 database entries in the granular recovery cache, specify:

```
--List --Cache --EntriesCount 20
```

To list details about completed recovery sessions, such as sessions IDs, session name, type, date and time when the session started and ended, mount status, specify:

```
--List --HistorySessions
```

To list all mailboxes that are part of backed up Exchange mailbox databases, specify:

```
--List --Mailboxes
```

List all mailboxes that are part of the Exchange database "RDB\_ExchangeGRE\_dpexchange5\_2011-11-15\_1" granular recovery cache, specify:

```
--List --Mailboxes --RecoveryDatabase RDB_ExchangeGRE_dpexchange5_2011-11-15_1
```

To list all backup versions of Exchange mailbox database "Mailbox Database 0474359329", specify:

```
--List --BackupVersions --mailboxDB "Mailbox Database 0474359329"
```

To list all backup versions of backup Exchange mailbox databases that contain the mailbox "Administrator", specify:

```
--List --BackupVersions --Mailbox Administrator
```

To list backed up Exchange mailbox databases, specify:

```
--List --AllBackupDatabases
```

To show details about the completed restore session "ExchangeGRE\_dpexchange5\_2011-11-09\_4", specify:

```
--Details --Session ExchangeGRE_dpexchange5_2011-11-09_4
```

## Changing the retention period

To change the retention period of the recovery database "ExchangeGRE\_dpexchange5\_2011-11-09\_4" on the server "dpexchange5.company.com" to end on January 15, 2012, specify:

```
--SetRP --RecoveryDatabase RDB_ExchangeGRE_dpexchange5_2011-11-15_1 --Server  
dpexchange5.company.com --Period 2012/01/15
```

## Mounting a mailbox database

To mount a database, specify:

```
--MountDB --RecoveryDatabase RecoveryDatabaseName --MailboxDB DatabaseName --Server  
computer.company.com
```

To mount the restored mailbox "Mailbox Database 0474359329" database on to recovery database "RDB\_ExchangeGRE\_dpexchange5\_2011-11-15\_1" on the server "dpexchange5.company.com", specify:

```
--MountDB --RecoveryDatabase RDB_ExchangeGRE_dpexchange5_2011-11-15_1 --MailboxDB  
"Mailbox Database 0474359329" --Server dpexchange5.company.com
```

To dismount a mailbox database from the Granular Recovery Cache and still keep the files in the temporary restore location:

```
--DismountDB --RecoveryDatabase RecoveryDatabaseName --MailboxDB DatabaseName --  
Server computer.company.com
```

To dismount the mounted Exchange database "Mailbox Database 0474359329" from the recovery database

"RDB\_ExchangeGRE\_dpexchange5\_2011-11-15\_1" on the Exchange server "dpexchange5.company.com", specify:

```
--DismountDB --RecoveryDatabase RDB_ExchangeGRE_dpexchange5_2011-11-15_1 --  
MailboxDB "Mailbox Database 0474359329" --Server dpexchange5.company.com
```

## Searching a mailbox

To search a mailbox "john" in a backup, specify:

```
--Search --Mailbox john
```

To search a mailbox "john" in the mounted restored database "Mailbox Database 0474359329" in the Granular Recovery Cache, specify:

```
--Search --cache --Mailbox john --MailboxDB "Mailbox Database 0474359329"
```

## Recovering items to the original location

In the following recovery examples, the recovery will be performed from the mailbox database "Mailbox Database 0474359329" mounted to the recovery database "RDB\_ExchangeGRE\_dpexchange5\_2011-11-15\_1".

To restore mailbox database to a temporary restore location:

```
--StartSession --Restore --DismountRDB true --MailboxDB DataBaseName --BackupID ID  
--Server computer.company.com --TargetLocation C:/restore
```

To recover a complete mailbox to the original location replacing the old emails by the latest version, specify:

```
--StartSession --Recovery --SrcMailbox mailbox_name --RecoveryDatabase DBName --  
MailboxDB mailbox_name --RecoveryWholemailbox --RecoveryTargetType orgMailbox --  
OrgLocation --KeepLatestMsg true
```

To recover the folder "inbox" from the user mailbox "Administrator" to the original location, without overriding new messages, specify:

```
--StartSession --Recovery --SrcMailbox Administrator --RecoveryDatabase RDB_  
ExchangeGRE_dpexchange5_2011-11-15_1 --MailboxDB "Mailbox Database 0474359329" --  
Filter Folders=inbox --RecoveryTargetType orgMailbox --OrgLocation --KeepLatestMsg  
true
```

To recover only e-mails with the subject "market analysis" from the folder "inbox" from the user mailbox "john" to the original location, without overriding new messages, specify:

```
--StartSession --Recovery --SrcMailbox john --RecoveryDatabase RDB_ExchangeGRE_  
dpexchange5_2011-11-15_1 --MailboxDB "Mailbox Database 0474359329" --Filter  
subject="market analysis"|folders="inbox" --RecoveryTargetType orgMailbox --  
OrgLocation --KeepLatestMsg true
```

## Recovering items to another location

To recover a complete mailbox to a new location for example a new mailbox, specify:

```
--StartSession --Recovery --SrcMailbox mailbox_name --RecoveryDatabase  
RecoveryDatabaseName --MailboxDB mailbox_name --RecoveryWholemailbox --  
RecoveryTargetType
```

To recover the complete user mailbox "Administrator" to the mailbox "john" to a new folder "recovered mailbox", specify:

```
--StartSession --Recovery --SrcMailbox Administrator --RecoveryDatabase RDB_  
ExchangeGRE_dpexchange5_2011-11-15_1 --MailboxDB "Mailbox Database 0474359329" --  
Filter Folders=inbox --RecoveryTargetType diffMailbox --DiffLocation --  
CreateNewFolder "recovered mailbox" --TargetMailbox john
```

To recover only e-mails with the subject "market analysis" from the folder "inbox" from the user mailbox "john" to a different default location, without overriding new messages, specify:

```
--StartSession --Recovery --SrcMailbox john --RecoveryDatabase RDB_ExchangeGRE_
dpexchange5_2011-11-15_1 --MailboxDB "Mailbox Database 0474359329" --Filter
subject="market analysis"|folders="inbox" --RecoveryTargetType orgMailbox --
OrgLocation --KeepLatestMsg true --DiffLocation --CreateNewFolder default
```

To recover only e-mails with the subject “market analysis” from the folder “inbox” from the user mailbox “john” to a different (existing) folder “recovered data items”, without overriding new messages, specify:

```
--StartSession --Recovery --SrcMailbox john --RecoveryDatabase RDB_ExchangeGRE_
dpexchange5_2011-11-15_1 --MailboxDB "Mailbox Database 0474359329" --Filter
subject="market analysis"|folders="inbox" --RecoveryTargetType orgMailbox --
OrgLocation --KeepLatestMsg true --DiffLocation --ExistingFolder "recovered data
items"
```

To recover a complete mailbox to a .pst file, specify:

```
--StartSession --Recovery --SrcMailbox mailbox_name --RecoveryDatabase
RecoveryDatabaseName --RecoveryDatabase MailboxDB mailbox_name --
RecoveryWholemailbox --RecoveryTargetType pst
```

To recover the complete user mailbox “john” to the file “C:\recovered\john.pst”, specify:

```
--StartSession --Recovery --SrcMailbox john --RecoveryDatabase RDB_ExchangeGRE_
dpexchange5_2011-11-15_1 --MailboxDB "Mailbox Database 0474359329" --
RecoverWholeMailbox --RecoveryTargetType pst --PSTfilename
"C:\\recovered\\john.pst"
```

## Removing sessions

To remove a completed recovery session with the ID 2011/09/08-5 from the Granular Recovery Cache, specify:

```
--Remove --Session 2011/09/08-5
```

To remove all the recovery sessions from the Granular Recovery Cache, specify:

```
--Remove --AllSessions
```

## Removing recovery databases

To remove the mailbox database “RDB\_ExchangeGRE\_dpexchange5\_2011-11-15\_1” from disk on the server “dpexchange5.company.com”, specify:

```
--Remove --RecoveryDatabase RDB_ExchangeGRE_dpexchange5_2011-11-15_1 --Server
dpexchange5.company.com
```

# Chapter 14: Troubleshooting

This chapter lists general checks and verifications, plus problems you might encounter when using the Data Protector Granular Recovery Extension for Microsoft Exchange Server.

- For Microsoft Exchange Server troubleshooting information, see the troubleshooting sections of the Microsoft Exchange Server parts of the *HPE Data Protector Integration Guide*.
- For general Data Protector troubleshooting information, see the *HPE Data Protector Troubleshooting Guide*.

## Before you begin

- To enable debugging, see "[Enabling debugging option](#)".
- Make sure that the latest official Data Protector patches are installed. See the *HPE Data Protector Help* index: "patches" on how to verify this.
- For general Data Protector limitations, as well as recognized issues and workarounds, see the HPE Data Protector Product Announcements, Software Notes, and References.
- For an up-to-date list of supported versions, platforms, and other information, see <http://support.openview.hp.com/selfsolve/manuals>

## Debugging

### Enabling debugging option

1. To enable the debugging option, click **Settings** in the console tree. The Granular Recovery Settings page is displayed.
2. Select the **Enable Debug Logs** option. The Debug Logs folder name field is activated. Specify a new location of the folder, and click **Save**.

For a list of known issues and workarounds, see "[Known issues and workarounds](#)".

## Known issues and workarounds

### Search Criteria Results page remains empty after at least one search keyword is entered

#### Problem

In the Granular Recovery wizard, in the Mailbox Search Criteria page, after you enter a term to search for and then click **Next**, no results appear in the Search Results page even if the search criteria are met for some items.

### Action

To display a list of search results, proceed as follows:

1. Dismount the recovery database. For detailed procedure see "[Dismounting databases](#)".
2. Using the Cache Management page of the Granular Recovery Extension GUI, identify the folder where the database has been restore into. From this folder, remove the subfolder that has the string CatalogData in its name.
3. In the Exchange Management Shell, run the following command:  
`set-mailboxDatabase DatabaseName -indexenabled $false.`
4. Mount the recovery database again. For detailed procedure, see "[Mounting databases](#)".
5. Start the recovery once again and follow the Granular Recovery wizard.
6. In the Mailbox Search Criteria page, re-enter the search keywords and click **Next**.

## Manual removal of temporary mailboxes created by the extension

### Problem

Normally, temporary mailboxes created by the extension during the recovery process, are also deleted automatically after the process completes. However, in exceptional cases (for example, if the extension stops working), the temporary mailboxes created by the extension, are not deleted automatically after the process completes and have to be removed manually.

### Action

You can identify such mailboxes by the prefix DP\_Recovery or DP\_SEARCH.

In the Microsoft Exchange Server 2010 environment, use the Exchange Management Console (EMC) to remove the redundant mailboxes manually.

In the Microsoft Exchange Server 2013 environment, use the Exchange Administration Center (EAC) or the Exchange Management Shell (EMS) to remove the redundant mailboxes manually.

## Search for mailbox items fails and reports an error

### Problem

In the Microsoft Exchange Server 2010 environment, in the Granular Recovery wizard, in the Mailbox Search Criteria page, after you trigger a search using the specified criteria, the search fails with the following error:

```
ERROR debugs - Powershell error : Restore-Mailbox : Error was found for DP_
Recovery_ExchangeGRE_2011-10-03_38 (DP_Recovery_ExchangeGRE_2011-10-03_38@mail.hp-
dp.com) because: Error occurred in the step: Opening source mailbox. Failed to open
mailbox by GUID with error: The operation failed. error code: -1056749260 +
CategoryInfo: InvalidOperation: (0:Int32) [Restore-Mailbox], RecipientTaskException
```

```
+ FullyQualifiedErrorId:  
DD312EA7,Microsoft.Exchange.Management.RecipientTasks.RestoreMailbox
```

### Action

Install the Update Rollup 2 for Exchange Server 2010 Service Pack 1 (KB2425179) or a subsequent update. You can obtain the Update Rollup 2 from the website <http://www.microsoft.com/download/en/details.aspx?id=12938>.

## Mailboxes are missing from the list in the Import from Backup wizard

### Problem

In the Import from Backup wizard, in the Mailbox Selection page, when you browse for user mailboxes after clicking **Advanced**, some mailboxes are missing from the Mailboxes tree, although they exist in the backup image of the Exchange Server database.

There can be different reasons for such a problem, including time synchronization problems within the Data Protector cell and Exchange Server problems in retrieving the mailbox metadata.

### Action

If you know to which mailbox database the desired mailbox belongs, you can start the process anew by selecting the appropriate database. Follow the steps:

1. Check **Back** to return to the Introduction page of the wizard.
2. Select **Database selection**, click **Next**, and follow the wizard to complete the importing process.

## Mounting a restored database fails

### Problem

In the Microsoft Exchange Server 2013 environment, mounting a restored database might end up with an error.

The problem occurs when the restored database is in the "dirty-shutdown state". The database should be in the "clean-shutdown state" to be mounted successfully.

### Action

1. Bring the restored database to the "clean-shutdown state" by executing the Microsoft Exchange Server `eseutil.exe` recovery command.  
For more information on the `eseutil.exe` utility, see the Microsoft Exchange Server documentation.
2. Retry to mount the restored database.

## Interprocess communication error being reported by the GUI

### Problem

After attempting to trigger an operation from the Granular Recovery Extension graphical user interface (GUI), the following error message is displayed in a dialog box:

The communication object, `System.ServiceModel.Channels.ServiceChannel`, cannot be used for communication because it is in the Faulted state.

All subsequent user actions in the GUI fail with the same error.

This error is reported when the Granular Recovery Extension GUI is open for a period of time that is longer than the Internet Information Services (IIS) recycling time period. The IIS unloads the Exchange GRE Web Service among other web services, resulting in a communication failure between the service and the GUI.

### Action

Close and then re-launch the Granular Recovery Extension GUI.

## An Exchange GRE recovery or restore operation fails due to insufficient permission

### Problem

If an Granular Recovery Extension recovery or restore operation fails due to insufficient permissions even when the user who executes the Granular Recovery Extension (either GUI or CLI) has sufficient permissions, the issue may arise due to insufficient permission for the local SYSTEM account.

This account needs appropriate permissions due to the following:

- The Granular Recovery Extension Web Service runs with Local SYSTEM privileges.
- The Granular Recovery Extension Web Service allows the Data Protector Inet service, which by default runs under the Windows local System user account, to execute or launch the Data Protector Exchange Integration agent. The restore session is performed using the same user account.

### Action

Grant the local SYSTEM user account appropriate permissions to restore Microsoft Exchange Server databases and create recovery databases:

1. Close the currently running Exchange Granular Recovery Extension client (GUI or CLI).
2. Stop the Granular Recovery Extension Web Service.
3. Provide appropriate permissions for the local SYSTEM account.
4. Start the Granular Recovery Extension and continue the Granular Recovery Extension operations.

When a request comes from the GUI or CLI, the Internet Information Services (IIS) start the Granular Recovery Extension Web Service automatically.

## The message Adding snap-in to console... is displayed for a long time

### Problem

When you open the Granular Recovery Extension graphical user interface (GUI), the message MMC cannot initialize the snap-in is displayed, followed by the Adding snap-in to console... which is displayed for a long time.

When you open the GUI and locate the console tree, the Cache Management, Status and Settings nodes are not loaded.

The issue may appear if Internet Information Services (IIS) or if its associated services are not running and the Granular Recovery Extension GUI cannot communicate with the Exchange GREWeb Service.

### Action

Make sure that IIS and its associated services are up and running:

1. Open the Internet Information Services (IIS) Manager, locate and select the ExchangeGre node in the console tree under the Default Web Site. The Exchange GRE Web Service home page is displayed.
2. Right-click the ExchangeGre node, click Manage Application, and then click Browse.

The snap-in is added to the MMC. When you open the GUI, the Cache Management, Status and Settings nodes are displayed. The message is not displayed anymore.

If during the step 1, the Exchange GRE Web Service home page is not displayed:

1. When the Adding snap-in to console... is displayed, click Cancel to close the message.
2. Open the Server Manager, select the Roles node. Under the Roles Summary locate the WebServer (IIS) and select it.
3. The Web Server (IIS) is displayed. Under the System Services, verify if all the services are up and running, including the Application Host Helper Service, IIS Admin Service, and the World Wide Web Publishing Service.
4. Re-open the Granular Recovery Extension GUI.

## The About HP Data Protector Granular Recovery Extension for Microsoft Exchange Server does not display the product build number

### Problem

You select Help **About HP Data Protector Granular Recovery Extension for Microsoft Exchange Server**, but the product version is not displayed.

The issue is caused by a Microsoft Management Console (MMC) known issue, due to a string caching mechanism in the MUI cache. The registry is not updated automatically after the upgrade. The MUI cache does not get cleared and the product version is not displayed in the MMC snap-in.

### Action

To manually delete strings in the MUI cache and re-install the snap-in:

1. Click the Start button, click Run, type REGEDIT, and click OK.
2. In the Registry Editor, locate one of the following hierarchy (if they exist):  
HKEY\_USERS\S-1-5-21-61196776-1057610366-2591919248-500\_Classes\Local  
Settings\Software\Microsoft\Windows\Shell\MuiCache  
HKEY\_USERS\S-1-5-21-2765349584-3720068851-1520285658-500\_Classes\Local  
Settings\MuiCache\96\52C64B7E
3. Delete the following registry keys of the Granular Recovery Extension for Microsoft Exchange Server:  
  
@C:\Program Files\Hewlett-Packard\Exchange Granular Recovery  
Extension\bin\GreSnapInResource.dll, -114  
  
@C:\Program Files\Hewlett-Packard\Exchange Granular Recovery  
Extension\bin\GreSnapInResource.dll, -115  
  
@C:\Program Files\Hewlett-Packard\Exchange Granular Recovery  
Extension\bin\GreSnapInResource.dll, -116  
  
@C:\Program Files\Hewlett-Packard\Exchange Granular Recovery  
Extension\bin\GreSnapInResource.dll, -117  
  
Close the Registry Editor.
4. Run the following command:  
  
%windir%\Microsoft.NET\Framework64\v2.0.50727\InstallUtil.exe "C:\Program  
Files\Hewlett-Packard\Exchange Granular Recovery  
Extension\bin\ExchangeGre.MmcGui.dll" /install
5. Click the Help menu and then click the **About HP Data Protector Granular Recovery  
Extension for Microsoft Exchange Server** again, the product build number is displayed.

