Documentation Updates

The title page of this document contains the following identifying information:

- Software Version number, which indicates the software version.
- Document Release Date, which changes each time the document is updated.
- Software Release Date, which indicates the release date of this version of the software.

To check for recent updates or to verify that you are using the most recent edition of a document, go to: <https://softwaresupport.hp.com/>.

This site requires that you register for an HP Passport and to sign in. To register for an HP Passport ID, click **Register** on the HP Support site or click **Create an Account** on the HP Passport login page.

You will also receive updated or new editions if you subscribe to the appropriate product support service. Contact your HP sales representative for details.

Support

Visit the HP Software Support site at: <https://softwaresupport.hp.com>.

This website provides contact information and details about the products, services, and support that HP Software offers.

HP Software online support provides customer self-solve capabilities. It provides a fast and efficient way to access interactive technical support tools needed to manage your business. As a valued support customer, you can benefit by using the support website to:

- Search for knowledge documents of interest
- Submit and track support cases and enhancement requests
- Download software patches
- Manage support contracts
- Look up HP support contacts
- Review information about available services
- Enter into discussions with other software customers
- Research and register for software training

Most of the support areas require that you register as an HP Passport user and to sign in. Many also require a support contract. To register for an HP Passport ID, click **Register** on the HP Support site or click **Create an Account** on the HP Passport login page.

To find more information about access levels, go to: <https://softwaresupport.hp.com/web/softwaresupport/access-levels>.

HPSW Solutions Catalog accesses the HPSW Integrations and Solutions Catalog portal website. This site enables you to explore HP Product Solutions to meet your business needs, includes a full list of Integrations between HP Products, as well as a listing of ITIL Processes. The URL for this website is <https://softwaresupport.hp.com/group/softwaresupport/search-result/-/facetsearch/document/KM01702710>.

About this PDF Version of Online Help

This document is a PDF version of the online help. This PDF file is provided so you can easily print multiple topics from the help information or read the online help in PDF format. Because this content was originally created to be viewed as online help in a web browser, some topics may not be formatted properly. Some interactive topics may not be present in this PDF version. Those topics can be successfully printed from within the online help.

Send Documentation Feedback	100

Wizards Overview

Wizards provide a powerful way to gather user input and help your users quickly and efficiently accomplish many different tasks within Service Manager. The Service Manager applications include many out-of-box wizards, and the Service Manager tailoring tools include a Wizard creation tool that enables you to design and build your own custom wizards that can be called from the various Service Manager applications and modules.

What this document covers

This document describes the Wizard tool that you use to create custom wizards, and defines and describes each of the fields the tool includes. A detailed example walks you through all of the steps involved in planning and building a sample wizard that creates a new Service Level Agreement. Troubleshooting information and common errors are also explained.

Prerequisites

Using the Wizard tool requires a solid understanding of the following areas, which are covered in other parts of the Service Manager tailoring documentation:

- Designing and creating forms
- Using the syntax of the Service Manager system language
- Performing traces for debugging purposes
- Creating processes and using the Document Engine

About creating a wizard

The Wizard tool enables implementers and administrators to add wizards within Service Manager that assist users with certain tasks, such as adding contacts to a database, escalating a Service Desk record to the applicable Service Manager module, and creating a new configuration item type for Configuration Management.

Functionality in a wizard record can include any or all of the following functionality:

- Creating records
- Selecting records from a database
- Modifying the current record
- Executing expressions (RAD or JavaScript), processes, and format control
- Asking for user input
- Stacking wizards to run in succession

You may find it helpful to review the embedded, out-of-box wizards. These wizards offer a variety of functionality, such as:

- Create a User (the User Quick Add Utility)
- Escalate an Interaction
- Reject a Change
- Add a CI Type
- Add a Contract

You can view these wizards by clicking **Tailoring > Wizards**, and then clicking the **Search** button.

In addition to simplifying repetitive user tasks, Wizards are very useful for processes that require the user to supply prerequisite information. For example, during the interaction creation cycle you could present a wizard panel flow for the operator to enter data. Based on how the caller replies to questions regarding the problem, the wizard determines which panels the operator sees next. While the wizard is executing, the operator-entered data may be accumulated in a file variable that is returned to the calling application when the wizard is complete.

The wizard can display a form and execute a Format Control record or process. The instructions in the Format Control record where there is a condition on "initial" that evaluates to true will be executed before the form opens. The instructions where there is a condition on "add" that evaluates to true will be executed after the user clicks OK.

Wizards are also very helpful when multiple complex decisions must be made in order to reach a conclusion. For example, Change Management approval requirement conditions are normally based on the data contents of one field in the change record. An example of such a condition is `risk.assessment in $L.file="1."` However, there may be circumstances where the approval requirement condition is based on the values of several different fields. For instance, there may be

three fields that affect the approval requirements: division, area, and department. Hard coding all the possible combinations of these field values into condition statements requires a great deal of work and would be difficult to maintain. You can define these conditions in wizard records that do not display forms but that allow you to call a subroutine or execute standard Service Manager processing statements (similar to Format Control calculation statements). These options allow for the manipulation of record data. At runtime, the wizard acts as a decision tree that results in significant processing reductions compared to that involved in the original method of coding.

Wizard flow

Wizard flow defines the order in which wizard panels execute. Wizard panels can move in a straight line from start to finish, or branch into several different process flows.

The more complex wizard flows use condition statements that must evaluate to true before certain wizard panels can execute. If none of the specified conditions evaluate to true, the wizard flow is considered complete, and control passes back to the calling application.

It is very helpful to develop a map of the entire flow showing the name of the form (if any) displayed by each wizard panel and the conditions controlling the flow from panel to panel. You can follow the map throughout the wizard creation process to avoid simple errors that could prevent your wizard from operating properly.

Wizards versus scripts

Service Manager wizards have much in common with the Service Manager scripts utility, a legacy tool that has been part of the system tailoring utilities for many releases. Wizards go beyond scripting, enabling much greater functionality and flexibility.

A major advantage of wizards over scripts is security. Wizards are more robust and ensure data integrity, which scripts cannot do.

Unlike scripts, wizards allow you to specify the format control and display screen; you are not limited to the format control for a particular form, or to a particular display screen.

In addition, wizards themselves can call Format Control records and processes. Wizards do not allow direct calls to RAD applications.

Using the Wizard Tool

Before beginning to create a wizard, you should have a basic plan for the wizard flow, including the function that each wizard panel must perform. This requirement is demonstrated for the example of [planning the SLA wizard panels](#) for a new SLA wizard.

When you are ready to create the wizard, you use the Wizard tool to create each successive panel of the complete wizard. Generally each panel represents a screen or step of the wizard that the end user will see, although some panels are not visible to the user and instead perform background activities, such as calling a Document Engine process.

To access the Wizard tool, click **Tailoring > Wizards** or type `wizards` in the Service Manager command line field.

The Wizard tool displays ten tabs:

- **Wizard Info**
- **File Selection**
- **Usage**
- **Actions**
- **Messaging**
- **Variables**
- **Next Wizard**
- **Comments**
- **Cancel Expressions**
- **Previous Wizard** (only visible after you click **Add**)

Wizard order of execution

When a wizard is run, it executes in the order the tabs are displayed in the wizard tool interface (Wizard Info, File Selection, Usage, and so on.)

The diagram labeled Order of Execution of Wizard Tabs illustrates this order. On the Usage tab, the developer determines whether the wizard panel is displayed to the end user. If the panel is displayed, the order of execution then depends on which button the end user clicks, Next, Previous, Cancel, or Finish, as indicated in the diagram.

If the end user clicks the Previous button, the previous wizard panel is displayed, or some other panel as set by the developer using the Previous Wizard tab in the wizard tool.

The Finish button is intended to be used at the end of the workflow. If the user clicks it in the middle of the workflow, the wizard will proceed through the rest of the sequential wizard panels without prompting the user for further input.

The Comments tab is used for internal development comments, and has no effect on the wizard processing flow.

Within the File Selection tab, the Initial Expressions and Javascript evaluate *after* the **Select \$L.file by** tab. This means that you cannot populate a query variable in Initial Expressions and then use it in "Select \$L.file by."

About variables

It is best to use local variables in a wizard in order to eliminate the chance of a variable collision between threads (or even in the same thread if the wizard calls an external application). However, variables local to the wizard application cannot be used by the display application or in Process records called by the wizard.

Specifying a local variable as a wizard variable increases the scope of the variable to include the display application and called Processes. The variable will automatically be cleaned up by the server when the entire wizard flow is complete, so there is no danger of namespace collisions with variables from other threads or processes.

Variables to avoid using in wizards

When creating a wizard, you should not use local variables that are used by the **wizard.run** RAD application. Using those variables could cause errors and unexpected results.

The variables to avoid using when creating a wizard are listed below.

\$L.action	\$L.action.file	\$L.action.file.save
\$L.action.save	\$L.addition	\$L.allow.finish

\$L.allow.skip	\$L.base.format	\$L.bitmap
\$L.category	\$L.disable.next	\$L.disable.next.previous
\$L.disable.previous	\$L.display.screen	\$L.ds.i
\$L.ds.junk	\$L.ds.nme	\$L.ds.var
\$L.env	\$L.eval	\$L.exit
\$L.fc	\$L.field.line.is	\$L.field.name.is
\$L.file	\$L.file.save	\$L.filename
\$L.finish	\$L.first.parent	\$L.format
\$L.format.name	\$L.gen.ms	\$L.i
\$L.link	\$L.list.field.name	\$L.lng
\$L.main.title	\$L.messages	\$L.mode
\$L.ms	\$L.msg	\$L.msg.cond
\$L.msg.lvl	\$L.msg.type	\$L.mult.sub
\$L.next.wizard	\$L.no.recs.msg	\$L.object
\$L.object.type	\$L.old.format.name	\$L.old.subformat
\$L.option	\$L.override.link	\$L.par.lng
\$L.parent	\$L.parent.file	\$L.parent.id
\$L.parent.object	\$L.pass.names	\$L.pass.values
\$L.passed.file	\$L.phase	\$L.prev.wizard
\$L.prompt	\$L.qbe	\$L.qbe.format
\$L.same	\$L.save.name	\$L.selected
\$L.selection	\$L.selection.filename	\$L.selection.save
\$L.selection.sort	\$L.selection.sql	\$L.sql
\$L.start	\$L.sub.format	\$L.title
\$L.var	\$L.window.title	\$L.wizard
\$L.wizard.bitmap	\$L.wizard.error.msg	\$L.wizard.format

\$L.wizard.name	\$L.wizard.names	\$L.wizard.prompt
\$L.wizard.sql	\$L.wizard.title	\$L.wizard.values
\$L.x	\$exit	\$normal
\$error		

Wizard Info tab field definitions

Use this tab to enter basic information such as the wizard name, description, window title, and images to be included on the panels displayed to the end user.

Field	Description
Wizard Name <i>name</i>	<p>This field forms the unique key for the wizard in the wizard dbdict. Enter a brief descriptive name for the wizard as the unique identifier for this wizard record. As a best practice, include the table (or module) for the wizard, the action the wizard panel performs, and other detail such as whether the wizard is the Start Node. For example, your first wizard panel name for creating a wizard panel for SLA could be something like "SLA Create 1 - Start - Type."</p> <p>This is a required field.</p>
Start Node? <i>start</i>	<p>Selecting this checkbox (setting it to true), indicates that this is the first in a series of wizard panels. When a wizard set as the Start Node also requests user input, the Previous button is automatically disabled when the wizard panel is displayed to the user.</p> <p>Note: If the Start Node wizard is not displayed to the user, be sure to disable the Previous button on the first wizard panel that is displayed.</p>
Brief Description <i>brief.description</i>	<p>Enter a brief, meaningful description of the wizard, including any important identifying information.</p>
Window Title <i>window.title</i>	<p>The window title is displayed on the tab that holds the wizard thread when displaying the wizard panel to the user. This field also takes a message number from the scmessage database. For example, scmsg(18,"wizard").</p> <p>Note: If the wizard you are creating will be localized (translated to another language or languages), then using the scmessage database is the preferred</p>

Field	Description
	method.
Title <i>title</i>	The title of the wizard entered in this field appears in bold in the upper left of the wizard panel when displayed. The title can be entered as a message number from the scmessage database such as scmsg(18,"wizard"). Enter a title that makes indicates the purpose of the panel to the user, such as "Create SLA." If more detail is needed, you can enter something like "Create SLA - Enter Description."
Prompt <i>prompt</i>	Enter a prompt that instructs the end user if this is a wizard panels that will be displayed to the user. HP Service Manager displays this information in the center of the panel, between the title and the wizard subformat, to give the user more detailed instructions on what kind of information should be entered in the panel. The prompt should be in large type. Note: Localizable messages, such as scmsg(18,"wizard"), can be used for the titles and prompt rather than hard-coding the wizard with text. This allows for localized languages in a multi-lingual environment.
Bitmap <i>bitmap</i>	The image to display on the left side of the wizard panel. The default image is located in the Service Manager Install Directory at: <code>Client\plugins\com.hp.ov.sm.client.common_<SM version and build number>\src\resources\icons\obj16\wizard<1,2,3>.gif</code> If you want to use a different image, add it to the installation path above and enter the image file name in this field.
Global Lists <i>global.list</i>	Click Fill to select the global lists to be built or updated so that they are available when the wizard is run.

File Selection tab field definitions

Use this tab to designate system language or JavaScript code to be run before file selection and determine the content of \$L.file. The tab includes three subtabs, described below. The **Select \$L.file by** subtab includes four main options, listed from top to bottom as they appear on the screen.

