Documentation updates

The title page of this document contains the following identifying information:

- Software Version number, which indicates the software version.
- Document Release Date, which changes each time the document is updated.
- Software Release Date, which indicates the release date of this version of the software.

To check for recent software updates, go to <https://softwaresupport.hpe.com/patches>.

To verify that you are using the most recent edition of a document, go to <https://softwaresupport.hpe.com/manuals>.

This site requires that you register for an HPE Passport and sign in. To register for an HPE Passport ID, go to <https://hpp12.passport.hpe.com/hppcf/login.do>.

You will also receive updated or new editions if you subscribe to the appropriate product support service. Contact your HPE sales representative for details.

Support

Visit the HPE Software Support Online web site at <https://softwaresupport.hpe.com>.

This web site provides contact information and details about the products, services, and support that HPE Software offers.

HPE Software online support provides customer self-solve capabilities. It provides a fast and efficient way to access interactive technical support tools needed to manage your business. As a valued support customer, you can benefit by using the support web site to:

- Search for knowledge documents of interest
- Submit and track support cases and enhancement requests

- Download software patches
- Access product documentation
- Manage support contracts
- Look up HPE support contacts
- Review information about available services
- Enter into discussions with other software customers
- Research and register for software training

Most of the support areas require that you register as an HPE Passport user and sign in. Many also require a support contract.

To register for an HPE Passport ID, go to <https://hpp12.passport.hpe.com/hppcf/login.do>.

To find more information about access levels, go to <https://softwaresupport.hpe.com/web/softwaresupport/access-levels>.

Recovery using Advanced GRE Web Plug-in	119
Prerequisites	120
Providing web service access to users	120
Using Data Protector GUI	120
Using CLI	120
Accessing the Advanced GRE Web Plug-in from VMware vSphere Web Client	121
Configuring GRE settings	122
Retention time	122
Configuring the mount proxy	123
Enabling debugging option	123
Viewing the list of requests	124
Creating a new request	125
Recovering files	126
Changing the Cell Manager	129
Identifying the Advanced GRE Web Plug-in version	129
Chapter 20: Troubleshooting	130
Before you begin	130
Known issues and workarounds	130
Mounting virtual machine disks	130
Issues after removing the extension	131
RSA certificates with keys that are less than 1024 bits long are blocked	132
Mounting of LVM logical volumes fail when browsing VMware GRE on Linux	132
VMware Granular Recovery Extension tab is missing	133
VMware Granular Recovery Extension tab is missing with vCenter Server plug-in disabled	133
Overwritten files issues	134
Missing VIX API libraries	135
Insufficient permission in the Host Operating System	135
Presentation failed	135
Cached recovery fails	136
Restore session stops after some time	136
The VMware GRE session is unresponsive	136
VMware GRE file recovery could not access network share	137
Resizing the browser window causes an error and reloads the page	137
Browsing for Recovery throws an error message	137
VMware GRE GUI fails to start agent on mount proxy system	137
Time difference exists between the backup sessions on the Data Protector GUI and vSphere web client	138
Unable to expand a folder for browsing	138
Expanding a partition for browsing throws an error	138
vSphere web interface becomes greyed out	139

- Error message appears while browsing for LVM disks 139
- Error message appears when starting VMware GRE agent on mount proxy host 139
- The message "VIX API is not installed" re-appears although VIX API is installed 140
- Shared folders/directories created on Media Agent host system are not removed 140
- While browsing a Smart Cache in the Advanced GRE Web Plug-in you may see
mount errors on agent timeout. 141
- VEPA backup to a Smart Cache fails on a Windows 2008 system. 141
- Browse and recovery problems with folders containing special characters 142
- Unable to browse the disk 142
- Error message appears while browsing for LVM disks on SLES 12 mount proxy host . 143
- The VMware GRE session of large volumes from Smart Cache devices may fail 143
- Recovery fails on Virtual Machine 143
- VMware Granular Recovery Extension intermittently fails to recover files and folders . 144
- The Granular Recovery Extension operation to StoreOnce Catalyst fails, when Data
Protector process dpfs is not initialized 144
- Backup session performed with "No Logs" option is not eligible for GRE or Live
Migrate and Power On from StoreOnce Catalyst 144
- Data consistency issues during Cached GRE operations 145
- VMware GRE recovery 146
- Loopback devices missing on Linux mount proxy for VMware GRE mount 146

Part 1: Microsoft SharePoint Server and the Granular Recovery Extension

This part of the guide describes Data Protector Granular Recovery Extension for Microsoft SharePoint Server 2010 and Microsoft SharePoint Server 2013 (**Microsoft SharePoint Server**).

This part includes the following chapters:

[Introduction](#)

[Installation](#)

[Configuration](#)

[Backup](#)

[Recovery](#)

[Command Line Interface](#)

[Troubleshooting](#)

Chapter 1: Introduction

A part of the information provided in this document is also available in a custom Help collection that the HPE Data Protector Granular Recovery Extension for Microsoft SharePoint Server adds to the basic Microsoft SharePoint Server Help. The collection contains Granular Recovery Extension-related topics. You can access them by clicking the Help icon in a Granular Recovery Extension context of the Central Administration site.

Backup

Back up Microsoft SharePoint Server data using one of the following backup solutions:

- HPE Data Protector Microsoft SharePoint Server 2010/2013 integration
- HPE Data Protector Microsoft SharePoint Server VSS based solution
- HPE Data Protector Microsoft SQL Server integration
- HPE Data Protector Microsoft Volume Shadow Copy Service integration

Recovery

The benefits of the HPE Data Protector Granular Recovery Extension are the following:

- **recovery granularity**

The smallest object that you can restore with the backup solution is a Microsoft SQL Server database (**content database**), which may contain data of multiple websites. In contrast, the smallest object that you can recover with HPE Data Protector Granular Recovery Extension is an individual website item, for example: a Calendar item, a Calendar, a Tasks item, a Team Discussion item, a document, a shared document, a folder, a list, a library, an announcement, a form, a reporting template, an object's metadata, and a document workflow status.

- **integration into Microsoft SharePoint Server Central Administration**

Granular Recovery Extension is fully integrated into the Microsoft SharePoint Server Central Administration. This empowers Site Collection Administrators to perform recovery of single items independently or with minimal interference of backup administrators.

- **recovery of multiple sites**

Accidental deletion of a site is no longer an issue, even if you cannot use the recycle bin to recover your site. Granular Recovery Extension can recover an entire site with multiple subsites.

- **ease of search**

The Granular Recovery Extension advanced and quick search helps you find the item you need to recover. This search system checks object's metadata, enabling you to filter your search by document type, author, date and so on. Objects are displayed in object tree browser.

- **recovery to different locations**

The Granular Recovery Extension enables recovery to different destinations, for example you can recover your objects to different sites, different farms, and to filesystem.

Chapter 2: Installation

Install the MS SharePoint Granular Recovery Extension on the Microsoft SharePoint Server Central Administration system, to recover individual Microsoft SharePoint Server objects.

The "Microsoft SharePoint Server Clients - Data Protector Granular Recovery Extension for Microsoft SharePoint Server" section in the *HPE Data Protector Installation Guide* provides prerequisites and other details necessary for installing the Data Protector Granular Recovery Extension for Microsoft SharePoint Server.

Chapter 3: Configuration

This section describes the configuration steps that you need to follow. Not following these steps may lead to failure in recovering your objects.

Verifying the configuration of the Recovery Web Application

Procedure

1. Open the Central Administration webpage and click the **Application Management** tab.
2. Under Application Security, click **Authentication providers** and click **Default**.
3. Ensure that the settings for the Recovery Web Application are the same as the default settings of the Central Administration Application.

Configuring HPE Data Protector user rights

Procedure

1. Launch the Data Protector GUI (**Data Protector Manager**).
2. In the Context list, select **Users**.
3. Ensure the user account under which the Windows SharePoint Services Timer service is running is assigned the Data Protector Start restore and See private objects user rights.

Data Protector user rights

NOTE:

The See private objects user right is useful in case you created your backup specification configured with access type private, and backup object owner. This is either the account under which the backup was executed or the account specified in the **Ownership** backup option. If this user account is different than the user account under which the Windows SharePoint Services Timer service is running, the private backup objects are not accessible in the Recovery Cache Management.

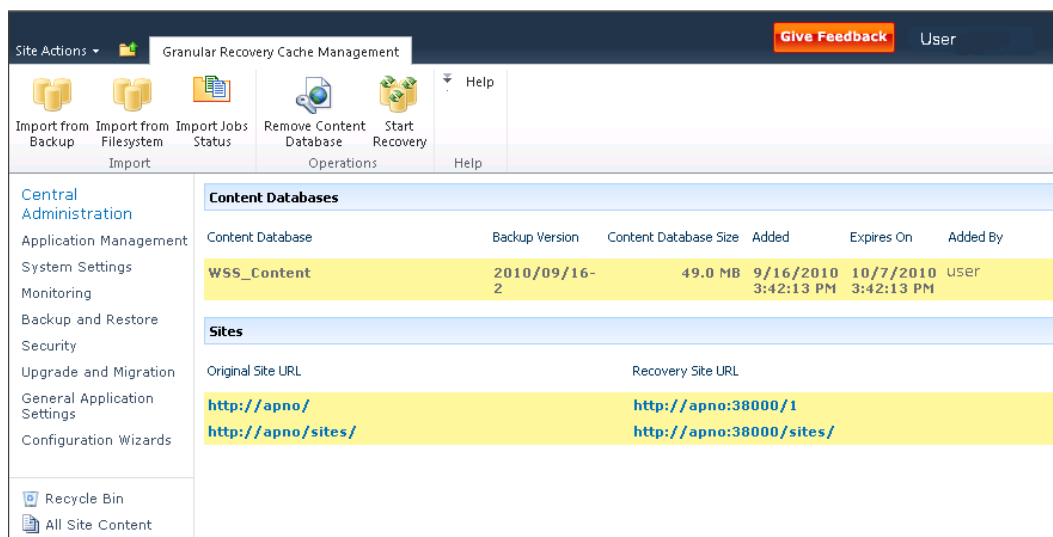

Configuring HPE Data Protector backup specifications

- Ensure the option **track the replica for instant recovery** is not selected, when you create VSS transportable backup.
- To prevent Data Protector from backing up content databases that are in the Granular Recovery Cache Management (in other words, to prevent Data Protector from backing up the same content databases twice), proceed with the following, depending on your configuration:
 - If the same Microsoft SQL Server instance is used by both Microsoft SharePoint Server and HPE Data Protector Granular Recovery Extension:

When you create backup specifications, select individual content databases, and not the client, Microsoft SQL Server instance, or Microsoft Volume Shadow Copy Writer.

The content databases restored by HPE Data Protector Granular Recovery are named *OriginalName_DataProtectorSessionID*. See [Selecting content databases, below](#).

Selecting content databases

NOTE:

If you have a backup specification with individual content databases selected, each time a Farm Administrator adds a new content database, you need to include the newly-added content database in the backup specification.

- If a separate Microsoft SQL Server instance is used for granular recovery purposes, specify this system as the destination Microsoft SQL Server for the Import From Backup procedure. Ensure that this system is excluded from the backup specification.

Verifying the configuration of Internet Information Services application pools

The same Microsoft SharePoint Server user account is used by both the **Recovery Web Application** and **SharePoint Central Administration v3/v4** application pools.

To be able to recover items to a filesystem, verify if the user specified in these application pools is granted enough permission. Ensure this user is granted full control of the filesystem.

To verify which user account is configured in the **Recovery Web Application** or **SharePoint Central Administration** (v4 for Microsoft SharePoint Server 2010/2013) application pools:

1. Connect to the Microsoft SharePoint Server Central Administration system.
2. In the Start menu, click **Control Panel, Administrative Tools, and Internet Information Services (IIS) Manager**.
3. Depending on the operating system version, proceed as follows:

Windows Server 2008 or Windows Server 2012:

- a. Open the Application Pools page.
- b. Right-click an application pool and click **Advanced Settings**.
- c. Under Process Model, verify the Identity of the Microsoft SharePoint Server user account.

Chapter 4: Backup

Back up Microsoft SharePoint Server data as described in your backup solution documentation.

For more information on the HPE Data Protector backup solutions, see:

- *HPE Data Protector Integration Guide*
- *HPE Data Protector Zero Downtime Backup Integration Guide*

NOTE:

Granular Recovery Extension for Microsoft SharePoint Server uses the same procedure for recovery of different objects. The recovery procedure does not depend on the backup type.

Considerations

- It is recommended to restore content databases bigger than 10 GB from VSS transportable backup.
- If you have configured VSS transportable backup using ZDB to disk+tape, Granular Recovery Extension for Microsoft SharePoint Server selects the content database version from disk for restore. This backup type does not require additional disk space and is adequate for bigger content databases, taking less time to complete the restore session.

Chapter 5: Recovery

Each site has its data stored in a Microsoft SQL Server database (**content database**). Therefore, to recover site items, follow this basic procedure:

1. **Import**
 - a. **Restore**

Restore the content database from backup to a temporary location on a Microsoft SQL Server system.
 - b. **Mount**

Present the restored content database (**recovery content database**) to the Microsoft SharePoint Server. This creates a temporary site (**recovery site**).
2. **Recover**

Transfer site items from the recovery site to the original site, or to another location of your choice.
3. **Dismount**

Dismount the recovery content database from the Microsoft SharePoint Server. Optionally, delete the database from the disk.

Launching the HPE Data Protector Granular Recovery Extension GUI

Procedure

1. Log on to the Microsoft SharePoint Server Central Administration system under a Microsoft SharePoint Server **Farm Administrator** user account.
2. Connect to the Central Administration webpage.
3. Look for **HPE Data Protector Granular Recovery Extension**:

HPE Data Protector Granular Recovery Extension links

4. Click **Granular Recovery Cache Management**. The Recovery Cache Management page is displayed.

The Granular Recovery Cache shows which recovery content databases are currently mounted to the Microsoft SharePoint Server. In the beginning, the Granular Recovery Cache is empty. See [Recovery Cache Management \(empty\)](#), on the next page.

Recovery Cache Management (empty)

Recovery Cache Management with a content database mounted , below shows available functionality of the Recovery Cache Management when a content database is already mounted. For a high-level description of the functionality, see Granular Recovery Cache Management , below.

Recovery Cache Management with a content database mounted

Content Database	Backup Version	Content Database Size	Added	Expires On	Added By

Importing content databases from backup

Prerequisites

On the destination Microsoft SQL Server system, you need enough disk space for the content database that you want to import.

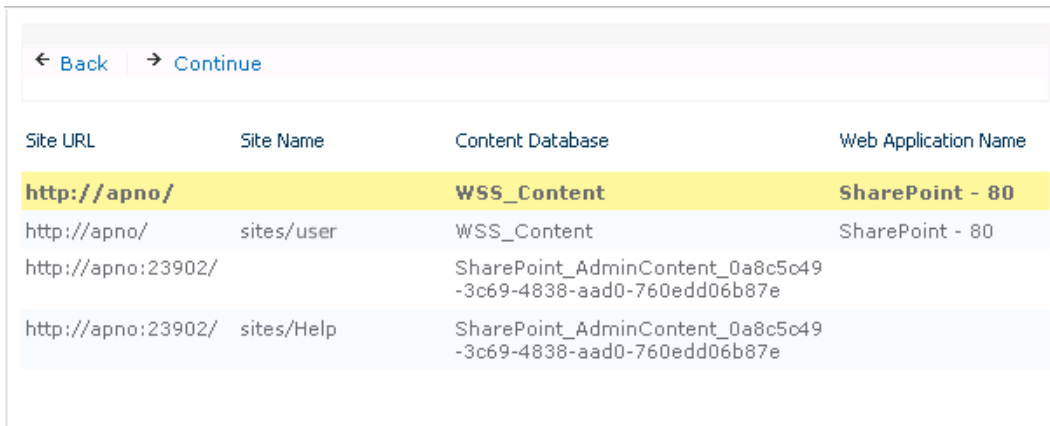

Considerations

- If a site already exists in the Recovery Cache Management, and you perform an Import From Filesystem session for the same site, the URL changes as follows:
 - `http://computer.company.com:38000/OriginalNameSequenceNumber`
 - `http://computer.company.com:25884/SequenceNumber`
(root site)
- If the original site does not exist in the Recovery Cache Management, the site URL does not change.
- If a root site does not exist, the Recovery Cache Management uses an empty string during the restore session, and the URL of the root site changes to:
`http://computer.company.com:25884/SequenceNumber`
- If the site URL exceeds 260 characters, the import of two backup versions is not possible.
- If the destination path exceeds 260 characters, recovery is not possible. Please select a different location.

Procedure

1. In the Recovery Cache Management page, click **Import From Backup**. The Site Collection Selection page is displayed. Select the content database of the site you want to recover and click **Continue**.

Site Collection Selection page

Site URL	Site Name	Content Database	Web Application Name
http://apno/		WSS_Content	SharePoint - 80
http://apno/	sites/user	WSS_Content	SharePoint - 80
http://apno:23902/		SharePoint_AdminContent_0a8c5c49-3c69-4838-aad0-760edd06b87e	
http://apno:23902/	sites/Help	SharePoint_AdminContent_0a8c5c49-3c69-4838-aad0-760edd06b87e	

2. In the Backup Version Selection page, select the content database version that you want to restore and click **Continue**.

Backup Version Selection page

← Back → Continue					
Name	Created Date	Size	Type	Method	Media
2010/04/13-2	4/13/2010 3:46:47 PM	31.5 MB	Full	MSVSS	TAPE

3. The Content Database Recovery page is displayed:

Content Database Recovery page

← Back ▶ Import content database	
Restore Settings	
SQL server:	<input type="text" value="APNO\SharePoint"/>
Restore path:	<input type="text" value="C:\Restore"/>

In the **SQL Server** drop-down list, select the destination Microsoft SQL Server instance. You can change the default restore location by specifying a new path. The default is C:\Restore.

NOTE:

If your Microsoft SQL Server is configured in a cluster, ensure that the restore location resides on the Microsoft SQL Server cluster shared disk.

Click **Import content database**.

4. Optionally, to monitor job status, click **Continue**. The Granular Recovery Import Job Status page is displayed:

Monitoring job status

Refresh Clear History Abort Recovery Cache Management					
Active					
ID	Name	Started By	Started	Ended	Details
9528425a-7973-4110-9b84-d64ab0632416	gr-job-restore-recovery-database_WSS_Content_2010/04/13-2	user			None
History					
No import of content databases to recovery cache performed.					

5. Click **Recovery Cache Management** to return to that page.

The content database is mounted to the Microsoft SharePoint Server.

Recovery Cache Management

The screenshot shows the 'Recovery Cache Management' interface. At the top, there is a navigation bar with 'Site Actions' and 'Granular Recovery Cache Management'. Below this are several icons for 'Import from Backup', 'Import from Filesystem', 'Import Jobs Status', 'Remove Content Database', and 'Start Recovery'. A sidebar on the left contains 'Central Administration' and various management options. The main content area displays two tables: 'Content Databases' and 'Sites'.

Content Database	Backup Version	Content Database Size	Added	Expires On	Added By
WSS_Content	2010/09/16-2	49.0 MB	9/16/2010 3:42:13 PM	10/7/2010 3:42:13 PM	user

Original Site URL	Recovery Site URL
http://apno/	http://apno:38000/1
http://apno/sites	http://apno:38000/sites

NOTE:

Once the content database is mounted to the Microsoft SharePoint Server, a **Perform content recovery** task is assigned to the Site Collection Administrator.

For details, see [Executing Perform content recovery tasks, on page 28](#).

Importing content databases from the filesystem

Prerequisites

- The content database must be restored to the filesystem.
- The user account under which the SharePoint 2010 Timer (Microsoft SharePoint Server 2010) or SharePoint Timer Service (Microsoft SharePoint Server 2013) service is running must be granted full control permission for the content database.

Considerations

- The Microsoft SQL Server Database Primary Data Files and all transaction log files cannot be imported from a network share.
- If a site already exists in the Recovery Cache Management, and you perform an Import From Filesystem session for the same site, the URL changes as follows:
 - `http://computer.company.com:38000/OriginalNameSequenceNumber`
 - `http://computer.company.com:25884/SequenceNumber`
(root site)
- If the original site does not exist in the Recovery Cache Management, the site URL does not change.

- If a root site does not exist, the Recovery Cache Management uses an empty string during the restore session, the URL of the root site changes to:

`http://computer.company.com:25884/SequenceNumber`

Procedure

1. On the Recovery Cache Management page, click **Import From Filesystem**.
2. On the Enter content database data page, specify the location of the Microsoft SQL Server Database Primary Data File *AbsolutePath.mdf* and all transaction log files *AbsolutePath.ldf*. Click **Add**.

Click **Continue**.

Specifying content database files

Central Administration > Enter content database data
Specify database files

← Back | → Continue

Database File Location

Database file path: Add

Database Files

File path

C:\Restore\2010-09-16-2\C\Program Files\Microsoft Office Servers\14.0\Data\MSSQL10.SHAREPOINT\MSSQL\DATA\WSS_Content.mdf	Remove
C:\Restore\2010-09-16-2\C\Program Files\Microsoft Office Servers\14.0\Data\MSSQL10.SHAREPOINT\MSSQL\DATA\WSS_Content_log.LDF	Remove

3. In the **SQL Server** drop-down list, select the destination Microsoft SQL Server instance.

Importing a content database from filesystem

Give Feedback User

Central Administration > Import content database
Click **Import content database** to start import.

← Back | ▶ Import content database

Import Settings

SQL server: APNO\SharePoint

Database name: WSS_Content

Version: 20100916170737

The content database name and version are filled in automatically. Optionally, you can edit the database name and version to better suit your needs.

Click **Import content database**.

- Optionally, to monitor job status, click **Continue**.

The Granular Recovery Import Job Status page is displayed:

http://apno/sites	http://apno:38000/sites

Recycle Bin All Site Content

NOTE:

Once the content database is mounted to the Microsoft SharePoint Server, a Perform content recovery task is assigned to the Site Collection Administrator.

For details, see [Executing Perform content recovery tasks, on the next page](#).

Executing Perform content recovery tasks

Prerequisites

- The content database must be mounted to the Microsoft SharePoint Server, by [Importing content databases from backup, on page 22](#) or by [Importing content databases from the filesystem, on page 25](#).
- You must be a **Site Collection Administrator** of the site you want to recover. For more information on how to add a user to the Site Collection Administrator group, see the Microsoft SharePoint documentation.

Perform content recovery task

Type	Title	Action	Associated Service	System Task	Assigned To	Status	Order	Due Date

Title	Perform content recovery 2010/04/13-2
Action	Perform granular recovery
Description	Perform granular recovery for site http://apno:23902
Order	20
Status	Not Started
Assigned To	User

Procedure

1. Click the link in the Perform content recovery task. The Browse and Select Objects page is displayed.
2. Proceed with the [On the Browse and Select Objects page, select the site items that you want to recover., on page 32](#).

Recovering site items

Prerequisites

- On all the front-end Web Server systems, you need enough disk space for the site items that you plan to recover. The default location is C:\Recovery. To change the default path, see [Changing HPE Data Protector Granular Recovery Extension settings, on page 38](#).
- You must be a **Site Collection Administrator** of the site you want to recover. For more information on how to add a user to the Site Collection Administrator group, see the Microsoft SharePoint documentation.
- The recovery content database must be mounted to the Microsoft SharePoint Server.
- If the original site no longer exists, create a site collection without a template and with the same language as the original site. Use the **Overwrite Existing** recovery mode. You must be a **Farm Administrator** of the site you want to recover in the Recovery Cache Management. If you have a sub site in the recovered site, quick links, top navigation bar are relocated at the end of the lists.
- Ensure that the site URL length does not exceed 260 characters:
If you use the **Rename if Exists** recovery mode, the URL length should not exceed 255 characters.

Supported items

You can recover the following Microsoft SharePoint Server items with the HPE Data Protector Granular Recovery Extension:

- Libraries:
 - Document library
 - Wiki page library
 - Report library
 - Asset library
 - Picture library
 - Translation Management Library
- Communication:
 - Announcements
 - Contacts
 - Discussion board
- Tracking:

- Links
- Calendar
- Tasks
- Project tasks
- Issue tracking
- Survey
- Custom List
- User Information List
- Pages and Sites:
 - Page
 - Site
 - Publishing pages
 - Sites with a blog template: Posts, Comments, Categories
 - Sites with a meeting template: Meetings, Agenda, Attendees, Decision, Meeting Objective, Text Box, Things To Bring, Home Page Library

NOTE:

Granular recovery of SharePoint lists that are customized with a custom ID value (greater than 10000) is supported. However, the success of granular recovery depends on the extent of list customization.

Considerations

- If the data to be recovered already exists at the destination, depending on the recovery mode, note the following:
 - **Rename if Exists** : Files and folders items are recovered with different names, *OriginalName_DPGRE_Timestamp*.
For example, suppose that on November 17, 2012 at 10:59:35 you start a recovery of the file wizard.txt. The file is recovered with the name wizard_DPGRE_20121117-105935.txt.
Other items (for example, form templates, documents and tasks items) are not recovered, and not renamed to the original location.
List items cannot be renamed as part of the recovery.
 - **Leave Existing** : Items are not recovered, the existing items remain the same in the target location.
 - **Overwrite Existing** : Items are recovered with the original names, replacing the existing. For

example, the existing Microsoft SharePoint Server items (Document Library) are overwritten with those from the backup data. Only lists and sites are not overwritten.

- If the data to be recovered does not exist at the destination, it is recovered with the original name.
- If the List items (Announcement, Contact, Link, Calendar, or Task) are recovered to other location, or to other farm twice, depending on the recovery mode:
 - **Overwrite Existing** : the List items are duplicated with the same names and different IDs. Delete the items with the same names.
 - **Rename if Exists** : the List items are renamed even though these kinds of items do not support renaming.
- If discussion items, with attachments and replies, or surveys with responses are recovered with the **Overwrite Existing** recovery mode, the items are overwritten but the attachments, replies, or responses are not recovered. To avoid data loss, delete the attachments, replies, or responses before starting your recovery session.
- Multiple recovery sessions can be performed in parallel, except if the same items are selected for recovery.
- Multiple farm administrators and site collection administrators can browse objects in parallel.
- To recover a document workflow status ensure you create a template and association at the destination site. Workflow status can be recovered only in case of recovery to the original location and if original item exists.
 - Workflow history cannot be recovered.
- Unique user permissions of an item are not recovered. The recovered item inherits permissions of the destination container type where it is recovered to.
- To recover a site collection or subsite, you need to manually create the destination site collection or subsite. Destination must be of the same template as that of site collection or subsite being recovered and the **Overwrite Existing** recovery mode must be used.

Procedure

1. On the Recovery Cache Management page, select the content database and the sites you want to recover. Note that a content database may contain data of multiple sites.

TIP:

To recover items from multiple sites, hold **Ctrl** while selecting specific sites under Sites, and then click **Start Recovery**. You can also hold **Shift** while selecting a group of sites under Sites, and then click **Start Recovery**.

Selecting a content database and multiple sites for recovery

The screenshot shows the 'Granular Recovery Cache Management' interface. At the top, there is a navigation bar with 'Site Actions' and 'Granular Recovery Cache Management' tabs, a 'Give Feedback' button, and a 'User' profile. Below this is a ribbon with icons for 'Import from Backup', 'Import from Filesystem', 'Import Jobs Status', 'Remove Content Database', 'Start Recovery', and 'Help'. The main content area is divided into two sections: 'Content Databases' and 'Sites'. The 'Content Databases' section contains a table with the following data:

Content Database	Backup Version	Content Database Size	Added	Expires On	Added By
WSS_Content	2010/09/16-2	49.0 MB	9/16/2010 3:42:13 PM	10/7/2010 3:42:13 PM	User

The 'Sites' section contains a table with the following data:

Original Site URL	Recovery Site URL
http://apno/	http://apno:38000/1
http://apno/sites/	http://apno:38000/sites/

On the left side, there is a 'Central Administration' menu with options like 'Application Management', 'System Settings', 'Monitoring', 'Backup and Restore', 'Security', 'Upgrade and Migration', 'General Application Settings', and 'Configuration Wizards'. At the bottom left, there are 'Recycle Bin' and 'All Site Content' options.