## Recovery items are not getting deleted automatically from the exchange management shell

### Problem

In the Exchange 2013 SP1 environment, Exchange GRE is sometimes unable to remove the mailbox restore request (initiated using "New-MailboxRestoreRequest" command) by using "Remove-MailboxRestoreRequest" command for a target mailbox even after the mailbox restore request status is updated to "completed". This could be because the Exchange server is unable to remove the request from the complete queue. As the previously executed Mailbox restore request for a mailbox is not cleaned / removed, it is not possible to initiate another recovery operation to the same target mailbox.

### Action

1. Please make sure that no Exchange GRE operation is active/running.
2. Clean up the completed "restore requests" for a mailbox manually by executing the following command in the Exchange Management shell and then retry the operation. Get-MailboxRestoreRequest -Status Completed | Remove-MailboxRestoreRequest

# Part 3 - VMware and the Granular Recovery Extension

This part of the guide describes Data Protector Granular Recovery Extension (GRE) for VMware vSphere.

This part includes the following chapters:

[Introduction](#)

[Installation](#)

[Configuration](#)

[Backup](#)

[Recovery](#)

[Troubleshooting](#)

# Chapter 15: Introduction

This section provides the following information on the Data Protector Granular Recovery Extension (GRE):

- [Features](#)
- [Recovery Flow](#)

The HPE Data Protector Granular Recovery Extension (GRE) restores data using the Data Protector Virtual Environment integration; this extension is a recovery solution only.

The GRE plug-in is accessible through two user interfaces:

- [Web Plug-in](#)
- [Advanced GRE Web Plug-in](#)

## GRE features

- **Restore and recovery:** The Data Protector GRE for VMware vSphere restores VMDK(s) to a temporary restore location (a mount proxy system) and then recovers individual VMware virtual machine files from the restored VMDK. This feature is available as Staged restore and recovery in Web Plug-in and as Non-Cached restore and recovery in Advanced GRE Web Plug-in.
- **Presentation and recovery:** The Data Protector GRE for VMware vSphere does not restore the VMDK file to a temporary location (mount proxy) for recovering individual files. Instead, the VMDK is presented to a temporary location (mount proxy) for recovering individual files. You can perform file recovery from a VMDK, without restoring the VMDK file into a temporary location (mount proxy). GRE for VMware vSphere directly mounts the VMDK to the mount proxy host and enables the user to browse the disk and select the file(s) to recover. Hence, with presentation, it is not necessary to restore a disk (or a whole chain) of any particular backup for recovering files. This feature is available as Non-Staged Recovery in the Web Plug-in and as Cached recovery in the Advanced GRE Web Plug-in.

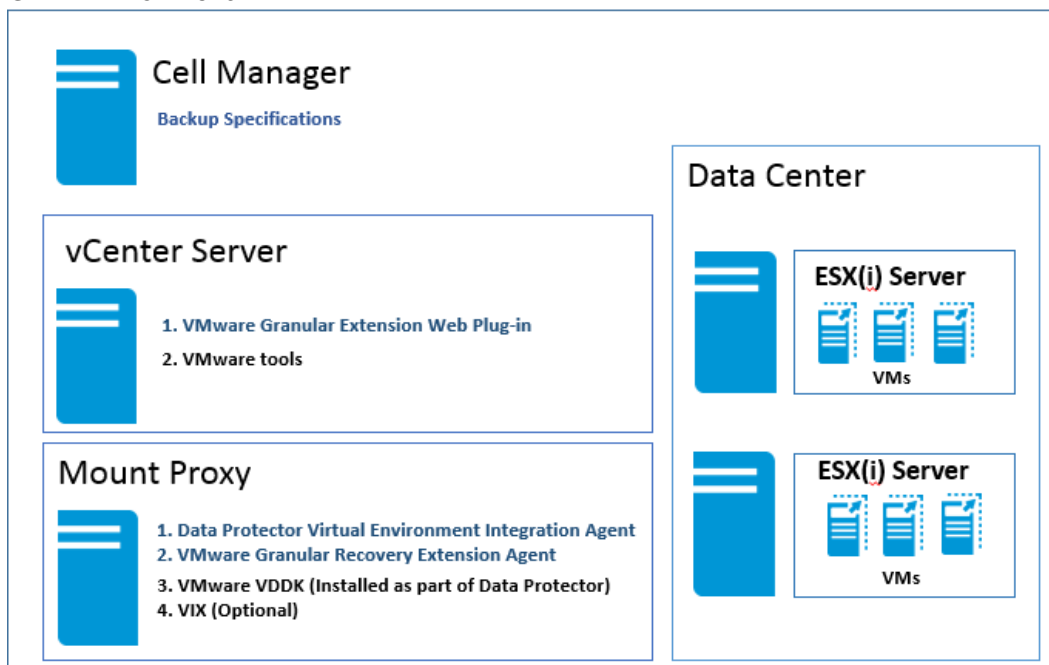

**Note:** Backups done to Smart Cache and StoreOnce Catalyst devices or backups from array snapshots residing on the HPE 3PAR storage are referred to as cached backups and the other backups are referred to as non-cached backups.

## Recovery flow

The Data Protector GRE and the plug-ins (Web Plug-in or the Advanced GRE Web Plug-in) enable file recovery from VM Disks. The Data Protector GRE environment must be configured before using the Web plug-ins for file recovery operations. The following illustration depicts the standard GRE environment. For detailed information on meeting the requirements for the GRE environment and installing the Data Protector GRE, see the "VMware Client" section of the *HPE Data Protector Installation Guide*.

The HPE Data Protector components appear in blue, and the VMware components appear in black.

## GRE Environment

## Web Plug-in

The process of recovering (staged or non-staged) virtual machine files using the Web Plug-in is as follows:

1. Access the plug-in from the vCenter web client. See [Accessing the Web Plug-in](#).
2. Configure the mount proxy systems (administrator only). See [Configure mount proxy](#).
3. Request a restore or presentation operation. See [Requesting restore or presentation](#).
4. Handle the requests (administrator only). See [Handling requests](#).
5. Monitor the requests. See [Monitoring the requests](#).
6. Recover files from Virtual Machines. See [Recovering files](#).
7. Remove Virtual Machine disks (administrator only). See [Removing virtual machine disks](#).

For more detailed information, see the section on [Recovery](#).

## Advanced GRE Web Plug-in

The following prerequisite must be met:

- Ensure that the IP address is configured in the vCenter.

The process of recovering (Cached or Non-Cached) virtual machine files using the Advanced GRE Web Plug-in is as follows:

1. Access the plug-in from the vCenter web client. See [Accessing the Advanced GRE Web Plug-in](#).
2. Configure the mount proxy systems. See [GRE Settings page](#).
3. View the list of requests. See [GRE Requests page](#).

4. Create a new request for restore or presentation. See [New Request page](#).
5. Monitor the requests. See [GRE Requests page](#).
6. Recover files from Virtual Machines. See [Recover files page](#).

For more detailed information, see the section on [Recovery](#) .

# Chapter 16: Installation

The Data Protector Granular Recovery Extension requires the installation and configuration of the following systems:

- **Data Protector** cell and the following clients:
  - VMware vCenter Server system
  - Mount proxy system

**Note:** If encrypted control communication is enabled on mount proxy systems (default), vCenter Server systems must be added as exceptions. For details, see the section [Configuring encrypted control communication](#).

For detailed instructions on meeting the requirements for the GRE environment, installing the Granular Recovery Extension, and the required Data Protector components, see the, "VMware clients" section of the *HPE Data Protector Installation Guide*.

For detailed instructions on remotely or locally installing any or all of the following, see the *HPE Data Protector Installation Guide*

- Data Protector Cell Manager - See the "*Installing the Data Protector Cell Manager and Installation Server*" section.
- Data Protector clients - See the "*Installing Data Protector integration clients*", "*VMware clients*" section.

# Chapter 17: Configuration

This chapter describes the configuration steps that you need to follow.

## Meeting Data Protector configuration requirements for Granular Recovery Extension

This section provides information for the following:

- [Configuring GRE User Group and Users](#)
- [Configuring GRE Administrators](#)
- [Configuring Systems for vSphere](#)
- [Configuring Encrypted Control Communication](#)

### Configuring a GRE for VMware vSphere user group and users

This section provides the following details:

- [Adding a GRE for VMware vSphere User Group](#)
- [Adding users to the GRE for VMware vSphere User Group](#)
- [Adding an Inet user account to the admin group](#)

#### Adding a GRE for VMware vSphere user group

**Note:** The steps provided in this section are required for using the GRE Web Plug-in. User must be part of the Data Protector administrator group to perform Granular Recovery Extension (GRE) on a specific virtual machine. If not, the Data Protector restricts the user from performing the GRE operations. Also, user must have sufficient permissions or privileges on the corresponding vCenter server to perform the GRE operations. If not, the Data Protector does not restrict the user, instead the user receives an error message from the vCenter server.

Also, user must have sufficient permissions or privileges on the corresponding vCenter server to perform the GRE operations. If not, the Data Protector does not restrict the user, instead the user receives an error message from the vCenter server.

Also, user must have sufficient permissions or privileges on the corresponding vCenter server to perform the GRE operations. If not, the Data Protector does not restrict the user, instead the user receives an error message from the vCenter server.

#### Prerequisite

You need to have the Data Protector User configuration user right assigned.

### Procedure

To create a Data Protector group for the Granular Recovery Extension VMware using the Data Protector GUI (Data Protector Manager):

1. In the Context List, click **Users**.
2. In the Scoping Pane, right-click **Users**.
3. Click **Add User Group** to open the wizard.
4. Under General, type the **Name** and **Description** of the new group.
5. Click **Next**.
6. Set the start restore user right for the group.
7. Click **Finish** to exit the wizard.

The new GRE VMware user group is added to Data Protector.

To add users, see ["Adding users to the GRE for VMware vSphere group" below](#).

### Adding users to the GRE for VMware vSphere group

**Note:** The steps provided in this section are required for using the GRE Web Plug-in.

### Prerequisite

You need to have the User configuration user right to be able to add users.

### Procedure

To add users to the GRE VMware group:

1. In the Context List, click **Users**.
2. In the Scoping Pane, expand **Users**.
3. Right-click the user group to which you want to add a user.
4. Click **Add/Delete Users** to open the wizard.
5. In the Add/Delete Users dialog, enter the specific user properties.

When entering **Name** and **Group/Domain**, make sure you enter information about an existing user on your network.

To make sure that GRE VMware Administrators have an access to the administrative entry point of the extension, specify the following information:

**Type** : Windows

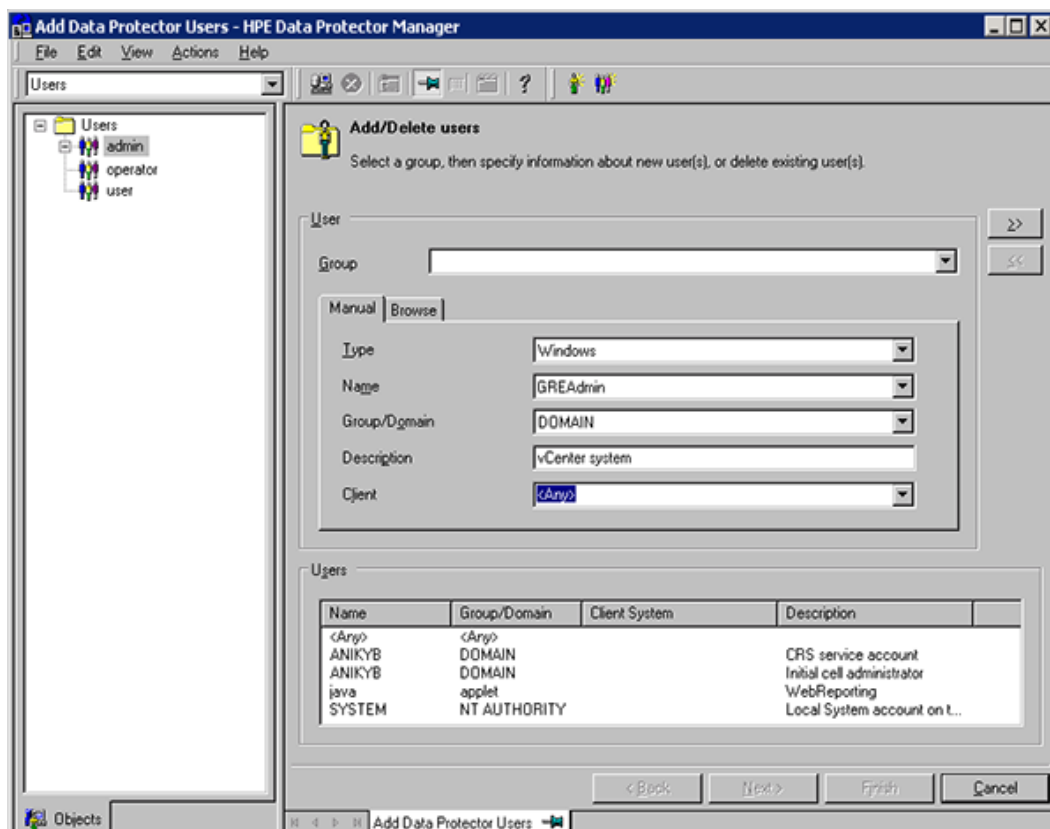

**Name** : *username*

**Group/Domain** : GRE VMware user group, VCENTER

**Client** : *VCenterSystemName*

The GRE VMware Administrators must be added to the vSphere permission tab. Set the user's role to Administrator.

## Adding user domain information

6. Click the arrow button >> to add the user to the user list.
7. Click **Finish** to exit the wizard.

The user is added to the Granular Recovery Extension for VMware administrators group and has the start restore user right assigned.

**Tip:** To delete a user select the user in the user list and click <<.

For details on how to configure Data Protector to meet the extension's user rights requirements, see ["Configuring GRE Administrators using HPE Data Protector" on the next page.](#)

## Adding an Inet user account to the Data Protector Admin group

To ensure the proper functioning of the VMware Granular Recovery Extension Agent, and the VMware Granular Extension Web Plug-In extension components, you need to add an Inet user account to the Data Protector Admin user group on the following systems:

1. In the Context List, click **Users**.
2. In the Scoping Pane, expand **Users**.
3. Right-click the **admin** user group to which you want to add a user.
4. Click **Add/Delete Users** to open the wizard.
5. In the Add/Delete Users dialog, enter the following user properties:

**Mount proxy system:**

**Type** : Windows or Linux

**Name** : SYSTEM or root

**Group/Domain** : NT AUTHORITY or root

**Note:** Make sure that you specify an existing user account on your network.

**Client** : *MountProxySystemName*

If you are using the GRE Web Plug-in, then set the vCenter Server system properties.

**vCenter Server system:**

**Type** : Windows

**Name** : the account under which the VMware vCenter Server runs (by default - SYSTEM).

**Group/Domain** : the account group/domain under which the VMware vCenter Server runs (by default - NT AUTHORITY).

**Client** : *VCenterSystemName*.

6. Click the arrow button >> to add the user to the user list.
7. Click **Finish** to exit the wizard.

The user accounts are added to the Data Protector admin user group with the user rights assigned to the group.

**Note:** The Data Protector Inet uses SYSTEM, NT AUTHORITY which is used in the Data Protector Local system account (in Windows operating system).

## Configuring GRE Administrators using HPE Data Protector

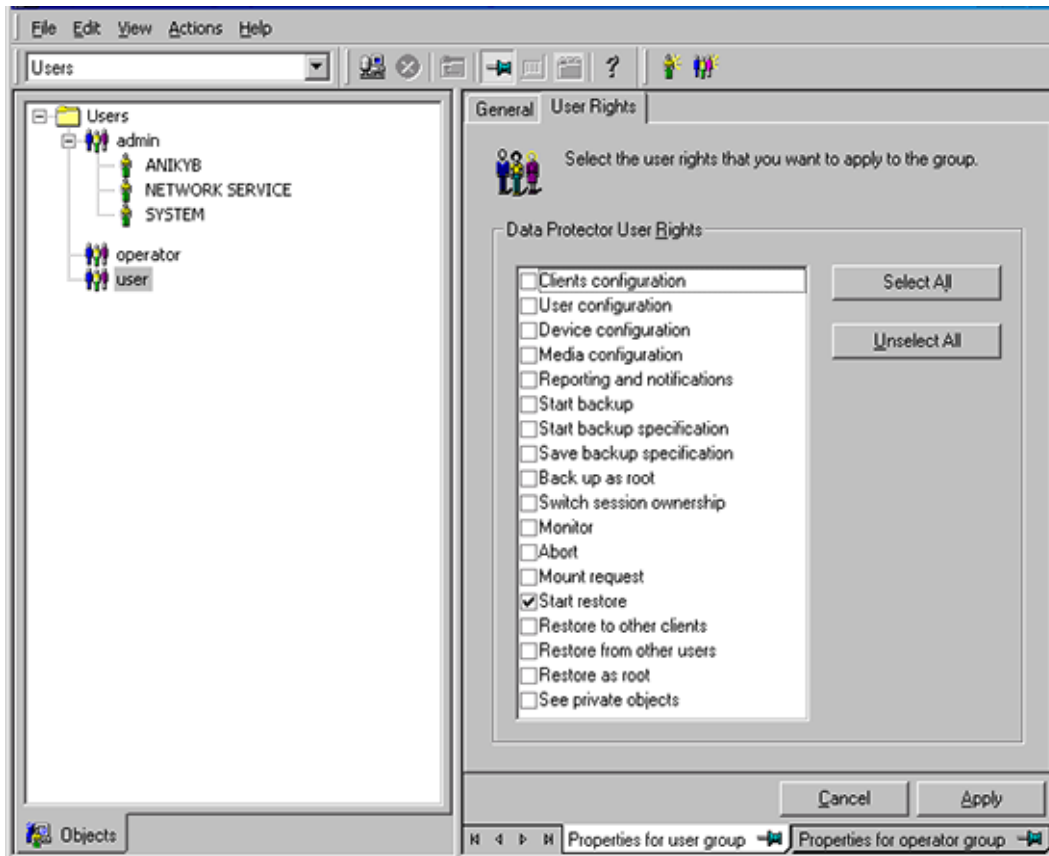

### Procedure

To enable the Granular Recovery Extension administrators a free access to the extension and their tasks, proceed as follows using the HPE Data Protector GUI (**Data Protector Manager**):

1. In the Context list, select **Users**.
2. Right-click the GRE VMware user group.
3. Click **Properties** and then click the **User Rights** tab.
4. Make sure the Data Protector user account is assigned the Data Protector Start restore user right.