Field	Description
Initial Expressions	Enter expressions using system language syntax that will be evaluated after

Field	Description
subtab <i>init.expressions</i>	the \$L.file is initialized. Use these expressions to initialize variables.
JavaScript subtab <i>javascript.init</i>	Enter the JavaScript code that will run after the \$L.file is initialized. Use this section to initialize variables or select values from related tables.
Select \$L.file by subtab	You must choose one of the four main options listed below to designate how the wizard will select the \$L.file variable.
No \$L.file (use typecheck) <i>file.selection</i>	<p>This option means that the wizard should not expect a file variable to be passed in from wherever the wizard is called; in fact, if one is passed in, it will be ignored. Instead it creates \$L.file by initializing it as a record in the "typecheck" table, which is an internal table that contains fields corresponding to different field types supported by the system.</p> <p>This is often used in simple wizards that require only a small amount of input that does not need to be saved into the database.</p>
\$L.file passed in <i>file.selection</i>	Selecting this option indicates that the file variable (\$L.file) was passed into this wizard as a parameter from the calling application or wizard. If a wizard is called as a next wizard, the file variable is automatically passed on. This option should be selected if you plan to continue to work on the current record stored in \$L.file.
Create a record <i>file.selection</i>	Selecting this option indicates that the wizard will create a new record. You must enter or select the dbdict name in the record of type field. This initializes \$L.file with the structure of the record from the table selected in the "of type" option.
of type (for Create a record) <i>create.record.filename</i>	Click Fill to select the dbdict that defines the record to be created.
Select records <i>file.selection</i>	Select this option to use a query statement to select one or many records.
of type (for Select records) <i>select.record.filename</i>	This field determines the record type for a query. Enter the dbdict name of the table from which the records should be selected, such as location. Click Fill to select a name from a list of all dbdict names.
using query <i>select.query</i>	Enter a query, using system language syntax, to search for records that will be used to select records. For example:

Field	Description
	<p>"<code>agreement.id="+\$G.new.sla</code></p> <p>Note: The quotes (") are required.</p>
Resolve Variables <i>resolve.variables</i>	Select this box (set to true) to ensure that any variables entered in the Select Records field are evaluated before running the query.
No Records Message <i>select.no.records</i>	<p>The text to display to the user if the query returns no records. This field also takes a message number from the message database.</p> <p>For example: <code>scmsg(111, "wizard")</code></p>

Usage tab field definitions

Use this tab to set wizard usage options, such as whether and which subformat will be displayed to the user and which buttons will be available on the panel displayed.

Field	Description
Wizard Usage section	Determines the action that HP Service Manager should take when the wizard is run. You must select one of the five main options presented on the screen.
Select one record from list <i>wizard.type</i>	Choose from the Selection Criteria listed below.
Selection Criteria	When you choose to Select one record from list , selecting one of the following options allows you to select a record from a list. The list is formed based on the options selected.
Use \$L.file as \$L.selection <i>use.file.as.selection</i>	This option uses the \$L.file variable to form the list of records where the selection is to be performed.
Query for records <i>query.for.records</i>	This option allows you to specify a query to form the list of records. The fields that are needed for the query are noted below.
of type <i>query.for.records.filename</i>	Enter the name of the table (dbdict name) that the query should run against. Check that the dbdict for field names is valid for the query.
using query	This option is used in conjunction with the options "Query for Records"

Field	Description
<i>query.for.records.query</i>	and "of type." Enter the query using Service Manager system language syntax.
sort by <i>query.for.records.sort</i>	This option allows you to present the list, sorted in order, based on the fields specified in this option. Enter field names that are valid for the selected dbdict and sorted in ascending order.
If no records <i>query.select.no.records</i>	This option allows you to specify an action if there are no records on the list. The actions are as follows: return: Returns to the previous wizard panel if there is one, or to the place from which the wizard was called (if this is the first panel). continue: Shows the empty list and allows you to continue. skip display: Skips the wizard panel and goes to the following panel, if applicable.
No records message <i>query.no.records.msg</i>	This option allows you to display a message to present if there are no records in the list. An scmessage record can be used to construct the message.
If one record <i>query.select.one.record</i>	This option allows you to specify an action if there is just one record in the list. The one record can be displayed in a list, or it can be used as the current file variable without being presented to the user for selection.
Allow "Skip" option? <i>allow.skip</i>	If selected (set to true), enables users to skip the panel.
Request user input <i>wizard.type</i>	This field indicates that the user will be prompted for information. When this option is selected, the Sub Format to display entry becomes required and a prompt with instructions needs to be entered in the Wizard Info tab.
Skip Display <i>wizard.type</i>	Skip Display should be used when the current wizard manipulates the current record without the need for user input. Typically, a wizard that is not displayed to the user is part of a complex wizard workflow.
Cancel Immediately <i>wizard.type</i>	This option is used to cancel a process immediately if a wizard is started by a user type who is not intended to use the wizard. For example: A company creates a wizard to gather information from top-level management customers. Let us say that a user who does not fit the criteria chooses to start the wizard and make his way through the wizard panels. The Cancel Immediately option causes the process to immediately end when it becomes clear that the information does not

Field	Description
	need to be gathered from that user.
Select multiple records from list <i>wizard.type</i>	Selecting this option displays a list and allows the user to select multiple records from the list. The list is formed based on the options selected in the "Selection Criteria" section.
Multiple Selection field <i>mult.field.name</i>	This option determines which field in the list becomes available for the user to select multiple records from.
Sub Format to Display <i>sub.format</i>	Enter the name of the format for user input to display within the wizard format.
Main Format (Defaults to Medium) <i>form.Name</i>	<p>The wizard creation tool offers several format choices that effect the size of the wizard and the placement of buttons. HP Service Manager offers the following wizard format options. If no format is selected, the default is "Medium."</p> <p>Small (wizard.small) - This wizard offers the least amount of space for text and options, but also requires the least amount of screen space. This wizard is ideal for clients running in low resolution environments. It allows only a small space for the subformat, so the subformats need to be kept small. Buttons available are Previous, Next, Finish, and Cancel, and placement is horizontally-aligned along the bottom.</p> <p>Medium (wizard) - This wizard offers sufficient space for most wizard tasks. Buttons available are Previous, Next, Finish, and Cancel, and placement is horizontally-aligned along the bottom.</p> <p>Large (wizard.large) - This wizard offers the most amount of space for text and options, but also requires the most amount of screen space. This wizard is ideal for clients running with high screen resoluitions. It offers the most amount of space for the subformat to display, allowing for more complex subforms. Buttons available are Previous, Next, Finish, and Cancel, and placement is horizontally-aligned along the bottom.</p> <p>OK Only - Small (wizard.okonly.small) - Uses the small wizard size and limits the buttons available to navigate through the task. Buttons available are OK and Cancel, and placement is horizontally-aligned along the bottom.</p> <p>OK Only - Medium (wizard.okonly) - Uses the medium wizard size and limits the buttons available to navigate through the task. Buttons available are OK and Cancel, and placement is horizontally-aligned along the bottom.</p>

Field	Description
	<p>Buttons on Top (wizard.buttonsOnTop) - Uses the medium wizard size and places the buttons along the top of the wizard. Buttons available are Previous, Next, Finish, and Cancel, and placement is horizontally-aligned along the top.</p> <p>Buttons on Side (wizard.buttonsOnSide) - Uses the medium wizard size and places the buttons along the right edge of the wizard. Buttons available are Previous, Next, and Finish, and placement is vertically-aligned along the right side.</p>
<p>Display Screen (Defaults to wizard.display)</p> <p><i>display.screen</i></p>	<p>Enter a display screen, if you want to customize the button and menu options available within the wizard. The default display screen is <code>wizard.display</code>.</p>
<p>Activate "Finish" option?</p> <p><i>allow.finish</i></p>	<p>Use this option for the final wizard in the series. Selecting this check box makes a Finish button appear on the wizard panel.</p> <div style="background-color: #f0f0f0; padding: 10px; margin-top: 10px;"> <p>Note: It is possible to have the Finish button available prior to the last wizard in the workflow, if the wizard panels displayed after this wizard only provide optional information. The Finish button cannot be activated before all required information can be collected from the user.</p> </div>
<p>Turn off Next and Previous buttons?</p> <p><i>disable.next.previous</i></p>	<p>Selecting this check box makes the Next and Previous buttons unavailable in the wizard, so the user cannot click "Next" or "Previous" to move forward or backward in the wizard.</p> <div style="background-color: #f0f0f0; padding: 10px; margin-top: 10px;"> <p>Note: This selection should only be made on the very last wizard panel in the workflow. Also, the Finish button needs to be activated if the Next and Previous buttons are disabled.</p> </div>
<p>Turn off Next button only?</p> <p><i>disable.next</i></p>	<p>Selecting this check box makes the Next button unavailable in the wizard, so the user cannot click "Next" to move forward in the wizard.</p>
<p>Turn off Previous button only?</p> <p><i>disable.previous</i></p>	<p>Selecting this check box makes the Previous button unavailable in the wizard, so the user cannot click "Previous" to move backward in the wizard.</p> <div style="background-color: #f0f0f0; padding: 10px; margin-top: 10px;"> <p>Note: This option should be used if the first displayed panel of the wizard is not the Start Node. Selecting Previous in such a case would</p> </div>

Field	Description
	<div style="background-color: #f0f0f0; padding: 5px;"> exit the wizard without going through proper cancel processing. </div>
Use Conditional Previous Exits? <i>previous.cond</i>	When you select this option, the Previous Wizard tab appears on the form. In the Previous Wizard tab, you define the different possible exits when the Previous button is clicked.
Never prompt on cancel?	Determines whether the user is prompted when canceling out of the wizard. The Return prompt can send the user back to the panel.

Actions tab field definitions

Use this tab to set wizard actions, including defining which Process or Format Control will be executed and on which file variable or record they will be performed.

Field	Description
Initial Process <i>initial.process</i>	This option lets you specify a process definition to be executed prior to the actions to be performed. For information on process definitions, see the <i>Document Engine</i> documentation.
Perform Actions On section	<p>You must select one of the three options to specify which record(s) will be affected by the action you are going to perform. The file is either the current file, the whole list selected, or an action to be performed on every single record selected. Actions are defined in the wizard, and define what will happen when a user clicks Next on a wizard.</p> <div style="background-color: #f0f0f0; padding: 10px; margin-top: 10px;"> <p>Note: Depending on what you selected in the File Selection tab, you can choose whether the actions performed when a user clicks Next will be performed on the current file or a record selection. Record selection (<i>\$.selection</i>) must only be chosen if the <i>\$.selection</i> file variable was filled when you chose Select Records on the File Selection tab, and if you chose either "select one" or "select multiple records" from the list on the Usage tab.</p> </div>
Current File (<i>\$.file</i>) <i>perform.action.on</i>	The actions will be performed on the single record represented by the <i>\$.file</i> file variable. The current file may have been passed in, created, or selected with a query returning only a single record.

Field	Description
	<p>Note: The actions defined in the Actions to Perform section apply to the current file selected in the File Selection tab and/or Usage tab.</p>
<p>Selection (\$L.selection) <i>perform.action.on</i></p>	<p>The actions defined in the Actions to Perform section apply to the group of records selected in the File Selection tab.</p>
<p>Each record in selection (\$L.selection) <i>perform.action.on</i></p>	<p>The actions defined in the Actions to Perform block apply to each record selected.</p>
<p>Actions to Perform section</p>	<p>Use the three subtabs in this section to indicate the actions to perform on the selected file.</p>
<p>Expressions subtab <i>expressions</i></p>	<p>Enter any expressions that should be run as part of the wizard after the initial process, before the JavaScript and Format Control (or process). These expressions use Service Manager system language syntax, such as:</p> <pre>name in \$L.file="Test"</pre> <p>These expressions are evaluated before the Reset Current File to Selection action is performed. Therefore, actions performed here should use \$L.selection rather than \$L.file if they are intended to manipulate the user selected record.</p> <p>Note: These expressions can use the record(s) selected, such as storing information in a field.</p>
<p>JavaScript subtab <i>javascript.actions</i></p>	<p>The JavaScript expressions will run as part of the wizard and are executed after the initial process and expressions, but before the Format Control or process entered on the next subtab. These JavaScript language expressions can be used to manipulate the current file variable or initialize variables.</p>
<p>Format Control/Process Name subtab</p>	
<p>Format Control <i>format.control</i></p>	<p>The Format Control record to use. You can enter a Format Control record to execute queries, calculations, validations, or subroutines after running through the expressions and JavaScript, and before calling the process.</p>

Field	Description
of type <i>format.control.type</i>	The Format Control type to use for this wizard to evaluate the applicable conditions, so that Format Control can be executed on the action (Add , Update , or Delete) that is evaluated in the Format Control record.
on bad validation <i>bad.validation.action</i>	When data validation in Format Control fails, choose to return the user to the current wizard panel to enter the correct information, or choose to let the wizard continue to the next panel, ignoring the failed validation. * Return sends the user back to the panel. Should only be used if the user has the opportunity to fix the failed validation. If the wizard does not request information from the user by displaying a subformat to enter information, selecting Return will end up in an infinite loop. * Continue lets the user continue.
Process Name <i>process.name</i>	Enter the name of a process to execute on this wizard panel. For more information, refer to the Document Engine documentation.
Reset Current File to Selections? <i>reset.to.selections</i>	If selected (set to true), replaces the current file variable (\$L.file) with the value selected by the user (\$L.selection). Note: This field depends on the selections in the Usage tab. If "Select one record fromlist" or "Select multiple records from list" are chosen, those options generate \$L.selection.
Restart Panel if <i>restart.condition</i>	Under some circumstances it may be necessary to run the wizard panel again. For example, an expected field may not have been filled in correctly, or an error code may have been returned from Format Control or the process. Enter a condition that evaluates to true or false to determine if this panel needs to be rerun.
Display Record(s) when complete? <i>display.when.complete</i>	Determines whether to display the record to the user when the wizard completes. If the condition is true, HP Service Manager displays the record to the user when complete. If the condition is false, no record is displayed.
Mode <i>display.mode</i>	This field determines how a record will be displayed to the user. * Browse: (This is the default.) Browse mode does not have any buttons to store a modified record. * Add: The Add button becomes available. * Update: The Save button becomes available.
Return Current File to	This option returns the current record to the application that called the

Field	Description
calling application? <i>reset.current.file</i>	wizard for further processing.