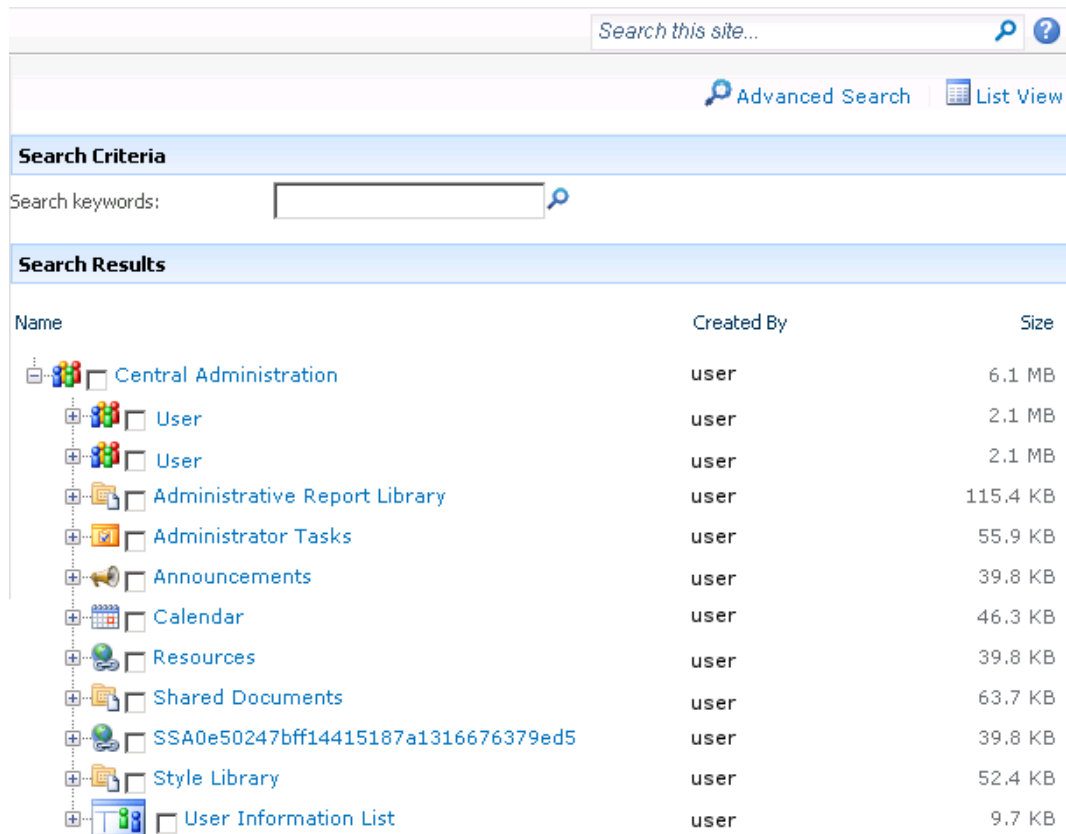

NOTE:

Alternatively, you can start a recovery session:

- By connecting to the original website.
Microsoft SharePoint Server 2010: In the **Site Actions** menu, select **Site Settings**.
Microsoft SharePoint Server 2013: Click the **settings icon** and select **Site Settings**.
On the Site Settings page, look for HPE Data Protector Granular Recovery Extension. Click **Granular Recovery**.
- By performing site tasks. For details, see [Executing Perform content recovery tasks, on page 28](#).

2. On the Browse and Select Objects page, select the site items that you want to recover.

Selecting site items

The screenshot shows a SharePoint search results page. At the top, there is a search bar with the text "Search this site..." and a magnifying glass icon. Below the search bar, there are two buttons: "Advanced Search" and "List View". The page is divided into two main sections: "Search Criteria" and "Search Results".

Search Criteria

Search keywords:

Search Results

Name	Created By	Size
  Central Administration	user	6.1 MB
 User	user	2.1 MB
 User	user	2.1 MB
 Administrative Report Library	user	115.4 KB
 Administrator Tasks	user	55.9 KB
 Announcements	user	39.8 KB
 Calendar	user	46.3 KB
 Resources	user	39.8 KB
 Shared Documents	user	63.7 KB
 SSA0e50247bff14415187a1316676379ed5	user	39.8 KB
 Style Library	user	52.4 KB
 User Information List	user	9.7 KB

NOTE:

All items can be previewed by clicking on the item name.

TIP:

To select multiple list view items, hold **Ctrl** while selecting specific items. Alternatively, you can hold **Shift** while selecting a group of items.

Advanced search

Central Administration > Browse and Select Objects
Select items for recovery.

Search this site...

→ Continue Quick Search List View

The exact **phrase**:

Any of these words:

None of these words:

Narrow the search...

Result type: All Results

Add property restrictions...

Where the Property...: (Pick Property) Equals And Add Property...

Search

TIP:

You can filter the items using the **Advanced search**. For example, in **Result type**, select **Microsoft Office Word documents**. In **Add properties restriction**, select a property and click **Search**.

For details about the advanced and quick search, see the *Microsoft SharePoint Server Help*.

To select multiple list view items, hold **Ctrl** while selecting specific items. Alternatively, you can hold **Shift** while selecting a group of items.

Click **Continue**.

3. On the Recovery Objects page, the selected site items are displayed.

NOTE:

The **Recovery mode** drop-down list offers the following options:

- **Rename if Exists** : Items such as files and folders are recovered with a new name *OriginalName_DPGRE_Timestamp*.
- **Leave Existing** : Items are not recovered, the existing items remain the same in the target location.
- **Overwrite Existing** : Recovered items replace the existing items.

TIP:

When recovering recurring events, for example, weekly team meetings in Calendars, before selecting the **Overwrite Existing** recovery mode, ensure the deletion of all the recurring events.

Recovering site items

Central Administration ► Recovery Objects
Click **Start Recovery** to recover the selected items.

Search this site...  

 

Recovery Settings

Recovery Mode:

Temporary Path:

Items for Recovery

Status	Type	Name	Into	Created By	Size	Log
	Central Administration/Announcements		<input type="text" value="Original Location"/>	User	39.8 KB	
	Central Administration/Shared Documents		<input type="text" value="Original Location"/>	User	63.7 KB	

Status

The **Temporary Path** option specifies which location on your Microsoft SharePoint Server system to use for recovery.

NOTE:

The **Into** drop-down list specifies the recovery destination:

- **Original Location** : The item is recovered to the original location in the original site. The option is not available for the recovery of sites or subsites with the **Rename If Exists**.
 - **Other Location** : The item is recovered to a different site or a different location in the original site. Use this location, if the original site no longer exists.
 - **Other Farm** : The item is recovered to a different destination farm.
 - **Filesystem** : The item is recovered to a directory in your filesystem. This option is available only for files and folders.
- If you select **Other Location**, the Recovery to other location dialog box is displayed.

Recovering site items to another location

Recovery to other location

Destination Site
Select destination site for recovery

Sites

Apply to all items of the same type

In the Site drop-down list, select the destination site.

If you select the **Apply to all items of the same type** option, items of the same type (for example, calendar items) are recovered to the same location.

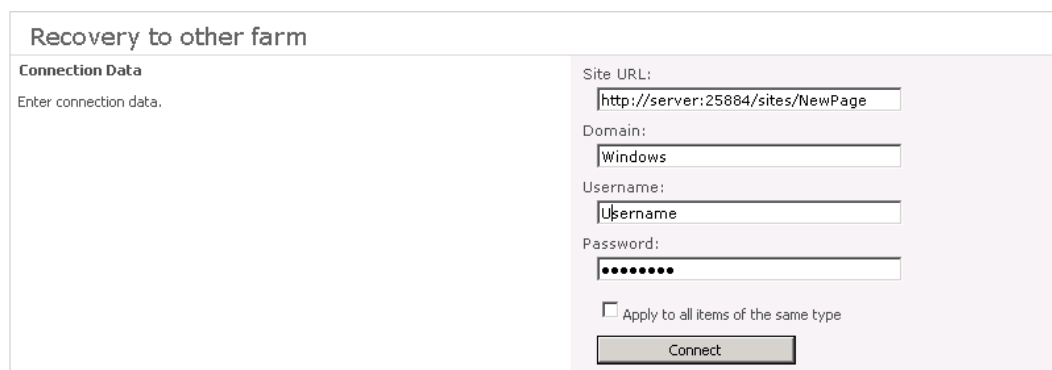

Click **OK**.

TIP:

The sites listed in the Recovery to other location dialog box are those for which you have enough permission. For example, if you are a Site Collection Administrator, you need to be granted the read configuration database right.

- If you select **Other Farm**, the Recovery to other farm dialog box is displayed.

Recovering site items to another farm

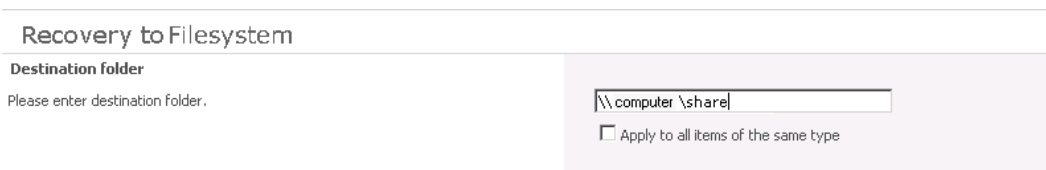

Specify the destination farm and which Windows domain user account to use.

If you select the **Apply to all items of the same type** option, items of the same type (for example, calendar items) are recovered to the same farm.

Click **Connect**.

- If you select **Filesystem**, the Recovery to Filesystem dialog box is displayed.

Recovering site items to a network share

In **Path**, specify the destination directory.

When specifying a network share as a destination, ensure that:

- Read, write, and change permissions are granted to the user that starts the recovery session.
- All necessary permissions are granted to the network share. Grant the same permissions specified for the user account configured in the **Web Recovery Application** and **SharePoint Central Administration v3/v4** application pools. For details, see [Verifying the configuration of Internet Information Services application pools, on page 17](#).
- The share is accessible from the system where the Microsoft SharePoint Foundation Web Application (Microsoft SharePoint Server 2010/2013) is running, in which the recovery session was started.

When specifying a folder as a destination, ensure that:

- The folder is accessible from the system where the Microsoft SharePoint Foundation Web Application (Microsoft SharePoint Server 2010/2013) is running.
- Read, write, and change permissions are granted to the user that starts a recovery session.

If you select the **Apply to all files and folders** option, all files and folders are recovered to the same directory.

Click **OK**.

4. Click **Start Recovery**.

Once the recovery completes, you can find the recovered items at the specified destination.

Removing content databases from the cache

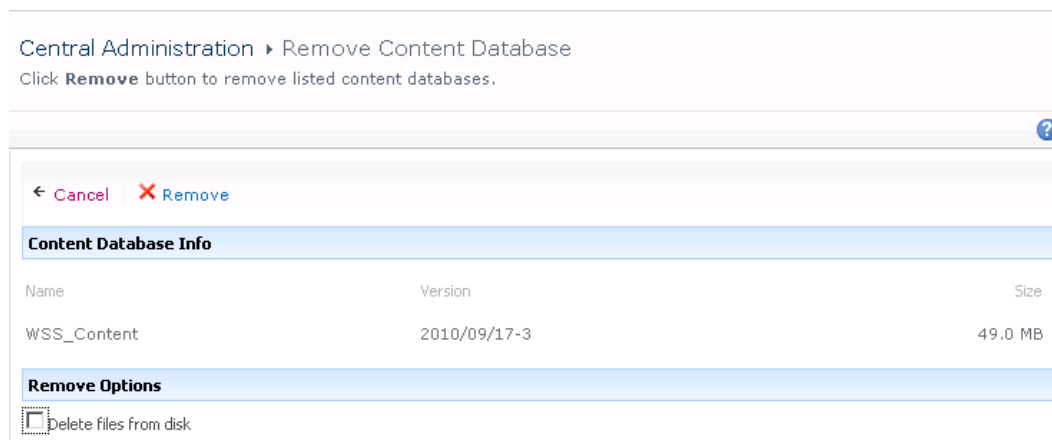

Procedure

Content databases are available for three weeks, after that they are removed from the cache automatically. To manually remove the content database from the Recovery Cache, proceed as follows:

1. On the Recovery Cache Management page, select which content database to remove, and click **Remove From Recovery Cache**. The Remove From Recovery Cache page is displayed.
2. To keep the content database files on the disk, clear the **Delete files from disk** option.

Click **Remove**.

Removing a content database

Monitoring granular recovery import jobs

Procedure

1. Connect to the Central Administration webpage.
2. Look for **HPE Data Protector Granular Recovery Extension**, and click **Granular Recovery Job Status**. The Granular Recovery Import Jobs page is displayed.

- Once you start a content database import session, HPE Data Protector Granular Recovery Extension starts monitoring the import job progress.

Monitoring an import job progress

Central Administration > Granular Recovery Import Job Status
 Click **Refresh** to update jobs list.

Optionally, after the recovery job is finished and you no longer need the job statuses, click **Clear History**.

To stop the operation in progress, click **Abort**.

Changing HPE Data Protector Granular Recovery Extension settings

During a granular recovery session, a content database is first restored to a temporary location on the selected Microsoft SQL Server system (default: C:\Restore).

Before the site items are recovered, they are copied to a temporary location on a Microsoft SharePoint Server system (default: C:\Recovery).

Procedure

- To change these default locations, connect to the Central Administration webpage.
- On the Granular Recovery Settings page, enter a new restore location or temporary recovery location and click **OK**.

Changing Granular Recovery settings

Product Version View Granular Recovery Extension version.	Version 6.11.28.1500
Default SQL Server for Import Select default SQL Server for import of content database.	SQL server <input type="text" value="APNO\SharePoint"/>
Restore Location Specify path on SQL server to which selected content database will be restored during import from backup.	Path <input type="text" value="C:\Restore"/> Example: c:\Restore
Temporary Location for Recovery Specify path for temporary files created during recovery.	Path <input type="text" value="C:\Recovery"/> Example: c:\Recovery

Chapter 6: Command line reference

Use the `HP.SharePoint.GranularRecovery.CLI.exe` command line tool that is located in:

Microsoft SharePoint Server 2010:

`C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\14\BIN`

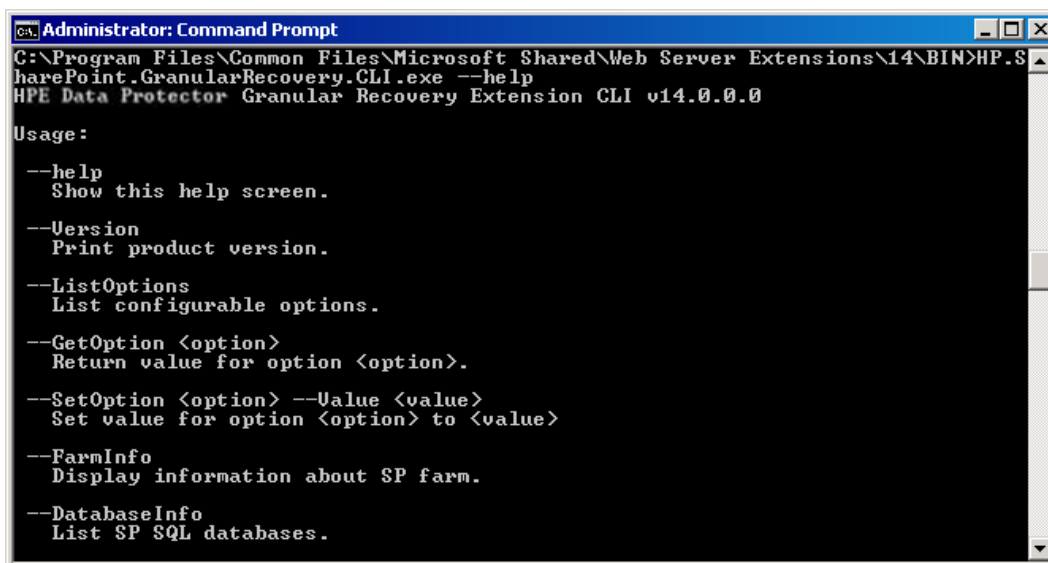

Microsoft SharePoint Server 2013:

`C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\15\BIN`

To display descriptions of options and their usage, run:

```
HP.SharePoint.GranularRecovery.CLI.exe --help.
```

Retrieving the command line help

```
Administrator: Command Prompt
C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\14\BIN>HP.SharePoint.GranularRecovery.CLI.exe --help
HP Data Protector Granular Recovery Extension CLI v14.0.0.0

Usage:
  --help
    Show this help screen.
  --Version
    Print product version.
  --ListOptions
    List configurable options.
  --GetOption <option>
    Return value for option <option>.
  --SetOption <option> --Value <value>
    Set value for option <option> to <value>
  --FarmInfo
    Display information about SP farm.
  --DatabaseInfo
    List SP SQL databases.
```

NOTE:

In the examples below, `HP.SharePoint.GranularRecovery.CLI.exe` is omitted for simplicity.

Examples

Restoring a content database from Data Protector backup

- To list all the backup versions of your content database named `WSS_Content_054a5bfa-f23c-49b8-8f78-e0b3ce00b193`, specify:
`--ListBackupVersions --ContentDB=WSS_Content_054a5bfa-f23c-49b8-8f78-e0b3ce00b193`

Monitoring jobs progress

- To list all the jobs that have been started of your content database, specify:
- To start a restore job by importing the content database from the backup version "2010/04/20-4" to the default restore location C:\Restore, specify:

```
--ListJobs  
  
--StartImportJob  
--ContentDB WSS_Content_054a5bfa-f23c-49b8-8f78-e0b3ce00b193  
--BackupID "2010/04/20-4" --Server computer  
--Instance OFFICESERVERS --TargetLocation C:\Restore
```

NOTE:

To successfully import the content database when your Microsoft SQL Server is installed with the default instance, replace OFFICESERVERS with one of the following:

- the instance name
- DEFAULT
- MSSQLSERVER

You can also leave the instance name empty to ensure that Data Protector uses its correct name.

- Suppose you want to start a restore job by importing the content database from a filesystem to the Microsoft SharePoint Server to the default restore location C:\Restore.

If the Microsoft SQL Server Database Primary Data File is WSS_Content_054a5bfa-f23c-49b8-8f78-e0b3ce00b193.mdf and the SQL Server Transaction log file is WSS_Content054a5bfa-f23c-49b8-8f78-e0b3ce00b193_log.LDF, specify:

```
--StartImportJob  
--ContentDB WSS_Content_054a5bfa-f23c-49b8-8f78-e0b3ce00b193  
--BackupID "2010/04/20-4" --Server computer  
--Instance OFFICESERVERS  
--Files="C:\Restore\WSS_Content_054a5bfa-f23c-49b8-8f78-e0b3ce00b193.mdf";"C:\Restore\WSS_Content054a5bfa-f23c-49b8-8f78-e0b3ce00b193_log.LDF"  
--TargetLocation C:\Restore
```

Verifying target location disk space size

- To check the available disk space on the default restore location C:\Restore, specify:
--QueryServerInfo --Server computer --Instance OFFICESERVERS --TargetLocation C:\Restore

This also lists the location of all content database files in the tree structure.

Listing content databases

- To list all content databases in the Recovery Cache including the backup versions, specify:
`--ListCache --All`
- To list detailed information of the content databases, specify:
`--ListCache --Verbose`

Removing restore jobs

- To delete all the restore job statuses, specify:
`--DeleteAllJobs Confirm`
- To delete a specific restore job, specify:
`--DeleteJob=JobID`

Recovering a site item to the original site

- Suppose you want to recover the site item `/Shared Documents/Document.txt` that was backed up from the site `http://computer.company.com:25884/sites/AnikyB`. Suppose the recovery site is `http://computer.company.com:38000/sites/AnikyB`. To recover the item to the original location, specify:

```
--Recover  
--Source http://computer.company.com:38000/sites/AnikyB  
--Destination http://computer.company.com:25884/sites/AnikyB  
--TempLocation="C:\Recovery"  
--Items "/Shared Documents/Document.txt"
```

The recovery session finishes and the following message is displayed:

```
recovery ended, object status:  
  object: [/Shared Documents/Document.txt]  
  destination: [/Shared Documents/Document_MOSSGR_24032010-024302.txt]  
  status: Finished  
  status details: [recovered to [http://computer.company.com:  
                  25884/sites/AnikyB//Shared Documents]]
```

Recovering a site item to another location

- To recover the site item `/Shared Documents/Document.txt` to My Documents, specify:
`--Recover`
`--Source http://computer.company.com:38000/sites/AnikyB`
`--Destination http://computer.company.com:25884/sites/AnikyB`
`--TempLocation="C:\Recovery"`
`--Items "/Shared Documents/Document.txt:/My Documents"`

Removing content databases from the cache

- To remove a database from the cache, specify:
`--RemoveFromCache --ContentDB DatabaseName --BackupID BackupID`
- To remove all the content databases from the cache, specify:
`--RemoveFromCache --All`

Removing content databases from disk

- To delete a content database from the disk after you have removed it from the cache, specify:
`--RemoveFromCache --ContentDB DatabaseName --DeleteFiles`

Setting content database automatic removal

Content databases remain available for 21 days (default retention period), afterwards they are removed from the cache.

- To display the time (number of days) a content database remains available before it is removed from the cache, specify:
`--GetOption RecoveryDatabaseAutoCleanupDays`
- To set how long a content database remains available before it is automatically removed from the cache, specify:
`--SetOption RecoveryDatabaseAutoCleanupDays --Value number_of_days`

Exporting items from a content database

- To export an item from a content database, specify:
`--Export --Source source --Location path
--Item item`
- To export items from a content database, specify:
`--Export --Source source --Location path
--Items item1 item2 item3`

NOTE:

Workflows cannot be exported.

Listing exported items

- To list the exported items, specify:
`--ListExport --Location`

Importing items from a content database

- To import an item from a content database, specify:
`--Import --Destination destination --Location path`
`--Item item`
- To import items from a content database, specify:
`--Import --Destination destination --Location path`
`--Items item1item2item3`

NOTE:
Workflows cannot be imported.

Displaying Microsoft SharePoint farm information

- To display detailed information of the farm, such as name, display name, address, type name, role, version, status and all services running in this farm, specify:
`--FarmInfo`

Displaying content database information

- To display content database information such as: Office Servers, Shared Services, SharePoint configuration, Share Services Search, Recovery Web Application, Shared Services Content, SharePoint Admin Content, content database name, specify:
`--DatabaseInfo`

Displaying a list of sites

- To display the Web Application name, the site's URL, content database name and the all the sites in this content database, specify:
`--ListSites`

Browsing sites

- To browse a My Site structure and items such as: Forms, Lists, Template Gallery, Master Page Gallery, Personal Documents, Shared Documents, Shared Pictures, Site Template Gallery, User Information List, and Web Part Gallery, specify:
`--BrowseSite --Site http://ivanka/personal/anikyb`

Displaying Granular Recovery Extension version

- To display the Granular Recovery Extension version, specify:
`--Version`

Chapter 7: Troubleshooting

This chapter lists general checks and verifications, plus problems you might encounter when using the Data Protector Granular Recovery Extension for Microsoft SharePoint.

- For Microsoft SharePoint troubleshooting information, see the troubleshooting sections of the Microsoft SharePoint Server parts of the *HPE Data Protector Integration Guide*.
- For general Data Protector troubleshooting information, see the *HPE Data Protector Troubleshooting Guide*.

The folder with debugs entries and logs is located in the folder:

Microsoft SharePoint Server 2010:

C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\14\LOGS\GranularRecovery

Microsoft SharePoint Server 2013:

C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\15\LOGS\GranularRecovery

This folder contains the files `debugs.txt`, `debugs_cliproxy.txt`, `note.txt`, and `note_cliproxy.txt`. The folder location may vary depending on where you install the Microsoft SharePoint Server.

During installation, a setup debug log is created in the `Data_Protector_program_data\tmp\shp_gre_setup.txt` file.

Troubleshooting Known Issues and Workarounds

Installation reports a warning "No full read permissions"

Problem

When installing the MS SharePoint Granular Recovery Extension component, Data Protector reports the following warning:

Windows SharePoint Services Search service has no full read permissions for all content databases.

Action

You can safely ignore the warning. However, to prevent it from appearing again, proceed as follows:

1. Open SQL Server Management Studio.
2. Under **Security**, expand **Logins**, right-click the user account under which the Windows SharePoint Services Search service is running, and click **Properties**.
3. In the Properties dialog box, click **User Mapping**. Select all content databases and assign the following two database roles to the user:

- db_owner
 - WSS_Content_Application_Pools
4. Click **OK** to apply the changes.

Remote installation fails

Problem

When installing the MS SharePoint Granular Recovery Extension component remotely, the session fails with an error similar to the following:

```
[Critical] ClientName Post-installation script for the MS SharePoint Granular Recovery Extension failed with the output: CreateProcessWithLogonW failed, trying LogonUser/CreateProcessAsUser, GetLastError(): 1326 LogonUser failed, GetLastError(): 1326
```

Action

Make sure that the user account under which Data Protector tries to connect to the Microsoft SharePoint Server system (for example, the Farm Administrator) has been assigned the **Allow log on locally** policy:

1. On the Microsoft SharePoint Server system, open **Administrative Tools** and then **Local Security Policy**.
2. Under Security Settings, expand **Local Policies** and then click **User Rights Assignment**.
3. Right-click the **Allow log on locally** policy, click **Properties**, and add the user.
4. Click **OK** to apply the changes.

An import job fails - Insufficient user rights

Problem

After performing an Import From Backup, the Granular Recovery Import Job Status page reports a failed status in the Restoring phase.

Restore fails with not enough user rights

Central Administration > Granular Recovery Import Job Status
Click **Refresh** to update jobs list.

Active
No import of content database to recovery cache is in progress.

History

Status	ID	Name	Started By	Started	Ended	Details
	1021ebca-05b3-4637-9a90-27e9069e5111	gr-job-restore-recovery-database_WSS_Content_2010/04/13-2	user	9/16/2010 4:25:37 PM	9/16/2010 4:26:58 PM	Checking disk space Restoring - Restore failed.

Action

Ensure the user account under which the Windows SharePoint Services Timer service is running is assigned the `Data ProtectorStart restore`, and the `See private objects` user rights. For example, if the Windows SharePoint Services Timer service is the one running under the `Network Service` account:

1. Launch the Data Protector GUI (**Data Protector Manager**).
2. In the Context list, select **Users**. Right-click the user group that has the `Start restore` and the `See private objects` user right enabled, and click **Add/Delete Users**.

The `Network Service` user account should be configured with the following properties:

- Name: `Network Service`
- Domain/Group: `NT Authority`
- Client system: `Any`

For details, see [Configuring HPE Data Protector user rights](#).

An import job fails - Insufficient disk space

Problem

After performing an `Import From Backup`, the Granular Recovery Import Job Status page reports `Not enough space available` and the Details column reads `Checking disk space`.

Restore fails with not enough disk space

Refresh Clear History Recovery Cache Management

Action

The root cause of the problem is that there is no Internet access and the HPEData Protector Granular Recovery Extension signature verification may take quite some time to complete. Perform the following:

- Ensure you have Internet access.
- Disable the signature verification:

To disable the HPE Data Protector Granular Recovery Extension signature verification, proceed as follows:

1. Locate the `cliproxy.exe` and the `HP.Sharepoint.GranularRecovery.CLI.exe` files in the Microsoft SharePoint Server BIN folder. By default, the BIN folder is located in the following directory:

Microsoft SharePoint Server 2010:

C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\14

Microsoft SharePoint Server 2013:

C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\15

2. In the BIN folder, create the configuration files `cliproxy.exe.config` and `HP.Sharepoint.GranularRecovery.CLI.exe.config` with the following content:

```
<?xml version="1.0" encoding="utf-8" ?><configuration>  
  <runtime>  
    <generatePublisherEvidence enabled="false"/>  
  </runtime></configuration>
```

Recovery session fails

Problem

If you start a recovery session by connecting to the original website, the following message is displayed:

No recovery available for this site http://computer:25884/sites/User! Please contact Granular Recovery Administrator for further info!

Action

The root cause of the problem is that the content database is not in the cache. Perform an import job.