## Data Protector user rights

**Note:** The specified user rights are assigned to the user group and to all users belonging to the group. It is recommended to create a specific VMware GRE vSphere user group to which the extension's administrators belong.

For details, see ["Configuring a GRE for VMware vSphere user group and users"](#) on page 109.

## Configuring systems for VMware vSphere

### Configuring Windows/Linux Firewall exceptions

This section provides the instructions required for setting or adding the VMware Granular Recovery Extension Agent component under Firewall exceptions.

#### Procedure

To ensure communication between the mount proxy system component and the extension on the vCenter Server:

1. Check your Windows/Linux Firewall Exceptions list.
2. Make sure the VMware Granular Recovery Extension Agent (`vmwaregre-agent.exe`) is in the list of Windows/Linux Firewall exceptions, on both the mount proxy system and the vCenter.

Server systems.

**Note:** Only inbound firewall rules are automatically created during the installation of the Granular Recovery Extension for VMware vSphere. You need to manually create any outbound firewall rule. This is required for communication between the extension's components and the vCenter Server. For the required port ranges, see the *HPE Data Protector Installation Guide*: “firewall support”.

The port ranges for the Advanced GRE Web-plugin are between 15000 and 15999.

## Configuring encrypted control communication

### Procedure

Complete the following steps to enable VMware GRE integration to work in an encrypted Data Protector environment.

1. Identify all the Data Protector clients that have the VMware GRE agent installed (that is, identify all the mount proxy systems).
2. On each client with the VMware GRE agent installed, implement the following:
  - a. Create a new file called `config` in the following path:  
Windows systems: `Data_Protector_program_data\Config\Server\` and set encoding to UCS-2 Little Endian.  
UNIX systems: `/etc/opt/omni/server` and create an ordinary (ascii) file.
  - b. For each vCenter Server system add an entry one after another in the `config` file. For example:  

```
<vcenter1.company.com>={ encryption={ exception=1; }; };  
<vcenter2.company.com>={ encryption={ exception=1; }; };
```

  
Here `<vcenter.company.com>` is the host where the plug-in is installed, and uses the VMware GRE agent.
  - c. Copy the created file (`config`) to all the VMware GRE agent hosts.
  - d. If the VMware GRE agent and vCenter Server are installed on the same system, then modify the `omnirc` file on the GRE agent client and set: `OB2SEC_READ_LOCAL_EXCEPTIONS=1`

## Chapter 18: Backup

The HPE Data Protector Granular Recovery Extension (GRE) for VMware vSphere relies on the Data Protector `Virtual Environment Integration` component for VMware vSphere to back up VMDK(s). Back up your VMware vSphere data using the backup solution. For details, see the *HPE Data Protector Integration Guide*, the chapter about the Virtual Environment integration.

The extension supports full, incremental and differential backups. Incremental / differential backups are supported for cached recovery operations from StoreOnce Catalyst device. For details on backup types, see the *HPE Data Protector Help*: “backup types”. A backup of virtual machines with user snapshots and quiescence is also supported.

**Note** : The Granular Recovery Extension for VMware vSphere uses the same procedure for recovery of all VMware vSphere data. The procedure does not depend on the backup type. It is recommended to set up a dedicated mount proxy system. The extension will need to allocate extendable disk space (disk space that can be made larger) for the temporary restore location of virtual machine disks.

To utilize the non-staged recovery feature in the Web Plug-in or the Cached recovery feature in the Advanced GRE Web Plug-in of the GRE for VMware vSphere, you must use a Smart Cache or StoreOnce Catalyst device for VMware vSphere VMDK backups, using the Data Protector `Virtual Environment Integration` component.

### Backup to Smart Cache devices

The Smart Cache device is a disk-based device, which is configurable on Windows and Linux. The administrator can back up VM(s) out of a vCenter configuration to a Smart Cache device using the Data Protector GUI.

For more background information on Smart Cache devices, see the *HPE Data Protector Concepts Guide*.

**Note**: The Smart Cache device is available as a target only for VMware Virtual Environment Integration backups. Additionally, only one directory as a datastore per Smart Cache device is supported.

The non-cached and the cached recovery operation is performed when the Smart Cache device presents the disks to the mount proxy host. The Smart Cache device saves the VM disks in native format and when a presentation operation is requested, these disks are made available to the GRE agent. By managing disks in the native format, and by enabling easy presentation, restores are avoided, thereby saving time and space.

For more information on configuring a Smart Cache device, see the *Configuring a backup to disk device* page in *HPE Data Protector Help*.

**Note**: Backups done to disk devices or backups from array snapshots residing on the HPE 3PAR storage are referred to as cached backups and the other backups are referred to as non-cached backups.

## Backups from 3PAR arrays

**Note:** This feature is available for the Advanced GRE Web Plug-in only.

Cached recovery of data from virtual machines is possible from array snapshots residing on the HPE 3PAR storage. This can be done by performing the zero downtime backup of virtual machines using ZDB to disk, ZDB to tape, and ZDB to disk+tape options. The virtual machines that are protected using the **Snapshot backup** method can be used to perform a recovery operation.

The 3PAR storage system enables snapshot replication of the disk volumes used by virtual machines. This unique method utilizes the cached recovery feature of the Advanced GRE Web Plug-in available in the GRE for VMware vSphere. The backups done using this method use existing zero downtime backup functionality. The Data Protector Virtual Environment ZDB integration for VMware supports environments where ESX and/or ESXi Server systems are set up with the 3PAR storage system and are managed through a vCenter Server (vCenter environments).

For more information on disk replication, see the *HPE Data Protector Concepts Guide*. For more information on the ZDB backups of virtual machines on the 3PAR replica, see the *HPE Data Protector Integration Guide*.

## Backups to StoreOnce Catalyst device

**Note:** This feature is available for the Advanced GRE Web Plug-in only.

The StoreOnce Catalyst device is a Backup to Disk (B2D) device. To utilize the cached recovery feature in GRE for VMware vSphere without staging the restore, you must use a StoreOnce Catalyst device for backups. The administrator can back up VM(s) out of a vCenter configuration to a StoreOnce Catalyst device using the Data Protector GUI.

For more information on configuring a StoreOnce Catalyst device, see the *Configuring a backup to disk device - StoreOnce* page in *HPE Data Protector Help*. For more background information on StoreOnce Catalyst devices, see the *HPE Data Protector Concepts Guide*.

Full, incremental and differential backups are supported for cached recovery operations. For details on backup types, see the *HPE Data Protector Help*: "backup types". When you perform GRE, all the backups that were performed prior to 9.07 are listed as Non-Cached.

**Note:** Non-CBT backups are also displayed as Non-Cached.

# Chapter 19: Recovery

## Considerations

- The Granular Recovery Extension for VMware vSphere does not support a cross-platform recovery. A recovery of Windows virtual machine files from a Windows virtual machine to a Linux virtual machine and the other way around is not supported. However, you can perform a restore of Windows virtual machine disks to different mount proxy system platforms. A restore of Linux virtual machine disks to Windows mount proxy systems is not supported.
- Consider a VMware vSphere Web Client with two or more vCenters and each vCenter being a member of different Data Protector cell configuration. If each Data Protector cell contains the same user in user lists but with a different set of permissions, the user acquires privileges from the Data Protector cell on which the VMware GRE agent for selected vCenter starts to run first.
- You cannot recover a virtual machine from an incremental and differential backup, if the virtual machine name in the vSphere Center has been changed after full backup.
- If two operators connect remotely using the VMware vSphere Client with the same user account and browse one partition of a virtual machine disk simultaneously, once the first partition is mounted the second partition is dismounted. Parallel mounting of partitions is not supported.
- The extension displays the whole restore chain. When browsing through files, the objects displayed contain the whole restore chain: a full backup of the object and any number of related incremental backups.
- You may experience slow performance when browsing folders with many files and subfolders.
- To preserve ownership and permission bits UID/GUID on a target virtual machine and a mount proxy system, both must be mapped. A network share server should be properly configured to support it.
- The non-partitioned disks on the Guest virtual machine are not supported.
- You can perform GRE operations only on LVM volumes, which have partition Type ID set to 8E. Also, kpartx is required for disks with LVM partitions.
- If the ESX server is not accessible from the mount proxy, then you need to modify the host file and add the ESX hostname and IP address or resolve the hostname of ESX server.

**Note:** You need to partition the disk before adding a volume group. The partitions reported in `fdisk -l` can only be considered.

**Note:** Windows Internet Explorer 8 version is not supported for the Granular Recovery Extension interface.

For a list of supported environments, see the latest support matrices at <http://support.openview.hp.com/selfsolve/manuals>.

### HPE 3PAR storage systems

- To perform GRE operations from the 3PAR replica, the mount ESX server and the production ESX server must be present in the same 3PAR zone.

- Configure the 3PAR array, having a replica and being used for GRE in the cell manager, by executing the following command on the Cell Manager: `omnidbzd --diskarray 3PAR --ompasswd --add <3PAR array CIM server name/ip> --user <CIM server login name> --passwd <CIM server password>`
- To perform GRE operations using the Linux mount proxy for Windows Guest Operating System, the backup session must have the Operating System disk backed up and the same must be selected for creating a new request along with the disk(s) to be browsed.

## Limitations

Data Protector Granular Recovery Extension (GRE) for VMware vSphere has certain limitations.

### Recovery

- Cached GRE of Windows Guest VM is not supported from StoreOnce Catalyst device. Windows Guest VM can be recovered in Non-Cached mode using Windows mount proxy.
- To perform GRE of Windows Server 2012 and Windows Server 2012 R2 on Linux mount proxy, use NTFS-3G (an NTFS driver for Linux) version 2011 on SLES. To download the NTFS-3G driver, refer to the following link:

<https://www.rpmfind.net/linux/rpm2html/search.php?query=ntfs-3g>

- You cannot:
  - Recover empty folders.
  - Perform VIX related recovery for files or folders with non-ASCII characters in their names.
  - Perform the recovery of files from Windows 2012 Resilient File System (ReFS) file system.
  - Recover files with longer path names.

**Note:** You must ensure that the file path in the mount point and the selected disk does not exceed 260 characters for the disk mounted on a mount proxy.

- List the skipped and failed files in recovery details, if the target machine does not have sufficient disk space.
- Preserve POSIX ACLs during recovery, on a Linux target virtual machine or on a Linux mount proxy system.
- When the GRE mount proxy host is rebooted, the mount points created for the requests (which are browsed at least once) of LVM disks become invalid. Hence these requests must be re-created to perform GRE operations.
- For both Advanced GRE Web Plug-in and GRE Web Plug-in, GRE from Dynamic disk is not supported.
- 3PAR ZDB backups from Data Protector 9.03 and earlier versions for VMs residing on data stores created using multiple 3PAR LUNs does not support granular recovery.

## Restoration and preservation of Ownerships, ACLs, File attributes, and Alternate data streams

The tables below list the file properties, and the preservation conditions.

### Windows VM/Windows mount proxy

File properties	Files	Directories
Ownership	Yes	No
ACLs	Yes	No
File attributes	Yes. Some file attributes are not preserved due to operating system limitations, such as hidden file attribute, compressed file attribute, and encrypted file.	No
Alternate data streams	Yes	No

### Linux VM/Linux mount proxy

File properties	Files	Directories
Ownership	Yes. Files that do not have root:root ownership are preserved.  Files with root:root ownership are not preserved, because the ownership becomes nobody:nobody. The ownership settings depend on the NFS settings /etc/exports that is set in the target Linux system.	No. Ownership becomes root:root.
ACLs	No	No
File attributes e:Extent format is set as a default value.	No	No
Permissions	Yes	No

**Note:** If VIX is used, none of the file properties are preserved.

If the Ownership, ACLs, File attributes, and Alternate data streams are not preserved by the GRE operation, the restored objects have the VM operating system credentials (mentioned in the GRE page) as their properties.

### 3PAR storage systems

- Cached GRE can be done only till the replica is rotated/presented.
- If the backup is disk+tape, then the secondary storage is considered for GRE only after the replica is rotated.

### Smart Cache devices

- You can perform only a Non-Cached recovery from incremental / differential backups on Smart Cache devices. Incremental / differential backups are not supported for Cached GRE operations.
- A VMware backup to a Smart Cache device is supported for a Network Share (CIFS or NFS share). To perform a Cached presentation operation from a Smart Cache device residing on the Network Share, the Smart Cache device should be listed as a mount point and not as a share.
- An AES encrypted VMware backup is not supported to a Smart Cache device.

### StoreOnce Catalyst devices

- Only Linux mount proxies are supported. If Linux mount proxy is used to recover Windows Guest VM, then Ownership, ACLs, File attributes, and Alternate data streams are not recovered.
- Cached GRE from StoreOnce Catalyst backups is not supported with Windows mount proxy.
- If a Windows mount proxy is selected for GRE, the backups are auto converted from Cached to Non-Cached. These requests are now displayed in grey color.
- Full and incremental backups on different devices are not supported for GRE operations.
- Non-CBT backups to StoreOnce Catalyst device are displayed as Non-Cached.
- If the mount proxy host is rebooted with any active GRE request, the request is inaccessible for up to 4 hours.
- Cached GRE is not supported, if the backup to StoreOnce Catalyst device is performed using software compression or AES encryption.
- If the data backed up with Data Protector 9.04 or earlier versions is transferred to a StoreOnce Catalyst through single session copy in 9.07 version, then Cached GRE is not supported.

**Note:** If you want to migrate your Data Protector 9.05 or 9.06 version backups to StoreOnce Catalyst to use the feature of Cached GRE, it is recommended to perform object operations at individual session. If you choose multiple sessions at once, data consistency will not be there.

## Recovery using GRE Web Plug-in

The Data Protector GRE and the Web plug-in provides the interface required to perform a recovery operation. Recovery can be performed by the operator and administrator users. This section provides information on the following:

- Operator tasks
- Administrators tasks

## Operator tasks

As an operator, you can perform the following tasks:

- Access the Data Protector plug-in from VMware vSphere web client
- Request restore or presentation
- Monitor request
- Recover files
- View GRE and plug-in version

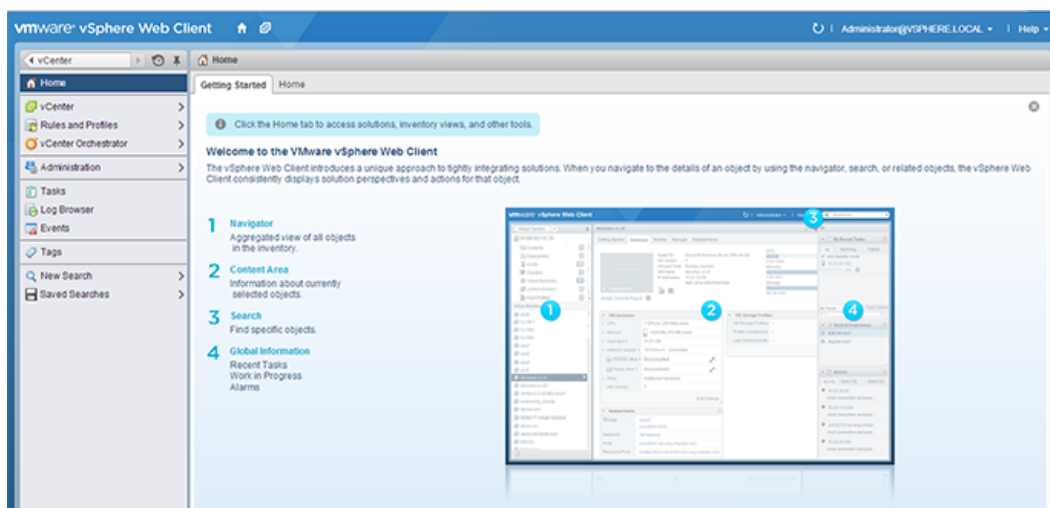

## Accessing the Data Protector Web plug-in from VMware vSphere Web Client

To access the Data Protector plug-in from VMware vSphere Web Client:

1. Open VMware vSphere Web Client and enter the user name and password.
2. Click **Login**.

The VMware vSphere Web Client main page is displayed. It comprises the following key components: object navigator, main workspace, tasks, and, alarms panel.

### VMware vSphere Web Client main page

3. Under Inventories, expand the VMs and templates tab and select the desired virtual machine.
4. Click **Manage > HPE Data Protector**.

If you receive the security alert notification after accessing the VMware vSphere Web Client application, you do not have the vSphere certificate installed on your system. Click **Yes** to open the extension. For details on how to obtain a valid vSphere certificate, see the VMware end-user documentation or Help index: "About vCenter Server Certificates" or "Replacing vCenter Server

Certificates".

**Note:** An error message appears when you log in to the HPE Data Protector Granular Recovery Extension GUI to notify that you do not have all the Admin rights.

The HPE Data Protector Granular Recovery Extension GUI opens in the operator mode. The left pane displays various tabs and the right pane displays the main workspace area.