Messaging tab field definitions

Use this tab to set any messages to be displayed to the end user when specified conditions occur.

Field	Description
Message <i>message</i>	Message to be displayed when a certain condition occurs. This field will also take a message number from the scmessage database. For example: <code>scmsg(106, "fc")</code> .
Condition <i>message.cond</i>	Enter a condition for the message that evaluates to true or false to determine if the message should be issued. For example: <code>not nullsub(\$L.finish, false)</code>
Type <i>message.type</i>	Select the format of the message to display to users (pop-up or on- screen). The default is on-screen.
Level <i>message.level</i>	Select the level of severity of the message: *Info: Informational only (<i>default</i>) *Action needed *Error message: The error message issued to the user when a serious error is encountered.

Variables tab field definitions

Use this tab to document the variables used in the wizard workflow.

Field	Description
Wizard variables <i>wizard.variables</i>	Use this tab to define variables for use within the wizard. Variables can be passed to applications or formats being created by the wizard, but must be assigned. For example, a variable such as <code>\$L.return.action</code> must be defined here, if it will be used within the wizard. The data type and value of a variable can be different at different times, and can have a primitive or compound data type as its value.

Field	Description
	Service Manager contains three types of variables: 1) local, 2) global, and 3) thread. Local variables begin with \$L and persist only within the currently executing RAD application. The server automatically cleans up local variables when it exits a RAD application.

Next Wizard tab field definitions

Use this tab to specify the next wizard panel (if any) to be called.

Field	Description
Wizard Name <i>next.wizard</i>	Name of the next wizard to execute within the workflow (series of wizard panels).
Condition <i>next.wizard.cond</i>	Enter a condition that evaluates to true or false. The next wizard in the workflow is determined by the first condition that evaluates to true, regardless of the conditions that follow (even if they evaluate to true as well). If all conditions evaluate to false, the wizard workflow will exit and finish.

Previous Wizard tab field definitions

This tab is displayed when you check the **Use Conditional Previous Exits?** checkbox in the Usage tab.

Field	Description
Wizard Name <i>prev.wizard</i>	Specify the name of the wizard to which the user should exit.
Condition <i>prev.wizard.cond</i>	Set the condition for when the user should be taken to this previous wizard. The condition must evaluate to true or false.

Comments tab field definitions

Use this tab to enter internal development comments about the wizard. These comments have no effect on the wizard workflow itself.

Field	Description
Comments <i>comments</i>	Enter any developer comments concerning the wizard here. As a best practice, use the Comments tab to describe details, such as the purpose of the wizard panel, the settings selected to implement that purpose, variables used, wizard workflow, and exit conditions.

Cancel Expressions tab field definitions

Enter system language expressions or JavaScript code that will execute if the end user clicks the Cancel button. This cleans up variables that were used in the wizard to ensure correct behavior the next time the wizard is executed.

Field	Description
Expressions Executed on Cancel subtab <i>cancel.expressions</i>	Enter any expressions that will execute when a user cancels the wizard process. This provides the wizard creator an opportunity to reset values or clean up variables initialized in the wizard.
JavaScript Executed on Cancel subtab <i>javascript.cancel</i>	Enter any JavaScript code that should be used to reset values and clean up variables that were initialized in the wizard.

Calling Wizards

The RAD application in charge of executing wizards is called **wizard.run**. You can call this application from:

- Menus
- Display Options
- Format Control
- Process Records

The sections following this one explain the steps required in calling wizards from these areas.

Wizards themselves can call:

- Format Control records
- Processes
- Other wizards.

Wizards do not allow direct calls to RAD applications.

Warning: It is possible to send a wizard into an infinite loop. For example, this would happen if you called `wizard.run` from a process to execute a wizard that in turn calls the originating process.

Call a wizard from menus

To set up a wizard to be called from menus, follow these steps:

1. Click **Tailoring > Tailoring Tools > Menus**.
2. Select a menu record.
3. Add an option number; a group, if necessary; and a description with the name that you want to display on the menu.
4. Enter `wizard.run` for the application.

5. In the Parameter Name field, specify the name of the parameters to pass to the application. The name of the parameters to pass to the application should be enclosed with quotes "" and curly brackets {}. The available parameters for the wizard.run application are: **file**, **name**, **text**, and **prompt**.
6. In the Parameter Value field, specify the value of the parameter being passed, enclosed with quotes "" and curly brackets {}. For example, {"createUser Pre"}.

Example:

In this example, a wizard is set up to be called from the **SYSTEM ADMINISTRATION** menu through the option **Quick Add Utility**. Once the wizard is set up, the user clicks the following:

System Administration > Ongoing Maintenance > User Quick Add Utility

When the user clicks **User Quick Add Utility** on the menu, a wizard opens with a predefined set of steps that assist the user in populating information and completing the task of adding an operator.

To see how this wizard has been set up to be called from menus, follow these steps:

1. Click **Tailoring > Tailoring Tools > Menus**.
2. Open the SYSTEM ADMINISTRATION menu record.
3. The Description field displays **User Quick Add Utility**.
4. The Application field specifies **wizard.run**, the RAD application called from the menu.
5. The Parameter Name field specifies the name of a single parameter to pass to the menu item. In this example, {"name"} represents the name of the wizard. The name is enclosed with quotes "" and curly brackets {}.
6. The Parameter Value field specifies the value of the parameter being passed. In this example, {"createUser Pre"}. The name is enclosed with quotes "" and curly brackets {}.

Call a wizard from display options

To set up a wizard to be called from display options, follow these steps:

1. Click **Tailoring > Tailoring Tools > Display Options**.
2. Select the display option that you want to use to call a wizard.

3. Select the **Rad** tab.
4. In the RAD Application field, enter the RAD Application **wizard.run**.
5. The Names field specifies the parameters to pass to the RAD application. The available parameters are: file, name, text, and prompt. The **name** parameter is required.
6. The Values field specifies the values of the parameters being passed to the RAD application.
7. Click **Save**.
8. Click **OK**.

Example: Set up a wizard to be called from display options

In this example, a wizard is set up to be called from the display application **wizard.display.kmsearch**, so that when an operator selects the "Search Again" option, the wizard "KM choose shared content" is called.

To set up a wizard to be called from display options, follow these steps:

1. Click **Tailoring > Tailoring Tools > Display Options**.
2. Select the **wizard.display.kmsearch**, Text Option definition 7500.
3. Select the **Rad** tab.
4. In the RAD Application field, enter the RAD Application `wizard.run`.
5. The Names field specifies the parameters to pass to the RAD application. The available parameters are: file, name, text, and prompt. The **name** parameter is required.
6. In this example, the following values are specified for each parameter named.

Name of parameter	Value of the parameter
file	\$L.file
name	KM choose shared content

7. Click **Save**.
8. Click **OK**.

Call a wizard from Format Control

To call a wizard from Format Control, follow these steps:

1. Click **Tailoring > Format Control**.
2. Select the Format Control where you want to call a wizard.
3. Click **Subroutines**.
The Format Control Maintenance - Subroutines form opens.
4. In the Application field, enter the application `wizard.run`.
5. In the Names field, enter the name of the parameter(s) to pass data to the subroutine application (name, file, text, and prompt).
6. In the Values field, enter the parameters to pass to the subroutine application. The type of parameters in this field must match the type of parameters in the Names field.
7. Specify the condition for each parameter. When a condition is set to "true" and a user clicks Save, Format Control runs every section or expression where the Update field is set to true before it updates the record.

Call a wizard from process records

To set up a wizard to be called from process records, follow these steps:

1. Click **Tailoring > Document Engine > Processes**.
2. Select a process record.
3. Select the **RAD** tab.
4. In the RAD Application field, enter the RAD Application `wizard.run` to associate the wizard with this record.
5. In the Condition field, enter the condition associated with the RAD Application field. For example, "true".
6. In the Parameter Names field, enter the parameter names to pass to the RAD application.

7. In the Values field, enter the parameter values to pass to the RAD application.
8. Click **Save**.
9. Click **OK**.

Example:

In this example, a wizard is set up to be called from the add.device Process record. The add.device Process record is opened to evaluate the RAD call.

To set up a wizard to be called from process records, follow these steps:

1. Click **Tailoring > Document Engine > Processes**.
2. Open the **add.device** Process record.
3. Select the **RAD** tab.
4. In the RAD Application field, enter the RAD Application `wizard.run` to associate the wizard with this record.
5. The Condition field contains the name of the parameters to be used (file and name).
6. In the Parameter Names field, enter the parameter names to pass to the RAD application.
7. The Values field specifies the values of the parameters being passed to the RAD application. In this example, the following values are specified for each parameter named.

Name of parameter	Value of the parameter
file	\$L.file
name	"Add Device"

8. Click **Save**.
9. Click **OK**.

Step-by-Step Example of Building a Custom Wizard

In this example, you will create a wizard that defines a new SLA record by prompting the user to enter the necessary data for a new SLA and then saving that data to the database.

Out of box, a Service Manager user creates a new SLA by clicking **Service Level Management > Service Level Agreements > Create New SLA**. The user then fills in the required fields and any relevant optional fields in the Service Level Agreement entry form.

The new wizard will guide users through supplying the necessary SLA record information by presenting a series of wizard panels. When all the information has been supplied by the user, the wizard process saves the SLA record to the database.

Adding Service Level Targets to the SLA

SLAs generally have Service Level Targets (SLTs) associated with them. Service Manager includes two out-of-box wizards for adding SLTs: Response SLT and Availability SLT.

After creating an SLA by filling out the Service Level Agreement form, the user can then go to the SLA record and click the **Add SLT** buttons in the **Response** and **Availability** tabs to launch the out-of-box Add Response and Add Availability SLT wizards. The Create SLA wizard will call the out-of-box Add SLT wizards so that the user can go seamlessly from creating a new SLA to adding any SLTs related to it.

Designing the SLA wizard

It is helpful to design a new wizard by considering the overall process flow that must occur, including both what the end user needs to do, and any background processes that need to take place.

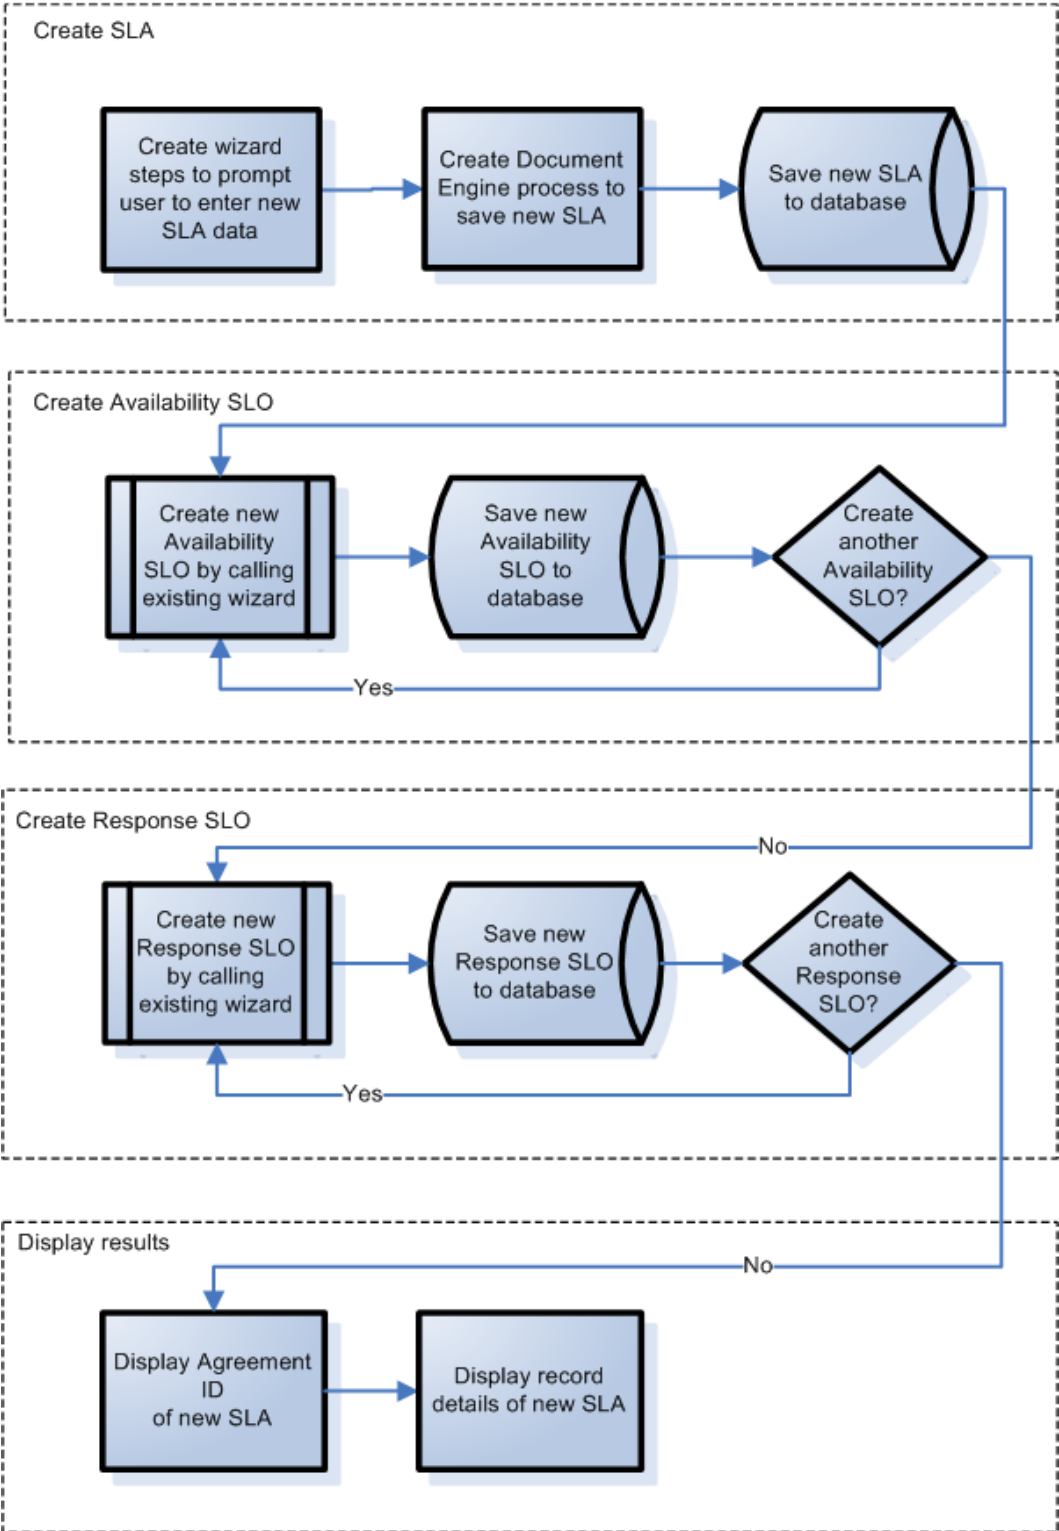

In this case, we will need to create a series of consecutive wizard steps or panels to display to users to prompt them to enter the basic information needed for the new SLA record. When the required information has been gathered, the new SLA record must be saved by a Document Engine process to the database.