Granular Recovery Cache Management link is not accessible from My Sites - Manage Farm Features

Problem

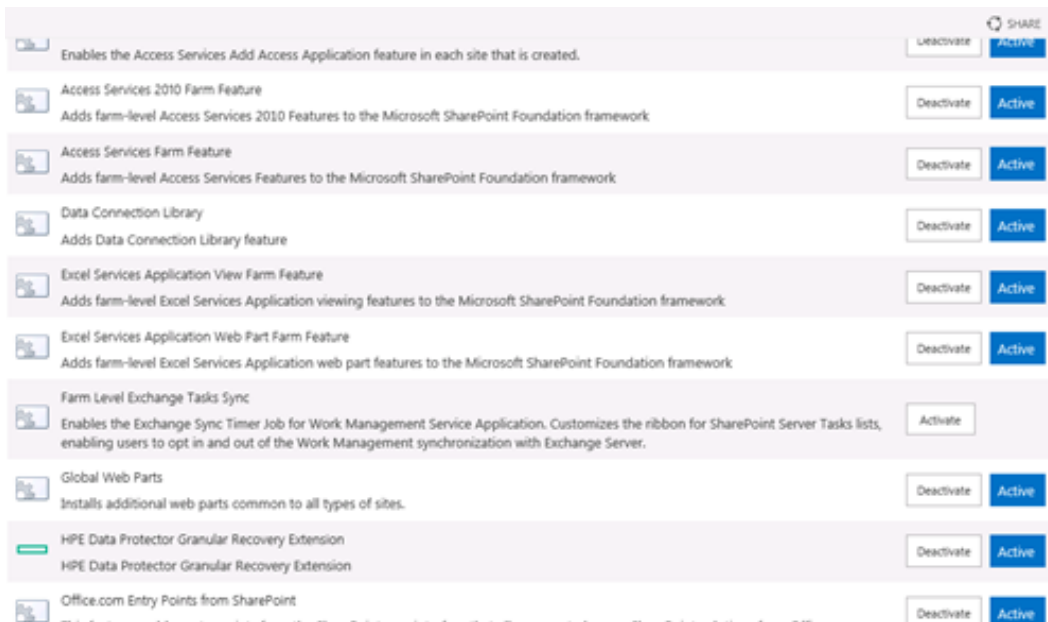

After you create a new site collection or a new web application and then back up your new site collection, you cannot access the Granular Recovery Cache Management link from My Sites (**Site Actions > Site Settings > Granular Recovery** for Microsoft SharePoint Server 2010 or **settings icon > Site Settings > Granular Recovery** for Microsoft SharePoint Server 2013). The following message is displayed:

GR resource files are missing in site's "App_GlobalResources" folder.

Action

1. Open **Central Administration** as follows:
Microsoft SharePoint Server 2010/2013:
Under System Settings, select **Manage Farm Features**.
2. By the HPE Data Protector Granular Recovery Extension, click **Deactivate**. The Warning page is displayed, click the **Deactivate this feature** link. Return to Manage Farm Features. By the HPE Data Protector Granular Recovery Extension, click **Activate**.

Manage Farm Features deactivating HPE Data Protector Granular Recovery Extension

Granular Recovery Cache Management link is not accessible from My Sites - Read permission

Problem

After you create a new site collection or a new web application and then back up your new site collection, you cannot access the Granular Recovery Cache Management link from My Sites (**Site Actions > Site Settings > Granular Recovery** for Microsoft SharePoint Server 2010 or **settings icon > Site Settings > Granular Recovery** for Microsoft SharePoint Server 2013). The message "Access denied." is displayed. The following debug entry is displayed:

```
[6 - Fatal] FATAL debugs - Recovery.aspx: OnPreInit: - Exception: Thread was being aborted.
```

Action

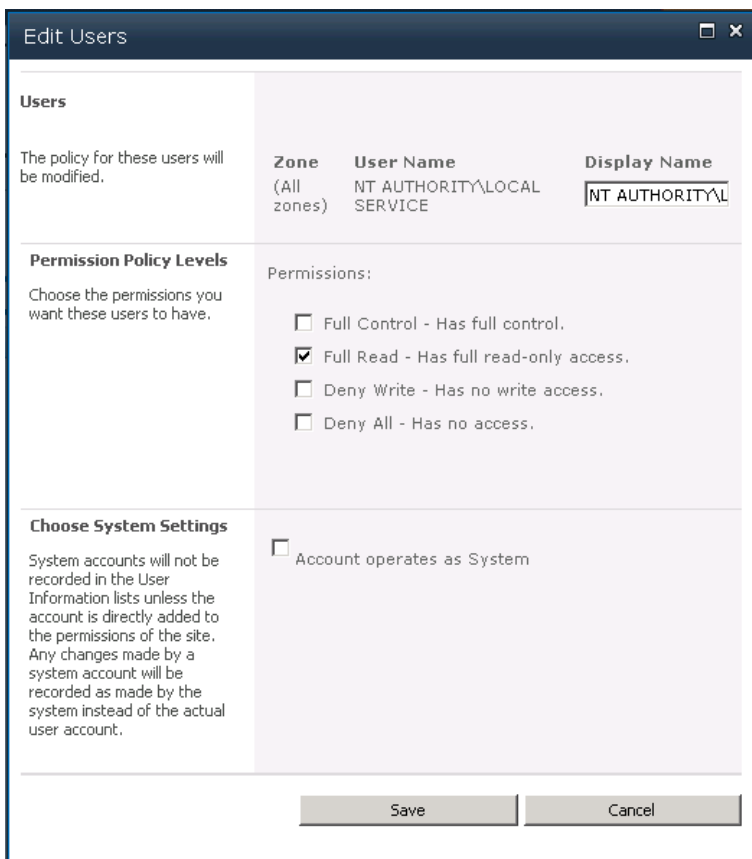

Application pool users of every web application in the farm must be granted the Read permissions on the Recovery Web Application. To grant the Read permission to application pool user accounts:

1. Connect to the Microsoft SharePoint Server Central Administration system as follows:
Microsoft SharePoint Server 2010/2013:
Under Application Management, select **Manage web applications**, select **Recovery Web Application**, and click **User Policy**, the Policy for Web Application is displayed.
2. If a user does not exist in the Policy for Web Application, click **Add Users**. In the Add Users page, select **All Zones** and then click **Next**. Enter application pool users, select **Full Read - Has full read-only access** and then click **Finish**.

If a user exists in the Policy for Web Application, select the user and then click **Edit Permission of Selected Users**. In the Edit Users page, select **Full Read - Has full read-only access** and then click

Save.

Granting Full Read permission

HPE Data Protector Granular Recovery Extension is not available on a newly created Web Application

Problem

After you added a new Web Application or a new Front-end Web Server to the farm where HPE Data Protector Granular Recovery Extension is already installed, the Site Collection Administrator may have problems with accessing the Granular Recovery Extension user interface. HPE Data Protector Granular Recovery Extension is not available on the newly created Web Applications.

Action

1. Open **Central Administration** as follows:
Microsoft SharePoint Server 2010/2013:
Under System Settings, select **Manage Farm Features**.
2. By the HPE Data Protector Granular Recovery Extension, click **Deactivate**. The Warning page is displayed, click the **Deactivate this feature** link. Return to Manage Farm Features. By the HPE Data Protector Granular Recovery Extension, click **Activate**.

Import from backup or from filesystem fails

Problem

Import from backup or from filesystem ends with an error `Checking disk space – Unknown error` occurred. This problem may occur if Microsoft SQL prerequisites are not met on one or more systems in the farm.

Action

Make sure that all prerequisites are installed. In case you had to install the missing packages, restart SharePoint Timer service and IIS on the updated clients.

Changing default recovery settings fails

Problem

When starting the recovery process, you cannot change the default recovery settings, for example, the recovery location. As the default recovery settings are configured in the pop-up windows, the problem can be caused by the enabled pop-up blocker in your browser.

Action

Disable any pop-up blocker software in your browser.

Recovery fails with "Unknown error has occurred, contact administrator." error message

Problem

Recovery fails with "Unknown error has occurred, contact administrator." error message and in the debug.log there is a debug line logged "System.ServiceModel.FaultException: There was an exception running the extensions specified in the config file. --> Maximum request length exceeded."

It happens as the size of the item being recovered exceeds the maximum allowed content length of a request body.

Action

Navigate to `%ProgramFiles%\Common Files\Microsoft Shared\web server extensions\15\TEMPLATE\LAYOUTS\web.config` file and increase the maximum allowed content length on every remote farm's Web Front End (WFE) by adding the following code:

```
<location path="GranularRecovery/RemoteFarm.aspx">
<system.web>
<!-- maxRequestLength is in kilobytes (KB) -->
<httpRuntime maxRequestLength="102400"/>
```

```
</system.web>  
<system.webServer>  
<security>  
<requestFiltering>  
<!-- maxAllowedContentLength is in bytes (B) -->  
<requestLimits maxAllowedContentLength="104857600"/>  
</requestFiltering>  
</security>  
</system.webServer>  
</location>
```

NOTE:

The code added is an example for setting the limit to 100 MB. If you need to recover files greater than 100 MB, you need to set values in the code accordingly.

Slow response of the command line interface

Problem

You can notice slow response of the HPE Data Protector Granular Recovery Extension command line interface. For example when you run the `HP.Sharepoint.GranularRecovery.CLI.exe --help` command, the command takes from 10 seconds to several minutes to display the usage. The root cause of the problem is the HPE Data Protector Granular Recovery Extension signature verification which may take quite some time to complete.

Action

To disable the HPE Data Protector Granular Recovery Extension signature verification, proceed as follows:

1. Locate the `cliproxy.exe` and the `HP.Sharepoint.GranularRecovery.CLI.exe` files in the Microsoft SharePoint Server BIN folder. By default, the path of the BIN folder is:

Microsoft SharePoint Server 2010:

`C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\14\BIN`

Microsoft SharePoint Server 2013:

`C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\15\BIN`

2. In the BIN folder, create the configuration files `cliproxy.exe.config` and `HP.Sharepoint.GranularRecovery.CLI.exe.config` with the following content:

```
<?xml version="1.0" encoding="utf-8"  
  ?><configuration><runtime><generatePublisherEvidence  
  enabled="false"/></runtime></configuration>
```

Slow response of the graphical user interface

Problem

You can notice slow response of the HPE Data Protector Granular Recovery Extension GUI. For example when importing a content database from backup or from filesystem. The import job might fail, due to a time-out. The root cause of the problem is the HPE Data Protector Granular Recovery Extension signature verification which may take too long to complete.

Action

To disable the HPE Data Protector Granular Recovery Extension signature verification, proceed as follows.

1. Locate the `cliproxy.exe` and the `HP.Sharepoint.GranularRecovery.CLI.exe` files in the Microsoft SharePoint Server BIN folder. By default, the path of the BIN folder is:

Microsoft SharePoint Server 2010:

`C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\14\BIN`

Microsoft SharePoint Server 2013:

`C:\Program Files\Common Files\Microsoft Shared\Web Server Extensions\15\BIN`

2. In the BIN folder, create the configuration files `cliproxy.exe.config` and `HP.Sharepoint.GranularRecovery.CLI.exe.config` with the following content:

```
<?xml version="1.0" encoding="utf-8" ?><configuration>
  <runtime>
    <generatePublisherEvidence enabled="false"/>
  </runtime></configuration>
```

The Data Protector service is not running

Problem

When performing an import from filesystem session, the following message is displayed: Required Data Protector service is not running!

Action

1. Open Control Panel, double-click **Administrative tools**, and double-click **Services**. Find the Data Protector services, right-click the disabled service, and click **Start** to enable it.
2. In the Backup Version Selection page, click **Back** to finish your session.

The restoring - Mount Request Pending status

Problem

When performing an import from backup session, the status **Restoring - Mount Request Pending** is displayed on the Granular Recovery Import Job Status page.

Action

1. Launch the Data Protector GUI (Data Protector Manager).
2. In the Monitor context, check for any mount requests. Confirm the mount requests and restart the backup session.
3. Once the backup session is finished, perform an import from backup session again.

Subfolders are not recovered to original location

Problem

When recovering a folder with subfolders the parent folder is recovered but its subfolders are not.

Action

After you delete a folder, Microsoft SharePoint Server places this folder in the Site Collection Recycle bin. To recover your folder and its subfolders to original location using Granular Recovery Extension:

1. In the Site Collection Recycle bin, select the folder and click Delete Selection.
2. Perform a recovery session of your folder again.

Granular Recovery Extension component installation fails

Problem

Installing HPE Data Protector with the HPE Data Protector Granular Recovery Extension component enabled fails.

Action

To manually install the HPE Data Protector Granular Recovery Extension without using standard HPE Data Protector installation procedure:

1. Log on to the Microsoft SharePoint Server Central Administration system under a Microsoft SharePoint Server **Farm Administrator** user account.
2. In the Start menu, right-click **Command Prompt** and select **Run as Administrator**.
3. Change the current directory to the *Data_Protector_home\bin* directory where the files from the self-extracting archive were extracted during the product installation process.
4. Run `grm_install.bat` to install the HPE Data Protector Granular Recovery Extension solution.

Granular Recovery Extension removal fails

Problem

After HPE Data Protector deinstallation, the HPE Data Protector Granular Recovery Extension is not removed from the system.

Action

To manually remove the HPE Data Protector Granular Recovery Extension without using standard HPE Data Protector removal procedure:

1. **Microsoft SharePoint Server 2010/2013:**

Start SharePoint 2010/2013 Management Shell using the SharePoint system account.

2. From the *Data_Protector_home\bin* directory, run:

```
grm_check.ps1
```

Installation ends unexpectedly on a farm with multiple servers on Central Administration

Problem

On a farm with multiple servers on Central Administration, the installation of the HPE Data Protector Granular Recovery Extension ends unexpectedly.

Action

Ensure that the following service is enabled on Central Administration:

Microsoft SharePoint Server 2010/2013:

Microsoft SharePoint Foundation Web Application

Enabling Central Administration Services

The screenshot shows the SharePoint Central Administration interface. At the top, there is a navigation bar with 'Site Actions' and 'Server \Administrator'. Below this, the page title is 'Central Administration > Services on Server'. A sidebar on the left contains navigation links for 'Central Administration', 'Application Management', 'System Settings', 'Monitoring', 'Backup and Restore', 'Security', 'Upgrade and Migration', 'General Application Settings', and 'Configuration Wizards'. The main content area displays a table of services. The table has columns for 'Service', 'Status', and 'Action'. The 'Microsoft SharePoint Foundation Web Application' service is highlighted in blue, and its status is 'Started'. Other services include 'Access Database Service', 'Application Registry Service', 'Business Data Connectivity Service', 'Central Administration', 'Claims to Windows Token Service', 'Document Conversions Launcher Service', 'Document Conversions Load Balancer Service', 'Excel Calculation Services', 'Lotus Notes Connector', 'Managed Metadata Web Service', 'Microsoft SharePoint Foundation Incoming E-Mail', 'Microsoft SharePoint Foundation Sandboxed Code Service', 'Microsoft SharePoint Foundation Subscription Settings Service', and 'Microsoft SharePoint Foundation Workflow Timer Service'.

Service	Status	Action
Access Database Service	Started	Stop
Application Registry Service	Started	Stop
Business Data Connectivity Service	Started	Stop
Central Administration	Started	Stop
Claims to Windows Token Service	Stopped	Start
Document Conversions Launcher Service	Stopped	Start
Document Conversions Load Balancer Service	Stopped	Start
Excel Calculation Services	Started	Stop
Lotus Notes Connector	Stopped	Start
Managed Metadata Web Service	Started	Stop
Microsoft SharePoint Foundation Incoming E-Mail	Started	Stop
Microsoft SharePoint Foundation Sandboxed Code Service	Stopped	Start
Microsoft SharePoint Foundation Subscription Settings Service	Stopped	Start
Microsoft SharePoint Foundation Web Application	Started	Stop
Microsoft SharePoint Foundation Workflow Timer Service	Started	Stop

Part 2 - Microsoft Exchange and the Granular Recovery Extension

This part of the guide describes the Data Protector Granular Recovery Extension for Microsoft Exchange Server 2010 and Microsoft Exchange Server 2013 (hereafter both referred to as **Microsoft Exchange Server** unless differences are pointed out).

This part includes the following chapters:

[Introduction](#)

[Installation](#)

[Configuration](#)

[Backup](#)

[Recovery](#)

[Command Line Interface](#)

[Troubleshooting](#)

Chapter 8: Introduction

The Granular Recovery Extension for Microsoft Exchange Server (**the extension**) does not provide you with any backup solution. Use the Data Protector Microsoft Exchange Server 2010 integration to back up Microsoft Exchange Server 2010 mailbox and public folder databases or Microsoft Exchange Server 2013 mailbox databases (**databases**). Use the extension to restore Microsoft Exchange Server mailbox database files and to recover Microsoft Exchange Server single items or complete mailboxes.

Thus, the extension enables you to recover individual mailbox items, such as e-mail folders, calendar, contacts, or notes, with no need to recover the whole Microsoft Exchange Server mailbox or the entire mailbox database.

Granular Recovery Extension Documentation set

- **Electronic PDF format**

The HP Data Protector Granular Recovery Extension User Guide for Microsoft Exchange Server provides information specific to this extension:

- For detailed information about Data Protector specifics, see the Data Protector [Documentation set](#).
- For detailed information about Microsoft Exchange Server specifics, refer to the official Microsoft Exchange Server documentation.

- **Help**

To complete the information presented in this guide available in the electronic PDF format, the Granular Recovery Extension for Microsoft Exchange Server provides the context-sensitive (F1) Help integrated in the Microsoft Management Console (MMC). The Help explains the pages and options available in the Granular Recovery Extension Graphical User Interface (GUI). You can access the Help by pressing F1, or by clicking the question mark (? Help) in the action pane.

Accessing the Help

Backup

The Granular Recovery Extension for Microsoft Exchange Server does not provide you any backup solution. Back up your Microsoft Exchange Server databases using the HP Data Protector Microsoft Exchange Server 2010 integration.

- the HP Data Protector Microsoft Exchange Server 2010 integration
- the HP Data Protector Microsoft Volume Shadow Copy Service integration

For more information on the HP Data Protector Microsoft Exchange Server backup solution, see the *HPE Data Protector Integration Guide*.

Restore and recovery

The extension offers you the following benefits:

- **Recovery granularity**

The smallest Microsoft Exchange Server object that you can restore is a database. After the restore you can browse individual Microsoft Exchange Server mailbox items, such as e-mail folders, calendar, contacts, or notes. Thus, you can select to recover the entire database or the desired mailbox items only.

- **Multiple restore requests**

You can receive multiple restore requests concurrently.

- **Recovery of multiple mailboxes**

You can recover multiple mailboxes concurrently.

- **Recovery to different locations**

You can recover Microsoft Exchange Server items to:

- the original location in a mailbox
- a different location:
 - a different mailbox
 - a Personal Folders file (.pst)
You can recover your Microsoft Exchange Server items to a Microsoft Office Outlook client located on a different Microsoft Exchange Mailbox Server without the extension's component installed, by using a Personal Folders file (.pst).
 - a different Mailbox Server node without the extension's component installed

- **Easy to search**

You can filter your Microsoft Exchange Server items by specifying the e-mail subject, author, date, terms in the attachments name, or even terms in the message body of e-mail messages. The Microsoft Exchange Server items can be searched before the recovery process is started. This way you can preview all the Microsoft Exchange Server items which will be recovered.

- **Secure operation of the extension**

To restore and recover Microsoft Exchange Server items, you (as a Microsoft Exchange Server administrator) must be assigned the `start_restore` user right by a Data Protector backup administrator.

For detailed information, see the [Configuring user account for the Granular Recovery Extension](#).

- **Microsoft Management Console (MMC) snap-in**

The extension's Graphical User Interface (GUI) is a Microsoft Management Console (MMC) snap-in integrated with the Exchange Management Console (EMC). You can find the extension's entry point above the EMC entry point (Microsoft Exchange icon) in the console tree.

The Granular Recovery Extension entry point

The integration eases switching between managing Exchange tasks and performing Granular Recovery Extension tasks such as requesting restores, starting recovery sessions, and so on.

Chapter 9: Installation

The Data Protector Granular Recovery Extension for Microsoft Exchange Server is used to recover individual Microsoft Exchange Server mailbox items. Depending on the configuration of your Microsoft Exchange Server environment, you may need to install the corresponding Data Protector component on single or multiple Microsoft Exchange Server systems.

As part of Granular Recovery Extension package installation process, the IIS (Internet Information Service) service is restarted. Please plan accordingly for installation of Granular Recovery Extension package so that other applications dependent on IIS can be taken care in advance.

Prerequisites

- Install the following to the chosen Microsoft Exchange Server system:
 - The Data Protector MS Exchange Server 2010+ Integration component.
 - The Data Protector User Interface component.
 - All required non-Data Protector components.
- Keep the TCP/IP port 60000 (default) free on the chosen Microsoft Exchange Server system.

Microsoft Exchange Server software

Install the following:

- Microsoft Exchange Server
Make sure that you have correctly installed and configured the Microsoft Exchange Server environment.
For supported versions, platforms, devices, and other information, see the latest support matrices at <https://softwaresupport.hpe.com/manuals>.
For information on installing, configuring, and using Microsoft Exchange Server, see the Microsoft Exchange Server documentation.
- Microsoft Management Console (MMC) 3.0 or later
- .NET Framework 3.5.1
- Internet Information Services (IIS) 6.0 or later

Data Protector software

Install the following Data Protector components:

- The Data Protector User Interface component
- The Data Protector MS Exchange Server 2010+ Integration component on all Microsoft Exchange Server systems

Make sure that you installed and configured your Data Protector backup solution as described in the *HPE Data Protector Installation Guide* and in the *HPE Data Protector Integration Guide*.

Other non-Data Protector software and services

- Install Windows PowerShell 1.0 or later (a Windows Management Framework Core package)
- Localization for PowerShell other than English is not supported (The Windows OS must use the English Localization).
- Keep the TCP/IP port 60000 (default) free for the Granular Recovery Web service.
- Configure a firewall to allow new ports.

Chapter 10: Configuration

This chapter describes the configuration steps that you need to follow.

Meeting Data Protector configuration requirements for the Granular Recovery Extension

Configuring the Granular Recovery Web service port

The Granular Recovery Web service establishes communication using the TCP/IP 60000 port number. If other service is using this port number, configure the Granular Recovery Web service to use an alternative port number:

1. Without starting the extension, search for the following Windows Registry key: HKEY_LOCAL_MACHINE\SOFTWARE\Hewlett-Packard\OpenView\OmniBackII\Plugins\exchgre.
2. Edit the key `Client port` and enter the new port number.
3. Update the IIS configuration to have the new port value for the Granular Recovery Web service by running the command:

```
IISWeb /create Web Service web site path website name /b new port number
```

Where:

Web Service web site path is the root path for the Granular Recovery Web service web site. The default path `C:\inetpub\wwwroot`.

website name is the web site hosted by the Granular Recovery Web service.

new port number is the new port number on which Granular Recovery Web service establishes communication.

For example:

```
IISWeb /create c:\inetpub\wwwroot "HP MS Exchange GRE" /b 8000
```

Configuring user account for the Granular Recovery Extension

Configure your Granular Recovery Extension (GRE) user account with the following user rights and privileges:

Data Protector user rights

Make sure you have the following Data Protector user rights assigned:

1. Open the Data Protector GUI (**Data Protector Manager**).
2. Create a new user group to be used by the extension, for example, `GRE_Microsoft_Exchange_Server`.

For details on adding user groups, see the *HPE Data Protector Help* index: "adding, user groups".

3. Assign the following Data Protector user rights to the `GRE_Microsoft_Exchange_Server` user

group:

Monitor, **Abort**, **Mount request**, **Start restore**, **Restore to other clients**, and **See private objects**.

For details on assigning Data Protector user rights, see the *HPE Data Protector Help* index: “changing, user rights”.

Assigning Data Protector user rights to the GRE_Microsoft_Exchange_Server user group

- Each time you perform a new installation of the Granular Recovery Extension, add a Data Protector user to the GRE MS Exchange user group. Specify the following General User properties:

Name: SYSTEM, **Domain or UNIX Group:** NT AUTHORITY, **Client system:** *ComputerName*
(Specify the computer name which contains the node with the Granular Recovery Extension installation).

For the detailed procedure, see the *HPE Data Protector Help* index: “adding, users”.

Other necessary privileges

Assign the following permissions to your GRE user account:

- creating Windows Registry keys
- setting the Windows registry key values

Privileges for executing Exchange Management cmdlet operations

To create a remote runspace for executing the Exchange Management cmdlet operations remotely, configure user credentials with specific Exchange Management roles. These operations are executed as part of Microsoft Exchange Server backup and restore operations and are necessary for successful operation of the extension.

Configure your GRE user account with the following Exchange privileges:

- a member of the specific Exchange Management built-in role groups with certain built-in management roles assigned:
 - the Organization Management role group
 - the Discovery Management role group
 - the Mailbox Import Export management role

As a member of the Organization Management role group, you are not assigned this management role by default. Assign the role to your GRE user account to be able to recover Exchange mailbox items to the original location in the original mailbox or to a Personal Folders file (.pst).

NOTE:

Recovery to a .pst file requires you to create a network shared folder with read/write permissions granted to the Exchange Trusted Subsystem group.

- a member of the administrators group of the Microsoft Exchange Server system on which the extension is installed

The user credentials specified in the Remote Powershell Configuration dialog box are stored locally in the Windows Registry under the HKEY_LOCAL_MACHINE\SOFTWARE\Hewlett-Packard\OpenView\OmniBackII\Plugins\exchgre directory, on the Microsoft Exchange Server system on which the extension is installed.

IMPORTANT:

Only user credentials (a username, password and domain name) of a single user can be stored. Each time you enter new user credentials the existing ones are overwritten. The encrypted password is stored on the Microsoft Exchange Server system on which the extension is installed.

For more information on the Exchange Management cmdlet operations and on how to assign the Exchange Management built-in management roles, see the Microsoft Exchange Server documentation.

Chapter 11: Backup

The Granular Recovery Extension for Microsoft Exchange Server does not provide you any backup solution. Back up your Microsoft Exchange Server databases using the HP Data Protector Microsoft Exchange Server 2010 integration.

For more information on the HP Data Protector Microsoft Exchange Server backup solution, see the *HPE Data Protector Integration Guide*.

The following backup types are supported: Full, Incremental, Copy, and Differential.

The following disk-based backups are not supported:

- Microsoft Volume Shadow Copy Service (VSS) zero downtime backup (ZDB) to Disk
- VSS ZDB to Disk + Tape
- VSS ZDB instant recovery transportable

For detailed information on backup types, see the *HPE Data Protector Help* index: “backup types”.

NOTE:

The recovery procedure does not differ by Data Protector backup type.

Chapter 12: Restore and recovery

Limitations

Data Protector Granular Recovery Extension limitations

- Databases or mailboxes encrypted by third party applications cannot be recovered.
- The **View** button in the action pane is meant for the future use. Thus, you cannot customize columns displayed in the results pane in the Cache Management and Status pages yet.
- The recovery of Public Folder mailboxes, team/site mailboxes, and linked mailboxes are not supported.
- The mount-point folder path that points to a mount volume location without a drive letter is not a supported restore location path.

Microsoft Exchange Server limitations

- Due to Microsoft Exchange Server `Restore-Mailbox` cmdlet limitation, the items stored in the Exchange Server special folders cannot be browsed in the Granular Recovery – Recovery Settings Page:
 - using the **Recover to an existing folder** option that sets the target of the original mailbox.
 - using the **Recover into different Mailbox** option that sets the target of the different mailbox.

You can recover items where the target is a special folder only when using the option **Recovery to original location**.

- Due to the Microsoft Exchange Server limitations, the restore of Public Folder mailbox databases is not supported.
- Due to the Microsoft Exchange Server 2013 limitation in identifying the deleted team mailboxes, those mailboxes cannot be filtered out.
- Due to the lack of direct support of single mailbox item recovery by Microsoft Exchange Server 2013, the search query is formed with the supported options "subject", "From", "sent", and "Received" to narrow down the search of selected mails/items for recovery. Due to this approach, selected or unselected mails / items that match the search query are recovered.
- The Microsoft Exchange GRE integration uses Exchange Web Services (EWS) for displaying found mails. Because of Exchange server throttling policy, EWS can return only 1000 items at a time. As result, in Search Results screen, after selecting the folder in left panel, only 1000 mails are displayed in right panel.