### HPE Data Protector Granular Recovery Extension GUI (Operator mode)

The screenshot shows the HPE Data Protector Granular Recovery Extension GUI in Operator mode. On the left, a navigation pane contains the following tabs: **Request Restore / Present** (selected), Monitor Request, Recover Files, and About. The main workspace area displays the 'Restore / Present Request Options' form. At the top of the workspace, there are two buttons: 'Request Restore / Present' and 'Refresh'. Below these buttons, the form contains the following fields and options:

- Source Data Center: DPOACENTER
- Source VM: VM\_name
- Include Backups In The Last: Please select ... (dropdown menu)
- Exclude backups which must be staged:
- Backup Start Time: Please select ... (dropdown menu)
- Force staged restore:
- Virtual Disks: A table with two columns: Disk Name and Disk Size (GB). The table is currently empty.
- Disk Retention Time: 30 Days

Instructions for the form: Select the backup of Virtual Machine disks from which you want to recover files. Specify the retention time you need to recover files (after this period, disks will be deleted / unavailable). Click Request Restore / Present to submit a restore / media presentation request.

### Requesting restore or presentation

To request restore or present:

1. In the HPE Data Protector Granular Recovery Extension page, click the **Request Restore/ Present** tab.

The Restore / Present Request Options page.

## Request restore or present

**Hewlett Packard Enterprise** | **HPE Data Protector Granular Recovery Extension**

**Request Restore / Present** | Monitor Request | Recover Files | About

Select the backup of Virtual Machine disks from which you want to recover files.  
Specify the retention time you need to recover files (after this period, disks will be deleted / unavailable).  
Click Request Restore / Present to submit a restore / media presentation request.

**Request Restore / Present Options** [Request Restore / Present] [Refresh]

Source Data Center: Datacenter  
Source VM: VMWare Non-Staged GRE Demo  
Include Backups In The Last: All  
Exclude backups which must be staged:   
Backup Start Time: 4/21/2014 1:08:44 PM Full Non-Staged  
Force staged restore:   
Virtual Disks:  

Disk Name:	Disk Size (GB):
<input checked="" type="checkbox"/> scsi0:1	0.10

  
Disk Retention Time: 1 Days

2. In the **Request Restore / Present Options** page, proceed as follows:
  - In the **Include Backups in The Last** drop-down list, select the backup period.
  - Select **Exclude backups which must be staged** to view backups, which can be used for Cached recovery.
  - In the **Backup Start Time** drop-down list, select the start date, time, and backup type.
  - Select **Force staged restore** to perform a Non-Cached restore, instead of the Cached presentation.
  - From the **Virtual Disks** list, select single or multiple virtual disks for restore. Use Ctrl+X from the keyboard to select multiple disks.
  - In the **Disk Retention Time** text box, enter the retention period. This period starts from the restore or presentation operation. After the retention period, the virtual disks are not available.

**Note:** The default retention period for the restored files is 30 days. The default retention period for the presented shares is one day.

**Note:** If you are using the 3PAR storage system for recovery of files, ensure that you have selected the **Keep the replica after the backup** checkbox in the MFC GUI during the backup procedure. For more information on ZDB backups of virtual machines on the 3PAR replica, see the *Data Protector ZDB Integration Guide*.

3. Click **Request Restore / Present**.
4. A message box appears with the request ID. Note your request ID to identify your request and click the **Monitor Request** tab to display the request status.

**Note:** When the GRE mount proxy host is rebooted, the mount points created for the requests (which are browsed at least once) of LVM disks become invalid. Hence these requests must be re-created to perform GRE operations.

## Monitoring requests

To monitor requests:

1. In the HPE Data Protector Granular Recovery Extension page, click the **Monitor Request** tab. The Monitor requests page is displayed.

### Monitor requests

ID	VM	Time of Backup	Status	Restore Started	Progress	Submitter
0002	VMWare Non	4/21/2014 1:08:44 PM	Pending			VSPHEREADMINISTRATC
0001	VMWare Non	4/21/2014 1:18:03 PM	Approved	4/21/2014 1:27:04 PM		VSPHEREADMINISTRATC
0000	VMWare Non	4/21/2014 1:18:03 PM	Pending			VSPHEREADMINISTRATC

2. Select your request identified by its ID number.
3. You can:
  - Click **Get Session Report** to display the following session information under Session Report.

State	Session Information
Restored	Restore or recovery session information after first recovery
Recovering	Recovery session information
Approved	Media or recovery session information after first recovery

- Click **Remove Request** to delete the unwanted pending requests.
- Click **Abort Recovery** to stop recovering the files of virtual machine disks.

The Abort Recovery option is not applicable to already recovered files, but it stops recovering the rest of the files.

**Note:** If you abort recovery of a large file and recovery does not finish in five seconds, the following status message is displayed: Abort recovery of files is started for request id=xxxx. When the recovery of the large file completes, the rest of the files stop

recovering.

- Click **Refresh** to update the status of your request.

## Recovering files from virtual machines

### User permissions

To perform recovery of file(s), the user must have appropriate permissions on the target virtual machine. If **Use VIX as fallback option** is selected, then the following permissions should be provided in vCenter - **Virtual machine**->**Interaction**->**Guest operating system management by VIX API**.

If samba has to be used for file recovery, then user name and password of the samba user should be provided. This user should be able to mount network share to which files have to be recovered.

For a Linux **Target VM**, the **VM Username**, and **VM Password** fields cannot be empty; therefore hence these credentials should be provided. However, as an NFS share is exported these credentials are not used.

### Procedure

To recover files from virtual machine disks:

1. In the HPE Data Protector Granular Recovery Extension page, click the **Recover Files** tab.  
The Select Restored / Presented Disk and Partition page appears.
2. To select the virtual machine disk containing the files to recover, proceed as follows:
  - a. Select the ID and then select the required partition from the **Available Partitions** drop-down list. If a Linux partition is selected, then select the logical volumes from the **Available Logical Volumes** drop-down list.

### Recovering files (select the Windows partition for browse)

The screenshot shows the HPE Data Protector Granular Recovery Extension interface. On the left is a navigation menu with 'Request Restore / Present', 'Monitor Request', 'Recover Files', and 'About'. The main area contains instructions: 'Select disk and partition for recovery. Click Browse to open the file selection and recovery page.' Below this is a table titled 'Select Restored / Presented Disk and Partition' with columns for ID, Disk, Backup Start Time, Disk Removal Time, Disk Size (GB), Mount Proxy Host, and Type. There are 'Browse' and 'Refresh' buttons to the right of the table. Below the table is an 'Available Partitions:' label and a dropdown menu showing 'Partition 1: 0.09 GB [HPFS/NTFS]'.

ID	Disk	Backup Start Time	Disk Removal Time	Disk Size (GB)	Mount Proxy Host	Type
0003	scsi0:1	4/21/2014 1:18:03 PM	5/21/2014 2:07:05 PM	0.10	mountproxy3.company.com	Non-Staged
0002	scsi0:1	4/21/2014 1:08:44 PM	5/21/2014 2:03:57 PM	0.10	mountproxy1.company.com	Non-Staged
0001	scsi0:1	4/21/2014 1:18:03 PM	5/21/2014 1:27:04 PM	0.10	mountproxy2.company.com	Staged

Available Partitions: Partition 1: 0.09 GB [HPFS/NTFS]

- b. Click **Browse**.  
The Select Files To Recover page is displayed.

## Recover files from the selected disk

The screenshot shows the HPE Data Protector Granular Recovery Extension interface. On the left is a navigation menu with 'Recover Files' selected. The main area is titled 'Select Files To Recover' and contains several sections: 'Virtual Disk Information' (Backup Start Time: 4/21/2014 1:18:03 PM, Source Disk: scsi0:1, Source Partition: Partition 1), 'Virtual Machine OS Credentials' (Target VM: VMWare Non-Staged GRE Demo, VM Username: administrator, VM Password: masked), and 'Recovery Options' (Location: E:\recovered, If File Exists: Overwrite selected, Keep Directory Structure: checked, Use VIX as fallback option: unchecked). On the right, the 'Available Files' list shows '\$RECYCLE.BIN', 'For Demo Only', 'Recovery.log' (selected), and 'Recovered'. Buttons for 'Recover Selected Files' and 'Refresh' are at the top right.

3. Under Virtual Machine OS Credentials, select the virtual machine from the **Target VM** drop-down list, and enter its credentials in the **VM Username** and **VM Password** text boxes.

**Note:** Ensure to complete the following steps on the target Linux VM:  
Resolve any Hostname or IP conflicts for Target VM.  
NFS services must be configured and running.  
Firewall must be configured. For Windows environment, see [Configuring Windows Firewalls](#).

4. In the **Location** text box, enter the target recovery location path.
  - For locations on Windows systems, use the format *DriveLetter:\Folder\Subfolder*.
  - For locations on Linux systems, use the format */Directory/Subdirectory*.

**Note:** For shared directories, enter the path without the hostname. For example, in case of an NFS share hostname, use: */shared\_dir/subdir*. Files get recovered to *shared\_dir/subdir/<target location specified>*. Also, ensure that the Samba and NFS shares are set up correctly. The NFS share must also be exported as pseudo root shares.

Any missing directories in the path are created automatically. For example, if you specify */shared\_dir/subdir1/subdir2*, the *subdir1/subdir2* subdirectories are automatically created inside */shared\_dir*, if they do not already exist.

5. If the file already exists on the target system, select one of the following recovery options:

- **Overwrite:** deletes the original files, and saves the latest files.
  - **Rename:** keeps the original files and saves the recovered files with a unique number (generated by Data Protector).renamed.
  - **Skip:** keeps the original files.
6. Select **Keep Directory Structure** to maintain the original directory structure of the source virtual machine disk on the target system.
  7. Select **Use VIX as fallback option** when network share is not available.
  8. Under Available Files, select the files and folders to be recovered.
  9. Click **Recover Selected Files**.

## About Granular Recovery Extension

### Procedure

To determine the VMware Granular Recovery Extension agent and Plug-in version:

1. In the HPE Data Protector Granular Recovery Extension for VMware vSphere Web Client, click the **About** tab.  
The About Granular Recovery Extension page is displayed.
2. Click **User Manual** to download a copy of the *HPE Data Protector 9.07 Granular Recovery Extension User Guide for VMware vSphere*.

**Note:** You can download the GRE guide if the Data Protector documentation component is installed on the vCenter Server.

## Administrator tasks

The administrator can perform the following tasks:

- [Access the Data Protector plug-in from VMware vSphere web client](#)
- [Configure the mount proxy systems](#)
- [Handle requests](#)
- [Monitor requests](#)
- [Recover files from virtual machines](#)
- [Remove virtual machine disks](#)
- [View GRE and plug-in version](#)

## Accessing the Data Protector plug-in from VMware vSphere Web Client

To access the Data Protector plug-in from VMware vSphere Web Client:

1. Open VMware vSphere Web Client, and connect to the vCenter server. Specify the credentials of the Data Protector user with permission to start restores.
2. Click **Login**.

The VMware vSphere Web Client home page is displayed. The **Home** tab is selected by default.

3. Under Inventories, expand the virtual machine node and select the desired virtual machine.
4. Click **Manage > HPE Data Protector**.

If you receive the security alert notification after accessing the VMware vSphere Web Client application, you do not have the vSphere certificate installed on your system. Click **Yes** to open the extension. For details on how to obtain a valid vSphere certificate, see the VMware end-user documentation or Help index: "About vCenter Server Certificates", or "Replacing vCenter Server Certificates".

The HPE Data Protector Granular Recovery Extension GUI opens in the administrator mode. The left pane displays various tabs and the right pane displays the main workspace area.

**Note:** As an Administrator, you need to configure mount proxies in the **Settings** tab when you access the HPE Data Protector Granular Recovery Extension for the first time. Otherwise, the following error message is displayed:

The configuration check failed.

### HPE Data Protector Granular Recovery Extension GUI (Administrator mode)

Request Restore / Present

Select the backup of Virtual Machine disks from which you want to recover files.  
Specify the retention time you need to recover files (after this period, disks will be deleted / unavailable).  
Click Request Restore / Present to submit a restore / media presentation request.

Request Restore / Present Options

Request Restore / Present Refresh

Source VM: VMWare Non-Staged GRE Demo

Include Backups In The Last: Please select...

Exclude backups which must be staged:

Backup Start Time: Please select...

Force staged restore:

Virtual Disks:

Disk Name:	Disk Size (GB):

Disk Retention Time: 30 Days

## Configuring mount proxy systems

### Procedure

To specify a mount proxy system used as a target location for restoring virtual machine disks:

1. In the HPE Data Protector Granular Recovery Extension for VMware vSphere Web Client, click the **Settings** tab.

The Mount Proxy Information page is displayed.

## Administrative settings

The screenshot shows the 'Administrative settings' page. On the left is a navigation menu with options: Request Restore / Present, Handle Request, Monitor Request, Recover Files, Cleanup, Settings (highlighted), and About. The main content area is titled 'Mount Proxy Information' and includes 'Save' and 'Refresh' buttons. It has two sections: 'Windows host' and 'Linux host'. The 'Windows host' section has a dropdown menu set to 'windowshost.company.com', a 'Restore Paths' text box, and an 'Add Path' button. Below the text box is the instruction 'Enter Path In Windows Format' and an example path 'E:\staging' with a 'Remove' button. The 'Linux host' section has a dropdown menu set to 'Select Host ...', a 'Restore Paths' text box, and an 'Add Path' button. Below the text box is the instruction 'Enter Path In Linux Format'. Below the 'Mount Proxy Information' section is the 'Retention Time Options' section, which has four rows of settings: 'Restored Disks Will Be Removed After: 30 Days', 'Non-Staged Disks Will Be Removed After: 1 Days', 'Failed Requests Will Be Removed After: 30 Days', and 'Rejected Requests Will Be Removed After: 30 Days'. Below this is the 'Debugging Options' section with an 'Enable Debugging' checkbox. A note at the bottom states: 'NOTE: Ensure to click Save button to save the options before leaving this page.'

2. From the **Windows** or **Linux Host** drop-down list, select the available Windows or Linux mount proxy system.

**Note:** Only one mount proxy host is supported per operating system platform.

3. In the Windows and/or Linux **Restore Paths** text box, enter the path to a location on the mount proxy system. Use the following format:
  - *DriveLetter:\Folder\Subfolder* (Windows mount proxy system)
  - */Directory/Subdirectory* (Linux mount proxy system)
4. Click **Add Path** to add the specified path to the applicable list of restore or presentation paths.
5. Proceed as follows:
  - a. Optionally, add more restore paths to the list by repeating steps 3 and 4.
  - b. Click **Remove** to delete the desired restore path(s).

**Note:** To disable an already configured mount proxy system, select **Disable mount proxy host** from the required host drop-down list.

6. Under **Retention Time Options**, enter the retention period for the following text boxes:
  - Restored Disks Will Be Removed After
  - Non-Staged Disks will be removed After
  - Failed Requests Will Be Removed After
  - Rejected Requests Will Be Removed After

**Note:** The default retention period of the restored data is 30 days. The default retention period for the presented shares of virtual machine disks on the mount proxy system is 1 day.

7. Under Debugging Options, select **Enable Debugging** to create debug files.
8. Click **Save**.

**Note:** Click **Refresh** to get the previously saved changes.

## Handling requests

### Procedure

After receiving a request from an operator for a presentation or Cached recovery, you have the following options:

- [Approve request](#)
- [Reject request](#)

After receiving a restore request from an operator, you have the following options:

- [Trigger session](#)
- [Reject request](#)

### Approve request

#### Procedure

To approve presentation sessions:

1. In the HPE Data Protector Granular Recovery Extension for VMware vSphere Web Client, click the **Handle Request** tab.  
The **Restore / Present Requests** page is displayed.

## Managing restore requests

The screenshot shows the 'Request Restore / Present' interface. On the left is a navigation menu with options: Request Restore / Present, Handle Request (selected), Monitor Request, Recover Files, Cleanup, Settings, and About. The main area has instructions: 'Select request.', 'Click Approve to start presenting the Virtual Machine disks.', and 'Click Reject to reject request.' Below this is a table titled 'Restore / Present Requests' with columns: ID, Virtual Machine, Status, Date Submitted, Submitter, and Type. The table contains two rows: ID 0003 (VMWare Non-Stagec, Pending, 4/21/2014 2:04:34 PM, VSPHEREADMIN, Non-Stagec) and ID 0001 (VMWare Non-Stagec, Pending, 4/21/2014 1:23:17 PM, VSPHEREADMIN, Staged). To the right of the table are buttons for 'Approve', 'Reject', and 'Refresh'. Further right is the 'Request Details' section for ID 0003, listing: Request ID: 0003, Source Data Center: Datacenter, Source ESX: ESX\_company.com, Source VM: VMWare Non-Stagec GRE Demo, Time Of Backup: 4/21/2014 1:18:03 PM, Virtual Disks: scsi0:1 (0.10 GB), Disks Retention time: 1 Days, Estimated Size Needed on Disk: 0.10 GB, and Mount Proxy: mount.proxy.name.com.

2. Under Browse requests, select the required restore request ID number. The request details are displayed on the right.

**Note:** To configure a Windows and Linux mount proxy system, see [Configuring mount proxy systems](#).

3. Select the mount proxy system:
  - A Windows or Linux mount proxy system (for Windows virtual machine disks)
  - A Linux mount proxy system (for Linux virtual machine disks)

**Note:** To change the mount proxy system, see [Configuring mount proxy systems](#).

4. After selecting the required request, click **Approve**.

## Triggering restore sessions

### Procedure

To trigger restore sessions:

1. In the HPE Data Protector Granular Recovery Extension for VMware vSphere Web Client, click the **Handle Request** tab.

The Restore Requests page is displayed.

## Managing restore requests

The screenshot displays the HPE Data Protector Granular Recovery Extension web interface. On the left is a navigation menu with options: Request Restore / Present, Handle Request (selected), Monitor Request, Recover Files, Cleanup, Settings, and About. The main area is titled 'Restore / Present Requests' and includes instructions: 'Select request. Click Start Restore to start restore session of Virtual Machine disks. Click Reject to reject request.' Below these instructions is a table of requests:

ID	Virtual Machine	Status	Date Submitted	Submitter	Type
0001	VMWare Non-Stagec	Pending	5/2/2014 2:06:24 AM	VSPHEREVAC	Staged

To the right of the table is the 'Request Details' section, which includes: Request ID: 0001; Source Data Center: /DPQACENTER; Source ESX: ESX.company.com; Source VM: VM\_name; Time Of Backup: 11/22/2013 6:22:57 PM; Virtual Disks: a table with columns 'Disk Name' and 'Disk Size (GB)', containing 'scsi0:0' and '5.00'; Disks Retention time: 30 Days; Estimated Size Needed on Disk: 5.00 GB; Mount Proxy: mountproxy.company.com; Restore Location: E:\staging; Available Disk Space on Mount Proxy: 11.05 GB. At the top right of the details section are buttons for 'Start Restore', 'Reject', and 'Refresh'.