The wizard must then ask users if they want to add any availability or response SLTs. If they do, it will call the out-of-box SLT wizards, first for availability SLTs, and then for response SLTs.

Finally the wizard should display the record number and title of the newly-created SLA, and then provide a button for the user to view the record details.

The overall design of the new Create SLA wizard is shown in the following flowchart.

SLA Wizard Design

Planning the SLA wizard panels

In addition to the high-level wizard design, it is helpful to plan the function of each of the wizard panels. The general purpose of the wizard panels will be to prompt the user to enter the required fields for an SLA record:

- SLA type (service or customer)
- Customer
- Title and description
- SLA effective dates

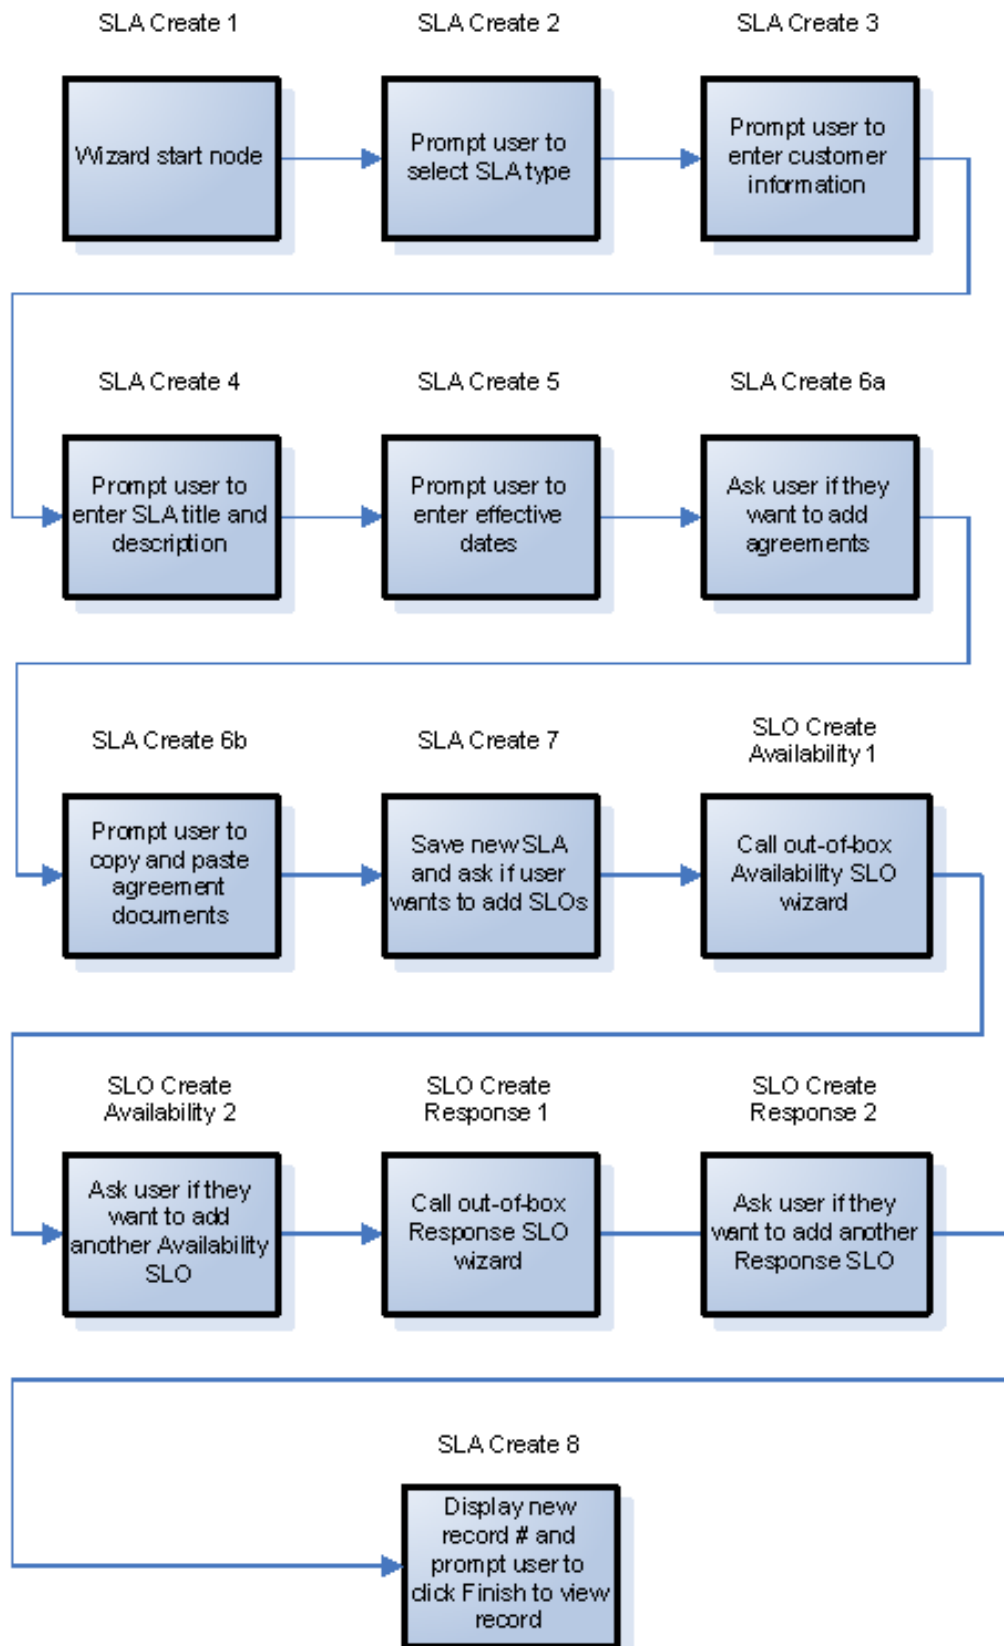

In addition, although it is not required, many users will want to copy and paste from the Agreement documents into the SLA record, so the wizard will also present panels to prompt the user for that information.

The names of the wizard panels will be consecutive (SLA Create 1, SLA Create 2, and so on) so that it is clear that these individual wizard panels connect together to form the Create SLA wizard that will be displayed to the end user.

The flowchart below shows the planned wizard panels and the function that each will perform. Each of the boxes in the flowchart also corresponds to the steps required to build the SLA wizard, described in the [Building the SLA wizard section](#).

SLA Wizard Panel Names and their Associated Functions

Step-by-Step Example of Building a Custom Wizard

Building the SLA wizard

This example describes how to use the Wizard tool to design each panel of the Create SLA wizard.

Most of the panels involve prompting the user to provide information, so they also require us to use the Forms Designer to design the form controls for the subformat that is displayed within the wizard panel.

Each of the overview steps listed below corresponds to a box on the flowchart in the previous section. These steps, along with the specific tasks that need to be done using the Wizard Tool and Forms Designer, are listed below.

["Step 1: Define the start node of the wizard" below](#)

["Step 2: Prompt the user to select SLA type" on page 39](#)

["Step 3: Prompt for customer information" on page 42](#)

["Step 4: Prompt for SLA title and description" on page 48](#)

["Step 5: Prompt for effective dates" on page 52](#)

["Step 6: Ask about agreement documents" on page 56](#)

["Step 7: Prompt to add agreements" on page 61](#)

["Step 8: Save new SLA and prompt for SLTs" on page 65](#)

[" Step 9: Call the Availability SLT wizard" on page 72](#)

["Step 10: Prompt for another Availability SLT" on page 74](#)

["Step 11: Call the Response SLT wizard" on page 78](#)

["Step 12: Prompt for another Response SLT" on page 80](#)

["Step 13: Display new SLA number and title" on page 85](#)

["Step 14: Set menu to call the new SLA wizard" on page 89](#)

Step 1: Define the start node of the wizard

This first task creates the first wizard panel the user sees when executing the Create New SLA wizard. You use the Wizard Tool to define this first wizard panel.

To create a wizard to prompt for SLA type, follow these steps:

1. Click **Tailoring > Wizards**. The Wizard information form opens.
2. Select the **Wizard Info** tab.
3. In the Wizard Name field, type `SLA Create 1`, and then click **Add**.

Caution: If you use an existing SLA record to create a new SLA wizard panel, click **Add** rather than **Save**. If you click **Save**, you will replace the existing record with the new record you are attempting to add.

4. In the **Wizard Info** tab, complete the following fields.

Field	Value
Start Node?	Select this checkbox to set to true , as this wizard is the first in a series of wizard panels.
Brief Description	Type: This wizard will create an SLA record and guide the user through creating associated SLTs.
Window Title	Type: Create New SLA
Title	Type: Create New SLA

5. Select the **File Selection** tab and the **Select \$L.file by** subtab to complete the following fields:

Field	Value
Create a record	Select this option to indicate that the wizard will create a record. You must enter or select the record type in the record "of type" field. This becomes \$L.file.
of type (for Create a record)	Click Fill to select the type of record to be created, and select sla .

6. Select the **Usage** tab and complete the following fields to determine the action that Service

Manager should take when the wizard is run:

Field	Value
Request user input	Select this field to prompt the user for information.
Sub Format to Display	Enter a subformat name of the format to display. Type: sla.create.type

7. Select the **Next Wizard** tab and complete the following fields:

Field	Value
Wizard Name	This is the name of the next wizard in a series of wizards. Type: SLACreate 2
Condition	The condition determines what happens next. In this case, you can enter the next wizard in sequence and an expression that evaluates to "true." Alternatively, you can specify different wizards, based on user actions or selections. Type: true

8. When you are finished, click **Save**.

You have created the first wizard panel. However to improve the appearance and behavior of the panel you will use Forms Designer to create the subformat to display in this wizard panel.

Step 2: Prompt the user to select SLA type

The purpose of this step is to refine the first wizard panel to prompt the user to select the SLA type: Service or Customer.

Use the Forms Designer to design the subformat that is displayed in the wizard panel:

Create New SLA

Select the SLA type. The available types are Service and Customer. A Service SLA is related to the Service CI, and a Customer SLA is related to the specific contact.

SLA Type

< Previous Next > Finish Cancel

For this task, you will use Forms Designer to create the form controls that prompt the user to select the SLA type. These form controls, together with the window title, prompt, buttons, and other choices you made in the wizard record, will be displayed to the end user as the screen shown above.

To create a new form for the SLA type wizard, follow these steps:

1. Start the Forms Designer.
2. In the Form field, type `sla.create.type`.

Best Practice: Because the form name must match the subformat display entry exactly, you can copy the subformat display entry in the Usage tab and paste it into the Form field. This helps avoid spelling errors.

3. Click **New**.
4. Click **No** for Forms wizard.
5. Create the following for this form. When you start to design the new form, make sure the X and Y

coordinates are at 0 (zero).

Property	Value
Wrap Label	
Caption	Type: Select the SLA type. The available types are Service and Customer. A Service SLA is related to the Service CI, and a Customer SLA is related to the specific contract.
Visible	Select.
Label	
Caption	Type: SLA Type :
Visible	Select.
Combo Box	The Combo Box should be place to the right of the Regular label box and contains a list of choices that are associated with the label.
Display List	Type two entries (each with an initial capital letter): <ul style="list-style-type: none"> ◦ Service ◦ Customer
Input	Type: type
Mandatory	Select.
Select Only	Select.
Value List	Type two entries (all lowercase letters): <ul style="list-style-type: none"> ◦ service ◦ customer
Visible	Select.

6. Click **OK** twice to save the new form and exit.

You have completed creating the form for the first panel of the Create New SLA wizard.

Step 3: Prompt for customer information

The purpose of this step is to create the panel prompting the user to enter customer, service contract, and service hours.

Note: You can use the record you just created, SLA Create 1, as a starting point, and revise the fields to reflect the information below. It is very important to remember to click the **Add** button after you start to make changes so that you do not overwrite the SLA Create 1 record.

Perform the following two tasks to design a wizard panel that gathers customer information:

[Create a wizard to gather customer information](#)

[Create a form to gather customer information](#)

Task 1: Create a wizard to gather customer information

For this task, you will create the next wizard panel the users will see, prompting them to enter customer, service contract, and service hours.

To create a wizard to gather customer information, follow these steps:

1. Click **Tailoring > Wizards**. The Wizard information form opens.
2. Select the **Wizard Info** tab.
3. In the Wizard Name field, type `SLA Create 2`, and then click **Add**.

Caution: If you use an existing SLA record to create a new SLA wizard panel, click **Add** rather than **Save**. If you click **Save**, you will replace the existing record with the new record you are attempting to add.