Considerations

Data Protector Granular Recovery Extension considerations

- Two or more instances of the Granular Recovery Extension GUI or the GUI and the command-line interface (CLI) cannot be used at the same time.
- Any Microsoft Exchange Server operations, such as creating or deleting the Recovery Database, that are performed outside the Granular Recovery Extension (GRE) using management tools such as the Exchange Management Console, while the GRE user interface is open, are not reflected in the GRE user interface.
- Multiple restore requests for the same backup object (mailbox database) from the same backup version are processed once.
- The **Export List ...** button is displayed in the action pane, if you select the HP Data Protector Granular Recovery Extension node. The button creates a list of all the contents displayed in the console tree: Cache Management, Status (Import Sessions / Recovery Sessions) and Settings Microsoft Exchange. The list can be exported in the following formats: text, Unicode text, comma-separated value (CSV), and Unicode CSV. This functionality is provided by default by the Microsoft Management Console (MMC).
- You can perform multiple recovery requests for the same restored database.
- In the GRE wizard, you can specify search criteria to narrow the list of items which you can select for recovery. After entering some values in the Mailbox Search Criteria page, and selecting one or more items for recovery in a specific mailbox folder, any items in this folder's subfolders will also be recovered if they meet the same search criteria.
- The Search Results page displays only three levels of folders, which does not affect your restore process. If you select an item on the third level, its child items will also be restored.
- Make sure the destination folder is empty before performing restore.

TIP:

You can specify a new restore folder in the Restore Settings page of the Import From Backup wizard, and the extension creates a new folder.

- In the Mailbox Selection page of the Import from Backup wizard, the Mailbox user names starting with non-ASCII characters are grouped under --.
- Non-ASCII characters are not supported in paths. When typing the restore path, avoid non-ASCII characters. Otherwise the restore may fail.
- If a recovery database already exists in a target location on a mailbox server, the Granular Recovery Cache keeps all the versions without deleting them.
- You can perform multiple restore requests to the same target location.
- Multiple recovery databases can be created on a mailbox server.
- The number of recovery databases is limited by the disk space available in the temporary restore location.
- The Granular Recovery Cache keeps only one recovery database (RDB) mounted per Microsoft Exchange mailbox server, even though the restored database files are still on the disk once the recovery session finishes.

On a Microsoft Exchange mailbox server, there is only one recovery database stored.

For example, in a DAG environment, each mailbox node can contain one recovery database, but only on one server there can be a mounted recovery database.

Data Protector considerations

- The Granular Recovery Extension cannot restore or recover items from backup images created with the Data Protector Microsoft Volume Shadow Copy Service (VSS) integration.
- The Granular Recovery Extension does not support Instant Recovery (IR).

Microsoft Exchange Server considerations

- The option of recovering data into a PST file is only available for Microsoft Exchange Server 2010 environments using Microsoft Exchange Server 2010 SP1 or a later service pack.
- Moved or deleted mailbox databases cannot be searched (the Microsoft Exchange Server known issue). However, you can recover a moved mailbox once it was moved.

Deleted mailboxes are displayed in the Import From Backup wizard, on the Import from Backup — Mailbox Selection only if the retention period is not expired. Once the retention period is reached and the deleted mailbox is no longer available in the Import From Backup wizard, re-importing the mailbox database that contains the needed mailbox is necessary.

For details, see [Importing mailbox databases](#).

- In the Microsoft Exchange Server 2013 environment, a combination of `New-MailboxRestoreRequest`, `Search-Mailbox`, and `New-SearchMailbox` cmdlet operations induces storage space and performance factors which cannot be avoided due to Microsoft Exchange Server limitations.
- Make sure that active databases in a standalone or DAG configuration (the GRE supported Microsoft Exchange Server configuration) have two times of a source mailbox size storage space for creating temporary mailboxes during recovery.
- Make sure that target mailboxes to which recovery items are to be stored have sufficient storage space for storing the recovered items.
- The Microsoft Exchange Server 2013, requires restart of the "Microsoft Exchange Information Store service" on mailbox server where database is restored for better performance of databases. However not doing this will not stop accessing the restore database, but Microsoft recommends to perform restart of the service. Hence restart the " Microsoft Exchange Information Store service" service manually after performing successful restore of database operation.

Restore and recovery flow

To restore and then recover the Microsoft Exchange Server items, follow the basic steps:

1. Import

a. Restore

The Data Protector Granular Recovery Extension uses the Data Protector Microsoft Exchange Server 2010 integration to restore the Microsoft Exchange Server databases.

Temporary restore location

First the Microsoft Exchange Server database files are saved to a temporary restore location. Restore the database files (.edb), checkpoint files (.chk), reserve transaction log files (.jrs), and transaction log files (.log) to the specified temporary restore location on a Microsoft Exchange Server system.

A recovery database (RDB) is created in the temporary location.

The restored files are located on the Microsoft Exchange Server system that is chosen as the restore target system. The default location is C:\Restore, but you can specify a different restore location.

For details, see [Changing settings](#).

After successful restore of mailbox databases from their backup images, the restored databases are available in the granular recovery cache.

b. Mount

Mount the restored database in the granular recovery cache to the Microsoft Exchange Server. Before browsing and recovering items you have to mount the restored database files.

2. Recover

Browse and recover the Microsoft Exchange Server items from the recovery database to the original mailbox database, or to any different location.

3. Dismount

Only one recovery database can remain mounted, for this reason when you no longer need to recover items from a recovery database:

- Dismount the recovery database from the Microsoft Exchange Server.

Once you dismount the recovery databases, the recovery databases are still in the Granular Recovery — Cache Management but their status are dismounted. At this point, you can still remount them if needed for another recovery session.

4. Removal

The recovery databases remain in the cache for 30 days (default value) or for as long as it is set in the retention time.

After the retention time expires, the database is dismounted and removed from the Granular Recovery Extension cache automatically, but the restored database files still exist in temporary restore location.

- Optionally, change the retention period. For detailed procedure, see [Changing the retention period](#).
- Optionally, remove the no longer needed recovery database from the cache manually before the retention period. For detailed procedure, see [Removing databases](#).
- The restored database files still remain in temporary restore location, you can completely remove them, by deleting the files from the temporary restore location manually.

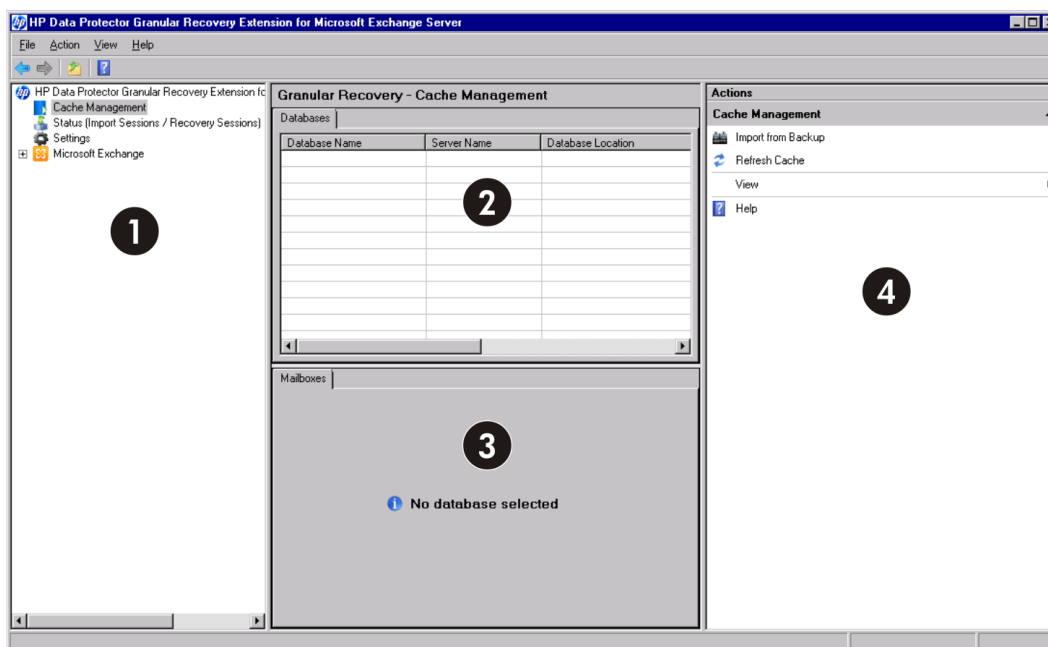

Opening the HP Data Protector Granular Recovery Extension GUI

To open the extension:

1. Log in to the Microsoft Exchange Server system where the Granular Recovery Extension is installed.
2. Click the **Start** button and then click the HP Data Protector Exchange GRE icon to open the extension's Graphical User Interface (GUI).

The HP Data Protector Granular Recovery Extension for Microsoft Exchange Server is started.

Main window of the Granular Recovery Extension Graphical User Interface (GUI)

Item	Description
1	Console tree
2	Result pane
3	Work pane
4	Action pane

NOTE:

In the Microsoft Exchange Server 2010 environment, the Exchange Management tasks are managed using the Exchange Management Console (EMC) accessible by clicking the Microsoft Exchange icon in the console tree of the Granular Recovery Extension Graphical User Interface (GUI).

In the Microsoft Exchange Server 2013 environment, the Exchange Management tasks are managed by using the Exchange Administration Center (EAC). The EAC has its own web based graphical user interface and cannot be accessed through the extension's Microsoft Management Console (MMC) snap-in GUI.

3. In the console tree, click the **Cache Management** icon.

The empty **Granular Recovery - Cache Management** is displayed.

The remote powershell has to be configured before performing any granular recovery operations. See [Remote powershell configuration](#).

To import Microsoft Exchange Server databases, follow the procedure for [Importing mailbox databases](#).

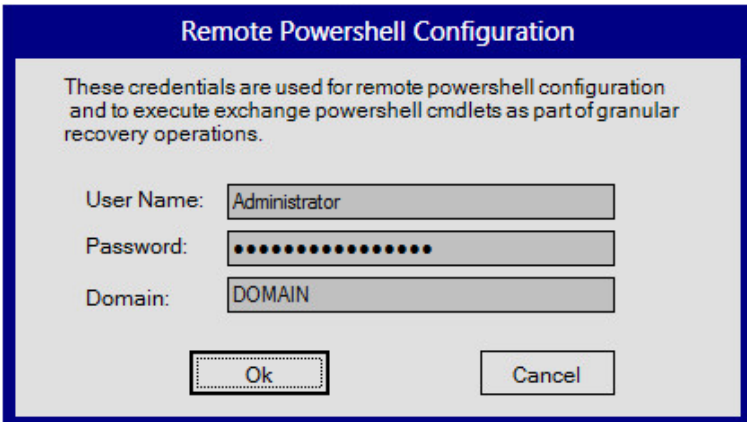

Remote powershell configuration

Configure a user account for executing the Exchange Management cmdlet operations remotely.

For details, see [Privileges for executing Exchange Management cmdlet operations](#).

If no valid user credentials are specified for executing the Exchange Management cmdlet operations remotely, the Remote Powershell Configuration dialog box is displayed. Enter the required user credentials and click **OK**.

Remote powershell configuration

Remote Powershell Configuration

These credentials are used for remote powershell configuration and to execute exchange powershell cmdlets as part of granular recovery operations.

User Name: Administrator

Password:

Domain: DOMAIN

Ok Cancel

Importing mailbox databases

Prerequisites

- Make sure sufficient disk space is available on the target Exchange Mailbox Server.

Considerations

- The Granular Recovery Extension cannot restore or recover items from backup images created with the Data Protector Microsoft Volume Shadow Copy Service (VSS) integration.
- The Data Protector Granular Recovery Extension does not support Instant Recovery (IR).

Limitations

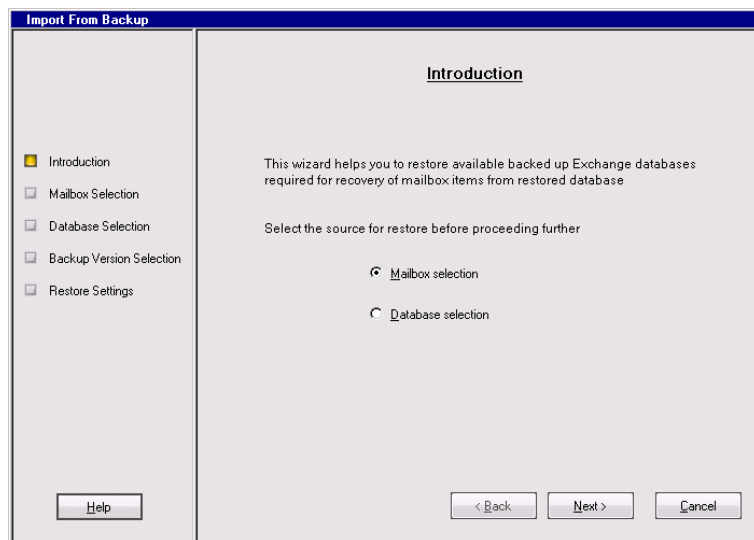

- In the Mailbox Selection page of the Import from Backup wizard, the deleted mailbox database names can be identified by the suffix @@De1eted in the mailbox display name. However, if there are more mailbox databases with the same display name, only one entry is displayed. To be able to import other mailboxes with the same name, contained in the database, use the Database selection page instead of Mailbox selection page.
- Deleted mailboxes are no longer displayed after the expiration of the retention period.
- If a mailbox is moved from a standalone environment to new standalone environment, an import from backup can be performed in the original environment. The backup version displayed is the one that still contains the mailbox in the original standalone environment.

Procedure

Before browsing and recovering items, you have to import databases:

1. In the console tree, click the **Cache Management** icon. The **Granular Recovery Cache Management** page is displayed in the results pane.
2. In the action pane under the Cache Management node, click **Import from Backup**. The Import From Backup wizard is displayed.

Selecting a restore object

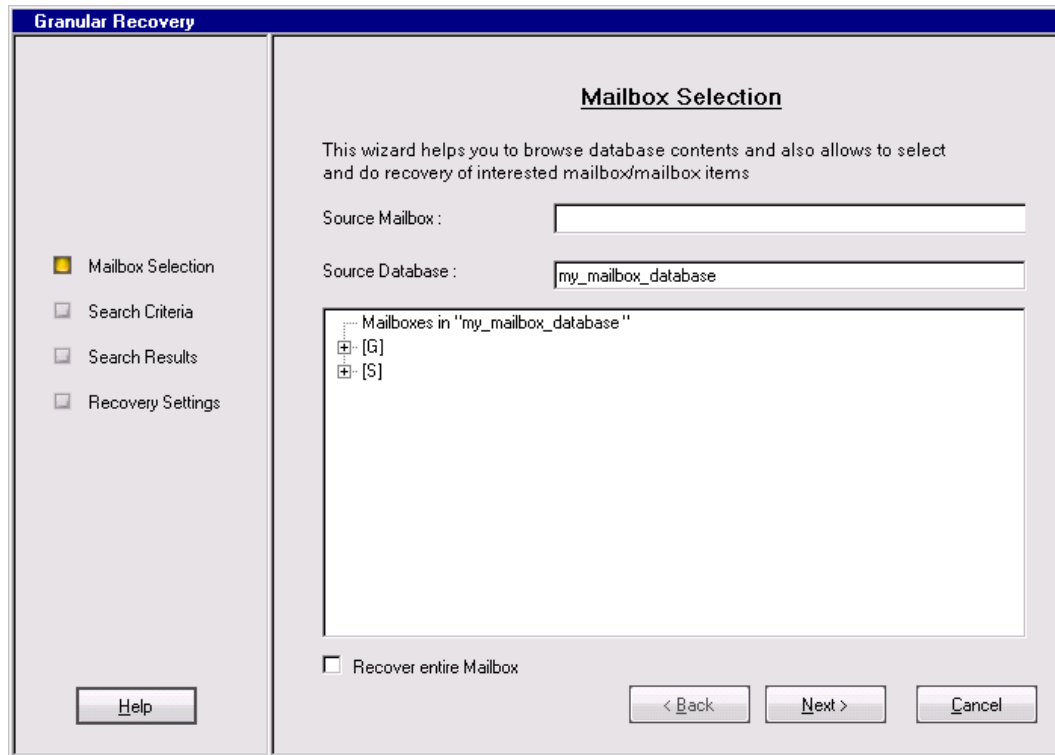

3. In the Introduction page, select a backup source:
 - To import only a specific mailbox, select **Mailbox selection** and click **Next**. The Mailbox Selection page is displayed.

TIP:

Mailbox selection is especially useful if the mailbox database is unknown.

Selecting a desired mailbox

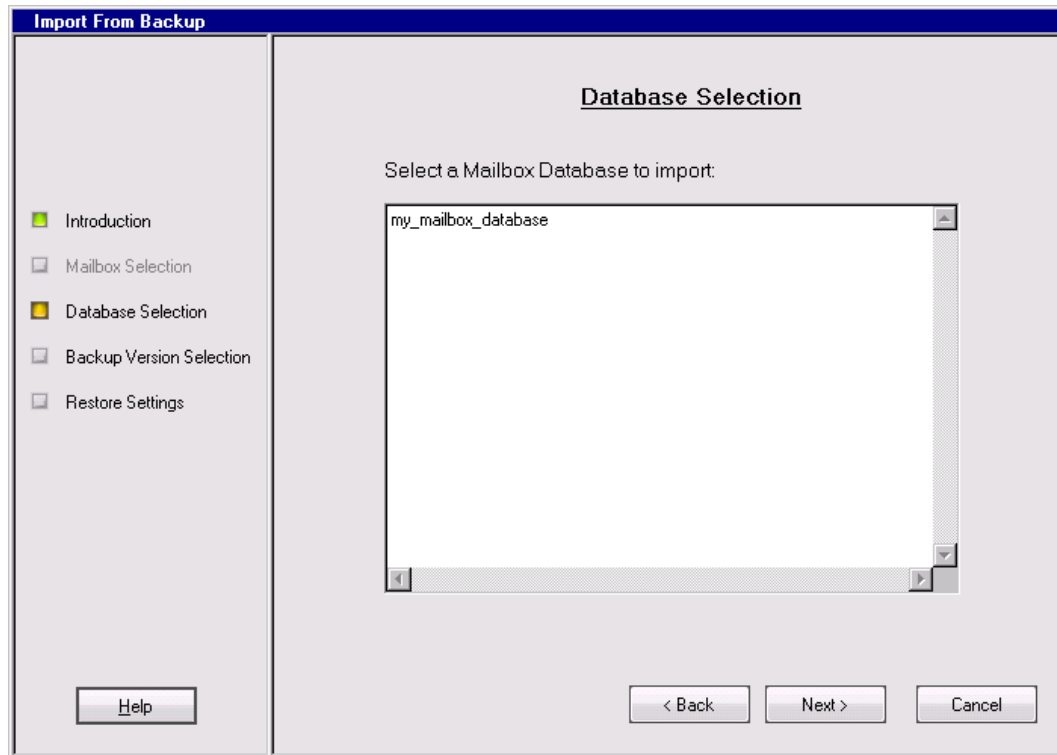

- a. Specify the mailbox user name, and click **Next**.
 - b. The Backup Version Selection page is displayed. Select the backup data you want to restore and click **Next**.
- To import a complete database and all the mailboxes contained in the database, select **Database selection** and click **Next**.

NOTE:

The database selection for restore can be useful if, for any reason, the mailbox you want to recover is not visible in the Mailbox Selection page.

Selecting a mailbox database

- a. The Database Selection page is displayed. Select the database you want to restore and click **Next**.
- b. The Backup Version Selection page is displayed. Select the backup version you want to restore and click **Next**.

Adjusting the restore settings

Import From Backup

Restore Settings

Database Name :

Server Name :

Restore Location :
(Path to store database) (for e.g., C:\Restore)

Unmount Recovery Database if one is already mounted

Click "Finish" to start importing Databases

Status can be checked by clicking on "Granular Recovery Status (Import sessions / Recovery Sessions)" node on the left pane of the Main Window

Make sure that the destination folder is empty before performing restore.

TIP:

You can specify a new restore folder in the Restore Settings page of the Import From Backup wizard and the extension creates a new folder.

5. Optionally, you can dismount a recovery database if one already exists in the Granular Recovery Cache Management on the server specified in the Restore Settings page. Select the option and click **Finish**.
6. To monitor the restore session, in the console tree click **Status (Import Sessions / Recovery Sessions)**. The Granular Recovery Status (Import Sessions / Recovery Sessions) page is displayed.
7. To stop the restore session, click **Abort Sessions**.

Imported database as displayed in the GUI

Mounting databases

Prerequisites

- Make sure the mailbox database files are restored (imported) in the Granular Recovery — Cache Management.

Procedure

After importing the mailbox database (once the restore process is finished), mount the database manually.

To mount the mailbox database manually:

1. In the console tree, select the Cache Management node.
2. In the results pane, select the database you want to mount.

Selecting a database

3. In the action pane under the Databases node, click **Mount Recovery Database**.

Once the database is mounted, in the work pane, the mailbox display name, size, and the last logged on username are displayed.

Starting recovery

Prerequisites

- Make sure the recovery database from which you want to recover Microsoft Exchange Server single items is mounted.

Limitations

- If you select contact items and mail items in the Search Results page, and recover them in one session, the contact items will not be recovered. You must select and recover the contact items separately.
- If several mailboxes with the same display name were disabled at the time of the backup and no other connected mailboxes in the database had the same display name, two deleted mailboxes are displayed in the Mailbox selection page after import, one with the suffix `@@Deleted` and one without. If the Granular Recovery Extension does not find the `@@Deleted` suffix and the mailbox was deleted, the **Mailbox Personal Folder** option is disabled in the Mailbox Search Criteria page. The `@@Deleted` suffix is not appended to the name of the deleted mailbox if there is no other mailbox with the same display name.

Procedure

To recover Microsoft Exchange Server single items:

1. In the console tree, select the Cache Management node. In the results pane, select the recovery database from which you want to recover.
2. In the action pane under Databases, click **Start Recovery**.

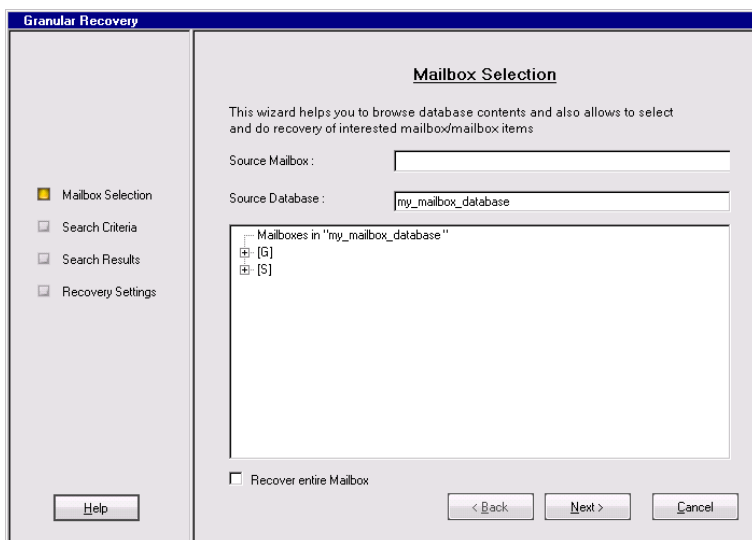

TIP:

A shortcut access to any action button, for example **Start Recovery**, is to right-click the database in the Granular Recovery—Cache Management.

3. In the Mailbox Selection page, select the mailbox for recovery. Optionally, to restore a complete mailbox folder, select the **Restore entire Mailbox** option.

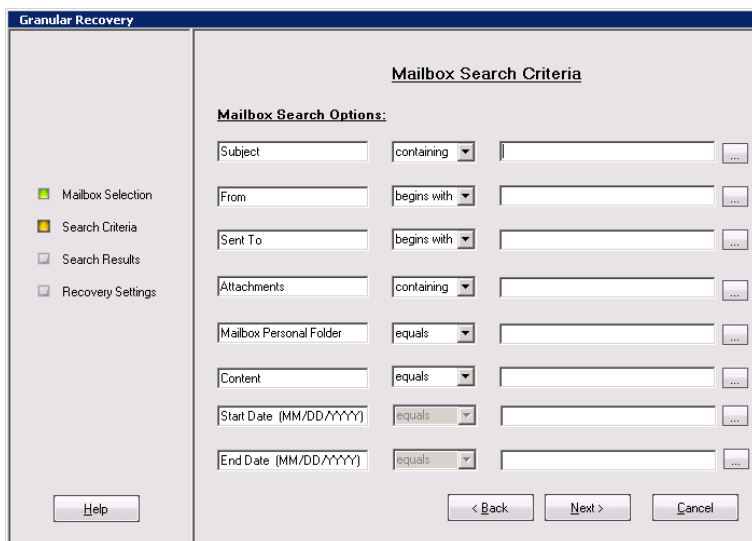

Click **Next**. The Mailbox Search Criteria page is displayed.

Selecting a mailbox

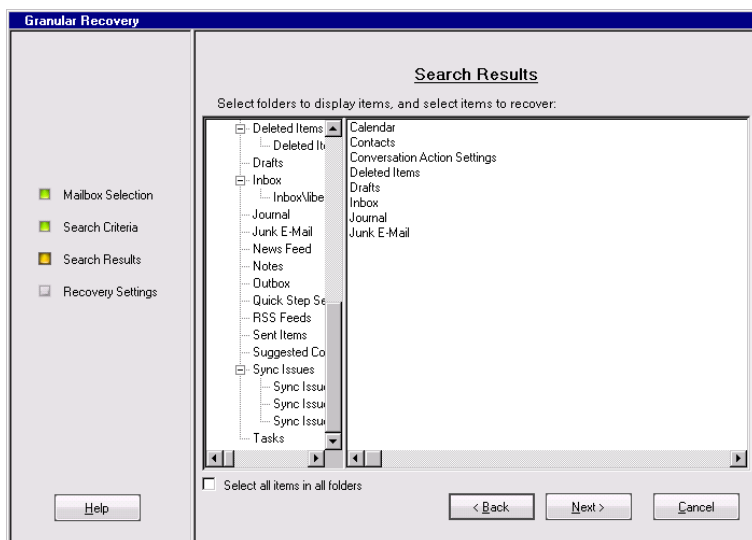

4. Filter e-mails by subject, author, recipient, attachment term, personal folder, or e-mail content, and click **Next**.

Specifying the search criteria

- In the Search Results page, select a folder from the mailbox. The items are displayed in a table.

Selecting an item for recovery

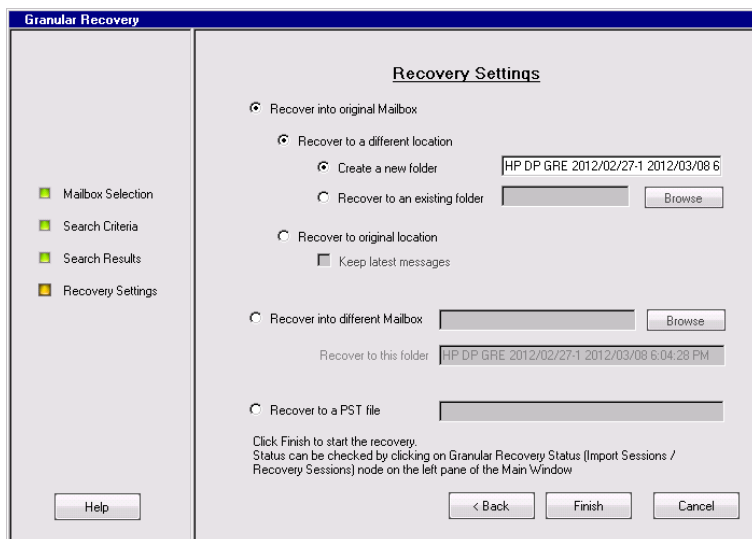

Select the item you want to recover and click **Next**. The Recovery Settings page is displayed.

TIP:

You can select multiple items by holding **Ctrl** or **Shift** button.

Specifying the target location

TIP:

If **Keep latest messages** is not selected, the items are overwritten.

- Specify the target recovery location: an existing Exchange Server mailbox or the name of the PST file to be created during recovery.

TIP:

When you recover items to an existing folder of the mailbox, only the folders you created

are displayed. Special folders, such as Inbox, Drafts, Sent Items, Deleted Items, Junk E-mail, Outbox, RSS Feeds, Sync Issues, Conversation History, Tasks, Calendars, and Contacts, cannot be set as a target, therefore are not displayed. Clicking the Browse button of **Recover to an existing folder** or, the Browse button of the **Recover into different Mailbox** does not display special folders. Only **Recover to original location** can recover items to special folders.