2. Under **Browse requests**, select the required restore request ID number. The restore request details are displayed on the right.

**Note:** To configure a Windows and Linux mount proxy system, see ["Recovery using GRE Web Plug-in" on page 120](#).

3. From the **Mount Proxy** drop-down list, select one of the following when restoring Windows or Linux virtual machine disks:
  - A Windows or Linux mount proxy system (for Windows virtual machine disks)
  - A Linux mount proxy system (for Linux virtual machine disks)

**Note:** If you have configured only one mount proxy system, it is automatically selected and displayed in the drop-down list. To restore Linux virtual machine disks, the configured mount proxy system must be of the Linux type.

4. From the **Restore Location** drop-down list, select one of the already specified restore paths (for Windows or Linux virtual machines). The available disk space on the target restore location and the cumulative size of the disks selected for restore are displayed.

**Note:** To change the mount proxy system or to specify an additional restore path, see ["Recovery using GRE Web Plug-in" on page 120](#).

5. After specifying the restore options for the selected restore request, click **Start Restore**.

## Rejecting requests

### Procedure

To reject a request:

1. In the HPE Data Protector Granular Recovery Extension for VMware vSphere Web Client, click the **Handle Request** tab.  
 The **Restore / Present Requests** page is displayed.
2. Under Browse requests, select the request ID number you want to reject.
3. Click **Reject**.

## Monitoring requests

### Procedure

To monitor requests:

1. In the HPE Data Protector Granular Recovery Extension for VMware vSphere Web Client, click the **Monitor Request** tab.

#### Monitor requests (Admin) page

The screenshot shows the 'Monitor Request' page. On the left is a navigation menu with options: Request Restore, Handle Request, Monitor Request (highlighted), Recover Files, Cleanup, Settings, and About. To the right of the menu are instructions: 'Select request.', 'Click Get Session Report to see details of the restore / present and recovery session.', and 'Click Abort to abort restore of request.' Below this is the 'Request Monitor' section with buttons for 'Get Session Report', 'Remove Request', 'Abort', 'Change Owner', and 'Refresh'. The table below has the following data:

ID	VM	Time of Backup	Status	Restore Started	Progress	Submitter	Duration
0003	VMWare Non	4/21/2014 1:18:03 PM	Approved	4/21/2014 2:07:05 PM		VSPHEREADMINISTRATI	
0002	VMWare Non	4/21/2014 1:08:44 PM	Approved	4/21/2014 2:03:57 PM		VSPHEREADMINISTRATI	
0001	VMWare Non	4/21/2014 1:18:03 PM	Restored	4/21/2014 1:27:04 PM		VSPHEREADMINISTRATI	
0000	VMWare Non	4/21/2014 1:18:03 PM	Pending			VSPHEREADMINISTRATI	

Below the table is a 'Session Report' section.

The **Request Monitor** list displays all the approved, pending and triggered requests. A restore request can have the following status: In Progress, Restored, Pending, or Failed. A request for presentation can have the following status: Approved, Pending or Failed.

2. Select your request identified by its ID number.
3. You can:
  - Click **Get Session Report** to display the following session information under Session Report.

State	Session Information
Restored	Restore or recovery session information after first recovery
Recovering	Recovery session information
Approved	Media or recovery session information after first recovery

- Click **Remove Request** to delete the unwanted pending requests.
- Click **Abort** to either abort recovery of files or abort restore of virtual machines. This feature

serves two functions depending on the state of request. For more details, see the table below.

State of request	Request status message
Recovering	Recovery of files are aborted.
Restoring	Restore of virtual machines are aborted.

**Note:** The option to **Abort** is not available for a presentation request.

- Click **Change Owner** to change the owner of the recovery process. Enter a new owner in the Change Owner text box and click **Change**.
- Click **Refresh** to update the status of your request.

## Recovering files from virtual machines

### User permissions

To perform recovery of file(s), the user must have appropriate permissions on the target virtual machine. If **Use VIX as fallback option** is selected, then the following permissions should be provided in vCenter - **Virtual machine->Interaction->Guest operating system management by VIX API**.

If samba has to be used for file recovery, then **VM Username** and **VM Password** of the samba user should be provided. This user should be able to mount the network share to which files have to be recovered.

For a Linux **Target VM**, the **VM Username**, and **VM Password** fields cannot be empty, hence these credentials should be provided. However, as an NFS share is exported, these credentials are not used.

### Procedure

To recover files from virtual machine disks:

1. In the HPE Data Protector Granular Recovery Extension page, click the **Recover Files** tab  
The Select Restored / Presented Disk and Partition page is displayed.

**Note:** If you abort recovery of a large file and recovery does not finish in 5 seconds, the following status message is displayed: Abort recovery of files is started for request id=xxxx. When the recovery of the large file completes, the rest of the files stop recovering.

2. To select the virtual machine disk containing the files to recover, proceed as follows:
  - a. In the **Available Partitions** drop-down list, select the required partition. If a Linux partition is selected, then select the logical volumes from the **Available Logical Volumes** drop-down list.

### Recovering files (select the Windows partition for browse)

Request Restore / Present

 About

Select Files To Recover Recover Selected Files Refresh

**Virtual Disk Information**

Backup Start Time: 12/2/2013 4:52:20 PM  
 Source Disk: scsi0:0  
 Source Partition: Partition 1

**Virtual Machine OS Credentials**

Target VM: VMWare Non-Staged GRE Demo  
 VM Username: administrator  
 VM Password: \*\*\*\*\*

**Recovery Options**

Location: E:/recovered  
 If File Exists:  Overwrite  
 Rename  
 Skip  
 Keep Directory Structure:   
 Use VIX as fallback option:  VIX API libraries must be installed on mount proxy.

**Available Files**

- ▶  \$RECYCLE.BIN
- ▼  For Demo Only
  - Recovery.log
- ▶  Recovered

3. Under Virtual Machine OS Credentials, select the virtual machine from the **Target VM** drop-down list, and enter its credentials in the **VM Username** and **VM Password** text boxes.

**Note:** Ensure to complete the following steps on the target Linux VM:  
 Resolve any Hostname or IP conflicts for Target VM.  
 NFS services must be configured and running.  
 Firewall must be configured. For Windows environment, see [Configuring Windows Firewalls](#).

4. In the **Location** text box, enter the target recovery location path.

- For locations on Windows systems, use the format *DriveLetter:\Folder\Subfolder*.
- For locations on Linux systems, use the format */Directory/Subdirectory*.

**Note:** For shared directories, enter the path without the hostname. For example, in case of an NFS share hostname, use: */shared\_dir/subdir*. Files get recovered to *shared\_dir/subdir/<target location specified>*. Also, ensure that the Samba and NFS shares are set up correctly. The NFS share must also be exported as pseudo root shares.

Any missing directories in the path are created automatically. For example, if you specify */shared\_dir/subdir1/subdir2*, the *subdir1/subdir2* subdirectories are automatically created inside */shared\_dir*, if they do not already exist.

5. If the file already exists on the target system, select one of the following recovery options:
  - **Overwrite:** deletes the original files and saves the latest files.
  - **Rename:** keeps the original files and saves the recovered files with a unique number (generated by Data Protector).renamed.
  - **Skip:** keeps the original files.
6. Select **Keep Directory Structure** to maintain the original directory structure of the source virtual machine disk on the target system.
7. Select **Use VIX as fallback option** when network share is not available.
8. Under Available Files, select the files and folders to be recovered.
9. Click **Recover Selected Files**.

## Removing virtual machine disks

### Procedure

When the specified retention period expires, the virtual machine disks are deleted automatically. You can remove the virtual machine disks manually, if you want to remove the disks before the retention period.

To delete virtual machine disks manually:

1. In the HPE Data Protector Granular Recovery Extension for VMware vSphere Web Client, click the **Cleanup** tab.  
The Cleanup page is displayed.

## Removing disks

**Hewlett Packard Enterprise** HPE Data Protector Granular Recovery Extension

Request Restore / Present Select path on mount proxy to display a list of restored / presented disks.  
 Handle Request Select the disk and click Remove Disk to remove / unrepresent it.  
 Monitor Request This will free up disk space on selected path.  
 Recover Files  
**Cleanup**  
 Settings  
 About

Select path on mount proxy to display a list of restored / presented disks.  
 Select the disk and click Remove Disk to remove / unrepresent it.  
 This will free up disk space on selected path.

**Cleanup** Remove Disk Refresh

Mount Proxies			Restored / Presented Disks				
Mount Proxy	Restore Path	Available Space (GB)	ID	VM	Disk	Size (GB)	Submitter
mountproxy.hostname1	Staged	NA	0003	VMWare Non	scsi0:1	0.10	VSPHEREADMINISTRATC
			0002	VMWare Non	scsi0:1	0.10	VSPHEREADMINISTRATC
			0001	VMWare Non	scsi0:1	0.10	VSPHEREADMINISTRATC

Command Status

- Under **Mount Proxies**, select the mount proxy and the restore path from where you want to remove the disks.  
 The table in the **Restored / Presented Disks** area displays the restored virtual machine disks in the selected path.
- Under **Restored Disks**, select the desired disk and click **Remove Disk** to remove the restored virtual machine disk from the mount proxy system. When you click **Remove Disk**, it unrepresents the share from the Smart Cache device and removes all disks with the same request ID.  
 A confirmation message is displayed in the **Command Status** area.

## About Granular Recovery Extension

### Procedure

To determine the VMware Granular Recovery Extension agent and Plug-in version:

- In the HPE Data Protector Granular Recovery Extension for VMware vSphere Web Client, click the **About** tab.  
 The About Granular Recovery Extension page is displayed.
- Click **User Manual** to download a copy of the *HPE Data Protector 9.07 Granular Recovery Extension User Guide for VMware vSphere*.

**Note:** You can download the GRE guide if the Data Protector documentation component is installed on the vCenter Server.

## Recovery using Advanced GRE Web Plug-in

The Data Protector GRE with the Advanced GRE Web Plug-in provides the interface required to perform a recovery operation.

The Advanced GRE Web Plug-in enables you to perform the following tasks:

- [Access the Advanced GRE Web Plug-in](#)
- [View the list of requests](#)

- [Configure the GRE settings](#)
- [Create new request](#)
- [Recover files](#)
- [Change the Cell Manager](#)
- [About Granular Recovery Extension Plug-in](#)

## Accessing the Advanced GRE Web Plug-in from VMware vSphere Web Client

To access the Advanced GRE Web Plug-in from the VMware vSphere Web Client, proceed as follows:

1. Open the VMware vSphere Web Client. You can specify any of the vCenter URLs that are already imported into the Data Protector Cell Manager. Specify the credentials of the Data Protector user and click **Login**.

The VMware vSphere Web Client home page is displayed and the Home tab is selected by default.

2. Select **Hosts and Clusters** or **VMs and Templates** and expand the virtual machine node to select the required virtual machine.
3. Click **Manage > HPE Data Protector**.

**Note:** If you receive the security alert notification after accessing the VMware vSphere Web Client application, you do not have the vSphere certificate installed on your system. Click **Yes** to open the extension.

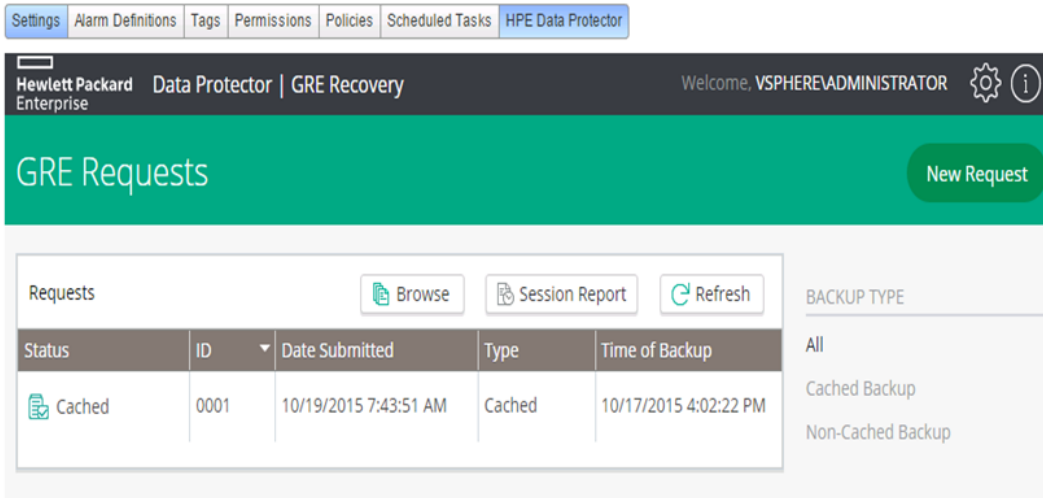

The Advanced GRE Web Plug-in opens and the Select Cell Manager dialog box appears.

4. Select the Cell Manager from the list and click **Select**. The GRE Request page with the list of requests appears. If there is only one Cell Manager, then selection is not required. The available Cell Manager is displayed briefly and you are re-directed to the GRE Requests page. If you select a different Cell Manager and click **Cancel** or **Close**, then you will be connected to the previously selected Cell Manager.

## Viewing the list of requests

The GRE requests page is the landing page for the Advanced GRE Web Plug-in. In this page you can view the list of requests and perform actions that are described in this section.

### Advanced GRE Web Plug-in - GRE Requests page

1. The Status, ID, Date Submitted, Type, and Time of Backup information is available for each of the requests. You can also filter the list of requests using the **Backup Type (All, Cached Backup, Non-Cached Backup)** in the right pane.
2. You can click **Refresh** to update the status of your request.
3. A request can have the following status:
  - Cached
  - Caching
  - Aborted
  - Recovered
  - Recovering
4. Select the required request and depending on the state of the request, appropriate buttons or actions become available.

Status	Actions available
Caching	Abort Session Report
Recovering	
Cached	Session Report , Browse
Recovered	Session Report

5. You can perform the following actions:
  - Click **Browse** to browse the disks that are selected while creating a request. You can browse partitions in disk/s and select the files or folders for recovery. However, browsing multiple disk at the same time is not allowed. At a given point of time you can browse only one disk . The

Recover Files page appears.

- Click **Session Report** to display the log messages for the actions that were taken most recently by the selected GRE request.
- Click **New Request** to create a new request for a Cached or Non-Cached operation. The New Request page appears.
- Click **Abort** to stop the restore or recovery that is in progress.

## Creating a new request

The New Request page lists all the available backups for the selected VM. You can filter the results using the options available under **Backups From** and **Backup Type** fields in the right pane.

**Backups From** - All, Last 30 Days, Last 90 Days, Last 6 Months, Last Year.

**Backup Type** - All, Cached Backup, Non-Cached Backup.

### Advanced GRE Web Plug-in - New Request page

The screenshot displays the 'New Request' page in the HP Data Protector interface. The page header includes 'Hewlett Packard Enterprise Data Protector | GRE Recovery' and 'Welcome, VSPHEREADMINISTRATOR'. A green navigation bar contains a 'Back to GRE Requests' link and a 'Send Request' button with a close icon. The main content area features a table of backups with the following data:

Time of Backup	Type	Virtual Disks
10/17/2015 4:02:22 PM	Cached	1
10/16/2015 12:12:38 PM	Cached	1

The right-hand pane contains two filter sections: 'BACKUPS FROM' with options: All, Last Week, Last 30 Days, Last 90 Days, Last 6 Months, Last Year; and 'BACKUP TYPE' with options: All, Cached Backup, Non-Cached Backup. A 'Refresh' button is located above the table. A pagination control at the bottom shows '1' of 1 items.

1. Select the required backup. Proceed as follows:
  - a. From the **Virtual Disks** section, select single or multiple virtual disks for restore /presentation.

**Note:** The virtual disks are selected by default for 3PAR cached sessions.

- b. In the **Disk Retention Time** text box, enter the retention period. This period starts from the restore or presentation operation. After the retention period, the virtual disks are not available.
- c. From the **ESX Host** drop-down list, select the required ESX host. By default, the production ESX is selected.
- d. From the **Select Mount Proxy** drop-down list, select the required mount proxy.
- e. From the **Restore Path** drop-down list, select the required restore path.

**Note:** The default retention period of the non-cached backup is 7 days (maximum can be set to 7 days). The default retention period for the cached backup is 1 day (maximum can be set to 7 days).

2. For Cached / Non-Cached Backups, click **Send Request**. The GRE Request page appears and you can monitor the status of the request. For more information on how to proceed with the request, see the GRE Request section.
3. Click **Refresh** to update the list of backups.

**Note:** Configure the mount proxy from the GRE Settings page before proceeding to create a new request for Non-Cached backups. However, it is not necessary to configure mount proxies for Cached backups.

**Note:** When the GRE mount proxy host is rebooted, the mount points created for the requests (which are browsed at least once) of LVM disks become invalid. Hence these requests must be re-created to perform GRE operations.

**Note:** Run the following command to force clean up the StoreOnce Catalyst request IDs:  
`vmwaregre-agent.exe -force_cleanup <request_id> -vcenter <hostname>`

where

- request\_id: StoreOnce Catalyst request ID that needs to be cleaned up
- hostname: vCenter host name on which the request is made

## Recovering files

### User permissions

To perform recovery of file(s), the user must have appropriate permissions on the target virtual machine. If **Use VIX as fallback option** is selected, then the following permissions should be provided in vCenter - **Virtual machine->Interaction->Guest operating system management by VIX API**.

If Samba has to be used for file recovery, then user name and password of the Samba user should be provided. This user should be able to mount network share to which files have to be recovered.