4. In the **Wizard Info** tab, complete the following fields.

Field	Value
Start Node?	Leave this option unchecked.
Brief Description	Type: This wizard panel prompts for the customer name, service contract, and service hours.
Window Title	Type: Create New SLA - Customer Information
Title	Type: Create New SLA - Customer Information

5. Select the **File Selection** tab and the **Select \$.file by** subtab to complete the following field:

Field	Value
\$.file passed in	Select this option to indicate that the \$.file variable should be passed to the wizard from a previous wizard.

6. Select the **Usage** tab and complete the following fields to determine the action that HP Service Manager should take when the wizard is run.
7. Select the **Actions** tab and the **Format Control/Process Name** subtab to define the actions when a user clicks **Next**, **Cancel**, or **Previous** within the wizard. Complete the following field:

Field	Value
Perform Actions On	Here you can specify which record(s) will be affected by the action that is being performed. This can either be the current file, the list selected (as a whole) or an action to be performed on every single record selected. Select Current File (\$.file) .

8. Select the **Next Wizard** tab and complete the following fields:

Field	Value
Wizard Name	This is the name of the next wizard in a series of wizards. Type: SLACreate 3
Condition	The condition determines what happens next. In this case, you entered the next wizard in sequence and an expression that evaluates to "true." Alternatively, you can specify different wizards, based on user actions or selections. Type: true

9. When you are finished, click **Save**.

You have created the customer information wizard panel. Next, you will create the new wizard form in Forms Designer.

Task 2: Create a form to gather customer information

For this task, you will use Forms Designer to create controls that prompt the user to supply basic customer information. These form controls, together with the window title, prompt, buttons, and other choices you made in the wizard record, will be displayed to the end user as the screen shown below.

Create New SLA - Customer Information

Select the Customer:

Select the Service Contract, if available:

Select the Service Hours, if available:

< Previous Next > Finish Cancel

To create a new SLA form to gather customer information, follow these steps:

1. Start the Forms Designer.
2. In the Form field, type `sla.create.customer`.

Best Practice: Because the form name must match the subformat display entry exactly, you can copy the subformat display entry in the Usage tab and paste it into the Form field. This will help you to avoid spelling errors.

3. Click **New**.
4. Click **No** for Forms wizard.
5. Create the following for this form. When you start to design the new form, make sure the X and Y coordinates are at 0 (zero).

Property	Value
Label	
Caption	Type: Select the customer:
Visible	Select.
Comfill	
Combo Button Visible	Select.
Input	customer
Mandatory	Select.
Select Only	Select.
Third Button Visible	Select.
Value List	Type: \$lo.colist
Visible	Select.
Label	
Caption	Type: Select the Service Contract, if available:
Visible	Select.
Comfill	
Combo Button Visible	Select.
Fill Button Visible	Select.
Input	Type: service.contract

Property	Value
Select Only	Select.
Third Button Visible	Select.
Value List Condition	Type: <code>select("contract.id","servicecontract","provider",[customer])</code>
Visible	Select.
Label	
Caption	Type: <code>Select the Service Hours, if available:</code>
Visible	Select.
Comfill	
Combo Button Visible	Select.
Fill Button Visible	Select.
Input	Type: <code>service.hours</code>
Select Only	Select.
Third Button Visible	Select.
Value List	Type: <code>\$G.calendars</code>
Visible	Select.
Display List Condition	<code>select("name","servicecontract","provider",[customer])</code>

6. Click **OK** twice to save the new form and exit.

You have completed creating one of the forms needed for the SLA wizard.

Step 4: Prompt for SLA title and description

The purpose of this step is to create the next wizard step, prompting the user to enter a title and description for the SLA.

Perform the following two tasks to design a wizard panel for the user to enter an SLA title and description:

[Create a wizard for SLA description](#)

[Create a form for SLA description](#)

Task 1: Create a wizard for SLA description

For this task, you will create a wizard panel that prompts the user to enter a title and description for the new SLA.

To create a wizard panel for the SLA title and description, follow these steps:

1. Click **Tailoring > Wizards**. The Wizard information form opens.
2. Select the **Wizard Info** tab.
3. In the Wizard Name field, type `SLA Create 3`, and then click **Add**.

Caution: If you use an existing SLA record to create a new SLA wizard panel, click "Add" rather than save. If you click Save, you will replace the existing record with the new record you are attempting to add.

4. In the **Wizard Info** tab, complete the following fields.

Field	Value
Start Node?	Leave this option unchecked.
Brief Description	Type: This wizard panel will prompt the user to enter a title and description for the SLA.

Field	Value
Window Title	Type: Create New SLA - Description
Title	Type: Create New SLA - Description

5. Select the **File Selection** tab and the **Select \$L.file by** subtab to complete the following field:

Field	Value
\$L.file passed in	Select this option to indicate that the \$L.file variable should be passed to the wizard from a previous wizard.

6. Select the **Usage** tab and complete the following fields to determine the action that HP Service Manager should take when the wizard runs.

Field	Value
Request user input	Select this field to prompt the user for information.
Sub Format to Display	Enter a subformat name of the format to display. Type: sla.create.description

7. Select the **Actions** tab to define the actions when a user clicks **Next**, **Cancel**, or **Previous** within the wizard. Complete the following field:

Field	Value
Perform Actions On	Here you can specify which record(s) will be affected by the action that is going to be performed. This can either be the current file, the list selected (as a whole), or an action to be performed on every single record selected. Select Current File (\$L.file) .

8. Select the **Next Wizard** tab and complete the following fields:

Field	Value
Wizard Name	This is the name of the next wizard in a series of wizards. Type: SLACreate 4
Condition	The condition determines what happens next. In this case, you entered the next wizard in sequence and an expression that evaluates to "true." Alternatively, you can specify different wizards, based on user actions or selections. Type: true

9. When you are finished, click **Save**.

You have created the new wizard panel. Next, you will create the new wizard form in Forms Designer.

Task 2: Create a form for SLA description

For this task, you will use Forms Designer to create controls that prompt the user to enter a title and description. These form controls, together with the window title, prompt, buttons, and other choices you made in the wizard record, will be displayed to the end user as the screen shown below.

The screenshot shows a wizard window titled "Create New SLA - Description". On the left side, there is a blue vertical bar. To its right, there are two labels: "Enter a title:" and "Enter a detailed description:". The "Enter a detailed description:" label is followed by a large, empty text area with a vertical scrollbar on the right side. At the bottom of the window, there are four buttons: "< Previous", "Next >", "Finish", and "Cancel".

To create a new form to display the SLA description wizard, follow these steps:

1. Start the Forms Designer.
2. In the Form field, type `sla.create.description`.

Best Practice: Because the form name must match the subformat display entry exactly, you can copy the subformat display entry in the Usage tab and paste it into the Form field. This will help you to avoid spelling errors.

3. Click **New**.
4. Click **No** for Forms wizard.
5. Create the following for this form. When you start to design the new form, make sure the X and Y coordinates are at 0 (zero).

Property	Value
Label	
Caption	Type: Enter a title.
Visible	Select.
Text	
Input	Type: title
Visible	Select.
Label	
Caption	Type: Enter a detailed description.
Visible	Select.
Text Area	
Input	Type: description

Property	Value
Visible	Select.

6. Click **OK** twice to save the new form and exit.

You have created one of the forms needed for the SLA wizard.

Step 5: Prompt for effective dates

The purpose of this step is to create the next wizard step, prompting the user to enter the starting and ending dates the SLA.

Perform the following two tasks to design a wizard panel for the user to indicate the effective dates of the SLA:

[Create a wizard for SLA effective dates](#)

[Create a form for SLA effective dates](#)

Task 1: Create a wizard for SLA effective dates

For this task, you will create a wizard that prompts the user to enter valid start and end dates.

To create a wizard for valid start and end dates, follow these steps:

1. Click **Tailoring > Wizards**. The Wizard information form opens.
2. Select the **Wizard Info** tab.
3. In the Wizard Name field, type `SLA Create 4`, and then click **Add**.

Caution: If you use an existing SLA record to create a new SLA wizard panel, click **Add** rather than **Save**. If you click **Save**, you will replace the existing record with the new record you are attempting to add.

4. In the **Wizard Info** tab, complete the following fields.

Field	Value
Start Node?	Leave this option unchecked.
Brief Description	Type: This wizard panel will prompt the user to enter the beginning and ending dates of the SLA.
Window Title	Type: Create New SLA - Effective Dates
Title	Type: Create New SLA - Effective Dates

5. Select the **File Selection** tab and the **Select \$.file by** subtab to complete the following fields:

Field	Value
\$.file passed in	Select this option to indicate that the \$.file variable should be passed to the wizard from a previous wizard.

6. Select the **Usage** tab and complete the following fields to determine the action that Service Manager should take when the wizard is run:

Field	Value
Request user input	Select this field to prompt the user for information.
Sub Format to Display	Enter a subformat name of the format to display. Type: <code>sla.create.validfromto</code>

7. Select the **Actions** tab and the **Format Control/Process Name** subtab to define the actions when a user clicks Next, Cancel, or Previous within the wizard. Complete the following field:

Field	Value
Perform Actions On	Here you can specify which record(s) will be affected by the action that is going to be performed. This can either be the current file, the list selected (as a whole), or an action to be performed on every single record selected.

Field	Value
	Select Current File (\$L.file) .

8. Select the **Next Wizard** tab and complete the following fields:

Field	Value
Wizard Name	This is the name of the next wizard in a series of wizards. Type: SLACreate 5
Condition	The condition determines what happens next. In this case, you entered the next wizard in sequence and an expression that evaluates to "true." Alternatively, you can specify different wizards, based on user actions or selections. Type: true

9. When you are finished, click **Save**.

You have created the valid From and To dates wizard panel. Next, you will create the new wizard form in Forms Designer.

Task 2: Create a form for SLA effective dates

For this task, you will use Forms Designer to create the form controls that prompt the user to indicate the effective dates of the SLA. These form controls, together with the window title, prompt, buttons, and other choices you made in the wizard record, will be displayed to the end user as the screen shown below.

Create New SLA - Effective Dates

SLA will be in effect from: ▼

SLA will expire on: ▼

< Previous Next > Finish Cancel

To create a new form for the SLA effective dates wizard, follow these steps:

1. Start the Forms Designer.
2. In the Form field, type `sla.create.validfromto`.

Best Practice: Because the form name must match the subformat display entry exactly, you can copy the subformat display entry in the Usage tab and paste it into the Form field. This will help you to avoid spelling errors.

3. Click **New**.
4. Click **No** for Forms wizard.
5. Create the following for this form. When you start to design the new form, make sure the X and Y coordinates are at 0 (zero).

Property	Value
Label	

Property	Value
Caption	Type: SLA will be in effect from:
Visible	Select.
Comfill	
Fill Button Visible	Select.
Input	start
Mandatory	Select.
Visible	Select.
Label	
Caption	Type: SLA will expire on:
Visible	Select.
Comfill	
Fill Button Visible	Select.
Input	Type: expiration
Mandatory	Select.
Visible	Select.

- Click **OK** twice to save the new form and exit.

You have finished creating one of the forms needed for the SLA wizard.

Step 6: Ask about agreement documents

The purpose of this step is to create a wizard panel that asks the user whether they want to copy text from an agreement document.

Perform the following two tasks to design a wizard panel asks users about agreements and other documents related to the SLA:

[Create a wizard to ask about agreements](#)

[Create a form to ask about agreements](#)

Task 1: Create a wizard to ask about agreements

The purpose of this task is to create a wizard panel that asks users if they want to copy text from agreement documents to this SLA.

To create the panel, follow these steps:

1. Click **Tailoring > Wizards**. The Wizard information form opens.
2. Select the **Wizard Info** tab.
3. In the Wizard Name field, type `SLA Create 5`, and then click **Add**.

Caution: If you use an existing SLA record to create a new SLA wizard panel, click **Add** rather than **Save**. If you click **Save**, you will replace the existing record with the new record you are attempting to add.

4. In the **Wizard Info** tab, complete the following fields.

Field	Value
Start Node?	Leave this option unchecked.
Brief Description	Type: This wizard will ask the user whether they want to copy text from Agreement documents or attach other documents to the SLA.
Window Title	Type: Create New SLA - Copy Agreements?
Title	Type: Create New SLA - Copy Agreements?

5. Select the **File Selection** tab to complete the following fields:

Field/Subtab	Value
Initial Expressions subtab	Type: <code>\$L.agreement.docs=false</code>
Select \$L.file by subtab	Select the \$L.file passed in option to indicate that the \$L.file variable should be passed to the wizard from a previous wizard.

6. Select the **Usage** tab and complete the following fields to determine the action that Service Manager should take when the wizard is run:

Field	Value
Request user input	Select this field to prompt the user for information.
Sub Format to Display	Enter a subformat name of the format to display. Type: <code>sla.create.ask.agreements</code>

7. Select the **Actions** tab to define the actions when a user clicks **Next**, **Cancel**, or **Previous** within the wizard. Complete the following field:

Field	Value
Perform Actions On	Here you can specify which record(s) will be affected by the action that you are going to perform. This can either be the current file, the list selected (as a whole), or an action to be performed on every single record selected. Select Current File (\$L.file) .

8. Select the **Next Wizard** tab and complete the following fields:

Field	Value
Wizard Name	This is the name of the next wizard in a series of wizards. Type: <code>SLA Create 6a</code>
Condition	The condition determines what happens next. In this case, you entered the next

Field	Value
	wizard in sequence and an expression that evaluates to "true." Alternatively, you can specify different wizards, based on user actions or selections. Type: <code>\$L.agreement.docs=true</code>
Wizard Name	This is the name of the next wizard in a series of wizards. Type: <code>SLA Create 7</code>
Condition	Type: <code>true</code>

- When you are finished, click **Save**.

This completes the wizard panel that asks users about attachments. The next step creates the corresponding new wizard form in Forms Designer.

Task 2: Create a form to ask about agreement

For this task, you will use Forms Designer to create the form controls that ask users to whether they want top copy text from agreements to the SLA. These form controls, together with the window title, prompt, buttons, and other choices you made in the wizard record, will be displayed to the end user as the screen shown below.

To create a new form for the SLA wizard that asks about agreements, follow these steps:

1. Start the Forms Designer.
2. In the Form field, type `sla.create.ask.agreements`.

Best Practice: Because the form name must match the subformat display entry exactly, you can copy the subformat display entry in the Usage tab and paste it into the Form field. This will help you to avoid spelling errors.

3. Click **New**.
4. Click **No** for Forms wizard.
5. Create the following for this form. When you start to design the new form, make sure the X and Y coordinates are at 0 (zero).

Property	Value
Group	
Caption	Type:

Property	Value
	Do you want to copy text from Agreement documents into this SLA?
Visible	Select.
Radio Button	
Caption	Type: Yes
Input	Type: \$L.agreement.docs
Value	Type: true
Visible	Select.
Radio Button	
Caption	Type: No
Input	Type: \$L.agreement.docs
Value	Type: false
Visible	Select.

- Click **OK** twice to save the new form and exit.

You have finished creating one of the forms needed for the SLA wizard.

Step 7: Prompt to add agreements

The purpose of this step is to create the wizard panel that prompts the user to add agreements related to the SLA if they answered Yes on the previous panel. The user does this by copying and pasting text

into the entry field.

Perform the following two tasks to design a wizard panel to prompt the user to add agreements:

[Create a wizard to add agreements](#)

[Create a form to add agreements](#)

Task 1: Create a wizard to add agreements

For this task, you will create a wizard panel that prompts users to copy and paste text from agreements related to the SLA, if they answered Yes in the previous panel.

To create a wizard panel that prompts users to attach agreement documents, follow these steps:

1. Click **Tailoring > Wizards**. The Wizard information form opens.
2. Select the **Wizard Info** tab.
3. In the Wizard Name field, type `SLA Create 6a`, and then click **Add**.

Caution: If you use an existing SLA record to create a new SLA wizard panel, click **Add** rather than **Save**. If you click **Save**, you will replace the existing record with the new record you are attempting to add.

4. In the **Wizard Info** tab, complete the following fields.

Field	Value
Start Node?	Leave this option unchecked.
Brief Description	Type: This wizard will prompt the user to copy and paste text from Agreement documents.
Window Title	Type: Create New SLA - Agreement Documents
Title	Type: Create New SLA - Agreement Documents

5. Select the **File Selection** tab and the **Select \$.file by** subtab to complete the following field:

Field	Value
\$.file passed in	Select this option to indicate that the \$.file variable should be passed to the wizard from a previous wizard.

6. Select the **Usage** tab and complete the following fields to determine the action that Service Manager should take when the wizard is run:

Field	Value
Request user input	Select this field to prompt the user for information.
Sub Format to Display	Enter a subformat name of the format to display. Type: <code>sla.create.add.agreements</code>

7. Select the **Actions** tab to define the actions when a user clicks **Next**, **Cancel**, or **Previous** within the wizard. Complete the following field:

Field	Value
Perform Actions On	Here you can specify which record(s) will be affected by the action that you are going to perform. This can either be the current file, the list selected (as a whole), or an action to be performed on every single record selected. Select Current File (\$.file) .

8. Select the **Next Wizard** tab and complete the following fields:

Field	Value
Wizard Name	This is the name of the next wizard in a series of wizards. Type: <code>SLA Create 7</code>
Condition	The condition determines what happens next. In this case, you entered the next wizard in sequence and an expression that evaluates to "true." Alternatively, you can specify different wizards, based on user actions or selections. Type: <code>true</code>

9. When you are finished, click **Save**.

You have created the wizard panel that prompts users to attach agreement documents. Next, you will create the new wizard form in Forms Designer.

Task 2: Create a form to add agreements

For this task, you will use Forms Designer to create the form controls that prompt the user to copy and paste text from agreement documents related to the SLA. These form controls, together with the window title, prompt, buttons, and other choices you made in the wizard record, will be displayed to the end user as the screen shown below.

The screenshot shows a wizard window with the title "Create New SLA - Agreement Documents". On the left side, there is a vertical blue bar. The main area of the window contains a text prompt: "Copy and paste text from Agreement documents related to this SLA:". Below this prompt is a large, empty text input field with a vertical scrollbar on the right side. At the bottom of the window, there are four buttons: "< Previous", "Next >", "Finish", and "Cancel".

To create a new form to display the wizard that prompts users to add agreement document text, follow these steps:

1. Start the Forms Designer.
2. In the Form field, type `sla.create.add.agreements`.

Best Practice: Because the form name must match the subformat display entry exactly, you can copy the subformat display entry in the Usage tab and paste it into the Form field. This will help you to avoid spelling errors.

3. Click **New**.
4. Click **No** for Forms wizard.
5. Create the following for this form. When you start to design the new form, make sure the X and Y coordinates are at 0 (zero).

Property	Value
Label	
Caption	Type: Copy and paste text from Agreement documents related to this SLA:
Visible	Select.
Text Area	
Input	Type: agreements
Visible	Select.

6. Click **OK** twice to save the new form and exit.

You have finished creating one of the forms needed for the SLA wizard.

Step 8: Save new SLA and prompt for SLTs

At this point, all of the information needed for the new SLA has been collected. The next task is create a process in Document Engine to save the new SLA to the database.

Additionally this task asks the user if they want to add SLTs to the SLA.

Perform the following three tasks to complete this step:

[Create a process to save the new SLA](#)

[Create a wizard to check SLT requirements](#)

[Create a form to check SLT requirements](#)

Task 1: Create a process to save the new SLA

For this task, you will create a process to save the new SLA record that you just created.

To create a process to save the new SLA record, follow these steps:

1. Click **Tailoring > Document Engine > Processes**. The Process Definition form opens.
2. In the Process Name field, type `sla.save.from.wizard`.
3. In the RAD tab, type the following expressions in the first two rows of the **Expressions evaluated before RAD call** section:

```
$L.action="add"
```

4. In the **RAD Application** section of the RAD tab, type `se.view.engine` as the RAD application to be called, and then type `true` as the condition to execute it. Then enter the following parameter names and values:

Parameter Name	Parameter Value
file	Type: <code>\$L.file</code>
description	<code>\$L.action</code>

5. In the **Post RAD Expressions** section of the RAD tab, type `$L.new.sla=agreement.id` in `$L.file`.
6. Click **Add**.
7. When you are finished, click **OK**.

You have created the process to save the new SLA record to the database.

Task 2: Create a wizard to check SLT requirements

For this task, you will create a wizard to call the save process, and then create a subformat that asks users whether they want to add SLTs and check the SLT requirements.

To create a wizard to call the save process and check SLT requirements, follow these steps:

1. Click **Tailoring > Wizards**. The Wizard information form opens.
2. Select the **Wizard Info** tab.
3. In the Wizard Name field, type `SLA Create 7`, and then click **Add**.

Caution: If you use an existing SLA record to create a new SLA wizard panel, click **Add** rather than **Save**. If you click **Save**, you will replace the existing record with the new record you are attempting to add.

4. In the **Wizard Info** tab, complete the following fields.

Field	Value
Start Node?	Leave this option unchecked.
Brief Description	Type: This wizard panel will ask the user if they want to create Availability or Response SLTs.
Window Title	Type: Create New SLA - Check SLT Requirements
Title	Type: Create New SLA - Check SLT Requirements

5. Select the **File Selection** tab to complete the following fields:

Field/Subtab	Value
Initial Expressions subtab	Type: <code>\$L.create.response.slo=false</code> <code>\$L.create.avail.slo=false</code>
Select \$L.file by subtab	Select the \$L.file passed in option to indicate that the \$L.file variable should be passed to the wizard from a previous wizard.

6. Select the **Usage** tab and complete the following fields to determine the action that Service

Manager should take when the wizard is run:

Field	Value
Request user input	Select this field to prompt the user for information.
Sub Format to Display	Enter a subformat name of the format to display. Type: sla.create.ask.slos

7. Select the **Actions** tab to define the actions when a user clicks **Next**, **Cancel**, or **Previous** within the wizard. Complete the following field:

Field	Value
Perform Actions On	Here you can specify which record(s) will be affected by the action that you are going to perform. This can either be the current file, the list selected (as a whole), or an action to be performed on every single record selected. Select Current File (\$L.file) .
Format Control/Process Name subtab	Define the actions when a user clicks Next, Cancel, or Previous within the wizard. Complete the following field:
Process Name	To specify that this wizard can run a process after completing, type: sla.save.from.wizard
Wizard Variables	\$L.create.response.slo \$L.crate.avail.slo \$L.new.sla

8. Select the **Next Wizard** tab and complete the following fields:

Field	Value
Wizard Name	This is the name of the next wizard in a series of wizards. Type: SLA Create Response 1
Condition	The condition determines what happens next. In this case, you entered the next

Field	Value
	wizard in sequence and an expression that evaluates to "true." Alternatively, you can specify different wizards, based on user actions or selections. Type: <code>\$L.create.response.slo=true</code>
Wizard Name	This is the name of the next wizard in a series of wizards. Type: <code>SLA Create Availability 1</code>
Condition	Type: <code>\$L.create.avail.slo=true</code>
Wizard Name	Type: <code>SLA Create 8</code>
Condition	Type: <code>true</code>

9. When you are finished, click **Save**.

You have created the wizard panel that calls the save process and checks SLT requirements. Next, you will create the new wizard form in Forms Designer.

Task 3: Create a form to check SLT requirements

For this task, you will use Forms Designer to create form controls that ask users if they want to create Service Level Targets related to the SLA.

To create a new form for the wizard that calls the save process and checks SLT requirements:

1. Start the Forms Designer.
2. In the Form field, type `sla.create.ask.slos`.

Best Practice: Because the form name must match the subformat display entry exactly, you can copy the subformat display entry in the Usage tab and paste it into the Form field. This helps avoid spelling errors.

3. Click **New**.
4. Click **No** for Forms wizard.

5. Create the following for this form. When you start to design the new form, make sure the X and Y coordinates are at 0 (zero).

Property	Value
Group	
Caption	Type: Do you want to create Service Level Targets based on Help Desk response times?
Visible	Select.
Radio Button	
Caption	Type: Yes
Input	Type: \$L.create.response.slo
Value	Type: true
Visible	Select.
Radio Button	
Caption	Type: No
Input	Type: \$L.create.response.slo
Value	Type: false
Visible	Select.

Property	Value
Group	
Caption	Type: Do you want to create Service Level Targets based on service availability?
Visible	Select.
Radio Button	
Caption	Type: Yes
Input	Type: \$L.create.avail.slo
Value	Type: true
Visible	Select.
Radio Button	
Caption	Type: No
Input	Type: \$L.create.avail.slo
Value	Type: false
Visible	Select.

6. Click **OK** twice to save the new form and exit.

You have finished creating one of the forms needed for the SLA wizard.

Step 9: Call the Availability SLT wizard

The next step is to create a wizard panel to call the existing out-of-box Availability Wizard for those users who answered that they did want an availability SLT.

Because this wizard panel only performs the background task of calling another wizard, there is no screen to show the end user. Thus there is no task requiring the use of Forms Designer in this step.

[Create a wizard to call an availability SLT](#)

Task: Create a wizard to call an Availability SLT

For this task, you will create a wizard that will call the existing out-of-box Availability SLT wizard.

To create a wizard that calls the existing out-of-box Availability SLT wizard, follow these steps:

1. Click **Tailoring > Wizards**. The Wizard information form opens.
2. Select the **Wizard Info** tab.
3. In the Wizard Name field, type `SLA Create Availability 1`, and then click **Add**.

Caution: If you use an existing SLA record to create a new SLA wizard panel, click **Add** rather than **Save**. If you click **Save**, you will replace the existing record with the new record you are attempting to add.

4. In the **Wizard Info** tab, complete the following fields.

Field	Value
Start Node?	Leave this option unchecked.
Brief Description	Type: This wizard calls the existing wizard to create an Availability SLT.
Window Title	Type: Create Availability SLT

Field	Value
Title	Type: Create Availability SLT

5. Select the **File Selection** tab and the **Select \$.file by** subtab to complete the following field:

Field	Value
\$.file passed in	checked

6. Select the **Usage** tab and complete the following fields to determine the action that Service Manager should take when the wizard is run:

Field	Value
Skip Display	Select this option as this panel does not include a form that needs to be displayed to the user.

7. Select the **Actions** tab to define the actions when a user clicks Next, Cancel, or Previous within the wizard. Complete the following field:

Field	Value
Perform Actions On	Here you can specify which record(s) will be affected by the action that you are going to perform. This can either be the current file, the list selected (as a whole), or an action to be performed on every single record selected. Select Current File (\$.file) .
Format Control/Process Name subtab	Define the actions when a user clicks Next, Cancel, or Previous within the wizard. Complete the following field:
Process Name	To specify that this wizard can run a process after completing, type: slo.add.avail.sla

8. Select the **Next Wizard** tab and complete the following fields:

Field	Value
Wizard Name	This is the name of the next wizard in a series of wizards. Type: SLA Create Availability 2
Condition	The condition determines what happens next. In this case, you entered the next wizard in sequence and an expression that evaluates to "true." Alternatively, you can specify different wizards, based on user actions or selections. Type: true

- When you are finished, click **Save**.

You have created a wizard panel that calls the existing out-of-box Availability SLT. A new form is not needed for this wizard.

Step 10: Prompt for another Availability SLT

The next step is to ask the user if they want to add another availability SLT. If they do, this panel must call the out-of-box Availability SLT wizard again. If they do not, the wizard must call the out-of-box Response SLT if the user indicated they wanted to add a Response SLT, or else go to the final wizard screen.

Perform the following two tasks to design a wizard panel to prompt for another Availability SLT:

[Create a wizard for more availability SLTs](#)

[Create a form for more availability SLTs](#)

Task 1: Create a wizard for more Availability SLTs

For this task, you will create a wizard so users can create more Availability SLTs.