For a Linux **Target VM**, the **VM Username**, and **VM Password** fields cannot be empty; therefore, these credentials should be provided. However, as an NFS share is exported, these credentials are not used.

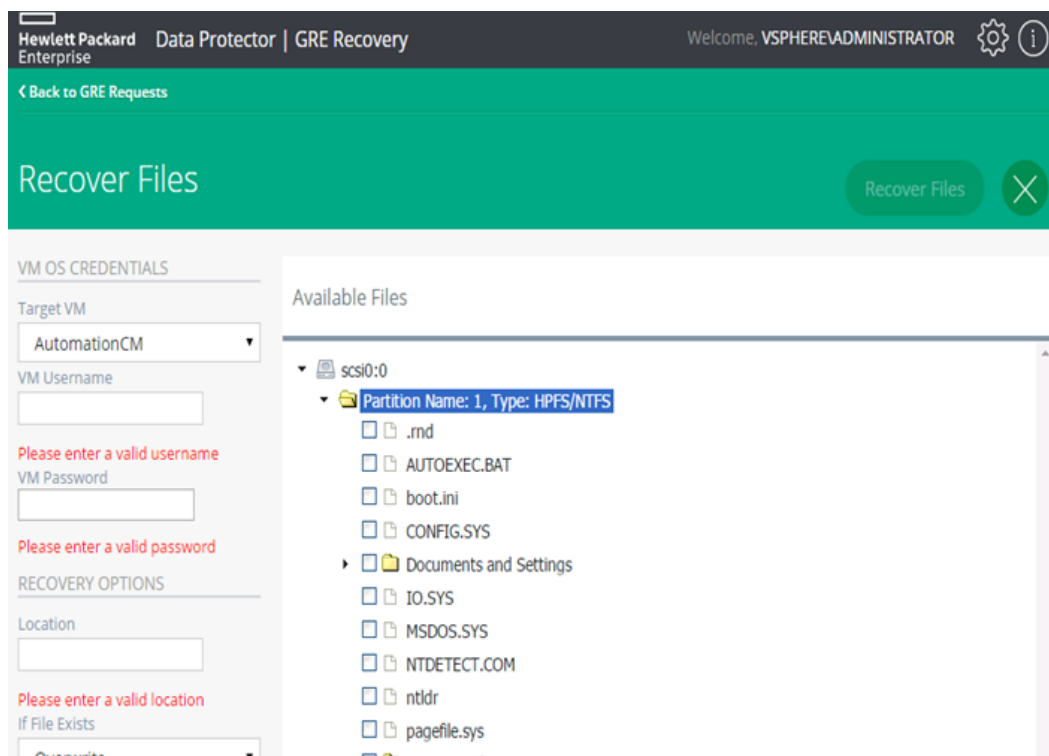

## Procedure

To recover files from virtual machine disks:

1. The Recover Files page appears. It is assumed that you have selected a restored or recovered request and clicked **Browse** from the GRE Request view.

The file structure of the VMs is displayed in the Available Files section of the main content area.

### Advanced GRE Web Plug-in - Recover Files page

2. Under the Available Files section, select the virtual machine disk containing the files to recover.

**Note:** For cached 3PAR sessions, selecting the virtual machine disk mounts a backup replica, mounts datastores, and registers the VM resulting in the display of the following message:

Request submitted successfully and is in progress. Please try browsing after some time.

Selecting the virtual machine disk when the process is still in progress results in the display of the following message:

Request is still in progress. Please try browsing after some time.

Browsing enables the user to expand one disk and one partition at a time, since only one disk and one partition is supported for recovery. Proceed as follows:

- a. Click the disk name to expand the required partition. If a Linux partition is selected, then select the logical volumes from the **Available Logical Volumes** drop-down list.

**Note:** If the user has selected files or folders, browse will not allow another disk/partition

to be selected until the files/folders have been deselected.

- b. Select the files to recover from the selected disk.
3. Under Virtual Machine OS Credentials, select the virtual machine from the **Target VM** drop-down list, and enter its credentials in the **VM Username** and **VM Password** text boxes. The **Target VM** lists all the running VMs under the selected vCenter.

**Note:** Ensure to complete the following steps on the target Linux VM:  
Resolve any Hostname or IP conflicts for Target VM.  
NFS services must be configured and running.  
Firewall must be configured. For Windows environment, see [Configuring Windows Firewalls](#).

4. Under the Recovery Options section, in the **Location** text box, enter the target recovery location path.
  - For locations on Windows systems, use the format *DriveLetter:\Folder\Subfolder*.
  - For locations on Linux systems, use the format */Directory/Subdirectory*.

**Note:** For shared directories, enter the path without the hostname. For example, in the case of an NFS share hostname, use: */shared\_dir/subdir*. Files get recovered to *shared\_dir/subdir/<target location specified>*. Also, ensure that the Samba and NFS shares are set up correctly. The NFS share must also be exported as pseudo root shares.

Any missing directories in the path are created automatically. For example, if you specify */shared\_dir/subdir1/subdir2*, the *subdir1/subdir2* subdirectories are automatically created inside */shared\_dir*, if they do not already exist.

5. If the file already exists on the target system, select one of the following recovery options:
  - **Overwrite:** deletes the original files, and saves the latest files.
  - **Rename:** keeps the original files, and saves the recovered files with a unique number (generated by Data Protector).renamed
  - **Skip:** keeps the original files.
6. Select **Keep Directory Structure** to maintain the original directory structure of the source virtual machine disk on the target system.
7. Select **Use VIX as fallback option** when network share is not available. Recovery using VIX takes a longer time and can be monitored through the session reports generated in the GRE Request page.
8. Under Available Files, select the files and folders to be recovered.
9. Click **Recover Files**. A confirmation message appears and the GRE Request page is displayed, where you can monitor the recovery.

## Configuring GRE settings

In this page, you can modify the options for retention time and debugging. In addition you can configure, add, or modify the mount proxy system used as a target location for restoring virtual machine disks.

## Retention time and debugging

To modify the options for retention time and debugging:

1. In the HPE Data Protector Granular Recovery Extension for VMware vSphere Web Client, click the **Tools** icon.
2. Click **GRE Settings**. The GRE Settings page is displayed.

### Advanced GRE Web Plug-in - GRE Settings page

The screenshot shows the 'GRE Settings' page. At the top, there is a navigation bar with 'Hewlett Packard Enterprise Data Protector | GRE Recovery' and 'Welcome, VSPHEREADMINISTRATOR'. Below the header, there is a green bar with 'GRE Settings' and 'Save' and 'Refresh' buttons. The main content area is divided into three sections: 'RETENTION TIME OPTIONS', 'DEBUGGING OPTIONS', and 'MOUNT PROXY INFORMATION'. Under 'RETENTION TIME OPTIONS', there are two input fields: 'Remove Non-Cached Disks After' (set to 7) and 'Remove Cached Disks After' (set to 1), both with 'Days' labels. Under 'DEBUGGING OPTIONS', there is a radio button for 'Enable Debugging' with 'No' selected. Under 'MOUNT PROXY INFORMATION', there are two columns: 'Windows Host' and 'Linux Host'. The 'Windows Host' dropdown is set to 'iwf1113073.vc.com' and has a 'Restore Path' field with a '+' button. Below it, two paths are listed: 'e:\restore' and 'e:\restore2'. The 'Linux Host' dropdown is set to 'No linux mount proxies are configured' and has a 'Restore Path' field with a '+' button.

3. Under **Retention Time Options**, enter the retention period for the following text boxes:
  - Remove Non-Cached Disks After
  - Remove Cached Disks After

**Note:** The default retention period of the non-cached backup is 7 days (maximum can be set to 7 days). The default retention period for the cached backup is 1 day (maximum can be set to 7 days).

4. Under Debugging Options, select **Enable Debugging** to create debug files.
5. Click **Save**.
6. Click **Back to GRE Request** to return to the list of requests available in the GRE Request page.

## Configuring the mount proxy

To configure, add or modify the mount proxy system used as a target location for restoring virtual machine disks:

1. From the **Windows** or **Linux Host** drop-down list, select the required Windows or Linux mount proxy system.

**Note:** You can configure multiple mount proxies and restore paths.

2. In the Windows and/or Linux **Restore Paths** text box, enter the path to a location on the mount proxy system. Use the following format:
  - *DriveLetter:\Folder\Subfolder* (Windows mount proxy system)
  - */Directory/Subdirectory* (Linux mount proxy system)
3. Click **+** to add the specified path to the applicable list of restore or presentation paths. You can add more restore paths, if required.
4. Click **-** to delete the required restore path(s). You cannot delete a restore path if it is the only one for the mount proxy system.
5. Click **Save**.
6. Click **Back to GRE Requests** to return to the list of requests available in the GRE Requests page.

## Changing the Cell Manager

If you are accessing the Advanced GRE Web Plug-in for the first time, you must select a Cell Manager (if there is only one, it is selected automatically). If more than one Cell Manager exists, then you will not be able to cancel or close the operation. However, the next time you access the plug-in, you can change the Cell Manager.

To change the Cell Manager:

1. In the HPE Data Protector Granular Recovery Extension for VMware vSphere Web Client, click the **Tools** icon.
2. Click **Change Cell Manager**. The Select Cell Manager box appears.
3. Select the required Cell Manager from the drop-down list and click **Select**.
4. If you select a different Cell Manager and click **Cancel** or **Close**, the previously selected Cell Manager is still applicable. However, if there is only one Cell Manager, then selection is not required. The available Cell Manager is displayed briefly and you are re-directed to the GRE Requests page.

The GRE Request page appears with the list of requests available for the selected Cell Manager.

## Identifying the Advanced GRE Web Plug-in version

To determine the VMware Granular Recovery Extension agent and Plug-in version:

1. In the HPE Data Protector Granular Recovery Extension for VMware vSphere Web Client, click the **Tools** icon.
2. Click **About**, the Granular Recovery Extension information is displayed.

### Advanced GRE Web Plug-in - About page

The screenshot displays the 'About' page of the HPE Data Protector GRE Recovery web interface. At the top, there are navigation tabs: Summary, Monitor, Manage (selected), and Related Objects. Below these are sub-tabs: Settings, Alarm Definitions, Tags, Permissions, Policies, Scheduled Tasks, and HPE Data Protector. The main header area includes the Hewlett Packard Enterprise logo, 'Data Protector | GRE Recovery', and a welcome message for 'VSPHEREADMINISTRATOR'. A green banner contains a link to 'Back to GRE Requests' and the title 'About'. The main content area provides the following information:

- ABOUT GRANULAR RECOVERY EXTENSION
- AGENT VERSION:  
HPE Data Protector A.09.07: vmwaregre-agent.exe, internal build 109, built on Wed Jun 29 02:25:39 2016
- PLUGIN VERSION:  
09.07.0.53855

# Chapter 20: Troubleshooting

This chapter lists general checks and verifications, plus problems you might encounter when using the Data Protector Granular Recovery Extension for VMware vSphere.

- For Virtualization Environments troubleshooting information, see the troubleshooting section of the VMware part about the Data Protector Virtual Environment integration, in the HPE Data Protector Integration Guide.
- For general Data Protector troubleshooting information, see the *HPE Data Protector Troubleshooting Guide*.

## Before you begin

- To enable debugging, see "[Enabling debugging option](#)" below.
- Ensure that the latest official Data Protector patches are installed. See the *HPE Data Protector Help* index: "patches" on how to verify this.
- For general Data Protector limitations, as well as recognized issues and workarounds, see the HPE Data Protector Product Announcements, Software Notes, and References.
- For an up-to-date list of supported versions, platforms, and other information, see <http://support.openview.hp.com/selfsolve/manuals>.

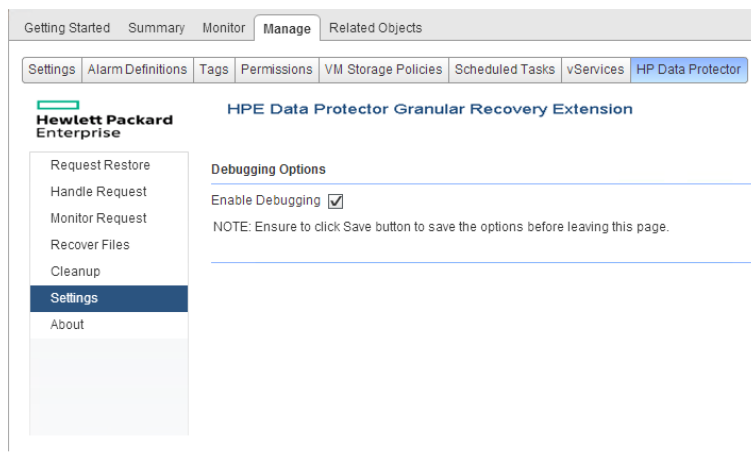

## Debugging

### Enabling debugging option

1. If you encounter an issue when using this extension, the information in the log files can help you determine the problem. To enable the debugging option, locate the Settings page by clicking the **Settings** button. The Settings page is displayed.
2. Locate the Debugging option, select **Enable Debugging**. When you close the vSphere client interface this option is cleared, and the debugging option for this extension disabled.

For detailed descriptions of the Data Protector log files, see the HPE Data Protector Troubleshooting Guide, index: "Contents of log files".

#### Debugging option enabled

Log files are located in the default Data Protector log files directory and the default temporary files directory.

For a list of known issues and workarounds, see "[Known issues and workarounds](#)".

## Known issues and workarounds

### Mounting virtual machine disks

#### Problem

When performing recovery of files, the following message is displayed after selecting a partition:

```
[EXCEPTION] boost: filesystem: status: The volume does not contain a recognized file system. Please make sure that all required file system drivers are loaded and that the volume is not corrupted: "\\?\M:\\" ProxyGetAllNodesForPath.
```

After mounting the virtual disks manually, the following is displayed in the command line interface:

```
The volume does not contain a recognized file system. Please make sure that all required file system drivers are loaded and that the volume is not corrupted
```

Your configuration is not supported. The extension and the VMware VDDK do not support dynamic disks. This is a known VMware-mount limitation. The issue may occur when a partition does not contain any file system, or it contains a different unsupported file system.

#### Action

- For Windows virtual machine disks, use one of the supported file systems, for example NTFS or FAT system formats.
- For Linux virtual machine disks, use NTFS or FAT system formats, or one of the supported Linux file systems.

For a list of supported file systems, see the latest support matrices at <http://support.openview.hp.com/selfsolve/manuals>

## Inability to browse a virtual machine disk

### Problem

#### When browsing a virtual machine disk, an external error is reported

When you try to browse a virtual machine disk in the vSphere Client, the following error message is displayed in a pop-up window:

```
External utility reported error
```

The error details read:

```
/opt/omni/lib/vddk/vmware-mount -K VirtualDiskRestorePath/Hostname.vmdk:  
umount VirtualDiskMountPoint: device is busy. (In some cases useful info about  
processes that use the device is found by lsof(8) or fuser (1) ) Failed to unmount  
all partitions on disk 'VirtualDiskRestorePath/Hostname.vmdk': umount command  
failed
```

This problem occurs after the `vmware-mount` utility fails to delete the lock for the mounted disk after dismounting it. The Data Protector VMware Granular Recovery Extension Agent is therefore unable to mount the disk again.

### Action

Delete the `Hostname.vmdk.lck` directory from the `VirtualDiskRestorePath` folder.

## Issues after removing the extension

### Problem

You removed the VMware Granular Recovery Extension Agent component and the scripts (post-install and post-reinstall) in the Windows environment. When you remove the component, the removal tries to delete the driver. If the removal command is not successful, the driver stays in the stopped / pending removal on next boot state. Even after repeating the installation procedure the driver stays in a stopped / pending removal on next boot state.

When you try again to install the VMware Granular Recovery Extension Agent component, the HPE Data Protector Manager displays the following message in the installation session log:

```
[Critical] computer.company.com Post-installation script for the VMware Granular  
Recovery Extension Agent failed with the output
```

```
Data_Protector_home\bin
```

```
perl -I "..\lib\perl" vmwgre_ag.pl -install
```

```
Cannot start vstor2-mntapi20-shared: The service is starting or stopping. Please  
try again later.
```

```
Delete of vstor2-mntapi20-shared driver failed: [SC] DeleteService FAILED 1072:
```

```
The specified service has been marked for deletion.
```

You must restart target machine to finish installation of VMware GRE Agent.

**Note:** These error messages may differ from case to case, but the above error message can be considered as an example.

#### Action

Restart the system.

**Note:** If the VMDK driver is already installed on the system outside of Data Protector and running, then this driver is used; it is not removed or reinstalled. The upgrade procedure is successful.

## VMware VirtualCenter Management Webservices service is not running

#### Problem

The debug log file contains the following message:

```
File not found - C:\Program Files (x86)
\VMware\Infrastructure\tomcat\webapps\VMWareGRE\register.xml
```

There is a problem with VMware VirtualCenter Management Webservices service. Check that the target system has VMware VirtualCenter Management Webservices running.

#### Action

Check if the C:\Program Files (x86)\VMware\Infrastructure\tomcat\webapps\VMWareGRE folder exists. If it exists, remove it. The VMware VirtualCenter Management Webservices service should create a new folder automatically. Run the script: *Data\_Protector\_home\bin\vmwgre\_wp.cmd*

If folder does not exist, VMware VirtualCenter Management Webservices is probably not started. Start it, check that the folder is created and run the script: *Data\_Protector\_home\bin\vmwgre\_wp.cmd*.

## RSA certificates with keys that are less than 1024 bits long are blocked

#### Problem

After installation of the Microsoft Security Advisory update (KB2661254), connection to the vCenter Server VMware GRE plugin may fail.

#### Action

This happens because the VMware vCenter Server by default uses RSA certificates which are 512 bits and the update in Microsoft Security Advisory kb2661254, blocks the use of RSA certificates which are less than 1024 bits long.