To create a wizard so users can create more Availability SLTs, follow these steps:

- Click **Tailoring > Wizards**. The Wizard information form opens.
- Select the **Wizard Info** tab.
- In the Wizard Name field, type `SLA Create Availability 2`, and then click **Add**.

Caution: If you use an existing SLA record to create a new SLA wizard panel, click **Add** rather than **Save**. If you click **Save**, you will replace the existing record with the new record you are attempting to add.

4. In the **Wizard Info** tab, complete the following fields.

Field	Value
Start Node?	Leave this option unchecked.
Brief Description	Type: This wizard panel asks the user if they want to create another Availability SLT.
Window Title	Type: Create another Availability SLT
Title	Type: Create another Availability SLT

5. Select the **File Selection** tab and the **Select \$.file by** subtab to complete the following field:

Field	Value
Initial Expressions:	\$.create.avail.slo=false
No \$.file (use typecheck)	Select this option to initialize a typecheck file, which acts as a holding file.

6. Select the **Usage** tab and complete the following fields to determine the action that Service Manager should take when the wizard is run:

Field	Value
Request user input	Select this field to prompt the user for information.
Sub Format to Display	Enter a subformat name of the format to display. Type: <code>sla.create.ask.other.avail</code>

Field	Value
Turn off Previous button only?	Checked

7. Select the **Actions** tab to define the actions when a user clicks **Next**, **Cancel**, or **Previous** within the wizard. Complete the following field:

Field	Value
Perform Actions On	Here you can specify which record(s) will be affected by the action that you are going to perform. This can either be the current file, the list selected (as a whole), or an action to be performed on every single record selected. Select Current File (\$L.file) .
Wizard Variables:	\$L.create.avail.slo

8. Select the **Next Wizard** tab and complete the following fields:

Field	Value
Wizard Name	This is the name of the next wizard in a series of wizards. Type: SLA Create Availability 1
Condition	The condition determines what happens next. In this case, you entered the next wizard in sequence and an expression that evaluates to "true." Alternatively, you can specify different wizards, based on user actions or selections. Type: \$L.create.avail.slo=true
Wizard Name	This is the name of the next wizard in a series of wizards. Type: SLA Create 8
Condition	true

9. When you are finished, click **Save**.

You have created the wizard so users can create more Availability SLTs. Next, you will create the new wizard form in Forms Designer.

Task 2: Create a form for more Availability SLTs

For this task, you will use Forms Designer to create form controls that ask users if they want to create an additional Service Level Target record.

To create a new form for the wizard that creates more Availability SLTs, follow these steps:

1. Start the Forms Designer.
2. In the Form field, type `sla.create.ask.other.avail`.

Best Practice: Because the form name must match the subformat display entry exactly, you can copy the subformat display entry in the Usage tab and paste it into the Form field. This will help you to avoid spelling errors.

3. Click **New**.
4. Click **No** for Forms wizard.
5. Create the following for this form. When you start to design the new form, make sure the X and Y coordinates are at 0 (zero).

Property	Value
Group	
Caption	Type: Would you like to create another Availability SLT record?
Visible	Select.
Radio Button	
Caption	Type: Yes
Input	Type: <code>\$L.create.avail.slo</code>
Value	Type:

Property	Value
	true
Visible	Select.
Radio Button	
Caption	Type: No
Input	Type: <code>\$L.create.avail.slo</code>
Value	Type: false
Visible	Select.

6. Click **OK** twice to save the new form and exit.

You have finished creating one of the forms needed for the SLA wizard.

Step 11: Call the Response SLT wizard

The next step is to create a wizard panel to call the existing out-of-box Response Wizard for those users who answered that they did want to add a Response SLT.

Because this wizard panel only performs the background task of calling another wizard, there is no screen to show the end user. Thus there is no task requiring the use of Forms Designer in this step.

Task: Create a wizard to call a Response SLT

For this task, you will create a wizard that will call the existing out-of-box Response SLT wizard.

To create a wizard to call the existing out-of-box Response SLT wizard, follow these steps:

1. Click **Tailoring > Wizards**. The Wizard information form opens.
2. Select the **Wizard Info** tab.

3. In the Wizard Name field, type `SLA Create Response 1`, and then click **Add**.

Caution: If you use an existing SLA record to create a new SLA wizard panel, click **Add** rather than **Save**. If you click **Save**, you will replace the existing record with the new record you are attempting to add.

4. In the **Wizard Info** tab, complete the following fields.

Field	Value
Start Node?	Leave this option unchecked.
Brief Description	Type: This wizard will call the out-of-box wizard that creates a Response SLT.
Window Title	Type: Create Response SLT
Title	Type: Create Response SLT

5. Select the **File Selection** tab and the **Select \$.file by** subtab to complete the following field:

Field	Value
\$.file passed in	checked

6. Select the **Usage** tab and complete the following fields to determine the action that HP Service Manager should take when the wizard is run:

Field	Value
Skip Display	Select this option as this panel does not include a form that needs to be displayed to the user.

7. Select the **Actions** tab to define the actions when a user clicks **Next**, **Cancel**, or **Previous** within the wizard. Complete the following field:

Field	Value
Perform Actions On	Here you can specify which record(s) will be affected by the action that you are going to perform. This can either be the current file, the list selected (as a whole), or an action to be performed on every single record selected. Select Current File (\$L.file) .
Format Control/Process Name subtab	Define the actions when a user clicks Next, Cancel, or Previous within the wizard. Complete the following field:
Process Name	To specify that this wizard can run a process after completing, type: <code>slo.add.resp.sla</code>

8. Select the **Next Wizard** tab and complete the following fields:

Field	Value
Wizard Name	This is the name of the next wizard in a series of wizards. Type: <code>SLA Create Response 2</code>
Condition	The condition determines what happens next. In this case, you entered the next wizard in sequence and an expression that evaluates to "true." Alternatively, you can specify different wizards, based on user actions or selections. Type: <code>true</code>

9. When you are finished, click **Save**.

You have created the wizard that will call the existing out-of-box Response SLT wizard. A new form is not needed for this wizard.

Step 12: Prompt for another Response SLT

The next step is to ask the user if they want to add another response SLT. If they do, this panel must call the out-of-box Response SLT wizard again. If they do not want to add any more response SLTs, they should be shown the final wizard screen.

Perform the following two tasks to design a wizard panel to prompt for another Response SLT:

[Create a wizard for more response SLTs](#)

Create a form for more response SLTs

Task 1: Create a wizard for more Response SLTs

For this task, you will create a wizard so that users can create more Response SLTs.

To create a wizard so that users can create more Response SLTs, follow these steps:

1. Click **Tailoring > Wizards**. The Wizard information form opens.
2. Select the **Wizard Info** tab.
3. In the Wizard Name field, type `SLA Create Response 2`, and then click **Add**.

Caution: If you use an existing SLA record to create a new SLA wizard panel, click **Add** rather than **Save**. If you click **Save**, you will replace the existing record with the new record you are attempting to add.

4. In the **Wizard Info** tab, complete the following fields.

Field	Value
Start Node?	Leave this option unchecked.
Brief Description	Type: This wizard panel will ask the user if they want to add another Response SLT.
Window Title	Type: Create another Response SLT
Title	Type: Create another Response SLT

5. Select the **File Selection** tab and the **Select \$.file by** subtab to complete the following field:

Field	Value
Initial Expression:	<code>\$.create.response.slo=false</code>
No \$.file (use	Select this option to initialize a typecheck file, which acts as a holding

Field	Value
typecheck)	file.

6. Select the **Usage** tab and complete the following fields to determine the action that Service Manager should take when the wizard is run:

Field	Value
Sub Format to Display	Enter a subformat name of the format to display. Type: sla.create.ask.other.response
Request User Input	checked.
Turn Off Previous Button Only	checked

7. Select the **Actions** tab to define the actions when a user clicks **Next**, **Cancel**, or **Previous** within the wizard. Complete the following field:

Field	Value
Perform Actions On	Here you can specify which record(s) will be affected by the action that you are going to perform. This can either be the current file, the list selected (as a whole), or an action to be performed on every single record selected. Select Current File (\$L.file) .
Wizard Variables	\$L.create.response.slo \$L.crate.avail.slo

8. Select the **Next Wizard** tab and complete the following fields:

Field	Value
Wizard Name	This is the name of the next wizard in a series of wizards. Type: SLA Create Response 1
Condition	The condition determines what happens next. In this case, you entered the next wizard in sequence and an expression that evaluates to "true." Alternatively, you can

Field	Value
	specify different wizards, based on user actions or selections. Type: <code>\$L.create.response.slo=true</code>
Wizard Name	This is the name of the next wizard in a series of wizards. Type: <code>SLA Create Availability 1</code>
Condition	Type: <code>\$L.create.avail.slo=true</code>
Wizard Name	This is the name of the next wizard in a series of wizards. Type: <code>SLA Create 8</code>
Condition	Type: <code>true</code>

9. When you are finished, click **Save**.

You have created the wizard so that users can create more Response SLTs. Next, you will create the new wizard form in Forms Designer.

Task 2: Create a form for more Response SLTs

For this task, you will use Forms Designer to create form controls that ask users if they want to create an additional Service Level Target record.

To create a new form for a wizard that creates more Response SLTs, follow these steps:

1. Start the Forms Designer.
2. In the Form field, type `sla.create.ask.other.response`.

Best Practice: Because the form name must match the subformat display entry exactly, you can copy the subformat display entry in the Usage tab and paste it into the Form field. This will help you to avoid spelling errors.

3. Click **New**.
4. Click **No** for Forms wizard.

5. Create the following for this form. When you start to design the new form, make sure the X and Y coordinates are at 0 (zero).

Property	Value
Group	
Caption	Type: Would you like to create another Response SLT?
Visible	Select.
Radio Button	
Caption	Type: Yes
Input	Type: \$L.create.response.slo
Value	Type: true
Visible	Select.
Radio Button	
Caption	Type: No
Input	Type: \$L.create.response.slo
Value	Type: false
Visible	Select.

6. Click **OK** twice to save the new form and exit.

You have created one of the forms needed for the SLA wizard.

Step 13: Display new SLA number and title

In this final wizard step, the panel will display the record number and title of the newly created SLA, and have the record details displayed when the user clicks the **Finish** button.

Complete the following tasks to perform this step:

[Create a wizard for the completed SLA](#)

[Create a form for the completed SLA](#)

Task 1: Create a wizard for the completed SLA

For this task, you will create a wizard panel that displays the SLA record number and title of the newly-created SLA record to the user.

To create a wizard for the completed SLA, follow these steps:

1. Click **Tailoring > Wizards**. The Wizard information form opens.
2. Select the **Wizard Info** tab.
3. In the Wizard Name field, type `SLA Create 8`, and then click **Add**.

Caution: If you use an existing SLA record to create a new SLA wizard panel, click **Add** rather than **Save**. If you click **Save**, you will replace the existing record with the new record you are attempting to add.

4. In the **Wizard Info** tab, complete the following fields.

Field	Value
Start Node?	Leave this option unchecked.
Brief Description	Type: This wizard is the final panel the user sees, telling them the record number and name of the new SLA created.
Window	Type:

Field	Value
Title	Create new SLA - Done
Title	Type: Create new SLA - Done

5. Select the **File Selection** tab to complete the following fields:

Field	Value
Initial Expressions subtab	Type:
Select \$.file by subtab	
Select records "of type"	Select this option and click Fill to select sla as the record type.
using query	Type: "agreement.id="+\$.new.sla Note: Be sure to include the double quotes (") at each end of "agreement.id" as these quotes are part of the query.

6. Select the **Usage** tab and complete the following fields to determine the action that Service Manager should take when the wizard is run:

Field	Value
Request user input	Select this field to prompt the user for information.
Sub Format to Display	Enter a subformat name of the format to display. Type: sla.create.finished
Activate "Finish" option?	Since this is the final wizard in a series of wizard panels, select this option to make a "Finish" button appear on this wizard panel.

Field	Value
Turn off Next and Previous buttons ?	Select this checkbox.

7. Select the **Actions** tab to define the actions when a user clicks **Next**, **Cancel**, or **Previous** within the wizard. Complete the following field:

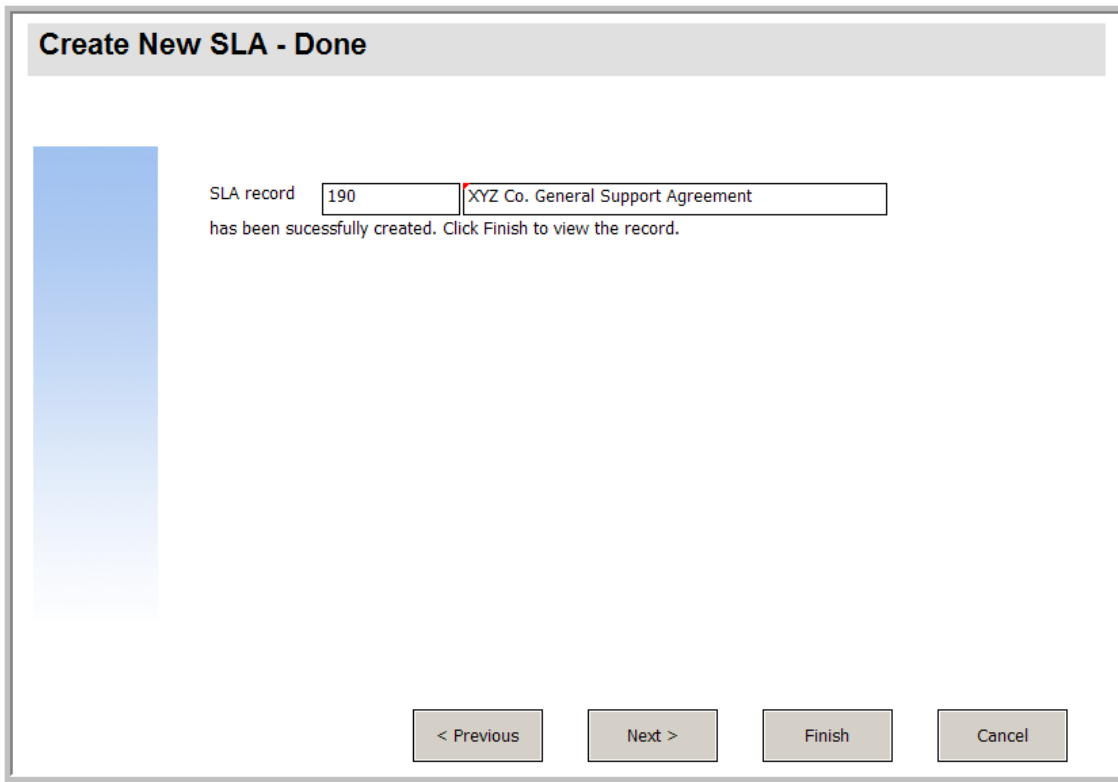

Field	Value
Perform Actions On	<p>Here you can specify which record(s) will be affected by the action that you are going to perform. This can either be the current file, the list selected (as a whole), or an action to be performed on every single record selected.</p> <p>Select Current File (\$L.file).</p>
Display Record(s) when complete?	Select this option (to set to true) to display the record to the user when the wizard completes.

8. When you are finished, click **Save**.

You have created the last wizard panel that displays the SLA record number and title of the newly-created SLA record. Next, you will create format for this wizard step in Forms Designer.

Task 2: Create a form for the completed SLA

For this task, you will use Forms Designer to create form controls display the record number and title of the new SLA record created. These form controls, together with the window title, prompt, buttons, and other choices you made in the wizard record, will be displayed to the end user as the wizard screen shown below.

To create a new form for the completed SLA, follow these steps:

1. Start the Forms Designer.
2. In the Form field, type `sla.create.finished`.

Best Practice: Because the form name must match the subformat display entry exactly, you can copy the subformat display entry in the Usage tab and paste it into the Form field. This helps avoid spelling errors.

3. Click **New**.
4. Click **No** for Forms wizard.
5. Create the following for this form. When you start to design the new form, make sure the X and Y coordinates are at 0 (zero).

Property	Value
Label	

Property	Value
Caption	Type: SLA record
Visible	Select.
Text	
Input	Type: agreement.id
Visible	Select.
Text	
Input	Type: title
Visible	Select.
Label	
Caption	Type: has been successfully created. Click Finish to view the record.
Visible	Select.

- Click **OK** twice to save the new form and exit.

You have finished creating the final wizard screen that is displayed for the SLA wizard.

Step 14: Set menu to call the new SLA wizard

The purpose of this step is to associate the new wizard with the menu command: **Service Level Management > Service Level Agreements > Create New SLA**. That is, the first panel of the new wizard is to be displayed rather than the Service Level Agreement entry form that is displayed out-of-box.

To set the menu to call the new wizard, follow these steps:

1. Click **Tailoring > Tailoring Tools > Menus**.
2. Type `SLA` in the Menu Name field, and then click **Search**.
3. Click in the row for **Option 5 – Service Level Agreements**.
4. In the Application column, replace `thread.start` by typing `wizard.run`.
5. In the Parameter Value column, replace `sla.add.object` by typing `SLA Create 1`.
6. Click **OK** to save the changes.

Now you can click **Service Level Management > Service Level Agreements > Create New SLA** to confirm that the menu changes were effected and the wizard opens and executes as expected.

Troubleshooting Custom Wizards

Check the topics in this section to troubleshoot issues that may appear when executing a wizard. Error logs can help with troubleshooting.

The following topics are discussed:

- [Button options are not displaying properly](#)
- [File variables not passed into wizard flow](#)
- [Format not found](#)
- [JavaScript syntax errors](#)
- [Query failed to provide correct results](#)
- [Query returned a list of records rather than a single record](#)
- [RAD expression syntax errors](#)
- [Records are not sorted properly](#)
- [Wizard stops with "Could not continue" errors](#)
- [Run a trace](#)

Button options are not displaying properly

If button options are not displaying or unexpectedly displaying, check the **Usage** tab to ensure that the correct checkboxes are enabled.

Also check the following:

- The first displayed panel should **not** have a Previous button.
- The last displayed panel **should** have a Finish button.
- If the Previous button is not displaying as expected, check to see if you selected the "Start Node?" option in the **Wizard Info** tab.

Tip: Only the first wizard panel should have the "Start Node?" option selected in the **Wizard Info** tab.

- Do not choose the "Next" button as a "Finish" button. If you do, the wizard will stop executing. As a best practice, disable the "Next" button and enable the "Finish" button in the last panel of the wizard work flow.
- Check to see if any of the options on the **Usage** tab were suppressed by mistake.

File variables not passed into wizard flow

The wizard stops executing, and the user is returned to the calling application with the following error message at the top of the screen:

```
Wizard could not continue. No file variable was passed in.
```

Cause

In the **Select \$.file by** subtab on the **File Selection** tab, the option "\$L.file passed in" was selected, but no file variable was passed in.

Fix

Either call `wizard.run` with the file parameter passed in correctly, or choose another option in the **Select \$.file by** tab on the **File Selection** tab. For example, select **Create a record of type**.

Format not found

The wizard stops executing, and the user is returned to the calling application with the following error message at the top of the screen:

```
Format "test" not found (display,show.rio)
```

Cause

An invalid format name was entered in the **Sub Format to Display** field on the **Usage** tab while using the "Request user input" option in the **Wizard Usage** section on the **Usage** tab.

Fix

Enter a valid format name in the **Sub Format to Display** field on the **Usage** tab, so a valid subformat will be displayed. Or, select the **Skip Display** option to bypass attempting to display the form.

JavaScript syntax errors

The wizard stops executing, and the user is returned to the calling application with the following error message(s) at the top of the screen:

```
Process panel <panel name> in RAD wizard.run encountered error in line 5  
(wizard.run,<panel name>)
```

```
Process panel init.expr in RAD wizard.run encountered error in line 5  
(wizard.run,init.expr)
```

```
Cannot evaluate expression (wizard.run,init.expr)
```

```
Script <UNKNOWN> line 1: ERROR ReferenceError: test is not defined at char 1
```

```
Unrecoverable error in application: se.call.process on panel call.rad.1
```

```
Unrecoverable error in application: wizard.run on panel init.expr
```

Cause

Invalid syntax was entered in a **JavaScript** tab. The RAD application and panel will give you a hint as to which JavaScript tab the syntax error was entered. Refer to the table below for help in determining where to make the fix.

RAD application/panel	Where to fix
wizard.run,init.expr	JavaScript subtab of the File Selection tab.

RAD application/panel	Where to fix
wizard.run,select.file.setup	Query statement in the Select \$.file by subtab of the File Selection tab.
wizard.run,run.expressions	Expressions subtab of the Actions tab.
wizard.run,exit.cancel	Javascript Executed on Cancel subtab of the Cancel Expressions tab.

Fix

Correct syntax for JavaScript expressions is discussed in the JavaScript Programmer's Guide. When using JavaScript, you must define variables before using them. For example:

```
var <name>=new String()
```

The correct syntax for assigning a value to a field is as follows:

```
Table.field1=value
```

To compare the values of two fields to each other, use the following syntax:

```
Table1.field1==table2.field2
```

Query failed to provide correct results

When entering a query in the **File Selection** tab, all strings such as field names must be enclosed in quotes. If the strings are not enclosed in quotes, the query will fail to provide the correct results.

For example:

```
"agreement.id="+G.new.sla
```

Or

```
"logical.name=\""+str($group.name.new)+"\""
```

Query returned a list of records rather than a single record

According to the wizard setup, a single record should be returned from the query entered in the **Usage** tab. Instead, a true search was performed.

Cause

Incorrect query syntax was used. For example, `agreement.id in $L.file=168`. Query statements should not include the file variable.

Fix

Use correct query syntax. For example, `"agreement.id="168`.

RAD expression syntax errors

The wizard stops executing, and the user is returned to the calling application with the following error message(s) at the top of the screen:

```
Process panel <panel name> in RAD wizard.run encountered error in line 2  
(wizard.run,<panel name>)
```

```
Process panel init.expr in RAD wizard.run encountered error in line 2  
(wizard.run,init.expr)
```

```
Cannot evaluate expression (wizard.run,init.expr)
```

```
Bad arg (2) oper = (wizard.run,init.expr)
```

```
Bad arg (3) oper index (wizard.run,init.expr)
```

```
Unrecoverable error in application: se.call.process on panel call.rad.1
```

```
Unrecoverable error in application: wizard.run on panel init.expr
```

Cause

These errors are caused by syntax errors in the wizard panels. The panel name gives you a hint as to where the issue occurred.

Bad arg (x) oper operator y indicates improper syntax of a statement or a missing or invalid parameter that is expected to be supplied to the statement.

Bad arg (1 or 2) oper <operator>: arg 1 indicates that the issue is to the left of the <operator>. If it is arg 2, then the issue is to the right of the <operator>. For example, operator can be defined as follows: =, <, >, ~=, ~<, ~>, etc.

Bad arg (1 or 2) oper <in> arg 1 indicates that the issue is to the left of "in" within the statement. If arg is 2, then the issue is to the right of "in" within the statement.

Bad arg (x) oper <function> indicates that the number of the parameter that was passed to the function is invalid.

The following table will help you find where in the wizard panel the error occurred and where to make the fix.

RAD application/panel	Where to fix
wizard.run,init.expr	Initial Expressions subtab of the File Selection tab.
wizard.run,select.file.setup	Query statement in the Select \$L.file by subtab of the File Selection tab.
wizard.run,get.selection.records	Query statement in Selection Criteria on the Usage tab.
wizard.run,run.expressions	Expressions subtab of the Actions tab.
wizard.run,decide.restart	Restart Panel if field on the Actions tab.
wizard.run,get.message	Condition field of the Messaging tab.
wizard.run,setup.wizard.variables	Wizard variables on the Variables tab.
wizard.run,find.next.wizard	Condition field on the Next Wizard tab.
wizard.run,exit.cancel	Expressions Executed on Cancel subtab of the Cancel Expressions tab.

Fix

Correct syntax for RAD expressions is discussed in the System Language topics in the Service Manager Online Help. You can view this help by clicking **Help > Help Contents** if you are using a Windows client, or pressing **F1** if you are using a web client.

The correct syntax for assigning a value to a field is as follows:

```
<field> in $L.file=value
```

To compare the values of two fields to each other, use the following syntax:

```
<field1> in $L.file=<field2> in $L.file
```

Any concatenated statement containing a field name and a variable needs to be entered as follows:

```
"agreement.id=" +$G.test where $G.test is numeric or Boolean.
```

```
"agreement.id =\" + $G.test + "\" where $G.test is a character.
```

```
"agreement.id='\" + $G.test + '\" where $G.test is a date/time.
```

Records are not sorted properly

According to the wizard setup, the list of selected records should be sorted by the values in a certain field. When the list of records is displayed, it is sorted by the unique key instead.

Cause

The type of field needed for the query (dbdict name) is invalid.

Fix

Enter a valid sort field in the record type dbdict.

Wizard stops with "Could not continue" errors

The wizard stops executing for a variety of reasons, including possible configuration errors. Some of the errors you may encounter are as follows:

Error	Cause/Fix
Cannot create record of type "test."	<p>Cause: The record type entered does not exist as a record in the dbdict table.</p> <p>Fix: Enter a valid record type or dbdict name.</p>
Cannot select from record of type "test."	<p>Cause: The record type entered does not exist as a record in the dbdict table.</p> <p>Fix: Enter a valid record type or dbdict name.</p>
Cannot initialize record of type "slas."	<p>Cause: On the Usage tab, Query for Records of type has an invalid record type entered.</p> <p>Fix: Enter a valid record type or dbdict name.</p>
Invalid selection query: agreement=\$G.test.	<p>Cause: On the Usage tab, an invalid field name was used in the Query for Records statement.</p> <p>Fix: Determine and use the correct field names in the statement.</p>
Wizard "test" does not exist. Contact your System Administrator.	<p>Cause: An invalid wizard name was entered on the Next Wizard tab. When a nonexistent wizard evaluates to true, the wizard workflow will be caught in an infinite loop and the session thread will be killed.</p> <p>Fix: Enter a valid wizard name on the Next Wizard tab.</p>
<p>Display application could not find screen. Query=screen.id="wizard.test.me" and language="ENG"</p> <p>Unrecoverable error in application: se.call.process on panel call.rad.1</p> <p>Display application error exit has been taken. \$L.ds.ids=L.ds.desc=</p>	<p>Cause: An invalid display screen name was selected on the Usage tab.</p> <p>Fix: On the Usage tab, enter a valid display screen name or leave the field empty for the default option.</p>

Run a trace

If you receive an error message, use the following to trace the error to get more detail on the message you receive. You can also run a trace when the wizard flow does not take the expected path.

To run a trace, follow these steps:

1. Enter the `RTM: 3` and `debugdbquery: 999` parameters in the HP Service Manager `sm.ini` file.
2. Start a new client connection.

For complete details, see the instructions in the *Diagnostics and Tuning* white paper.

3. Within the trace, search for the first call to the `wizard.run` RAD application.
4. Next, follow the flow of the wizard, checking the `dbquery` statements against the wizard table to see which wizard is called next.
5. Follow the trace to the error message if one was received, or follow the trace to understand which path the application took through the wizard flow.
6. Use print statements in the JavaScript expressions within the wizard panels, to write additional information to the log file. For example, the content of variables that will influence which wizard will be run next or statements as to which wizard is executed at the time.

Note: Remember to remove these debug statements before putting the wizard into production.

Send Documentation Feedback

If you have comments about this document, you can [contact the documentation team](#) by email. If an email client is configured on this system, click the link above and an email window opens with the following information in the subject line:

Feedback on Wizards Guide (Service Manager 9.41)

Just add your feedback to the email and click send.

If no email client is available, copy the information above to a new message in a web mail client, and send your feedback to ovdoc-ITSM@hp.com.

We appreciate your feedback!