For more details, on the resolution see

[http://kb.vmware.com/selfservice/microsites/search.do?language=en\\_US&cmd=displayKC&externalId=2037082](http://kb.vmware.com/selfservice/microsites/search.do?language=en_US&cmd=displayKC&externalId=2037082)

and Microsoft Security Advisory update: **kb2661254** = <http://support.microsoft.com/kb/2661254>

## Remote installation of VMware Granular Recovery Extension Web Plug-In ends unexpectedly

### Problem

The remote installation of VMware Granular Recovery Extension Web Plug-In ends unexpectedly. In the debug.log file on the target system the following message is displayed:

```
Log on to Virtual Center computer.company.com could not be performed. Web service error: No connection could be made because the target machine actively refused it.
```

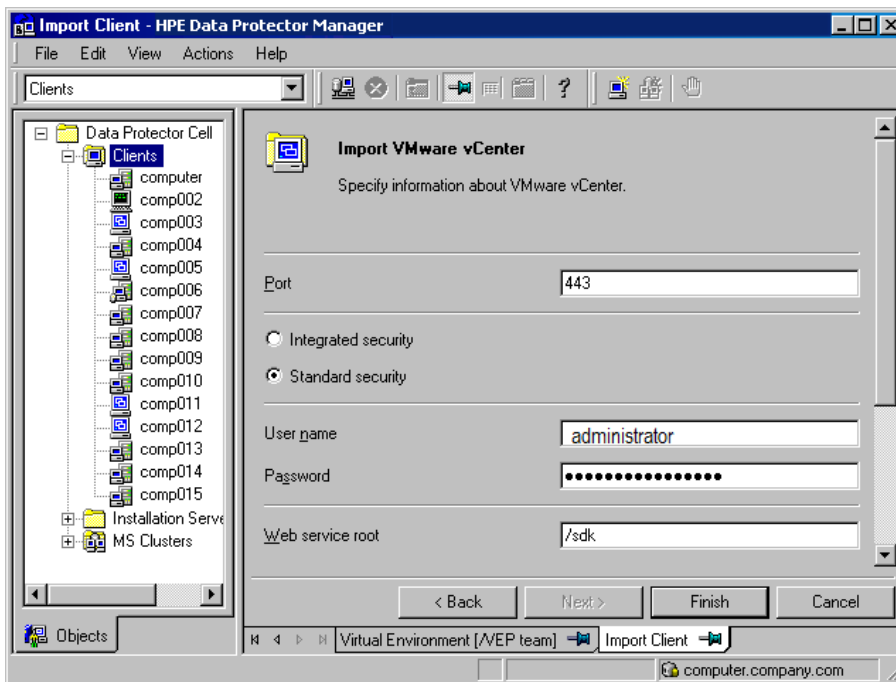

Or:

```
Log on to Virtual Center computer.company.com could not be performed. Details: Web service error: Cannot complete login due to an incorrect user name or password.
```

### Action

Ensure the user credential information and the correct port number are specified on the following HPE Data Protector client import settings page:

#### User credentials during the import client procedure

## VMware Granular Recovery Extension Web Plug-In installation fails

### Problem

The post-installation script for the VMware Granular Recovery Extension Web Plug-In fails with the following error message:

```
C:\Program Files\OmniBack\bin>perl -I "..\lib\perl" vmwgre_wp.pl -install
```

There was a problem during VMware Granular Recovery Extension Web Plug-In installation. Check if the target system has VMware vCenter Server installed and configured.

### Action

1. Navigate to the installation log file under C:\ProgramData\OmniBack\tmp to determine the failure of the post-installation script.

**Note:** The created installation log file is of the form: OB2DBG\_...\_\_VMWGRE\_WP\_...txt.

The possible causes are:

- The Data Protector client is not installed on vCenter host and imported as VMware vCenter to Data Protector Cell.
  - The username and password specified when importing the vCenter host to the Data Protector cell are not valid.
  - Due to some leftovers from the previous installation.
  - The Auto deploy is not enabled on the vCenter Tomcat web server.
2. Fix the possible causes and push the component again.

## Mounting of LVM logical volumes fail when browsing VMware GRE on Linux

### Problem

When you try to browse an LVM logical volume, it fails with the following error message:

There are no partitions on selected disk.

### Action

You can perform GRE operations only on LVM volumes, which have partition Type ID set to 8E. The following steps describe how to create a new LVM partition/group/volume. Proceed as follows:

1. `fdisk /dev/<device_name>`
2. Create a new partition by pressing `n` and configure the settings for this partition.
3. After creating a partition, press `t` and set the partition type to `8e`.

4. Press `w` to write the partition table.
5. Create a physical volume on the newly created partition: `pvcreate /dev/<partition_name>`.
6. Create a volume group on the physical volume: `vgcreate <VGNAME> /dev/<partition_name>`.
7. Create a logical volume in the volume group: `lvcreate -l <Total PE> -n <LVNAME> /dev/<VGNAME>`.

**Note:** `<Total PE>` refers to the size of the volume group. You can get that using `vgdisplay -v <VGNAME>`.

8. Create a file system over the newly created logical volume: `mkfs -t ext3 /dev/<VGNAME>/<LVNAME>`.
9. Mount the logical volume to any location of your choice.

**Note:** You can view that there is one LVM partition in the disk if you run the `fdisk -l` over `/dev/<partition_name>` command. Hence, the VDDK VIX mount locates the partitions on the selected disk and mounts them.

## VMware Granular Recovery Extension tab is missing

### Problem

You connected with vSphere Client to vCenter. When you select a virtual machine in the VMs and Templates view, there is no HPE Data Protector tab, the extension is missing. The root cause is the firewall is probably preventing communication.

### Action

On the vCenter server, configure the Windows Firewall. Select the Exceptions tab and **Add port** of the VMware vCenter Server-Web Services HTTPS (default 8443) to the exceptions list, and restart the vSphere Client interface.

## VMware Granular Recovery Extension tab is missing with vCenter Server plug-in disabled

### Problem

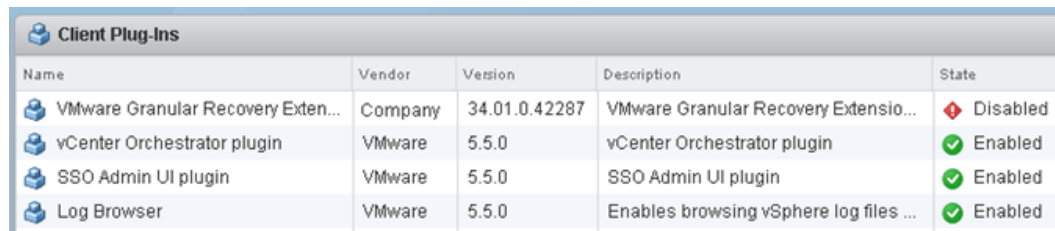

You connected with vSphere Client to vCenter. When you select a virtual machine in the VMs and Templates view, there is no HPE Data Protector tab, and the extension is missing. The root cause is an installation that ended abnormally.

### Action

1. On the vCenter server, remove the extension from the system.
2. Remotely install the extension again. For details on the importing procedure, see "Configuring the Integration" section in the *HPE Data Protector Integration Guide*.
3. Connect with the vSphere Client interface to a vCenter Server system. The VMware vSphere Web Client home page is displayed. The **Home** tab is selected by default. Click the

- Administration** tab and then click **Client Plug-ins**. The Client Plug-ins window is displayed.
- Under the Client Plug-ins Name column, locate VMwareGRE, right click it, and click **Enable**.

#### Extension disabled

Name	Vendor	Version	Description	State
VMware Granular Recovery Extension	Company	34.01.0.42287	VMware Granular Recovery Extension	Disabled
vCenter Orchestrator plugin	VMware	5.5.0	vCenter Orchestrator plugin	Enabled
SSO Admin UI plugin	VMware	5.5.0	SSO Admin UI plugin	Enabled
Log Browser	VMware	5.5.0	Enables browsing vSphere log files ...	Enabled

## HPE Data Protector cannot add any Granular Recovery Extension component

### Problem

HPE Data Protector cannot add components. The probable root cause is that Data Protector client was imported as a VMware vCenter host without any Data Protector component installed on it.

### Action

- Export the Data Protector client.
- Install any Data Protector component on the client and re-import as VMware vCenter.

## Local installation workaround

### Problem

You cannot install the extension remotely on your system.

### Action

Install the extension on your local system.

For details on the importing procedure, see "Configuring the Integration" section in the *HPE Data Protector Integration Guide*.

### Local installation workaround in Windows

- To install this extension on a Data Protector cell system, follow these steps:  
Install the VMware Granular Extension Web Plug-In component or the VMware Granular Recovery Extension Agent component by changing the directory to:  
Insert the Windows installation DVD-ROM by changing the directory to:  
**32-bit Windows systems:**  
\\Windows\_other\i386  
**64-bit Windows systems:**  
\\Windows\_other\x8664

2. Run the VMware Granular Extension Web Plug-In component installation:

The \ denotes continuation of the command line.

```
csetup.exe /quiet ADDLOCAL=core,vmwaregre_webplugin \  
INSTALLATIONTYPE="Client" \  
CELLNAME="CellManagerSystemName" \  
CELLCLIENTNAME="VirtualCenterSystemName" \  
INSTALLDIR="InstallationPath"\  
INETPORT=InetPort OPTDNSCHECK=1 OPT_MSG=1 \  
PUSHADDUPG=1
```

Run the VMware Granular Recovery Extension Agent component installation:

```
csetup.exe /quiet ADDLOCAL=core,vmwaregre_agent \  
INSTALLATIONTYPE="Client" \  
CELLNAME="CellManagerSystemName" \  
CELLCLIENTNAME="TargetSystemName" \  
INSTALLDIR="InstallationPath" \  
INETPORT=InetPort OPTDNSCHECK=1 OPT_MSG=1 \  
PUSHADDUPG=1
```

#### Local Installation workaround in Linux

UNIX clients are installed locally using the installation script `omnisetup.sh`. You can install the client locally from the UNIX installation DVD-ROM and import it to the Cell Manager using automated procedure. For more information on `omnisetup.sh`, see the *HPE Data Protector Command Line Interface Reference*.

## Monitor displays request removed by administrator

### Problem

A message, similar to the following is displayed when monitoring your request:

```
0030 scsi0:1 2/17/2011 10:35:07 AM Removed by administrator 3.00
```

Your administrator has removed this disk.

### Action

- To recover your files, ensure that you request a new restore for this removed disk.  
For details on the procedure, see "[Requesting restore or presentation](#)".

## Overwritten files issues

### Problem

A message, similar to the following is displayed when recovering items with the **Overwrite** option selected:

The \ denotes continuation of the command line.

```
[Failed] c:\vix_27-2\incremental-21-2\incremental\ \  
  Username \CheckVix\vixlibs\arp.ico  
Source:\incremental-21-2\incremental\Username\CheckVix\ \  
vixlibs\arp.ico  
You do not have access rights to this file.  
[Failed] c:\overwrite_incr-21-2\incr24-2\incremental-21-2\ \  
incremental\Username\CheckVix\vixlibs\vix.h  
Source:\incr24-2\incremental-21-2\incremental\Username\ \  
CheckVix\vixlibs\vix.h  
[5] Access is denied.
```

The item already exists on the target system. This item cannot be overwritten due to the file security option. If the source location contains NTFS file system and the target virtual machine disk are on the network, the Granular Recovery Extension for VMware recovers all security information associated with the items. This information cannot be overwritten.

### Action

If the item already exists in the target location, perform one of the following instead:

- Recover these items to another location.
- Select the **Skip** recovery option.
- Select the **Rename** recovery option.
- Change the file permissions on the target location manually before starting recovery.

## Missing VIX API libraries

### Problem

File recovery fails due to missing VIX API libraries with the following error message:

```
Could not start recovery.
```

```
Cannot find support libraries; Vix appears to have not been installed.
```

### Action

1. Install VMware tools on the target VM.
2. Install VMware VIX API 1.14 on the mount proxy system (Windows/Linux).

## Insufficient permission in the Host Operating System

### Problem

The following error message is displayed when performing the recovery of files:

Insufficient permission in host operating system.

#### **Action**

The user entered when importing the vCenter to the DP cell must have the following permission assigned on the vCenter:

Virtual machine -> Interaction-> Guest operating system management by VIX API

## **Authentication failure or insufficient permission in the Guest Operating System**

#### **Problem**

The following error message is displayed when performing the recovery of files:

Authentication failure or insufficient permissions in guest operating system.

#### **Action**

The user entered when specifying the options for the recovery of files in the Web Plug-In GUI must be able to log in to the target VM. The user can perform only the operations to which access rights has been provided on the target machine.

For example, if you want to write to a folder, you need to have permissions to recover files to that folder.

## **Viewing partitions on selected disk**

#### **Problem**

The following error message is displayed, for non-staged recovery:

No partitions on selected disk

#### **Action**

The selected disk may not have any valid partitions. Verify if the disk has partitions in the original Virtual Machine.

## **Presentation failed**

#### **Problem**

Non-staged recovery involves creating a share on a Smart Cache device or host and presenting the same to the mount proxy host. Failure of the presentation task can cause recovery to fail with the following messages:

Unable to present shared disk(displayed during a non-staged presentation operation)

Presentation failed(displayed in the corresponding Data Protector session report)

### Action

- Verify the user / admin credentials provided while configuring the Smart Cache device. This error can occur when there is a credential mismatch.
- Verify details from the session report, using either Data Protector GUI (from the IDB context), or using the GRE plug-in GUI (monitor request).
- Additionally access the share directly, using credentials stored in Data Protector at the time of device creation.

If the problem persists, contact the Data Protector administrator.

## Cached recovery fails

### Problem

Recovery of VMware files during cached recovery fails with the following error:

```
Cannot access the file. Access is denied.
```

This error may occur when there are multiple connections to a server or a shared resource for a single user.

### Action

Ensure that in a single Media Agent host, only one operating system user credential must be used to create a Smart Cache device. You may also disconnect all previous connections to the server or the shared resource and reboot the system.

## Restore session stops after some time

### Problem

When performing a restore, the session stops after a certain period of time and the RSM stops responding. This issue may be caused by firewall closing an inactive connection.

### Action

Ensure that the connection remains active so that the firewall does not close it. Set the following omnirc options: `OB2IPCKEERALIVE=1`, `OB2IPCKEERALIVETIME=number_of_seconds`, `OB2IPCKEERALIVEINTERVAL=number_of_seconds`

`OB2IPCKEERALIVETIME` specifies how long the connection may remain inactive before the first keep-alive packet is sent and `OB2IPCKEERALIVEINTERVAL` specifies the interval for sending successive keep-alive packets if no acknowledgment is received. The options must be set on the Cell Manager system.

## The VMware GRE session is unresponsive

### Problem

If the mount proxy host has a Linux environment, and the session is left idle for more than 10 minutes after browsing a disk or recovering from a disk, then the next browse or recovery operation makes the GRE session unresponsive.

### Action

Locate the running VMware GRE agent process (`vmwaregre-agent.exe`) on the mount proxies and end the process manually.

## VMware GRE file recovery could not access network share

### Problem

File recovery in VMware GRE could not access network share on windows mount proxy.

This issue occurs because of a missing update in the Windows 2008 R2 SP1 environment.

The following error message appears:

Could not start Recovery.

“Cannot access to network share on target VMError info: System error[2250]. The network connection could not be found.”

### Action

A supported hotfix is available from Microsoft. Check to see if this fix has been installed . For more details on this fix see, <http://support.microsoft.com/kb/2807716>

## Resizing the browser window causes an error and reloads the page

### Problem

Resizing the browser window opened with the Advanced GRE Web Plug-in causes an error and reloads the page.

### Action

This is a known issue with VMware. <https://communities.vmware.com/message/2434421#2434421>.

## Browsing for Recovery throws an error message

### Problem

While browsing for recovery in the Advanced Web Plug-in throws an error message `Failure of REST call to getPartitionsForDisks:status =500` error. This might happen if you selected an unformatted disk in the Available Files section.

### Action

Format the disk. The Advanced GRE Web Plug-in does not support recovery of unformatted disks.

## While performing a Recovery operation a session time-out occurs

### Problem

While performing a recovery operation the session may time-out with the following error message:

```
Agent Process on vcenter with IP number has ended because vmwaregre-agent.exe did not send response in the expected time frame of 6 minutes.
```

This may occur if the firewall is enabled on the target virtual machine but not configured.

### Action

You can configure the firewall according to your port requirements or you can disable the firewall.

## Time difference exists between the backup sessions on the Data Protector GUI and vSphere web client

### Problem

There is a time difference of 1 minute for all the backup sessions between the Data Protector GUI vs vSphere web client.

### Action

Rather than comparing Session Time, you need to compare Object Version. A session can have more than one VMs and IDB has object version for each VM. Proceed as follows:

1. Start the Data Protector GUI, and select **Internal IDB**.
2. Click **Sessions**.
3. Expand the session that you are verifying on the left (format <date>-<number> IE: 2014-09-22-1)
4. Click on the vCenter. On the right you see **Backup Object Version**
5. Select **Start Time**. Here you can observe that the time stamp is the same.

## Unable to expand a folder for browsing

### Problem

While trying to browse files for recovery, the folder will not expand to browse the files

### Action

This happens if you have been idle on the browse screen for 10 minutes or more because the Mount Proxy Agent shuts down.

Click **“Cancel”** and then **“Browse”** to browse and expand folders.

## Expanding a partition for browsing throws an error

### Problem

While trying to expand the partition, the following error is displayed "Error trying to mount the restored disk(s). Exception occurred while mounting the disk"

### Action

There are various causes for this problem. One of them is when you have been idle on the browse screen for 10 minutes or more because the Mount Proxy Agent shuts down.

Click **“Cancel”** and then **“Browse”** to browse and expand partitions.

## vSphere web interface becomes greyed out

### Problem

If you view the Advanced GRE Web Plug-in on a VM and that VM is shut down, then the vSphere web interface can become partially disabled (appearing greyed out). However, the Advanced GRE Web Plug-in does not change its appearance.

### Action

You can do as follows:

- Avoid shutting down a guest host while a user is using the plug-in with that host selected.
- If the web interface surrounding the Advanced GRE Web Plug-In becomes greyed out, select a different VM.

## Error message appears while browsing for LVM disks

### Problem

While browsing for LVM disks, the VMware Advanced GRE Web Plug-in displays the following error message "Something went wrong while searching for logical volumes. Check if you

backed up and restored all the disks that are a part of the same volume group and try again".

This could happen for the following reasons:

- If the LVM is created with more than 8 disks and all 8 loop devices are available, then browsing of the partition fails with an error message. This is because the additional loop devices are using all the disks that are part of the LVM.
- If the LVM is created with X number of disks and the count of available loop devices is less than the count of LVM disks, then browsing of the partition fails with an error message. This is also because the additional loop devices are using all the disks that are a part of the LVM.

#### Action

1. It is possible to configure the loop device limit and there are different ways to perform the configuration. For more information, see the following articles on changing the number of loop device support by the loop device module. <http://www.tldp.org/HOWTO/CDServer-HOWTO/addloops.html>
2. Retry the Browsing operation.

## Error message appears when registering the Advanced GRE Web Plug-in

#### Problem

While importing a vCenter and registering the Advanced GRE Web Plug-in, the following error message appears "Script failed: Cannot get information from remote host".

#### Action

This error occurs when all the mount proxies have not been upgraded to the latest Data Protector 9.07 patch. Upgrade all of your mount proxies and you will be able to import the vCenter Successfully.

## The message "VIX API is not installed" re-appears although VIX API is installed

#### Problem

On seeing an error message `VIX API is not installed` during a recovery operation, while using the VMware GRE Web Client, you proceed to install the VIX API. However, the same message `VIX API is not installed` appears even after installing the VIX API.

#### Action

This error message may appear if the GRE agent is running during the installation process of VIX API. After the agent exits, you are prompted with the message `VIX installed`.

## Shared folders/directories created on Media Agent host system are not removed

### Problem

The shared folders/directories created on Media Agent host system as part of cached (Smart Cache device backups) request creation process are not removed if the request is not browsed / recovered once before request gets expired.

### Action

Perform the following manual steps to remove the shared folders/directories on the Media Agent host.

In the Windows environment

**Privileges:** The user should be the Local Administrator of the Media Agent system.

Complete the following steps for removing a share:

1. Select the Share folder.
2. Right-click and select properties.
3. In the Properties tab select the "Sharing" tab and uncheck the check box "share this folder" and then click **Apply** button.
4. Close the Properties dialog box.

In the Linux environment:

**Privileges:** The user should be a root user.

Complete the following steps for removing a share:

1. Make a note of the shared folder name for the non-browsed request by selecting the request and getting the session report. The session report contains the shared folder name.
2. Login to the Media Agent host system and go to file `/etc/samba/smb.conf`
3. In the `smb.conf` file check for the entry that matches the shared folder name.
4. The shared folder entries format is as follows:  

```
[dp_share_12435]
comment = dp share
path = /blob_store/blobShare/12435
writeable = yes
valid users = dp_user2
create mask = 0755
```
5. Remove the matched entry from the `smb.conf` file.
6. Execute the command "`killall -HUP smbd`" at the command prompt to reload the configuration by the Samba daemon.

## **While browsing a Smart Cache in the Advanced GRE Web Plug-in you may see mount errors on agent time-out.**

### **Problem**

This may happen when you browse the disks but do not initiate a recovery operation. You will not be able to browse the same disk again until all the GRE agent processes are stopped. However, it is not recommended to stop the processes manually, as the agent could be running for a different vCenter and might also be running for the GRE Web Plug-in.

### **Action**

Wait for the GRE agent processes to exit gracefully and try browsing again. This may take around 15 minutes.

## **VEPA backup to a Smart Cache fails on a Windows 2008 system.**

### **Problem**

This could happen if the size of the VM disk is more than 16TB. The backup fails because the Windows operating system is unable to handle this size. The size limitation is documented by Microsoft - <https://technet.microsoft.com/en-us/library/cc938937.aspx>

### **Action**

VEPA backups to the Smart Cache devices created on Windows 2012 works as expected and this is because Windows 2012 is able to handle large size of files.

## **Browse and recovery problems with folders containing special characters**

### **Problem**

#### **In the Advanced GRE Web Plug-in:**

Browsing folders with multi-byte characters in their names not possible. Browsing folders with multi-byte characters does not return the contents.

### **Action**

Although, it is not possible to browse the folders, if selected for recovery, the folder may be recovered successfully.

### **Problem**

#### **In the Advanced GRE Web Plug-in and the GRE Web Plug-in:**

Recovery of folders or files with special characters in their names is not supported on Linux

It is not possible to recover folders or files with the following special characters. You will see “Failed to copy” error in the session report.

- “\” (backslash):
- “” (grave accent)
- “\” (backslash):

#### **Action**

This can be resolved by using the DP GUI to recover the entire VM instead of using GRE for recovering this problem.

## **Unable to browse the disk**

#### **Problem**

While browsing the disk, the following error message is displayed

```
Discovery of the newly presented replica disk(s) on the mount proxy host <mount proxy hostname> is still in progress.
```

Retry the operation after sometime. This could happen when the mount proxy host system takes more time to scan the newly presented replica disk(s).

Retry the operation after sometime.

#### **Action**

This could be because of the following:

1. Multi-path service is not running on the mount proxy system, hence the presented replica is not identified by the mount proxy operating system.
2. The mount proxy operating system is taking more time in identifying the presented replica.
3. The mount proxy operating system is not identifying the presented replica. Although, multi-path service is running.

For all the above mentioned, check to see if there are any problems on the operating system and re-try the operation.

## **Unable to view existing requests in Recover Files page of GRE Web Plug-in**

#### **Problem**

After upgrading from Data Protector 8.1x to 9.x, there may be occasions where you are unable to view the existing requests in the Recover Files page of the GRE Web Plug-in. However, you can see the requests in the Monitor Request Page and the restored disks on the related Mount Proxy.

### Action

You can cleanup the existing requests and related restore disks from the associated mount proxy manually, and you can also try to create new requests for recovering the files.

## VMware vSphere Web Client hangs

### Problem

In the VMware vSphere Web Client, when you click the HPE Data Protector tab and select the Cell Manager, the web GUI hangs.

### Action

Ensure that encrypted control communication is configured as described in the [Configuring encrypted control communication](#) and restart the VMware vSphere Web Client service on the vCenter Server system.

For example, on a UNIX VMware vCenter Server system, run:

```
service vsphere-client restart
```

## Error message appears while browsing for LVM disks on SLES 12 mount proxy host

### Problem

While browsing for LVM disks on SLES 12 mount proxy host, the agent fails with the following error message:

```
"Something went wrong while searching for logical volumes. Check that you backed up and restored all disks that are part of same volume group and try again."
```

This problem in SLES 12 is caused by an issue in the `lvscan` output.

### Action

To get the `lvscan` command output, set the following line in the `/etc/lvm/lvm.conf` file:

```
log {  
...  
silent = 0  
...  
}
```

## The VMware GRE session of large volumes from Smart Cache devices may fail

### Problem

Granular recovery of large volumes from the Smart Cache device may fail when the Smart Cache device is hosted on the Windows 2008/2008 R2 server. This failure may be due to memory fragmentation issues in the operating system.

### Action

Use Windows 2012 R2 servers for hosting the Smart Cache device, and then perform backup and granular recovery operations.

## Recovery fails on Virtual Machine

### Problem

Recovery of files or folder on target virtual machine fails with the following error message:

```
Error while trying to do recovery
```

```
Could not start recovery:
```

```
Details: Cannot access to network share on target VM
```

```
Error info: System Error[2] No such file or directory
```

This occurs when the target virtual machine is not accessible from the mount proxy system.

### Action

Check if the target virtual machine is accessible. Ensure that configured hostname of the target virtual machine is same as DNS of mount proxy systems.

## VMware Granular Recovery Extension intermittently fails to recover files and folders

### Problem

For a cached recovery from StoreOnce Catalyst device, VMware Granular Recovery Extension intermittently fails to recover files and folders from Windows virtual machine while using Linux mount proxy.

### Action

Perform non-cached recovery using Windows mount proxy.

## The Granular Recovery Extension operation to StoreOnce Catalyst fails, when Data Protector process dpfs is not initialized

### Problem

The Data Protector dpfs process fails to initialize during VMware GRE operation for backups to StoreOnce catalyst. The failure is due to fuse library not being initialized. The error message "Files are not available at mount path" is found in the OB2DBG\_\_DBGLOG\_ClientInterface debug log.

### Action

Execute the following `modprobe fuse` command on the mount proxy host:

```
<hostname>/: # modprobe fuse
```

## Backup session performed with "No Logs" option is not eligible for GRE or Live Migrate and Power On from StoreOnce Catalyst

### Problem

The Data Protector backup session performed with "No Logs" option is not eligible for GRE or Live Migrate and Power On from StoreOnce Catalyst. The following error message is displayed during the backup:

```
[Major] From: BSM@hostname.com <VMname> Time: <Timestamp>  
[61:4039] Following error occurred while storing detail catalog  
information for device <Catalyst_device>  
with loaded medium <Catalyst_medium> to Data Protector Internal Database:  
There is no more space available in any of the Detail Catalog directories.  
From this point on, all objects on this medium will have logging switched to "No  
Log".
```

### Action

Create space on the IDB drive on the cell manager and perform a single session copy to another device. Ensure that replication option is not selected when single session copy is being performed to another StoreOnce Catalyst.

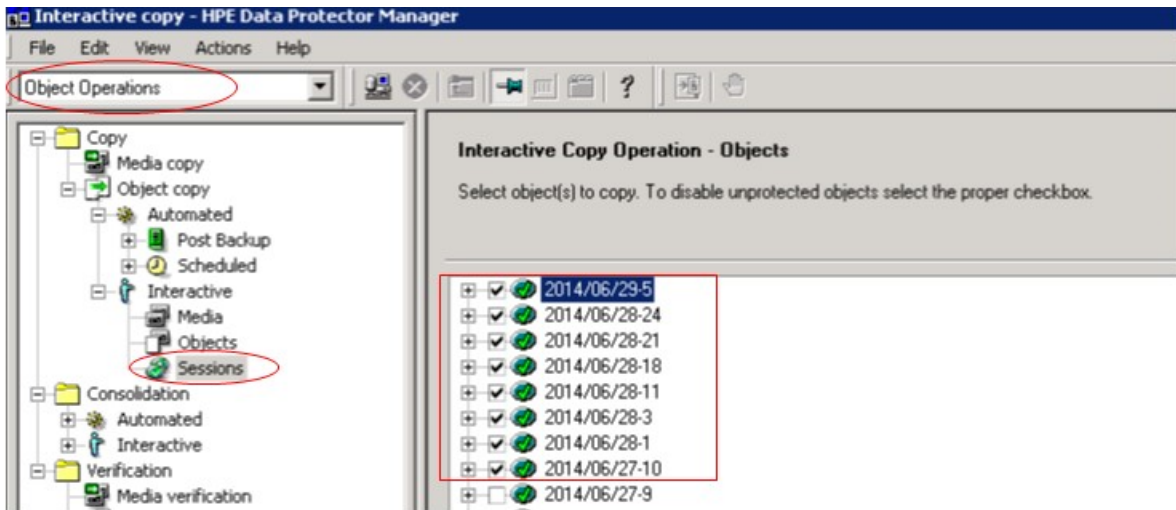

## Data consistency issues during cached GRE operations

### Problem

Data consistency issues during cached GRE operations due to following reasons:

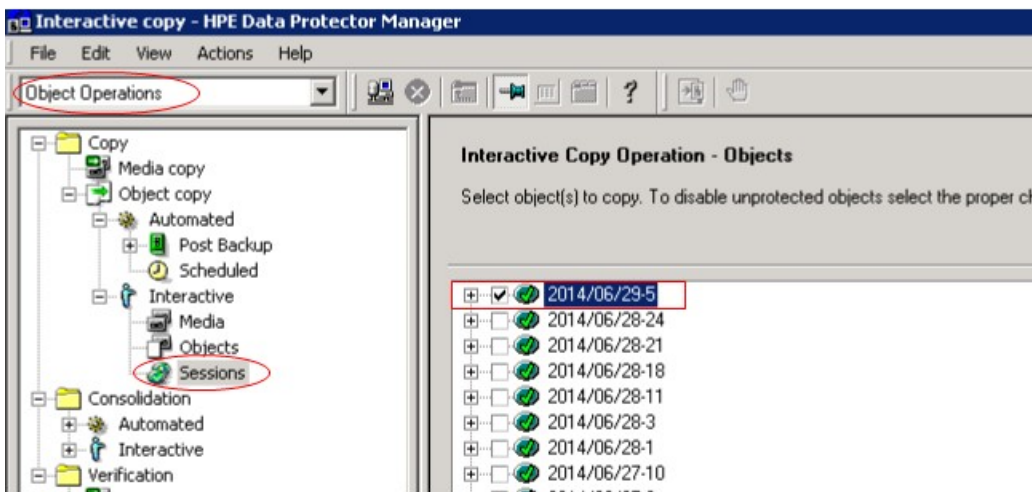

1. User has chosen a session which is a result of object copy.
2. Object copy is performed by aggregating many backup sessions into single object copy session as shown in the figure below:

### Action

Choose individual session while performing object copy as shown in the figure below:

# Documentation set

**Note:** The documentation set available at the HPE support website at <http://support.openview.hp.com/selfsolve/manuals> contains the latest updates and corrections.

You can access the Data Protector documentation set from the following locations:

- Data Protector installation directory.  
**Windows systems:** `Data_Protector_home\docs`  
**UNIX systems:** `/opt/omni/doc/C`
- **Help** menu of the Data Protector GUI.
- HPE Support website at <http://support.openview.hp.com/selfsolve/manuals>

# Documentation map

The following table shows where to find information of different kinds. Squares shaded in gray are a good place to look first.

## Abbreviations

Abbreviations in the documentation map above are explained below. The documentation item titles are all preceded by the words “HPE Data Protector.”

Abbreviation	Documentation item	
Admin	Administrator's Guide	This guide describes administrative tasks in Data Protector.
CLI	Command Line Interface Reference	This guide describes the Data Protector command-line interface, command options, and their usage as well as provides some basic command-line examples.
Concepts	Concepts Guide	This guide describes Data Protector concepts and zero downtime backup (ZDB) concepts and provides background information on how Data Protector works. It is intended to be used with the task-oriented Help.
DR	Disaster Recovery Guide	This guide describes how to plan, prepare for, test, and perform a disaster recovery.
Getting Started	Getting Started Guide	This guide contains information to get you started with using Data Protector. It lists installation prerequisites, provides instructions on installing and configuring a basic backup environment and procedures for performing backup and restore. It also lists resources for further information.
GRE Guide	Granular Recovery Extension User Guide for Microsoft SharePoint Server, Exchange and VMware	This guide describes how to configure and use the Data Protector Granular Recovery Extension for: <ul style="list-style-type: none"> <li>• Microsoft SharePoint Server</li> <li>• Exchange Server</li> <li>• VMware vSphere</li> </ul>
Help	Help	
Install	Installation Guide	This guide describes how to install the

Abbreviation	Documentation item	
		<p>Data Protector software, taking into account the operating system and architecture of your environment. This guide details how to upgrade Data Protector, as well as how to obtain the proper licenses for your environment.</p>
Integration Guide	Integration Guide	<p>This guide describes the integrations of Data Protector with the following applications:</p> <ul style="list-style-type: none"> <li>• <b>MSFT:</b> Microsoft SQL Server, Microsoft SharePoint Server, and Microsoft Exchange Server.</li> <li>• <b>IBM:</b> Informix Server, IBM DB2 UDB, and Lotus Notes/Domino Server.</li> <li>• <b>Oracle/SAP:</b> Oracle Server, SAP R3, SAP MaxDB, and SAP HANA Appliance.</li> <li>• <b>Sybase/NDMP:</b> Sybase and Network Data Management Protocol Server.</li> <li>• <b>Virtual Env:</b> Virtualization environments integration with VMware vSphere, VMware vCloud Director, Microsoft Hyper-V, and Citrix XenServer.</li> </ul>
Integration VSS	Integration Guide for Microsoft Volume Shadow Copy Service	<p>This guide describes the integrations of Data Protector with Microsoft Volume Shadow Copy Service (VSS).</p>
IG IDOL	Integration with Autonomy IDOL Server	<p>This technical white paper describes all aspects of integrating Data Protector with Autonomy IDOL Server: integration concepts, installation and configuration, Data Protector backup image indexing, full content search-based restore, and troubleshooting.</p>
PA	Product Announcements, Software Notes, and References	<p>This guide gives a description of new features of the latest release. It also provides information on installation requirements, required patches, and limitations, as well as known issues and workarounds.</p>

Abbreviation	Documentation item	
Troubleshooting	Troubleshooting Guide	This guide describes how to troubleshoot problems you may encounter when using Data Protector.
ZDB Admin	ZDB Administrator's Guide	This guide describes how to configure and use the integration of Data Protector with HPE P4000 SAN Solutions, HPE P6000 EVA Disk Array Family, HPE P9000 XP Disk Array Family, HPE 3PAR StoreServ Storage, NetApp Storage, and EMC Symmetrix Remote Data Facility and TimeFinder. It is intended for backup administrators or operators. It covers the zero downtime backup, instant recovery, and the restore of filesystems and disk images.
ZDB IG	ZDB Integration Guide	This guide describes how to configure and use Data Protector to perform zero downtime backup, instant recovery, and standard restore of Oracle Server, SAP R/3, Microsoft Exchange Server, Microsoft SQL Server databases, and Virtual Environment for VMware .

## Integrations

### Software Application Integrations

Software application	Guides
Autonomy IDOL Server	IG IDOL
IBM DB2 UDB	Integration Guide
Informix Server	Integration Guide
Lotus Notes/Domino Server	Integration Guide
Microsoft Exchange Server	Integration Guide, ZDB IG, GRE Guide
Microsoft Hyper-V	Integration Guide

Software application	Guides
Microsoft SharePoint Server	Integration Guide, ZDB IG, GRE Guide
Microsoft SQL Server	Integration Guide, ZDB IG
Microsoft Volume Shadow Copy Service (VSS)	Integration VSS
Network Data Management Protocol (NDMP) Server	Integration Guide
Oracle Server	Integration Guide, ZDB IG