The PST file folder must be accessible from the Exchange Server system.

To use a remote system or current server, enter the path to the network shared folder in the following (UNC) format:

```
\\SystemName\FolderShareName\Filename.pst
```

NOTE:

Make sure the local system user account performing the recovery has read and write permissions set on the network share folder in order to create a PST file. If the folder is located on a remote server system, the Data Protector MS Exchange Granular Recovery Extension component does not need to be installed on the remote system.

Click **Finish** to start the recovery operation and close the wizard.

Dismounting databases

Prerequisites

- Make sure the recovery database you want to dismount is mounted.

Considerations

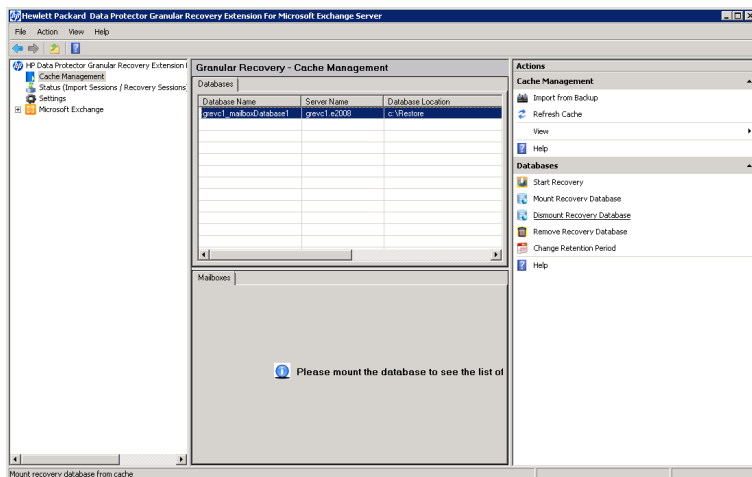

- Only one recovery database can stay mounted. For this reason, when you want to recover single items, or complete mailboxes from a different backup version or from a different mailbox database, you have to first dismount the mailbox database already presented to the Microsoft Exchange Server, the one displayed in the Granular Recovery Cache Management.

After the restore process is finished, the selected database is mounted in the Granular Recovery Cache Management. The mounted database is displayed in the results pane.

To dismount no longer needed databases from the Granular Recovery Cache Management:

1. In the console tree, select the Cache Management node. The Granular Recovery Cache Management page is displayed.
2. In the results pane, select the database. In the action pane under the Databases node, click **Dismount Recovery Database**.

Clicking Dismount

3. The confirmation dialog box is displayed. Click **Yes**. The database is dismounted, the mailbox information is no longer displayed in the work pane.

Removing databases

Prerequisites

- Make sure the recovery database you want to remove from the disk is restored.

Considerations

- The restored mailbox database is available in the Granular Recovery — Cache Management for 30 days (default value). After the retention period the database is deleted automatically.

Procedure

To remove no longer needed databases manually from the Granular Recovery — Cache Management and from the temporary restore location on the disk:

1. In the console tree, select the Cache Management node. The Granular Recovery Cache Management page is displayed.
2. In the results pane, select the database. In the action pane under the Databases node, click **Remove Recovery Database**.

Removing a database

3. The confirmation dialog box is displayed. Click **Yes**. The database is removed from the temporary restore location.

Changing settings

After the restore session is completed, the database files (.edb), checkpoint files (.chk), reserve transaction log files (.jrs), and transaction log files (.log) are copied to the temporary restore location c:\restore.

Procedure

To change the default settings of the extension:

1. In the console tree, click the **Settings** icon. The **Granular Recovery Settings** page is displayed in the results pane.
2. The temporary restore location is set to c:\restore (default). To change the temporary restore location, specify the new path by typing or browsing the new directory.
3. To set how many completed sessions (restore and recovery sessions) are displayed in the Granular Recovery Status page, specify the maximum number of history sessions.
4. To enable debugging of the Granular Recovery extension, select **Enable debug logs**. To change the default location of the debug files: type the new location, or specify a new location by clicking **Browse**, and click **Save**.

Changing default settings

Changing the retention period

Prerequisites

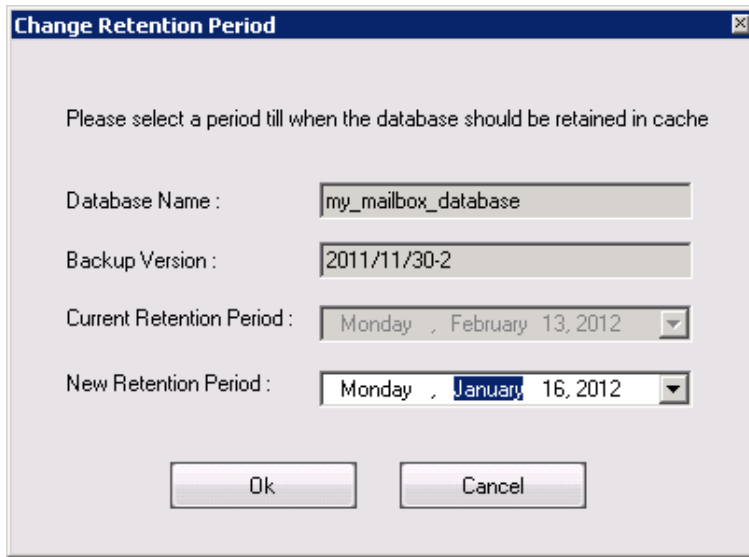

- Make sure the mailbox database is available in the granular recovery cache.

Procedure

The retention period of the mailbox databases is 30 days. After the expiration date the databases are removed from the cache automatically. To change the default value:

1. In the results pane, select the database.
2. In the action pane under the Databases node, click **Change Retention Period**. The Change Retention Period dialog box is displayed.
3. In the New Retention Period drop-down list, select the new date in the calendar.

Changing retention period

The image shows a dialog box titled "Change Retention Period" with a close button in the top right corner. The dialog contains the following fields and controls:

- Text: "Please select a period till when the database should be retained in cache"
- Database Name:
- Backup Version:
- Current Retention Period: (dropdown arrow)
- New Retention Period: (dropdown arrow)
- Buttons: "Ok" and "Cancel"

Chapter 13: Command line reference

The Data Protector Granular Recovery Extension for Microsoft Exchange Server offers a command line interface which you can use instead of the GUI.

Prerequisites

Configure a user account for executing the Exchange Management cmdlet operations remotely by using the command `--Config`, providing Username, Password, and Domain. The remote powershell has to be configured before performing any granular recovery operations using the CLI commands.

For details, see [Privileges for executing Exchange Management cmdlet operations](#).

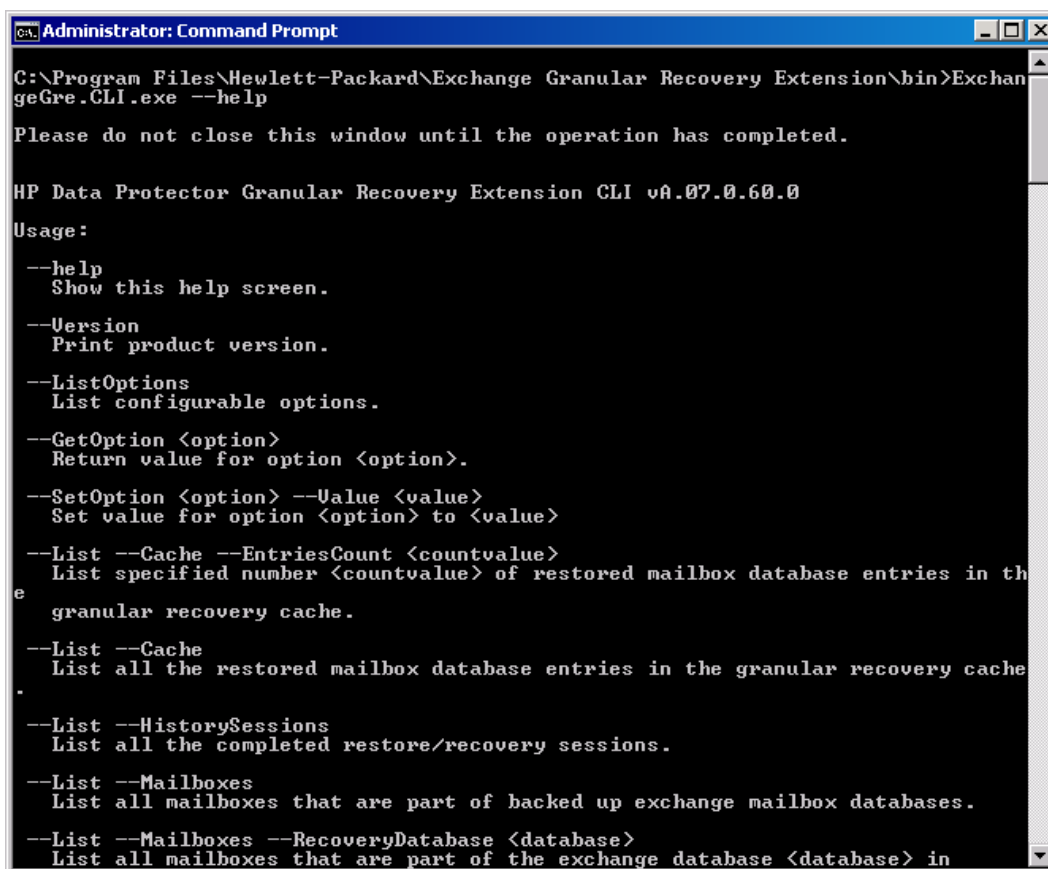

NOTE:

If no valid user credentials are specified for remotely executing the Exchange Management cmdlet operations, the command displays an error message.

The command `ExchangeGre.CLI.exe` is located in the installation directory of the extension:

`C:\Program Files\Hewlett-Packard\Exchange Granular Recovery Extension\bin`

Retrieving the command line help

```
Administrator: Command Prompt
C:\Program Files\Hewlett-Packard\Exchange Granular Recovery Extension\bin>ExchangeGre.CLI.exe --help
Please do not close this window until the operation has completed.

HP Data Protector Granular Recovery Extension CLI vA.07.0.60.0

Usage:
--help
  Show this help screen.
--Version
  Print product version.
--ListOptions
  List configurable options.
--GetOption <option>
  Return value for option <option>.
--SetOption <option> --Value <value>
  Set value for option <option> to <value>
--List --Cache --EntriesCount <countvalue>
  List specified number <countvalue> of restored mailbox database entries in the granular recovery cache.
--List --Cache
  List all the restored mailbox database entries in the granular recovery cache.
--List --HistorySessions
  List all the completed restore/recovery sessions.
--List --Mailboxes
  List all mailboxes that are part of backed up exchange mailbox databases.
--List --Mailboxes --RecoveryDatabase <database>
  List all mailboxes that are part of the exchange database <database> in

Description

ExchangeGre.CLI.exe is the command line interface of the Granular Recovery Extension for Microsoft Exchange Server. You can use it to perform queries, to restore, mount, recover, and dismount databases, to recover single items, and set different recovery options.

For a detailed description of available options see [Options](#).

NOTE:

The command line interface and the graphical user interface cannot be used at the same time.

Options

Available Options

Option	Description
--Version	Displays the version of the extension.
--Help	Displays the usage synopsis for the ExchangeGre.CLI.exe command.
--List {--Cache --HistorySessions --Mailboxes[--RecoveryDatabase RecoveryDatabaseName] --BackupVersions[--MailboxDB MailboxDatabaseID --MailboxMailboxName] --AllBackupDatabases}	<p>The --List option lists various information about the Granular Recovery Cache, mailboxes, sessions, and so on.</p> <p>The --Cache option lists the information of the restored mailbox databases in the Granular Recovery Cache Management:</p> <p>The database name, the Recovery Database ID with the granular recovery time stamp, for example RDB_ExchangeGRE_dpexchange5_2011-11-15_1, the server name, the status of the mailbox database (mounted or dismounted), and the backup version and the size of the database. With the --Verbose option you can see more details such as the database location (the directory to where the database files are restored), the date the database was restored, and the date of the expiration when the retention period is over the database is dismounted from the Granular Recovery Cache Management.</p> <p>The --HistorySessions option displays 10 restore and recovery sessions by default, with the following information: session ID, Name, Type Start Time, End time, and status (completed or failed).</p> <p>The --Mailboxes option displays all the mailbox names from the backed up Microsoft Exchange mailbox databases.</p> <p>The --BackupVersions option displays all backup versions</p>

Option	Description
	<p>available for a recovery database with information about the name, data of backup creation, the size of the backup, type of the backup, the method used to perform the backup, and the media type; as well as all backup versions of a recovery database of a specific mailbox.</p> <p>The <code>--AllBackupDatabases</code> option displays all the backup databases names.</p>
<code>--Details-- Session <i>SessionID</i></code>	<p>Displays details of the specified session.</p>
<code>--ListOptions -- GetOption <i>OptionName</i> -- SetOption <i>OptionName</i> -- Value <i>Number</i></code>	<p>The <code>--ListOptions</code> option displays the available options.</p> <p>The <code>--GetOption <i>OptionName</i></code> option retrieves the value of a specified option.</p> <p>The <code>--SetOption <i>OptionName</i> --Value <i>Number</i></code> option applies a value to a specified option.</p> <p>The following options are available:</p> <ul style="list-style-type: none"> • The <code>DebugFolder</code> option displays the path of the debug files when the <code>EnableDebugLogging</code> option is set to 1. • The <code>RestoreLocation</code> option displays the directory where the restored mailbox database files are located. • The <code>MaxHistorySessionsNumber</code> option displays how many latest restore and recovery sessions are displayed under the History Tab of the Status page the extension.
<code>--Remove {-- Sessions <i>SessionID</i> [<i>SessionID...</i>] -- AllSessions -- RecoveryDatabase <i>DatabaseName</i>-- Server <i>ComputerName</i>}</code>	<p>The <code>--Remove</code> option removes the following items:</p> <ul style="list-style-type: none"> • The <code>--Sessions <i>SessionID</i> [<i>SessionID...</i>]</code> option removes the specified sessions. • The <code>--AllSessions</code> option removes all the recovery sessions from the Granular Recovery Cache. • The <code>--RecoveryDatabase <i>DatabaseName</i> --Server <i>ComputerName</i></code> option removes a specified recovery database, or a mailbox database from the Granular Recovery Cache but not the disk.
<code>{--Mount --Dismount} - -RecoveryDatabase <i>RecoveryDatabaseName</i></code>	<p>Mounts or dismounts the recovery database specified by <code>--RecoveryDatabase <i>RecoveryDatabaseName</i></code>.</p>
<code>--Search {-- Mailbox <i>MailboxName</i> -- Cache-- Mailbox <i>MailboxName</i>-- MailboxDB <i>DatabaseName</i>}</code>	<p>Lists the mailbox user name and the database name in a backup or in the Granular Recovery Cache Management.</p>

Option	Description
<pre>--StartSession--Restore --DismountRDB [true false]--MailboxDB DatabaseName--BackupID BackupVersion--Server ComputerName-- TargetLocation TargetFolderPath</pre>	<p>Restores mailbox databases, making them available for mount and then recovery.</p> <p>The --DismountRDB option controls whether the restore session dismounts any already mounted database in the Granular Recovery Cache Management. Available values are true or false.</p>
<pre>--StartSession-- Recovery--SrcMailbox SourceMailboxName-- RecoveryDatabase RecoveryDatabaseName-- MailboxDB DatabaseName {--RecoverWholeMailbox --Filter [FILTER_ OPTIONS]}-- RecoveryTargetType [ORG_ MAILBOX DIFF_MAILBOX PST]</pre>	<p>Recovers complete mailboxes or single items.</p> <p>The --SrcMailbox option defines the mailbox from which the data is recovered. The --RecoveryDatabase option defines the Recovery Database named with the granular recovery time stamp, for example RDB_ExchangeGRE_dpexchange5_2011-11-15_1. The --MailboxDB option defines the mailbox database from which the recovery is performed. You can choose to recover a complete mailbox database by using the --RecoverWholeMailbox option, or filter the items using the --Filter option.</p> <p>Different recovery target locations are selected with the --RecoveryTargetType option:</p> <p>ORG_MAILBOX</p> <p>OrgLocation--KeepLatestMsg [true false] [RECOVERY_OPTIONS]</p> <p>If the OrgLocation option is specified, the recovery is performed to the original mailbox. If the --KeepLatestMsg option is set to true, the recovery session does not overwrite new messages.</p> <p>DIFF_MAILBOX</p> <p>DiffMailbox [RECOVERY_OPTIONS] -- TargetMailboxMailboxName</p> <p>If the DiffMailbox option is specified, the recovery is performed to another location, not the original location of items. The --CreateNewFolderNewFolderName option recovers items to a new location in a different folder than the original item's</p>

Option	Description
	<p>location (specified by Default).</p> <p>The <code>--ExistingFolderFolderName</code> uses an existing folder in the mailbox as a target for the recovered items.</p> <p>FILTER_OPTIONS</p> <p>You can filter your mailbox items by using the following filtering options:</p> <ul style="list-style-type: none">• The <code>Subject="Term"</code> options filters the subject of the e-mails. You can list more than one term by separating them with colons (:), for example <code>Subject="Report:Proposal"</code>, where the search terms are "Report" and "Proposal".• The <code>Contents="Term"</code> option searches the body of the e-mails for a specific term.• The <code>Attachments="Term"</code> option searches the attachments for a specific term.• The <code>Senders="SenderName"</code> option searches your mailbox for an author, or group list of the e-mail.• The <code>Recipients="RecipientName"</code> option searches the receiver of the e-mail.• The <code>Folders="FolderName"</code> option searches for a name of a folder in the mailbox.• The <code>StartDate="Date"</code> and the <code>EndDate="Date"</code> options filters the dates when the messages were sent and received.

Examples

NOTE:

In the examples below, `ExchangeGre.CLI.exe` is omitted for simplicity.

Changing Granular Recovery Extension settings

To list available options for the granular recovery extension, specify:

```
--ListOptions
```

To get the value of the option "EnableDebugLogging", specify:

```
--GetOption EnableDebugLogging
```

To set the value for the option "EnableDebugLogging" to "1", specify:

```
--SetOption EnableDebugLogging --Value 1
```

Restoring a mailbox database from Data Protector backup

To list the backup databases, specify:

```
--List --AllBackupDatabases
```

To import a mailbox database from the Data Protector backup session with the ID 2011/09/08-5 to the temporary restore location c:\restore, specify:

Microsoft Exchange 2010 Server :

```
--StartSession --Restore --DismountRDB false --MailboxDB DatabaseName --BackupID  
2011/09/08-5 --Server computer.company.com --TargetLocation "c:\Restore"
```

Listing mailbox database information

To list mailbox database information, such as database name, recovery database ID, server name, mount status, backup version and its size for all database entries in the granular recovery cache, specify:

```
--List --Cache
```

To list more specific details about the recovery sessions such as mailbox database name, server name, location of the restored database files, database ID, mount status, backup version, size of the database, retention period, specify:

```
--List --Cache --Verbose
```

To list mailbox database information for 20 database entries in the granular recovery cache, specify:

```
--List --Cache --EntriesCount 20
```

To list details about completed recovery sessions, such as sessions IDs, session name, type, date and time when the session started and ended, mount status, specify:

```
--List --HistorySessions
```

To list all mailboxes that are part of backed up Exchange mailbox databases, specify:

```
--List --Mailboxes
```

List all mailboxes that are part of the Exchange database "RDB_ExchangeGRE_dpexchange5_2011-11-15_1" granular recovery cache, specify:

```
--List --Mailboxes --RecoveryDatabase RDB_ExchangeGRE_dpexchange5_2011-11-15_1
```

To list all backup versions of Exchange mailbox database "Mailbox Database 0474359329", specify:

```
--List --BackupVersions --mailboxDB "Mailbox Database 0474359329"
```

To list all backup versions of backup Exchange mailbox databases that contain the mailbox "Administrator", specify:

```
--List --BackupVersions --Mailbox Administrator
```

To list backed up Exchange mailbox databases, specify:

```
--List --AllBackupDatabases
```

To show details about the completed restore session "ExchangeGRE_dpexchange5_2011-11-09_4", specify:

```
--Details --Session ExchangeGRE_dpexchange5_2011-11-09_4
```

Changing the retention period

To change the retention period of the recovery database "ExchangeGRE_dpexchange5_2011-11-09_4" on the server "dpexchange5.company.com" to end on January 15, 2012, specify:

```
--SetRP --RecoveryDatabase RDB_ExchangeGRE_dpexchange5_2011-11-15_1 --Server  
dpexchange5.company.com --Period 2012/01/15
```

Mounting a mailbox database

To mount a database, specify:

```
--MountDB --RecoveryDatabase RecoveryDatabaseName --MailboxDB DatabaseName --Server  
computer.company.com
```

To mount the restored mailbox "Mailbox Database 0474359329" database on to recovery database "RDB_ExchangeGRE_dpexchange5_2011-11-15_1" on the server "dpexchange5.company.com", specify:

```
--MountDB --RecoveryDatabase RDB_ExchangeGRE_dpexchange5_2011-11-15_1 --MailboxDB  
"Mailbox Database 0474359329" --Server dpexchange5.company.com
```

To dismount a mailbox database from the Granular Recovery Cache and still keep the files in the temporary restore location:

```
--DismountDB --RecoveryDatabase RecoveryDatabaseName --MailboxDB DatabaseName --  
Server computer.company.com
```

To dismount the mounted Exchange database "Mailbox Database 0474359329" from the recovery database

"RDB_ExchangeGRE_dpexchange5_2011-11-15_1" on the Exchange server "dpexchange5.company.com", specify:

```
--DismountDB --RecoveryDatabase RDB_ExchangeGRE_dpexchange5_2011-11-15_1 --  
MailboxDB "Mailbox Database 0474359329" --Server dpexchange5.company.com
```

Searching a mailbox

To search a mailbox "john" in a backup, specify:

```
--Search --Mailbox john
```

To search a mailbox "john" in the mounted restored database "Mailbox Database 0474359329" in the Granular Recovery Cache, specify:

```
--Search --cache --Mailbox john --MailboxDB "Mailbox Database 0474359329"
```

Recovering items to the original location

In the following recovery examples, the recovery will be performed from the mailbox database "Mailbox Database 0474359329" mounted to the recovery database "RDB_ExchangeGRE_dpexchange5_2011-11-15_1".

To restore mailbox database to a temporary restore location:

```
--StartSession --Restore --DismountRDB true --MailboxDB DataBaseName --BackupID ID  
--Server computer.company.com --TargetLocation C:/restore
```

To recover a complete mailbox to the original location replacing the old emails by the latest version, specify:

```
--StartSession --Recovery --SrcMailbox mailbox_name --RecoveryDatabase DBName --  
MailboxDB mailbox_name --RecoveryWholemailbox --RecoveryTargetType orgMailbox --  
OrgLocation --KeepLatestMsg true
```

To recover the folder "inbox" from the user mailbox "Administrator" to the original location, without overriding new messages, specify:

```
--StartSession --Recovery --SrcMailbox Administrator --RecoveryDatabase RDB_  
ExchangeGRE_dpexchange5_2011-11-15_1 --MailboxDB "Mailbox Database 0474359329" --  
Filter Folders=inbox --RecoveryTargetType orgMailbox --OrgLocation --KeepLatestMsg  
true
```

To recover only e-mails with the subject "market analysis" from the folder "inbox" from the user mailbox "john" to the original location, without overriding new messages, specify:

```
--StartSession --Recovery --SrcMailbox john --RecoveryDatabase RDB_ExchangeGRE_  
dpexchange5_2011-11-15_1 --MailboxDB "Mailbox Database 0474359329" --Filter  
subject="market analysis"|folders="inbox" --RecoveryTargetType orgMailbox --  
OrgLocation --KeepLatestMsg true
```

Recovering items to another location

To recover a complete mailbox to a new location for example a new mailbox, specify:

```
--StartSession --Recovery --SrcMailbox mailbox_name --RecoveryDatabase  
RecoveryDatabaseName --MailboxDB mailbox_name --RecoveryWholemailbox --  
RecoveryTargetType
```

To recover the complete user mailbox "Administrator" to the mailbox "john" to a new folder "recovered mailbox", specify:

```
--StartSession --Recovery --SrcMailbox Administrator --RecoveryDatabase RDB_  
ExchangeGRE_dpexchange5_2011-11-15_1 --MailboxDB "Mailbox Database 0474359329" --  
Filter Folders=inbox --RecoveryTargetType diffMailbox --DiffLocation --  
CreateNewFolder "recovered mailbox" --TargetMailbox john
```

To recover only e-mails with the subject "market analysis" from the folder "inbox" from the user mailbox "john" to a different default location, without overriding new messages, specify:

```
--StartSession --Recovery --SrcMailbox john --RecoveryDatabase RDB_ExchangeGRE_  
dpexchange5_2011-11-15_1 --MailboxDB "Mailbox Database 0474359329" --Filter
```

```
subject="market analysis"|folders="inbox" --RecoveryTargetType orgMailbox --  
OrgLocation --KeepLatestMsg true --DiffLocation --CreateNewFolder default
```

To recover only e-mails with the subject “market analysis” from the folder “inbox” from the user mailbox “john” to a different (existing) folder “recovered data items”, without overriding new messages, specify:

```
--StartSession --Recovery --SrcMailbox john --RecoveryDatabase RDB_ExchangeGRE_  
dpexchange5_2011-11-15_1 --MailboxDB "Mailbox Database 0474359329" --Filter  
subject="market analysis"|folders="inbox" --RecoveryTargetType orgMailbox --  
OrgLocation --KeepLatestMsg true --DiffLocation --ExistingFolder "recovered data  
items"
```

To recover a complete mailbox to a .pst file, specify:

```
--StartSession --Recovery --SrcMailbox mailbox_name --RecoveryDatabase  
RecoveryDatabaseName --RecoveryDatabase MailboxDB mailbox_name --  
RecoveryWholemailbox --RecoveryTargetType pst
```

To recover the complete user mailbox “john” to the file “C:\recovered\john.pst”, specify:

```
--StartSession --Recovery --SrcMailbox john --RecoveryDatabase RDB_ExchangeGRE_  
dpexchange5_2011-11-15_1 --MailboxDB "Mailbox Database 0474359329" --  
RecoverWholeMailbox --RecoveryTargetType pst --PSTfilename  
"C:\\recovered\\john.pst"
```

Removing sessions

To remove a completed recovery session with the ID 2011/09/08-5 from the Granular Recovery Cache, specify:

```
--Remove --Session 2011/09/08-5
```

To remove all the recovery sessions from the Granular Recovery Cache, specify:

```
--Remove --AllSessions
```

Removing recovery databases

To remove the mailbox database “RDB_ExchangeGRE_dpexchange5_2011-11-15_1” from disk on the server “dpexchange5.company.com”, specify:

```
--Remove --RecoveryDatabase RDB_ExchangeGRE_dpexchange5_2011-11-15_1 --Server  
dpexchange5.company.com
```

Chapter 14: Troubleshooting

This chapter lists general checks and verifications, plus problems you might encounter when using the Data Protector Granular Recovery Extension for Microsoft Exchange Server.

- For Microsoft Exchange Server troubleshooting information, see the troubleshooting sections of the Microsoft Exchange Server parts of the *HPE Data Protector Integration Guide*.
- For general Data Protector troubleshooting information, see the *HPE Data Protector Troubleshooting Guide*.

Before you begin

- To enable debugging, see [Enabling debugging option](#).
- Make sure that the latest official Data Protector patches are installed. See the *HPE Data Protector Help* index: “patches” on how to verify this.
- For general Data Protector limitations, as well as recognized issues and workarounds, see the HPE Data Protector Product Announcements, Software Notes, and References.
- For an up-to-date list of supported versions, platforms, and other information, see <https://softwaresupport.hpe.com/>

Debugging

Enabling debugging option

1. To enable the debugging option, click **Settings** in the console tree. The Granular Recovery Settings page is displayed.
2. Select the **Enable Debug Logs** option. The Debug Logs folder name field is activated. Specify a new location of the folder, and click **Save**.

For a list of known issues and workarounds, see [Known issues and workarounds](#).

Known issues and workarounds

Search Criteria Results page remains empty after at least one search keyword is entered

Problem

In the Granular Recovery wizard, in the Mailbox Search Criteria page, after you enter a term to search for and then click **Next**, no results appear in the Search Results page even if the search criteria are met for some items.

Action

To display a list of search results, proceed as follows:

1. Dismount the recovery database. For detailed procedure see [Dismounting databases](#).
2. Using the Cache Management page of the Granular Recovery Extension GUI, identify the folder where the database has been restore into. From this folder, remove the subfolder that has the string CatalogData in its name.
3. In the Exchange Management Shell, run the following command:

```
set-mailboxDatabase DatabaseName -indexenabled $false.
```
4. Mount the recovery database again. For detailed procedure, see [Mounting databases](#).
5. Start the recovery once again and follow the Granular Recovery wizard.
6. In the Mailbox Search Criteria page, re-enter the search keywords and click **Next**.

Manual removal of temporary mailboxes created by the extension

Problem

Normally, temporary mailboxes created by the extension during the recovery process, are also deleted automatically after the process completes. However, in exceptional cases (for example, if the extension stops working), the temporary mailboxes created by the extension, are not deleted automatically after the process completes and have to be removed manually.

Action

You can identify such mailboxes by the prefix DP_Recovery or DP_SEARCH.

In the Microsoft Exchange Server 2010 environment, use the Exchange Management Console (EMC) to remove the redundant mailboxes manually.

In the Microsoft Exchange Server 2013 environment, use the Exchange Administration Center (EAC) or the Exchange Management Shell (EMS) to remove the redundant mailboxes manually.

Search for mailbox items fails and reports an error

Problem

In the Microsoft Exchange Server 2010 environment, in the Granular Recovery wizard, in the Mailbox Search Criteria page, after you trigger a search using the specified criteria, the search fails with the following error:

```
ERROR debugs - Powershell error : Restore-Mailbox : Error was found for DP_
Recovery_ExchangeGRE_2011-10-03_38 (DP_Recovery_ExchangeGRE_2011-10-03_38@mail.hp-
dp.com) because: Error occurred in the step: Opening source mailbox. Failed to open
mailbox by GUID with error: The operation failed. error code: -1056749260 +
CategoryInfo: InvalidOperation: (0:Int32) [Restore-Mailbox], RecipientTaskException
+ FullyQualifiedErrorId:
DD312EA7,Microsoft.Exchange.Management.RecipientTasks.RestoreMailbox
```

Action

Install the Update Rollup 2 for Exchange Server 2010 Service Pack 1 (KB2425179) or a subsequent update. You can obtain the Update Rollup 2 from the website

<http://www.microsoft.com/download/en/details.aspx?id=12938>.

Mailboxes are missing from the list in the Import from Backup wizard

Problem

In the Import from Backup wizard, in the Mailbox Selection page, when you browse for user mailboxes after clicking **Advanced**, some mailboxes are missing from the Mailboxes tree, although they exist in the backup image of the Exchange Server database.

There can be different reasons for such a problem, including time synchronization problems within the Data Protector cell and Exchange Server problems in retrieving the mailbox metadata.

Action

If you know to which mailbox database the desired mailbox belongs, you can start the process anew by selecting the appropriate database. Follow the steps:

1. Check **Back** to return to the Introduction page of the wizard.
2. Select **Database selection**, click **Next**, and follow the wizard to complete the importing process.

Mounting a restored database fails

Problem

In the Microsoft Exchange Server 2013 environment, mounting a restored database might end up with an error.

The problem occurs when the restored database is in the "dirty-shutdown state". The database should be in the "clean-shutdown state" to be mounted successfully.

Action

1. Bring the restored database to the "clean-shutdown state" by executing the Microsoft Exchange Server `eseutil.exe` recovery command.
For more information on the `eseutil.exe` utility, see the Microsoft Exchange Server documentation.
2. Retry to mount the restored database.

Interprocess communication error being reported by the GUI

Problem

After attempting to trigger an operation from the Granular Recovery Extension graphical user interface (GUI), the following error message is displayed in a dialog box:

The communication object, `System.ServiceModel.Channels.ServiceChannel`, cannot be used for communication because it is in the Faulted state.

All subsequent user actions in the GUI fail with the same error.

This error is reported when the Granular Recovery Extension GUI is open for a period of time that is longer than the Internet Information Services (IIS) recycling time period. The IIS unloads the Exchange GRE Web Service among other web services, resulting in a communication failure between the service and the GUI.

Action

Close and then re-launch the Granular Recovery Extension GUI.

An Exchange GRE recovery or restore operation fails due to insufficient permission

Problem

If an Granular Recovery Extension recovery or restore operation fails due to insufficient permissions even when the user who executes the Granular Recovery Extension (either GUI or CLI) has sufficient permissions, the issue may arise due to insufficient permission for the local SYSTEM account.

This account needs appropriate permissions due to the following:

- The Granular Recovery Extension Web Service runs with Local SYSTEM privileges.
- The Granular Recovery Extension Web Service allows the Data Protector Inet service, which by default runs under the Windows local System user account, to execute or launch the Data Protector Exchange Integration agent. The restore session is performed using the same user account.

Action

Grant the local SYSTEM user account appropriate permissions to restore Microsoft Exchange Server databases and create recovery databases:

1. Close the currently running Exchange Granular Recovery Extension client (GUI or CLI).
2. Stop the Granular Recovery Extension Web Service.
3. Provide appropriate permissions for the local SYSTEM account.
4. Start the Granular Recovery Extension and continue the Granular Recovery Extension operations.

When a request comes from the GUI or CLI, the Internet Information Services (IIS) start the Granular Recovery Extension Web Service automatically.

The message Adding snap-in to console... is displayed for a long time

Problem

When you open the Granular Recovery Extension graphical user interface (GUI), the message MMC cannot initialize the snap-in is displayed, followed by the Adding snap-in to console... which is displayed for a long time.

When you open the GUI and locate the console tree, the Cache Management, Status and Settings nodes are not loaded.

The issue may appear if Internet Information Services (IIS) or if its associated services are not running and the Granular Recovery Extension GUI cannot communicate with the Exchange GREWeb Service.

Action

Make sure that IIS and its associated services are up and running:

1. Open the Internet Information Services (IIS) Manager, locate and select the ExchangeGre node in the console tree under the Default Web Site. The Exchange GRE Web Service home page is displayed.
2. Right-click the ExchangeGre node, click Manage Application, and then click Browse.

The snap-in is added to the MMC. When you open the GUI, the Cache Management, Status and Settings nodes are displayed. The message is not displayed anymore.

If during the step 1, the Exchange GRE Web Service home page is not displayed:

1. When the Adding snap-in to console... is displayed, click Cancel to close the message.
2. Open the Server Manager, select the Roles node. Under the Roles Summary locate the WebServer (IIS) and select it.
3. The Web Server (IIS) is displayed. Under the System Services, verify if all the services are up and running, including the Application Host Helper Service, IIS Admin Service, and the World Wide Web Publishing Service.
4. Re-open the Granular Recovery Extension GUI.

The About HP Data Protector Granular Recovery Extension for Microsoft Exchange Server does not display the product build number

Problem

You select Help **About HP Data Protector Granular Recovery Extension for Microsoft Exchange Server**, but the product version is not displayed.

The issue is caused by a Microsoft Management Console (MMC) known issue, due to a string caching mechanism in the MUI cache. The registry is not updated automatically after the upgrade. The MUI cache does not get cleared and the product version is not displayed in the MMC snap-in.

Action

To manually delete strings in the MUI cache and re-install the snap-in:

1. Click the Start button, click Run, type REGEDIT, and click OK.
2. In the Registry Editor, locate one of the following hierarchy (if they exist):
HKEY_USERS\S-1-5-21-61196776-1057610366-2591919248-500_Classes\Local Settings\Software\Microsoft\Windows\Shell\MuiCache
HKEY_USERS\S-1-5-21-2765349584-3720068851-1520285658-500_Classes\Local Settings\MuiCache\96\52C64B7E
3. Delete the following registry keys of the Granular Recovery Extension for Microsoft Exchange Server:

```
@C:\Program Files\Hewlett-Packard\Exchange Granular Recovery  
Extension\bin\GreSnapInResource.dll, -114
```

```
@C:\Program Files\Hewlett-Packard\Exchange Granular Recovery  
Extension\bin\GreSnapInResource.dll, -115
```

```
@C:\Program Files\Hewlett-Packard\Exchange Granular Recovery  
Extension\bin\GreSnapInResource.dll, -116
```

```
@C:\Program Files\Hewlett-Packard\Exchange Granular Recovery  
Extension\bin\GreSnapInResource.dll, -117
```

Close the Registry Editor.

4. Run the following command:

```
%windir%\Microsoft.NET\Framework64\v2.0.50727\InstallUtil.exe "C:\Program  
Files\Hewlett-Packard\Exchange Granular Recovery  
Extension\bin\ExchangeGre.MmcGui.dll" /install
```

5. Click the Help menu and then click the **About HP Data Protector Granular Recovery Extension for Microsoft Exchange Server** again, the product build number is displayed.

Recovery items are not getting deleted automatically from the exchange management shell

Problem

In the Exchange 2013 SP1 environment, Exchange GRE is sometimes unable to remove the mailbox restore request (initiated using "New-MailboxRestoreRequest" command) by using "Remove-MailboxRestoreRequest" command for a target mailbox even after the mailbox restore request status is updated to "completed". This could be because the Exchange server is unable to remove the request from the complete queue. As the previously executed Mailbox restore request for a mailbox is not cleaned / removed, it is not possible to initiate another recovery operation to the same target mailbox.

Action

1. Please make sure that no Exchange GRE operation is active/running.
2. Clean up the completed "restore requests" for a mailbox manually by executing the following command in the Exchange Management shell and then retry the operation. `Get-MailboxRestoreRequest -Status Completed | Remove-MailboxRestoreRequest`

PowerShell commands fail because user couldn't be found

Problem

During ExchangeGRE recovery process, new temporary mailbox is created and user is added to AD. In some environments, because of slow AD replication, PowerShell commands needs to be repeated several times until AD sync is finished and new user is available. Also in complex domain environments, in some cases it is better to leave to Exchange server to decide where it should create new user instead of using DomainController parameter which is set by default in ExchangeGRE PowerShell commands.

Action

To increase number of repeats of PowerShell commands:

1. Create new StringValue variable in key HKEY_LOCAL_MACHINE\SOFTWARE\Hewlett-Packard\OpenView\OmniBackII\Plugins\exchgre, named cmdletTimeOut and give value 100.

To remove default DomainController parameter from ExchangeGRE PowerShell commands:

1. Create new StringValue variable in key HKEY_LOCAL_MACHINE\SOFTWARE\Hewlett-Packard\OpenView\OmniBackII\Plugins\exchgre, named skipDCParam and set value to 1.

Part 3 - VMware and the Granular Recovery Extension

This part of the guide describes Data Protector Granular Recovery Extension (GRE) for VMware vSphere.

This part includes the following chapters:

[Introduction](#)

[Installation](#)

[Configuration](#)

[Backup](#)

[Recovery](#)

[Troubleshooting](#)

Chapter 15: Introduction

The HPE Data Protector Granular Recovery Extension (GRE) restores data using the Data Protector Virtual Environment integration; this extension is a recovery solution only.

This chapter provides the following information on the Data Protector GRE:

- [GRE Features](#)
- [Recovery Flow](#)

The GRE plug-in is accessible using the [Advanced GRE Web Plug-in](#) user interface.

GRE features

- **Restore and recovery:** The Data Protector GRE for VMware vSphere restores VMDK(s) to a temporary restore location (a mount proxy system) and then recovers individual VMware virtual machine files from the restored VMDK. This feature is available as Non-Cached restore and recovery in Advanced GRE Web Plug-in.
- **Presentation and recovery:** The Data Protector GRE for VMware vSphere does not restore the VMDK file to a temporary location (mount proxy) for recovering individual files. Instead, the VMDK is presented to a temporary location (mount proxy) for recovering individual files. You can perform file recovery from a VMDK, without restoring the VMDK file into a temporary location (mount proxy). GRE for VMware vSphere directly mounts the VMDK to the mount proxy host and enables the user to browse the disk and select the file(s) to recover. Hence, with presentation, it is not necessary to restore a disk (or a whole chain) of any particular backup for recovering files. This feature is available as Cached recovery in the Advanced GRE Web Plug-in.

NOTE:

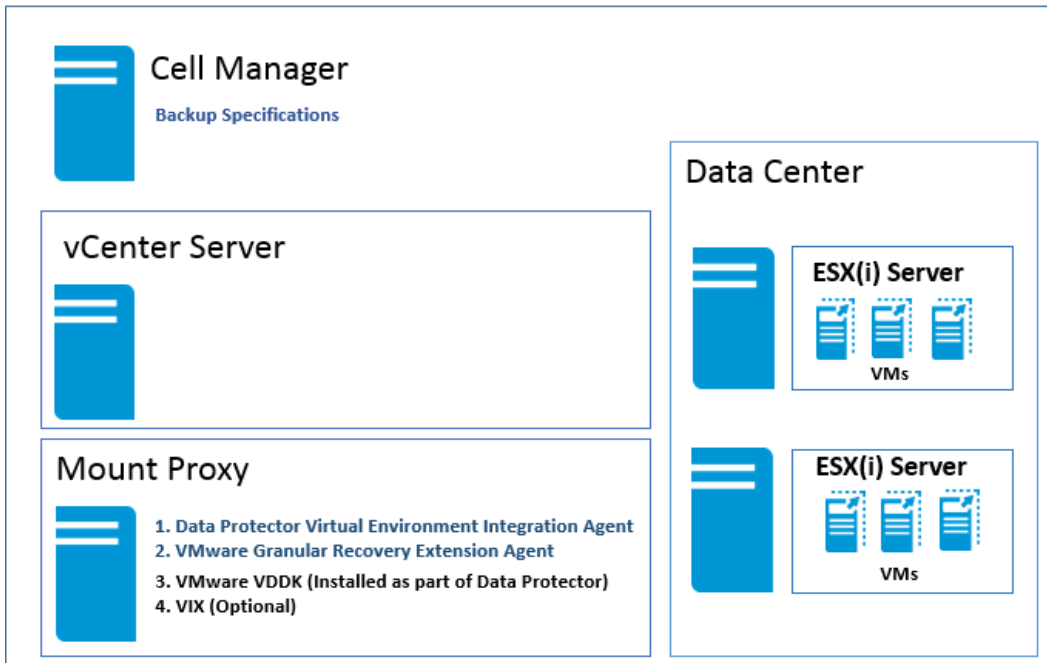

Backups done to Smart Cache and StoreOnce Catalyst devices or backups from array snapshots residing on the HPE 3PAR storage are referred to as Cached backups and the other backups are referred to as Non-Cached backups.

Recovery flow

The Data Protector Advanced GRE Web Plug-in enables file recovery from VM Disks. The Data Protector GRE environment must be configured before using the plug-in for file recovery operations. The following illustration depicts the standard GRE environment. For detailed information on meeting the requirements for the GRE environment and installing the Data Protector GRE, see the "VMware Client" section of the *HPE Data Protector Installation Guide*.

The HPE Data Protector components appear in blue, and the VMware components appear in black.

GRE Environment

Advanced GRE Web Plug-in

The following prerequisite must be met:

- Ensure that the IP address is configured in the vCenter.

The process of recovering (Cached or Non-Cached) virtual machine files using the Advanced GRE Web Plug-in is as follows:

1. Access the plug-in from the vCenter web client. See [Accessing the Advanced GRE Web Plug-in](#).
2. Configure the mount proxy systems. See [GRE Settings page](#).
3. View the list of requests. See [GRE Requests page](#).
4. Create a new request for restore or presentation. See [New Request page](#).
5. Recover files from Virtual Machines. See [Recover files page](#).

For more detailed information, see the section on [Recovery](#) .

Chapter 16: Installation

IMPORTANT:

Upgrade scenario: If you are upgrading Data Protector to the latest version, ensure that you complete the following steps after Data Protector upgrade procedure is complete:

1. Remove the existing Advanced GRE Web Plug-in.
2. Register the Plug-in again.

For more information on how to remove and register the Plug-in, see section Installing Data Protector GRE for VMware vSphere Web Client in *HPE Data Protector Installation Guide*.

The Data Protector Granular Recovery Extension requires the installation and configuration of the following systems:

- **Data Protector** cell and the following clients:
 - VMware vCenter Server system
 - Mount proxy system

With the Data Protector 9.09 release, a new service Data Protector Filter Listener Service is added, which is installed with Data Protector. This service listens to the data request from VMware, and then fetches the requested data from the StoreOnce Catalyst device. You must not start or stop this service when a GRE Power On or Live Migrate session is in progress.

When using windows backup host, ensure that Data Protector INET service and Data Protector Filter Listener Service are running under same user credentials. For detailed instructions on meeting the requirements for the GRE environment, installing the Granular Recovery Extension, and the required Data Protector components, see the, "VMware clients" section of the *HPE Data Protector Installation Guide*.

For detailed instructions on remotely or locally installing any or all of the following, see the *HPE Data Protector Installation Guide*

- Data Protector Cell Manager - See the "*Installing the Data Protector Cell Manager and Installation Server*" section.
- Data Protector clients - See the "*Installing Data Protector integration clients*", "*VMware clients*" section.

Chapter 17: Configuration

This chapter describes the configuration steps that you need to follow.

Meeting Data Protector configuration requirements for Granular Recovery Extension

This section provides information for the following:

- [Configuring GRE User Group and Users](#)
- [Configuring GRE Administrators](#)
- [Configuring Systems for vSphere](#)

Configuring a GRE for VMware vSphere user group and users

This section provides the following details:

- [Adding a GRE for VMware vSphere User Group](#)
- [Adding users to the GRE for VMware vSphere User Group](#)
- [Adding an Inet user account to the admin group](#)

Adding a GRE for VMware vSphere user group

NOTE:

The steps provided in this section are required for using the Advanced GRE Web Plug-in. User must be part of the Data Protector administrator group to perform GRE on a specific virtual machine. If not, the Data Protector restricts the user from performing the GRE operations. Also, user must have sufficient permissions or privileges on the corresponding vCenter server to perform the GRE operations. If not, the Data Protector does not restrict the user, instead the user receives an error message from the vCenter server.

Prerequisite

You must have the Data Protector User configuration user right assigned.

Procedure

To create a Data Protector group for the GRE VMware using the Data Protector GUI (Data Protector Manager):

1. In the Context List, click **Users**.
2. In the Scoping Pane, right-click **Users**.
3. Click **Add User Group** to open the wizard.
4. Under General, type the **Name** and **Description** of the new group.
5. Click **Next**.

6. Set the start restore user right for the group.
7. Click **Finish** to exit the wizard.

The new GRE VMware user group is added to Data Protector.

To add users, see [Adding users to the GRE for VMware vSphere group, below](#).

Adding users to the GRE for VMware vSphere group

NOTE:

The steps provided in this section are required for using the Advanced GRE Web Plug-in.

Prerequisite

You need to have the User configuration user right to be able to add users.

Procedure

To add users to the GRE VMware group:

1. In the Context List, click **Users**.
2. In the Scoping Pane, expand **Users**.
3. Right-click the user group to which you want to add a user.
4. Click **Add/Delete Users** to open the wizard.
5. In the Add/Delete Users dialog, enter the specific user properties.

When entering **Name** and **Group/Domain**, make sure you enter information about an existing user on your network.

To make sure that GRE VMware Administrators have an access to the administrative entry point of the extension, specify the following information:

Type : Windows

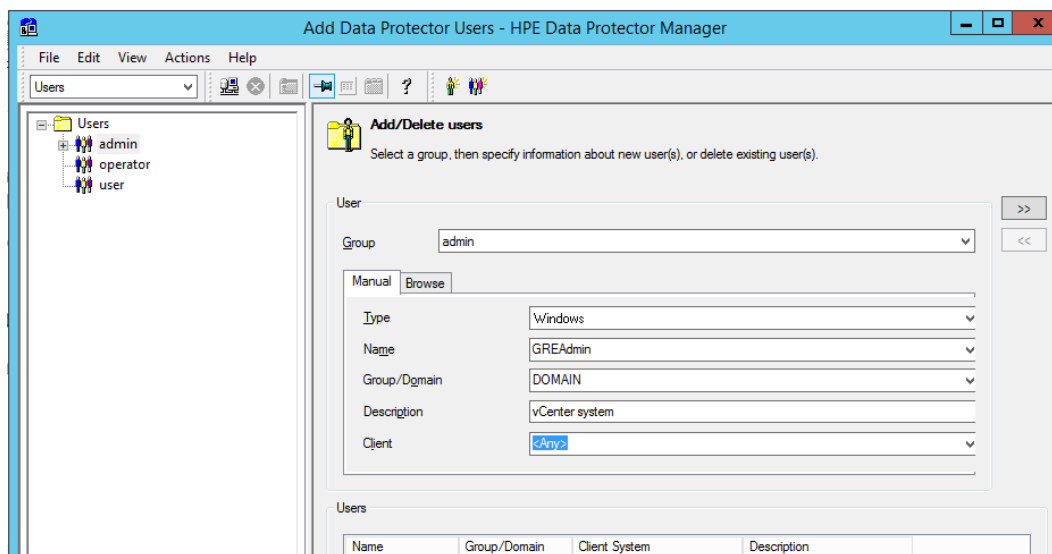

Name : *username*

Group/Domain : GRE VMware user group, VCENTER

Client : *vCenterSystemName*

The GRE VMware Administrators must be added to the vSphere permission tab. Set the user's role to Administrator.

Adding user domain information

6. Click the arrow button >> to add the user to the user list.
7. Click **Finish** to exit the wizard.

The user is added to the GRE for VMware administrators group and has the start restore user right assigned.

TIP:

To delete a user, select the user in the user list and click <<.

For details on how to configure Data Protector to meet the extension's user rights requirements, see [Configuring GRE Administrators using HPE Data Protector, on the next page](#).

Adding an Inet user account to the Data Protector Admin group

To ensure the proper functioning of the VMware Granular Recovery Extension Agent, and the VMware Granular Extension Advanced Web Plug-In extension components, you need to add an Inet user account to the Data Protector Admin user group on the following systems:

1. In the Context List, click **Users**.
2. In the Scoping Pane, expand **Users**.
3. Right-click the **admin** user group to which you want to add a user.
4. Click **Add/Delete Users** to open the wizard.
5. In the Add/Delete Users dialog, enter the following user properties:

Mount proxy system:

Type : Windows or Linux

Name : SYSTEM or root

Group/Domain : NT AUTHORITY or root

NOTE:

Make sure that you specify an existing user account on your network.

Client : *MountProxySystemName*

Set the vCenter Server system properties.

vCenter Server system:

Type : Windows

Name : the account under which the VMware vCenter Server runs (by default - SYSTEM).

Group/Domain : the account group/domain under which the VMware vCenter Server runs (by default - NT AUTHORITY).

Client : *VCenterSystemName*.

6. Click the arrow button >> to add the user to the user list.
7. Click **Finish** to exit the wizard.

The user accounts are added to the Data Protector `admin` user group with the user rights assigned to the group.

NOTE:

The Data Protector Inet uses SYSTEM, NT AUTHORITY which is used in the Data Protector Local system account (in Windows operating system).

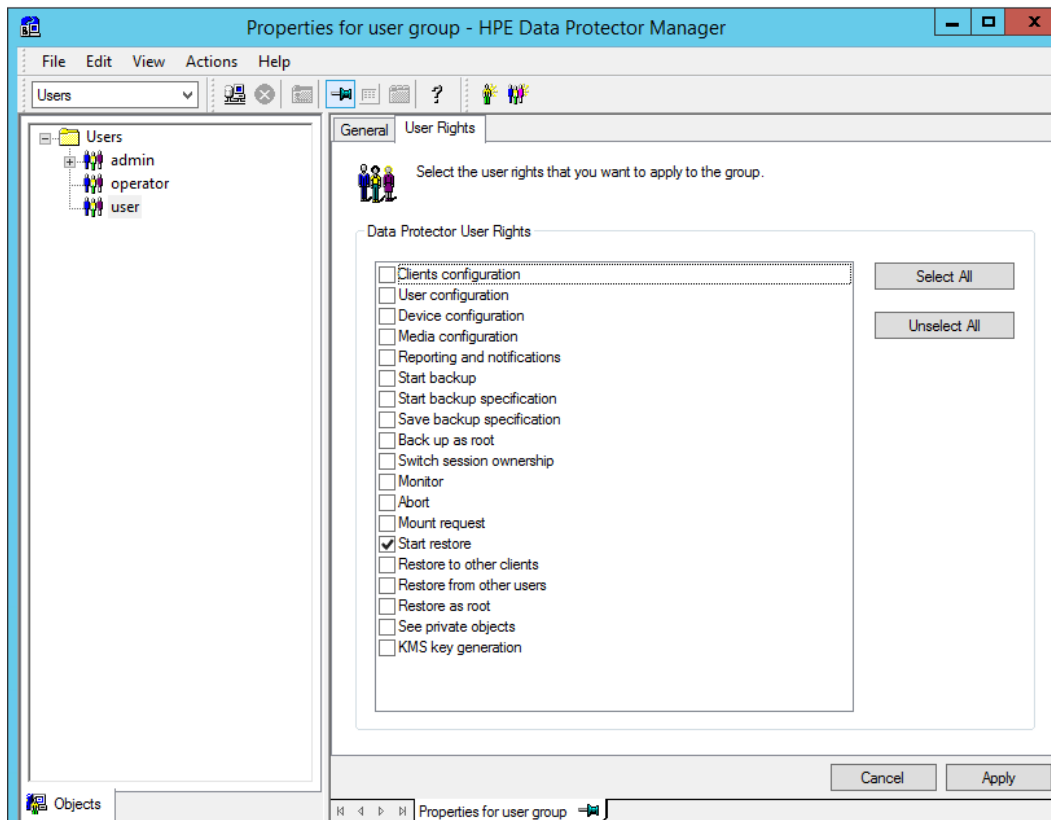

Configuring GRE Administrators using HPE Data Protector

Procedure

To enable the GRE administrators a free access to the extension and their tasks, proceed as follows using the HPE Data Protector GUI (**Data Protector Manager**):

1. In the Context list, select **Users**.
2. Right-click the GRE VMware user group.
3. Click **Properties** and then click the **User Rights** tab.
4. Make sure the Data Protector user account is assigned the Data Protector Start restore user right.

Data Protector user rights

NOTE:

The specified user rights are assigned to the user group and to all users belonging to the group. It is recommended to create a specific VMware GRE vSphere user group to which the extension's administrators belong.

For details, see [Configuring a GRE for VMware vSphere user group and users, on page 108](#).

Configuring systems for VMware vSphere

Configuring Windows/Linux Firewall exceptions

This section provides the instructions required for setting or adding the VMware Granular Recovery Extension Agent component under Firewall exceptions.

Procedure

To ensure communication between the mount proxy system component and the extension on the vCenter Server:

1. Check your Windows/Linux Firewall Exceptions list.
2. Make sure the VMware Granular Recovery Extension Agent (`vmwaregre-agent.exe`) is in the list of Windows/Linux Firewall exceptions, on both the mount proxy system and the vCenter Server systems.

Chapter 18: Backup

The HPE Data Protector GRE for VMware vSphere relies on the Data Protector Virtual Environment integration component for VMware vSphere to back up VMDK(s). Back up your VMware vSphere data using the backup solution. For details, see the *HPE Data Protector Integration Guide*, the chapter about the Virtual Environment integration.

The extension supports full, incremental and differential backups. Incremental/differential backups are supported for Cached recovery operations from StoreOnce Catalyst device only. For details on backup types, see the *HPE Data Protector Help*: “backup types”. A backup of virtual machines with user snapshots and quiescence is also supported.

NOTE:

The GRE for VMware vSphere uses the same procedure for recovery of all VMware vSphere data. The procedure does not depend on the backup type.

It is recommended to set up a dedicated mount proxy system. The extension will need to allocate extendable disk space (disk space that can be made larger) for the temporary restore location of virtual machine disks for Non-Cached recoveries.

To utilize the Cached recovery feature in the Advanced GRE Web Plug-in of the GRE for VMware vSphere, you must use a Smart Cache or StoreOnce Catalyst device for VMware vSphere VMDK backups, using the Data Protector Virtual Environment Integration component.

Backup to Smart Cache devices

The Smart Cache device is a disk-based device, which is configurable on Windows and Linux. The administrator can back up VM(s) out of a vCenter configuration to a Smart Cache device using the Data Protector GUI.

For more background information on Smart Cache devices, see the *HPE Data Protector Concepts Guide*.

NOTE:

The Smart Cache device is available as a target only for VMware Virtual Environment Integration backups. Additionally, only one directory as a datastore per Smart Cache device is supported.

The Cached recovery operation is performed when the Smart Cache device presents the disks to the mount proxy host. The Smart Cache device saves the VM disks in native format and when a presentation operation is requested, these disks are made available to the GRE agent. By managing disks in the native format, and by enabling easy presentation, restores are avoided, thereby saving time and space.

For more information on configuring a Smart Cache device, see the *Configuring a backup to disk device* page in *HPE Data Protector Help*.

NOTE:

Backups done to disk devices or backups from array snapshots residing on the HPE 3PAR storage are referred to as Cached backups and the other backups are referred to as Non-

Cached backups.

Backups from 3PAR arrays

Cached recovery of data from virtual machines is possible from array snapshots residing on the HPE 3PAR storage. This can be done by performing the zero downtime backup (ZDB) of virtual machines using ZDB to disk, ZDB to tape, and ZDB to disk+tape options. The virtual machines that are protected using the **Snapshot backup** method can be used to perform a recovery operation.

The 3PAR storage system enables snapshot replication of the disk volumes used by virtual machines. This unique method utilizes the Cached recovery feature of the Advanced GRE Web Plug-in available in the GRE for VMware vSphere. The backups done using this method use existing ZDB functionality. The Data Protector Virtual Environment ZDB integration for VMware supports environments where ESX and/or ESXi Server systems are set up with the 3PAR storage system and are managed through a vCenter Server (vCenter environments).

For more information on disk replication, see the *HPE Data Protector Concepts Guide*. For more information on the ZDB backups of virtual machines on the 3PAR replica, see the *HPE Data Protector Integration Guide*.

Backups to StoreOnce Catalyst device

The StoreOnce Catalyst device is a Backup to Disk (B2D) device. To utilize the Cached recovery feature in GRE for VMware vSphere without staging the restore, you must use a StoreOnce Catalyst device for backups. The administrator can back up VM(s) out of a vCenter configuration to a StoreOnce Catalyst device using the Data Protector GUI.

For more information on configuring a StoreOnce Catalyst device, see the *Configuring a backup to disk device - StoreOnce* page in *HPE Data Protector Help*. For more background information on StoreOnce Catalyst devices, see the *HPE Data Protector Concepts Guide*.

Full, incremental and differential backups are supported for Cached recovery operations. For details on backup types, see the *HPE Data Protector Help*: “backup types”. When you perform GRE, all the backups that were performed prior to 9.07 are listed as Non-Cached.

IMPORTANT:
 Non-CBT backups are also displayed as Non-Cached.

The following table lists the considerations, based on how the device is configured (FC address or IP address) during GRE:

Behavior	Backup/Restore	GRE
Device configured using IP address	If the option to use "FC" is selected, check for FC address and connect using the FC.	During GRE device connection, Data Protector checks if the device is configured using the IP address. If IP address is used, obtain the FC address, and connect the device using the FC address. If the connection fails, fallback to IP address.
	Use the FC connection if	During GRE device connection, Data Protector checks if

	successful, else fallback to IP if "allow fallback" is selected. Connect using the IP address.	the device is configured using the IP address. If IP address is used, obtain the FC address, and connect the device using the FC address. If the connection fails, fallback to IP address.
Device configured using FC address	Use FC address only. If connection fails using FC, the session fails. There is no option to look for an IP address to connect to the catalyst.	Use FC address only. If connection fails using FC, the session fails. There is no option to look for an IP address to connect to the catalyst.

Chapter 19: Recovery

Considerations

- The Granular Recovery Extension for VMware vSphere does not support a cross-platform recovery. A recovery of Windows virtual machine files from a Windows virtual machine to a Linux virtual machine and the other way around is not supported. However, by installing a FUSE, Windows VMs can be recovered using a Linux proxy. Note that the ACLs are not preserved in this scenario. For more information on the different preservation conditions, see [Restoration and preservation of Ownerships, ACLs, File attributes, and Alternate data streams](#).

A restore of Windows virtual machine disks to different mount proxy system platforms is supported.

- Consider a VMware vSphere Web Client with two or more vCenters and each vCenter being a member of different Data Protector cell configuration. If each Data Protector cell contains the same user in user lists but with a different set of permissions, the user acquires privileges from the Data Protector cell on which the VMware GRE agent for selected vCenter starts to run first.
- You cannot recover a virtual machine from an incremental and differential backup, if the virtual machine name in the vSphere Center has been changed after full backup.
- If two operators connect remotely using the VMware vSphere Client with the same user account and browse one partition of a virtual machine disk simultaneously, once the first partition is mounted the second partition is dismounted. Parallel mounting of partitions is not supported.
- *StoreOnce catalyst only*: The extension displays the whole restore chain. When browsing through files, the objects displayed contain the whole restore chain: a full backup of the object and any number of related incremental backups.
- You may experience slow performance when browsing folders with many files and subfolders.
- To preserve ownership and permission bits UID/GUID on a target virtual machine and a mount proxy system, both must be mapped. A network share server should be properly configured to support it.
- The non-partitioned disks on the Guest virtual machine are not supported.
- You can perform GRE operations only on LVM volumes, which have partition Type ID set to 8E. Also, kpartx is required for disks with LVM partitions.

NOTE:

You need to partition the disk before adding a volume group. The partitions reported in `fdisk -l` can only be considered.

NOTE:

Windows Internet Explorer 8 version is not supported for the Granular Recovery Extension interface.

For a list of supported environments, see the latest support matrices at <https://softwaresupport.hpe.com/>.

HPE 3PAR storage systems

- To perform GRE operations from the 3PAR replica, the mount ESX server and the production ESX server must be present in the same 3PAR zone.

- Configure the 3PAR array, having a replica and being used for GRE in the cell manager, by executing the following command on the Cell Manager: `omnidbzd --diskarray 3PAR --ompasswd --add <3PAR array CIM server name/ip> --user <CIM server login name> --passwd <CIM server password>`
- To perform GRE operations using the Linux mount proxy for Windows Guest Operating System, the backup session must have the Operating System disk backed up and the same must be selected for creating a new request along with the disk(s) to be browsed.
- If the ESX server is not accessible from the mount proxy, then you need to modify the host file and add the ESX hostname and IP address or resolve the hostname of ESX server.

Limitations

Data Protector Granular Recovery Extension (GRE) for VMware vSphere has certain limitations.

Recovery

- To perform GRE of Windows Server 2012 and Windows Server 2012 R2 on Linux mount proxy, use NTFS-3G (an NTFS driver for Linux) version 2011 on SLES. To download the NTFS-3G driver, refer to the following link:

<https://www.rpmfind.net/linux/rpm2html/search.php?query=ntfs-3g>

- You cannot:
 - Recover empty folders.
 - Perform VIX related recovery for files or folders with non-ASCII characters in their names.
 - Perform the recovery of files from Windows 2012 Resilient File System (ReFS) file system.
 - Recover files with longer path names.

NOTE:

You must ensure that the file path in the mount point and the selected disk does not exceed 260 characters for the disk mounted on a mount proxy.

- List the skipped and failed files in recovery details, if the target machine does not have sufficient disk space.
- Preserve POSIX ACLs during recovery, on a Linux target virtual machine or on a Linux mount proxy system.
- When the GRE mount proxy host is rebooted, the requests that are browsed at least once, become invalid. Hence these requests must be re-created to perform GRE operations.
- For Advanced GRE Web Plug-in, GRE from Dynamic disk is not supported.
- 3PAR ZDB backups from Data Protector 9.03 and earlier versions for VMs residing on datastores created using multiple 3PAR LUNs does not support granular recovery.

Restoration and preservation of Ownerships, ACLs, File attributes, and Alternate data streams

The tables below list the file properties, and the preservation conditions.

The following table shows the properties that will be preserved for files and directories when Windows mount proxy is used to recover a Windows VM:

Windows VM/Windows mount proxy

File properties	Files	Directories
Ownership	Yes	No
ACLs	Yes	No
File attributes	Yes. Some file attributes are not preserved due to operating system limitations, such as hidden file attribute, compressed file attribute, and encrypted file.	No
Alternate data streams	Yes	No

The following table shows the properties that will be preserved for files and directories when Linux mount proxy is used to recover a Linux VM:

Linux VM/Linux mount proxy

File properties	Files	Directories
Ownership	Yes. Files that do not have root:root ownership are preserved. Files with root:root ownership are not preserved, because the ownership becomes nobody:nobody. The ownership settings depend on the NFS settings /etc/exports that is set in the target Linux system.	No. Ownership becomes root:root.
ACLs	No	No
File attributes e:Extent format is set as a default value.	No	No
Permissions	Yes	No

NOTE:

If VIX is used, none of the file properties are preserved.

NOTE:

If the Ownership, ACLs, File attributes, and Alternate data streams are not preserved by the GRE operation, the restored objects have the VM operating system credentials (mentioned in the GRE page) as their properties.

3PAR storage systems

- Cached GRE can be done only till the replica is rotated/presented.
- If the backup is disk+tape, then the secondary storage is considered for GRE only after the replica is rotated.

Smart Cache devices

- You can perform only a Non-Cached recovery from incremental/differential backups on Smart Cache devices. Incremental / differential backups are not supported for Cached GRE operations.
- A VMware backup to a Smart Cache device is supported for a Network Share (CIFS or NFS share). To perform a Cached presentation operation from a Smart Cache device residing on the Network Share, the Smart Cache device should be listed as a mount point and not as a share.
- An AES encrypted VMware backup is not supported to a Smart Cache device.

StoreOnce Catalyst devices

- If Linux mount proxy is used to recover Windows Guest VM, then Ownership, ACLs, File attributes, and Alternate data streams are not recovered.
- Full and incremental backups on different devices are not supported for GRE operations.
- Non-CBT backups to StoreOnce Catalyst device are displayed as Non-Cached.
- If the mount proxy host is rebooted with any active GRE request, the request is inaccessible for up to 4 hours.
- Cached GRE is not supported, if the backup to StoreOnce Catalyst device is performed using software compression or AES encryption.
- If the data backed up with Data Protector 9.04 or earlier versions is transferred to a StoreOnce Catalyst through single session copy in 9.07 version, then Cached GRE is not supported.

NOTE:

If you want to migrate your Data Protector 9.05 or 9.06 version backups to StoreOnce Catalyst to use the feature of Cached GRE, it is recommended to perform object operations at individual session. If you choose multiple sessions at once, data consistency will not be there.

Recovery using Advanced GRE Web Plug-in

The Advanced GRE Web Plug-in provides an interface to perform a recovery operation.

Using the Advanced GRE Web Plug-in, you can perform the following tasks:

- [Access the Advanced GRE Web Plug-in](#)
- [Configure the GRE settings](#)
- [View the list of requests](#)
- [Create new request](#)
- [Recover files](#)
- [Change the Cell Manager](#)
- [About Granular Recovery Extension Plug-in](#)

Prerequisites

From Data Protector version 10.00 onwards, a user must have web service access enabled to access the Advanced GRE Web Plug-in.

Providing web service access to users

You can provide web service access either using the Data Protector GUI or using the CLI.

NOTE:

WebAccess cannot be enabled for members of the Data Protector **user** class.

Using Data Protector GUI

Complete the following steps:

1. In the Context List, click **Users**.
2. In the Scoping Pane, expand **Users** and select the user to which you want to provide the web service access.
3. In the General tab of the Properties of the Data Protector User dialog box, enable the **WebAccess** check box. The Authentication window opens.
4. Enter the Password in the password text box, and click **OK**.
5. Click **Apply**.

Using CLI

Run one of the following commands based on whether you want to create a new user or update properties of an existing user:

- Create a new user with web service access:
`omniusers -add -type {U | W} -name <UserName> -webaccess enable -passwd <Password>`
- Update existing user:
`omniusers -webaccess enable -name UserName -passwd Password -group GroupOrDomainName -client ClientName`

For more information on omniusers command, see *HPE Data Protector Command Line Interface Reference* guide.

Accessing the Advanced GRE Web Plug-in from VMware vSphere Web Client

IMPORTANT:

From Data Protector version 10.00 onwards, a user must have web service access enabled to access the Advanced GRE Web Plug-in. For more information about how to give web service access to a user, see [Providing web service access to users, on the previous page](#).

Complete the following steps to access the Advanced GRE Web Plug-in:

1. Open the VMware vSphere Web Client. You can specify any of the vCenter URLs that are already imported into the Data Protector Cell Manager. Specify the credentials of the Data Protector user and click **Login**.

The VMware vSphere Web Client home page is displayed and the Home tab is selected by default.

2. Select **Hosts and Clusters** or **VMs and Templates** and expand the virtual machine node to select the required virtual machine.
3. Click **Manage > HPE Data Protector**.

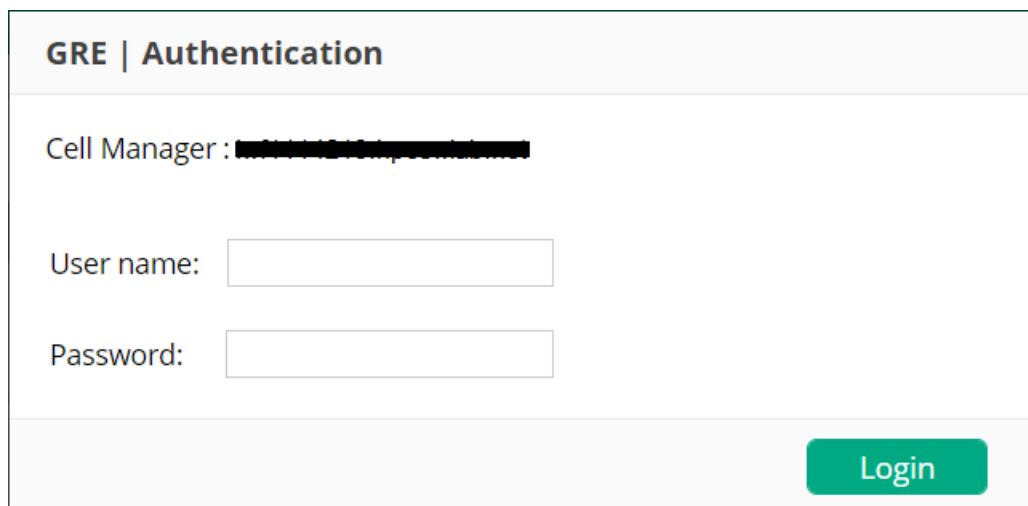

For VMware vSphere 6.5, click **Configure > More > HPE Data Protector**.

NOTE:

If you receive the security alert notification after accessing the VMware vSphere Web Client application, you do not have the vSphere certificate installed on your system. Click **Yes** to open the extension.

The Advanced GRE Web Plug-in opens and the Select Cell Manager dialog box appears.

4. Select the Cell Manager from the list and click **Select**. If there is only one Cell Manager, then selection is not required. The available Cell Manager is displayed briefly and you are redirected to the Authentication window. If you select a different Cell Manager and click **Cancel** or **Close**, then you will be connected to the previously selected Cell Manager. After you select the Cell Manager, the **Authentication** window appears.

The screenshot shows a web-based authentication dialog box titled "GRE | Authentication". It features a "Cell Manager" dropdown menu with a selected option. Below the dropdown are two text input fields: "User name:" and "Password:". A green "Login" button is positioned at the bottom right of the dialog.

5. Enter the user credentials in the **User name** and **Password** text box in the **Authentication**

window. The credentials are used for authenticating to Cell Manager over HTTPS. For more information about how to obtain the user name and password, see [Providing web service access to users, on page 120](#).

6. Click **Login**. After a successful login, the GRE Requests page appears with the complete list of requests.

NOTE:

After the first successful login to the Cell Manager, the **Authentication** window appears only when the authentication token expires.

Configuring GRE settings

In this page, you can modify the options for retention time. In addition, you can configure, add, or modify the mount proxy system used as a target location for restoring virtual machine disks.

Retention time

To modify the options for retention time:

1. In the HPE Data Protector Granular Recovery Extension for VMware vSphere Web Client, click the **Tools** icon.
2. Click **GRE Settings**. The GRE Settings page is displayed.

GRE Settings page

The screenshot shows the 'GRE Settings' page. At the top, there is a navigation bar with 'Hewlett Packard Enterprise Data Protector | GRE Recovery' and a user welcome message 'Welcome, VSPHEREADMINISTRATOR'. Below the navigation bar is a green header with 'GRE Settings' and 'Save' and 'Refresh' buttons. The main content area is divided into three sections: 'RETENTION TIME OPTIONS', 'DEBUGGING OPTIONS', and 'MOUNT PROXY INFORMATION'. Under 'RETENTION TIME OPTIONS', there are two input fields: 'Remove Non-Cached Disks After' with a value of 7 and 'Remove Cached Disks After' with a value of 1, both labeled 'Days'. Under 'DEBUGGING OPTIONS', there is a radio button for 'Enable Debugging' with 'Yes' and 'No' options, where 'No' is selected. Under 'MOUNT PROXY INFORMATION', there are two columns: 'Windows Host' and 'Linux Host'. The 'Windows Host' column has a dropdown menu and a 'Restore Path' input field with a '+' button. Below the input field are two rows of proxy paths: 'e:\restore' and 'e:\restore2'. The 'Linux Host' column has a dropdown menu showing 'No linux mount proxies are configured' and a 'Restore Path' input field with a '+' button.

3. Under **Retention Time Options**, enter the retention period for the following text boxes:
 - Remove Non-Cached Disks After
 - Remove Cached Disks After

NOTE:

The default retention period of the Non-Cached backup is 7 days (maximum can be set to 7 days). The default retention period for the Cached backup is 1 day (maximum can be set to 7 days).

4. Click **Back to GRE Request** to return to the list of requests available in the GRE Request page.

Configuring the mount proxy

To configure, add or modify the mount proxy system used as a target location for restoring virtual machine disks:

1. From the **Windows** or **Linux Host** drop-down list, select the required Windows or Linux mount proxy system.

NOTE:

You can configure multiple mount proxies and restore paths.

2. In the Windows and/or Linux **Restore Paths** text box, enter the path to a location on the mount proxy system. Use the following format:
 - *DriveLetter:\Folder\Subfolder* (Windows mount proxy system)
 - */Directory/Subdirectory* (Linux mount proxy system)
3. Click **+** to add the specified path to the applicable list of restore or presentation paths. You can add more restore paths, if required.
4. Click **-** to delete the required restore path(s). You cannot delete a restore path if it is the only one for the mount proxy system.
5. Click **Save**.
6. Click **Back to GRE Requests** to return to the list of requests available in the GRE Requests page.

Enabling debugging option

If you encounter an issue when using this extension, the information in the log files can help you determine the problem.

To enable the debugging option:

1. In the HPEData Protector Granular Recovery Extension for VMware vSphere Web Client, click the **Tools** icon.
2. Click **GRE Settings**. The GRE Settings page is displayed.
3. Under Debugging Options, select **Yes** option to enable creation of debug files.
4. Click **Save**.

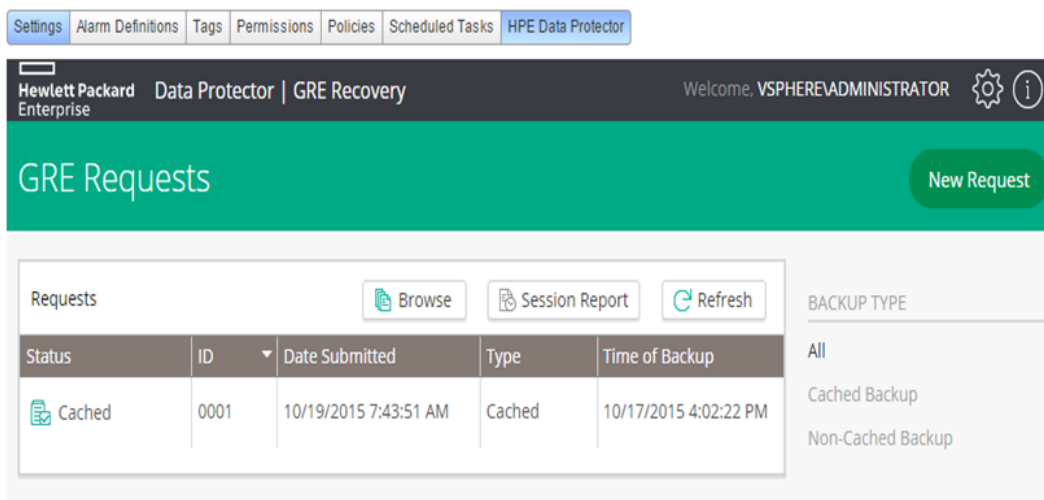

Log files are located in the default Data Protector log files directory and the default temporary files directory.

For the list of known issues and workarounds, see [Known issues and workarounds](#).

Viewing the list of requests

The GRE requests page is the landing page for the Advanced GRE Web Plug-in. In this page you can view the list of requests and perform actions that are described in this section.

Advanced GRE Web Plug-in - GRE Requests page

1. The Status, ID, Date Submitted, Type, and Time of Backup information is available for each of the requests. You can also filter the list of requests using the **Backup Type (All, Cached Backup, Non-Cached Backup)** in the right pane.
2. You can click **Refresh** to update the status of your request.
3. A request can have the following status:
 - Cached
 - Caching
 - Aborted
 - Recovered
 - Recovering
4. Select the required request and depending on the state of the request, appropriate buttons or actions become available.

Status	Actions available
Caching	Abort Session Report
Recovering	
Cached	Session Report , Browse

Recovered	Session Report
-----------	----------------

5. You can perform the following actions:
 - Click **Browse** to browse the disks that are selected while creating a request. You can browse partitions in disk/s and select the files or folders for recovery. However, browsing multiple disk at the same time is not allowed. At a given point of time you can browse only one disk . The Recover Files page appears.
 - Click **Session Report** to display the log messages for the actions that were taken most recently by the selected GRE request.
 - Click **New Request** to create a new request for a Cached or Non-Cached operation. The New Request page appears.
 - Click **Abort** to stop the restore or recovery that is in progress.

Creating a new request

The New Request page lists all the available backups for the selected VM. You can filter the results using the options available under **Backups From** and **Backup Type** fields in the right pane.

Backups From - All, Last 30 Days, Last 90 Days, Last 6 Months, Last Year.

Backup Type - All, Cached Backup, Non-Cached Backup.

Advanced GRE Web Plug-in - New Request page

The screenshot shows the 'New Request' page in the HP Data Protector interface. The page header includes 'Hewlett Packard Enterprise Data Protector | GRE Recovery' and a user welcome message 'Welcome, VSPHEREADMINISTRATOR'. A 'Send Request' button is visible in the top right corner.

The main content area displays a table of backups for a selected VM. The table has three columns: 'Time of Backup', 'Type', and 'Virtual Disks'. The selected backup is highlighted in green.

Time of Backup	Type	Virtual Disks
10/17/2015 4:02:22 PM	Cached	1
10/16/2015 12:12:38 PM	Cached	1

On the right side of the page, there are two filter sections: 'BACKUPS FROM' and 'BACKUP TYPE'. The 'BACKUPS FROM' section includes options: All, Last Week, Last 30 Days, Last 90 Days, Last 6 Months, and Last Year. The 'BACKUP TYPE' section includes options: All, Cached Backup, and Non-Cached Backup.

NOTE:

Configure the mount proxy from the GRE Settings page before proceeding to create a new request for Non-Cached backups. However, it is not necessary to configure mount proxies for Cached backups.

1. Select the required backup. Proceed as follows:
 - a. From the **Virtual Disks** section, select single or multiple virtual disks for restore /presentation.

NOTE:

The virtual disks are selected by default for 3PAR cached sessions.

- b. In the **Disk Retention Time** text box, enter the retention period. This period starts from the restore or presentation operation. After the retention period, the virtual disks are not available.

NOTE:

The default retention period of the Non-Cached backup is 7 days (maximum can be set to 7 days). The default retention period for the Cached backup is 1 day (maximum can be set to 7 days).

- c. From the **ESX Host** drop-down list, select the required ESX host. For 3PAR cached sessions, the production ESX is selected by default.
 - d. From the **Select Mount Proxy** drop-down list, select the required mount proxy.
 - e. From the **Restore Path** drop-down list, select the required restore path. The restore path is required only for Non-Cached Backup.
2. For Cached / Non-Cached Backups, click **Send Request**. The GRE Request page appears and you can monitor the status of the request. For more information on how to proceed with the request, see the GRE Request section.
3. Click **Refresh** to update the list of backups.

NOTE:

When the GRE mount proxy host is rebooted, the requests that are browsed at least once become invalid. Hence these requests must be re-created to perform GRE operations.

NOTE:

If you want to delete a request created for a StoreOnce catalyst, run the following command to force clean up the StoreOnce Catalyst request IDs:

```
vmwaregre-agent.exe -force_cleanup <request_id> -vcenter <hostname>
```

where,

- request_id: StoreOnce Catalyst request ID that needs to be cleaned up
- hostname: vCenter host name on which the request is made

Recovering files

User permissions

To perform recovery of file(s), the user must have appropriate permissions on the target virtual machine. If **Use VIX as fallback option** is selected, then the following permissions should be provided

in vCenter - **Virtual machine**->**Interaction**->**Guest operating system management by VIX API**.

If Samba has to be used for file recovery, then username and password of the Samba user should be provided. This user should be able to mount network share to which files have to be recovered.

For a Linux **Target VM**, the **VM Username**, and **VM Password** fields cannot be empty; therefore, these credentials should be provided. However, as an NFS share is exported, these credentials are not used.

To verify the list of exported directories, you can run the following command on Linux mount proxy host:

```
showmount -e
```

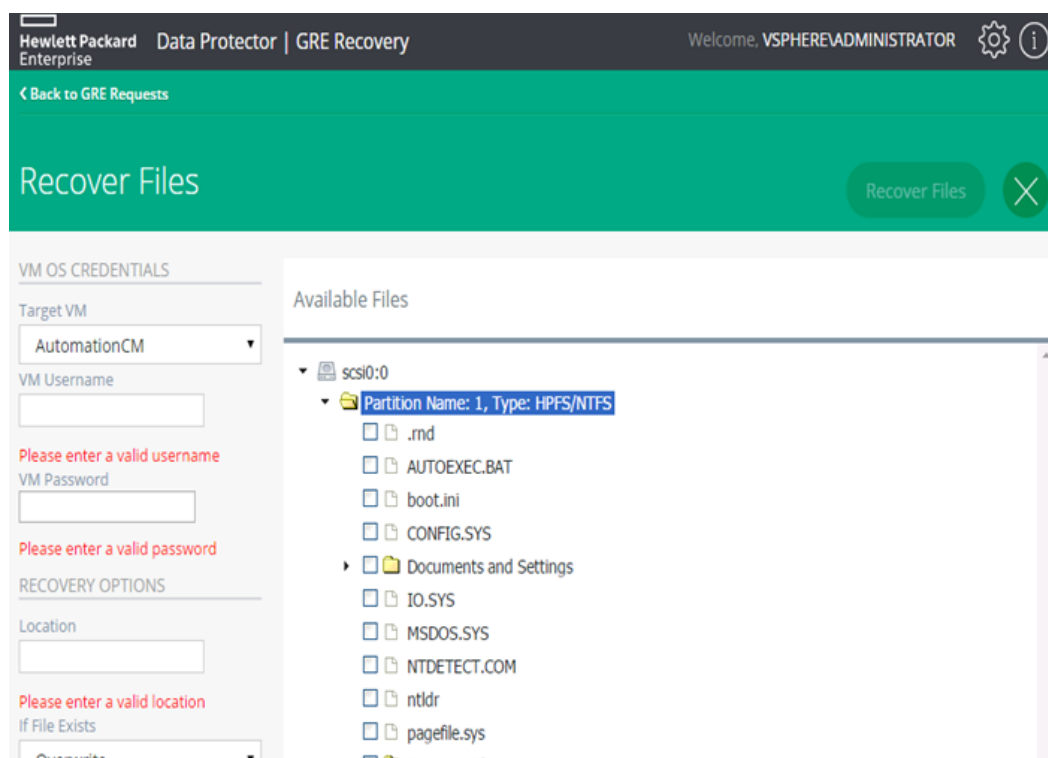

Procedure

To recover files from virtual machine disks:

1. The Recover Files page appears. It is assumed that you have selected a restored or recovered request and clicked **Browse** from the GRE Request view.

The file structure of the VMs is displayed in the Available Files section of the main content area.

Advanced GRE Web Plug-in - Recover Files page

2. Under the Available Files section, select the virtual machine disk containing the files to recover.

NOTE:

For Cached 3PAR sessions, selecting the virtual machine disk mounts a backup replica, mounts datastores, and registers the VM resulting in the display of the following message:

Request submitted successfully and is in progress. Please try browsing after some time.

Selecting the virtual machine disk when the process is still in progress results in the display of the following message:

Request is still in progress. Please try browsing after some time.

Browsing enables the user to expand one disk and one partition at a time, since only one disk and one partition is supported for recovery. Proceed as follows:

- a. Click the disk name to expand the required partition. If a Linux partition is selected, then select the logical volumes from the available logical volumes list.

NOTE:

If the user has selected files or folders, browse will not allow another disk/partition to be selected until the files/folders have been deselected.

- b. Select the files to recover from the selected disk.
3. Under Virtual Machine OS Credentials, select the virtual machine from the **Target VM** drop-down list, and enter its credentials in the **VM Username** and **VM Password** text boxes. The **Target VM** lists all the running VMs under the selected vCenter.

NOTE:

Ensure to complete the following steps on the target Linux VM:

- a. Resolve any Hostname or IP conflicts for Target VM.
 - b. NFS services must be configured and running.
4. Under the Recovery Options section, in the **Location** text box, enter the target recovery location path.
 - For locations on Windows systems, use the format *DriveLetter:\Folder\Subfolder*.
 - For locations on Linux systems, use the format */Directory/Subdirectory*.

NOTE:

For shared directories, enter the path without the hostname. For example, in the case of an NFS share hostname, use: */shared_dir/subdir*. Files get recovered to *shared_dir/subdir/<target location specified>*. Also, ensure that the Samba and NFS shares are set up correctly. The NFS share must also be exported as pseudo root shares.

Any missing directories in the path are created automatically. For example, if you specify */shared_dir/subdir1/subdir2*, the *subdir1/subdir2* subdirectories are automatically created inside */shared_dir*, if they do not already exist.

5. If the file already exists on the target system, select one of the following recovery options:
 - **Overwrite:** deletes the original files, and saves the latest files.
 - **Rename:** keeps the original files, and saves the recovered files with a unique number (generated by Data Protector).
 - **Skip:** keeps the original files.
6. Select **Keep Directory Structure** to maintain the original directory structure of the source virtual machine disk on the target system.

7. Select **Use VIX as fallback option** when network share is not available. Recovery using VIX takes a longer time and can be monitored through the session reports generated in the GRE Request page.
8. Click **Recover Files**. A confirmation message appears and the GRE Request page is displayed, where you can monitor the recovery.

Changing the Cell Manager

If you are accessing the Advanced GRE Web Plug-in for the first time, you must select a Cell Manager (if there is only one, it is selected automatically). If more than one Cell Manager exists, then you will not be able to cancel or close the operation. However, the next time you access the plug-in, you can change the Cell Manager.

To change the Cell Manager:

1. In the HPE Data Protector Granular Recovery Extension for VMware vSphere Web Client, click the **Tools** icon.
2. Click **Change Cell Manager**. The Select Cell Manager box appears.
3. Select the required Cell Manager from the drop-down list and click **Select**.
4. If you select a different Cell Manager and click **Cancel** or **Close**, the previously selected Cell Manager is still applicable. However, if there is only one Cell Manager, then selection is not required. The available Cell Manager is displayed briefly and you are re-directed to the GRE Requests page.

The GRE Request page appears with the list of requests available for the selected Cell Manager.

Identifying the Advanced GRE Web Plug-in version

To determine the VMware Granular Recovery Extension agent and Plug-in version:

1. In the HPE Data Protector Granular Recovery Extension for VMware vSphere Web Client, click the **Tools** icon.
2. Click **About**, the Granular Recovery Extension information is displayed.

About

ABOUT GRANULAR RECOVERY EXTENSION

AGENT VERSION:
HPE Data Protector A.10.00: vmwaregre-agent.exe, internal build 252, built on 04 May 2017, 02:37

PLUGIN VERSION:
10.00.0.58279

Chapter 20: Troubleshooting

This chapter lists general checks and verifications, plus problems you might encounter when using the Data Protector Granular Recovery Extension for VMware vSphere.

- For Virtualization Environments troubleshooting information, see the troubleshooting section of the VMware part about the Data Protector Virtual Environment integration, in the HPE Data Protector Integration Guide.
- For general Data Protector troubleshooting information, see the *HPE Data Protector Troubleshooting Guide*.

Before you begin

- Enable debugging. For more information on how to enable debugging, see [Enabling debugging option, on page 123](#).
- Ensure that the latest official Data Protector patches are installed. See the *HPE Data Protector Help* index: “patches” on how to verify this.
- For general Data Protector limitations, as well as recognized issues and workarounds, see the HPE Data Protector Product Announcements, Software Notes, and References.
- For an up-to-date list of supported versions, platforms, and other information, see <https://softwaresupport.hpe.com/>.

Known issues and workarounds

Mounting virtual machine disks

Problem

When performing recovery of files, the following message is displayed after selecting a partition:

```
[EXCEPTION] boost: filesystem: status: The volume does not contain a recognized file system. Please make sure that all required file system drivers are loaded and that the volume is not corrupted: "\\?\M:\" ProxyGetAllNodesForPath.
```

After mounting the virtual disks manually, the following is displayed in the command line interface:

```
The volume does not contain a recognized file system. Please make sure that all required file system drivers are loaded and that the volume is not corrupted
```

Your configuration is not supported. The extension and the VMware VDDK do not support dynamic disks. This is a known VMware-mount limitation. The issue may occur when a partition does not contain any file system, or it contains a different unsupported file system.

Action

- For Windows virtual machine disks, use one of the supported file systems, for example NTFS or FAT system formats.

- For Linux virtual machine disks, use one of the supported Linux file systems.

For a list of supported file systems, see the latest support matrices at <https://softwaresupport.hpe.com/>.

Problem

Issues after removing the extension

Problem

You removed the VMware Granular Recovery Extension Agent component and the scripts (post-install and post-reinstall) in the Windows environment. When you remove the component, the removal tries to delete the driver. If the removal command is not successful, the driver stays in the stopped / pending removal on next boot state. Even after repeating the installation procedure the driver stays in a stopped / pending removal on next boot state.

When you try again to install the VMware Granular Recovery Extension Agent component, the HPE Data Protector Manager displays the following message in the installation session log:

```
[Critical] computer.company.com Post-installation script for the VMware Granular Recovery Extension Agent failed with the output
```

```
Data_Protector_home\bin
```

```
perl -I "..\lib\perl" vmwgre_ag.pl -install
```

```
Cannot start vstor2-mntapi20-shared: The service is starting or stopping. Please try again later.
```

```
Delete of vstor2-mntapi20-shared driver failed: [SC] DeleteService FAILED 1072:
```

```
The specified service has been marked for deletion.
```

You must restart target machine to finish installation of VMware GRE Agent.

NOTE:

These error messages may differ from case to case, but the above error message can be considered as an example.

Action

Restart the system.

NOTE:

If the VMDK driver is already installed on the system outside of Data Protector and running, then this driver is used; it is not removed or reinstalled. The upgrade procedure is successful.

RSA certificates with keys that are less than 1024 bits long are blocked

Problem

After installation of the Microsoft Security Advisory update (KB2661254), connection to the vCenter Server VMware GRE plugin may fail.

Action

This happens because the VMware vCenter Server by default uses RSA certificates which are 512 bits and the update in Microsoft Security Advisory kb2661254, blocks the use of RSA certificates which are less than 1024 bits long.

For more details, on the resolution see

http://kb.vmware.com/selfservice/microsites/search.do?language=en_US&cmd=displayKC&externalId=2037082

and Microsoft Security Advisory update: **kb2661254** = <http://support.microsoft.com/kb/2661254>

Mounting of LVM logical volumes fail when browsing VMware GRE on Linux

Problem

When you try to browse an LVM logical volume, it fails with the following error message:

```
There are no partitions on selected disk.
```

Action

You can perform GRE operations only on LVM volumes, which have partition Type ID set to 8E. The following steps describe how to create a new LVM partition/group/volume. Proceed as follows:

1. Run the following command on a Linux system that supports LVM:

```
fdisk /dev/<device_name>
```
2. Create a new partition by pressing `n` and configure the settings for this partition.
3. After creating a partition, press `t` and set the partition type to `8e`.
4. Press `w` to write the partition table.
5. Create a physical volume on the newly created partition:

```
pvcreate /dev/<partition_name>
```

.
6. Create a volume group on the physical volume:

```
vgcreate <VGNAME> /dev/<partition_name>
```

.
7. Create a logical volume in the volume group:

```
lvcreate -l <Total PE> -n <LVNAME> /dev/<VGNAME>
```

.

NOTE:

`<Total PE>` refers to the size of the volume group. You can get that using

```
vgdisplay -v <VGNAME>
```

.

8. Create a file system over the newly created logical volume:

```
mkfs -t ext3
```

```
/dev/<VGNAME>/<LVNAME>.
```

9. Mount the logical volume to any location of your choice.

NOTE:

You can view that there is one LVM partition in the disk if you run the `fdisk -l` over `/dev/<partition_name>` command. Hence, the VDDK VIX mount locates the partitions on the selected disk and mounts them.

The `vmwaregre-agent.exe` uses `lvscan`, `vgscan`, and `pvscan` to collect specific information related to LVM partitions. In order for `vmwaregre-agent.exe` to work as expected, you must set the `log_silent` property to `0` in `lvm.conf` file.

Generally, the `silent` property is set to `0` but in some cases like SLES 12 it is set to `1`. If the property is set to `1`, then `lvscan`, `vgscan`, and `pvscan` displays no output and `vmwaregre-agent.exe` is unable to mount lvm partition.

VMware Granular Recovery Extension tab is missing

Problem

You have logged in to a vCenter server using a vSphere web client. When you select a virtual machine in the VMs and Templates view, there is no HPE Data Protector tab, the extension is missing. The issue appears if the firewall does not allow the communication.

Action

On the vCenter server, configure the Windows Firewall. Select the Exceptions tab and **Add port** of the VMware vCenter Server-Web Services HTTPS (default 8443) to the exceptions list, and restart the vSphere Client interface.

VMware Granular Recovery Extension tab is missing with vCenter Server plug-in disabled

Problem

You have logged in to a vCenter server using a vSphere web client. When you select a virtual machine in the VMs and Templates view, there is no HPE Data Protector tab, and the extension is missing. The root cause is an installation that ended abnormally.

Action

1. On the vCenter server, remove the extension from the system.
2. Remotely install the extension again. For details on the importing procedure, see "Configuring the Integration" section in the *HPE Data Protector Integration Guide*.
3. Connect with the vSphere Client interface to a vCenter Server system. The VMware vSphere Web Client home page is displayed. The **Home** tab is selected by default. Click the **Administration** tab and then click **Client Plug-ins**. The Client Plug-ins window is displayed.
4. Under the Client Plug-ins Name column, locate VMwareGRE, right click it, and click **Enable**.

Extension disabled

Client Plug-Ins

Overwritten files issues

Problem

A message, similar to the following is displayed when recovering items with the **Overwrite** option selected:

The \ denotes continuation of the command line.

```
[Failed] c:\vix_27-2\incremental-21-2\incremental\ \  
Username \CheckVix\vixlibs\arp.ico
```

```
Source:\incremental-21-2\incremental\Username\CheckVix\  
vixlibs\arp.ico
```

You do not have access rights to this file.

```
[Failed] c:\overwrite_incr-21-2\incr24-2\incremental-21-2\  
incremental\Username\CheckVix\vixlibs\vix.h
```

```
Source:\incr24-2\incremental-21-2\incremental\Username\  
CheckVix\vixlibs\vix.h
```

```
[5] Access is denied.
```

The item already exists on the target system. This item cannot be overwritten due to the file security option. If the source location contains NTFS file system and the target virtual machine disk are on the network, the Granular Recovery Extension for VMware recovers all security information associated with the items. This information cannot be overwritten.

Action

If the item already exists in the target location, perform one of the following instead:

- Recover these items to another location.
- Select the **Skip** recovery option.
- Select the **Rename** recovery option.
- Change the file permissions on the target location manually before starting recovery.

Missing VIX API libraries

Problem

File recovery fails due to missing VIX API libraries with the following error message:

Could not start recovery.

Cannot find support libraries; Vix appears to have not been installed.

Action

1. Install VMware tools on the target VM.
2. Install VMware VIX API 1.14 on the mount proxy system (Windows/Linux).

Insufficient permission in the Host Operating System

Problem

The following error message is displayed when performing the recovery of files:

Insufficient permission in host operating system.

Action

The user entered when importing the vCenter to the DP cell must have the following permission assigned on the vCenter:

Virtual machine -> Interaction-> Guest operating system management by VIX API

Presentation failed

Problem

Cached recovery involves creating a share on a Smart Cache device host and presenting the same to the mount proxy host. Failure of the presentation task can cause recovery to fail with the following messages:

Unable to present shared disk (displayed during a Cached presentation operation)

Presentation failed (displayed in the corresponding Data Protector session report)

Action

- Verify the user / admin credentials provided while configuring the Smart Cache device. This error can occur when there is a credential mismatch.
- Verify details from the session report, using either Data Protector GUI (from the IDB context), or using the Advanced GRE Web plug-in GUI (monitor request).
- Additionally access the share directly, using credentials stored in Data Protector at the time of device creation.

If the problem persists, contact the Data Protector administrator.

Cached recovery fails

Problem

Recovery of VMware files during Cached recovery fails with the following error:

```
Cannot access the file. Access is denied.
```

This error may occur when there are multiple connections to a server or a shared resource for a single user.

Action

Ensure that in a single Media Agent host, only one operating system user credential must be used to create a Smart Cache device. You may also disconnect all previous connections to the server or the shared resource and reboot the system.

Restore session stops after some time

Problem

When performing a restore, the session stops after a certain period of time and the RSM stops responding. This issue may be caused by firewall closing an inactive connection.

Action

Ensure that the connection remains active so that the firewall does not close it. Set the following omnirc options: `OB2IPCKEEPALIVE=1`, `OB2IPCKEEPALIVETIME=number_of_seconds`, `OB2IPCKEEPALIVEINTERVAL=number_of_seconds`

`OB2IPCKEEPALIVETIME` specifies how long the connection may remain inactive before the first keep-alive packet is sent and `OB2IPCKEEPALIVEINTERVAL` specifies the interval for sending successive keep-alive packets if no acknowledgment is received. The options must be set on the Cell Manager system.

The VMware GRE session is unresponsive

Problem

If the mount proxy host has a Linux environment, and the session is left idle for more than 10 minutes after browsing a disk or recovering from a disk, then the next browse or recovery operation makes the GRE session unresponsive.

Action

Locate the running VMware GRE agent process (`vmwaregre-agent.exe`) on the mount proxies and end the process manually.

VMware GRE file recovery could not access network share

Problem

File recovery in VMware GRE could not access network share on windows mount proxy.

This issue occurs because of a missing update in the Windows 2008 R2 SP1 environment.

The following error message appears:

Could not start Recovery.

“Cannot access to network share on target VMError info: System error[2250]. The network connection could not be found.”

Action

A supported hotfix is available from Microsoft. Check to see if this fix has been installed . For more details on this fix see, <http://support.microsoft.com/kb/2807716>

Resizing the browser window causes an error and reloads the page

Problem

Resizing the browser window opened with the Advanced GRE Web Plug-in causes an error and reloads the page.

Action

This is a known issue with VMware. <https://communities.vmware.com/message/2434421#2434421>.

Browsing for Recovery throws an error message

Problem

While browsing for recovery in the Advanced GRE Web Plug-in throws an error message Failure of REST call to getPartitionsForDisks:status =500 error . This might happen if you selected an unformatted disk in the Available Files section.

Action

Format the disk. The Advanced GRE Web Plug-in does not support recovery of unformatted disks.

VMware GRE GUI fails to start agent on mount proxy system

Problem

The VMware GRE GUI fails to start agent on a mount proxy system. The following message appears:

Error! Connection to agent ended (final repeat).

Action

The error appears if the mount proxy system uses an IP that is shared with multiple domain names. VMware GRE does not support mount proxy systems with shared IP hosting.

To resolve this problem, add the mount proxy system client by IP in the Data Protector Cell Manager, rather than the hostname and retry the GRE operation.

Time difference exists between the backup sessions on the Data Protector GUI and vSphere web client

Problem

There is a time difference of 1 minute for all the backup sessions between the Data Protector GUI vs vSphere web client.

Action

Rather than comparing Session Time, you need to compare Object Version. A session can have more than one VMs and IDB has object version for each VM. Proceed as follows:

1. Start the Data Protector GUI, and select **Internal IDB**.
2. Click **Sessions**.
3. Expand the session that you are verifying on the left (format <date>-<number> IE: 2014-09-22-1)
4. Click on the vCenter. On the right you see **Backup Object Version**
5. Select **Start Time**. Here you can observe that the time stamp is the same.

Unable to expand a folder for browsing

Problem

While trying to browse files for recovery, the folder will not expand to browse the files

Action

This happens if you have been idle on the browse screen for 10 minutes or more because the Mount Proxy Agent shuts down.

Click "**Cancel**" and then "**Browse**" to browse and expand folders.

Expanding a partition for browsing throws an error

Problem

While trying to expand the partition, the following error is displayed "Error trying to mount the restored disk(s). Exception occurred while mounting the disk"

Action

There are various causes for this problem. One of them is when you have been idle on the browse screen for 10 minutes or more because the Mount Proxy Agent shuts down.

Click "**Cancel**" and then "**Browse**" to browse and expand partitions.

vSphere web interface becomes greyed out

Problem

If you view the Advanced GRE Web Plug-in on a VM and that VM is shut down, then the vSphere web interface can become partially disabled (appearing greyed out). However, the Advanced GRE Web Plug-in does not change its appearance.

Action

You can do as follows:

- Avoid shutting down a guest host while a user is using the plug-in with that host selected.
- If the web interface surrounding the Advanced GRE Web Plug-In becomes greyed out, select a different VM.

Error message appears while browsing for LVM disks

Problem

While browsing for LVM disks, the VMware Advanced GRE Web Plug-in displays the following error message "Something went wrong while searching for logical volumes. Check if you backed up and restored all the disks that are a part of the same volume group and try again".

This could happen for the following reasons:

- If the LVM is created with more than 8 disks and all 8 loop devices are available, then browsing of the partition fails with an error message. This is because the additional loop devices are using all the disks that are part of the LVM.
- If the LVM is created with X number of disks and the count of available loop devices is less than the count of LVM disks, then browsing of the partition fails with an error message. This is also because the additional loop devices are using all the disks that are a part of the LVM.

Action

1. It is possible to configure the loop device limit and there are different ways to perform the configuration. For more information, see the following articles on changing the number of loop device support by the loop device module. <http://www.tldp.org/HOWTO/CDServer-HOWTO/addloops.html>
2. Retry the Browsing operation.

Error message appears when starting VMware GRE agent on mount proxy host

Problem

The following error message appears when you start the VMware GRE agent on a mount proxy host:

Authentication token expired. Please select 'Change Cell Manager' tab in GRE menu to authenticate with cell manager.

Action

This error message appears when the authentication token expires. You must perform the Cell Manager authentication again by selecting the same virtual machine. To select the same virtual machine again, select **Change Cell Manager** tab in the GRE menu, and select the same Cell Manager that was selected before.

The message "VIX API is not installed" re-appears although VIX API is installed

Problem

On seeing an error message `VIX API is not installed` during a recovery operation, while using the VMware GRE Web Client, you proceed to install the VIX API . However, the same message `VIX API is not installed` appears even after installing the VIX API.

Action

This error message may appear if the GRE agent is running during the installation process of VIX API. After the agent exits, the correct installation message appears `VIX installed`. No further action is required.

Shared folders/directories created on Media Agent host system are not removed

Problem

The shared folders/directories created on Media Agent host system as part of Cached (Smart Cache device backups) request creation process are not removed if the request is not browsed / recovered once before request gets expired.

Action

Perform the following manual steps to remove the shared folders/directories on the Media Agent host.

In the Windows environment

Privileges: The user should be the Local Administrator of the Media Agent system.

Complete the following steps for removing a share:

1. Select the Share folder.
2. Right-click and select properties.
3. In the Properties tab select the "Sharing" tab and uncheck the check box "share this folder" and then click **Apply** button.
4. Close the Properties dialog box.

In the Linux environment:

Privileges: The user should be a root user.

Complete the following steps for removing a share:

1. Make a note of the shared folder name for the non-browsed request by selecting the request and getting the session report. The session report contains the shared folder name.
2. Login to the Media Agent host system and go to `file /etc/samba/smb.conf`
3. In the `smb.conf` file check for the entry that matches the shared folder name.
4. The shared folder entries format is as follows:

```
[dp_share_12435]
comment = dp share
path = /blob_store/blobShare/12435
writeable = yes
valid users = dp_user2
create mask = 0755
```

5. Remove the matched entry from the `smb.conf` file.
6. Execute the command "`killall -HUP smbd`" at the command prompt to reload the configuration by the Samba deamon.

While browsing a Smart Cache in the Advanced GRE Web Plug-in you may see mount errors on agent timeout.

Problem

This may happen when you browse the disks but do not initiate a recovery operation. You will not be able to browse the same disk again until all the GRE agent processes are stopped. However, it is not recommended to stop the processes manually, as the agent could be running for a different vCenter.

Action

Wait for the GRE agent processes to exit gracefully and try browsing again. This may take around 15 minutes.

VEPA backup to a Smart Cache fails on a Windows 2008 system.

Problem

This could happen if the size of the VM disk is more than 16TB. The backup fails because the Windows operating system is unable to handle this size. The size limitation is documented by Microsoft - <https://technet.microsoft.com/en-us/library/cc938937.aspx>

Action

VEPA backups to the Smart Cache devices created on Windows 2012 works as expected and this is because Windows 2012 is able to handle large size of files.

Browse and recovery problems with folders containing special characters

Problem

In the Advanced GRE Web Plug-in, browsing folders with multi-byte characters in their names not possible. Browsing folders with multi-byte characters does not return the contents.

Action

Although, it is not possible to browse the folders, if selected for recovery, the folder may be recovered successfully.

Problem

In the Advanced GRE Web Plug-in, recovery of folders or files with special characters in their names is not supported on Linux

It is not possible to recover folders or files with the following special characters. You will see “Failed to copy” error in the session report.

- “\” (backslash):
- “” (grave accent)
- “\” (backslash):

Action

This can be resolved by using the Data Protector GUI to recover the entire VM instead of using GRE for recovering this problem.

Unable to browse the disk

Problem

While browsing the disk, the following error message is displayed

```
Discovery of the newly presented replica disk(s) on the mount proxy host <mount proxy hostname> is still in progress.
```

Retry the operation after sometime. This could happen when the mount proxy host system takes more time to scan the newly presented replica disk(s).

Retry the operation after sometime.

Action

This could be because of the following:

1. Multi-path service is not running on the mount proxy system, hence the presented replica is not identified by the mount proxy operating system.
2. The mount proxy operating system is taking more time in identifying the presented replica.

3. The mount proxy operating system is not identifying the presented replica. Although, multi-path service is running.

For all the above mentioned, check to see if there are any problems related to multi-path service or identification of the replicas from the array on the operating system, and retry the operation.

Error message appears while browsing for LVM disks on SLES 12 mount proxy host

Problem

While browsing for LVM disks on SLES 12 mount proxy host, the agent fails with the following error message:

```
"Something went wrong while searching for logical volumes. Check that you backed up and restored all disks that are part of same volume group and try again."
```

This problem in SLES 12 is caused by an issue in the `lvscan` output.

Action

To get the `lvscan` command output, set the following line in the `/etc/lvm/lvm.conf` file:

```
log silent = 0
```

The VMware GRE session of large volumes from Smart Cache devices may fail

Problem

Granular recovery of large volumes from the Smart Cache device may fail when the Smart Cache device is hosted on the Windows 2008/2008 R2 server. This failure may be due to memory fragmentation issues in the operating system.

Action

Use Windows 2012 R2 servers for hosting the Smart Cache device, and then perform backup and granular recovery operations.

Recovery fails on Virtual Machine

Problem

Recovery of files or folder on target virtual machine fails with the following error message:

```
Error while trying to do recovery
```

```
Could not start recovery:
```

```
Details: Cannot access to network share on target VM
```

```
Error info: System Error[2] No such file or directory
```

This occurs when the target virtual machine is not accessible from the mount proxy system.

Action

Check if the target virtual machine is accessible. Ensure that configured hostname of the target virtual machine is same as DNS of mount proxy systems.

VMware Granular Recovery Extension intermittently fails to recover files and folders

Problem

For a Cached recovery from StoreOnce Catalyst device, VMware Granular Recovery Extension intermittently fails to recover files and folders from Windows virtual machine while using Linux mount proxy.

Action

Perform Non-Cached recovery using Windows mount proxy.

The Granular Recovery Extension operation to StoreOnce Catalyst fails, when Data Protector process dpfs is not initialized

Problem

The Data Protector dpfs process fails to initialize during VMware GRE operation for backups to StoreOnce catalyst. The failure is due to fuse library not being initialized. The error message "Files are not available at mount path" is found in the OB2DBG__DBGLOG_ClientInterface debug log.

Action

Execute the following `modprobe fuse` command on the mount proxy host:

```
<hostname>/: # modprobe fuse
```

Backup session performed with "No Logs" option is not eligible for GRE or Live Migrate and Power On from StoreOnce Catalyst

Problem

The Data Protector backup session performed with "No Logs" option is not eligible for GRE or Live Migrate and Power On from StoreOnce Catalyst. The following error message is displayed during the backup:

```
[Major] From: BSM@hostname.com <VMname> Time: <Timestamp>  
[61:4039] Following error occurred while storing detail catalog  
information for device <Catalyst_device>  
with loaded medium <Catalyst_medium> to Data Protector Internal Database:  
There is no more space available in any of the Detail Catalog directories.
```

From this point on, all objects on this medium will have logging switched to "No Log".

Action

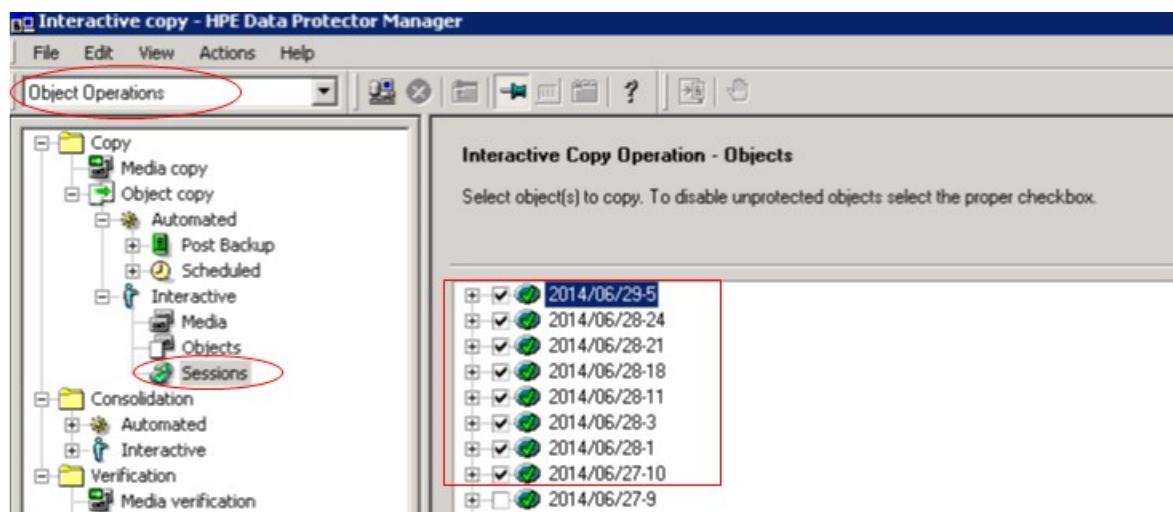

Create space on the IDB drive on the cell manager and perform a single session copy to another device. Ensure that replication option is not selected when single session copy is being performed to another StoreOnce Catalyst.

Data consistency issues during Cached GRE operations

Problem

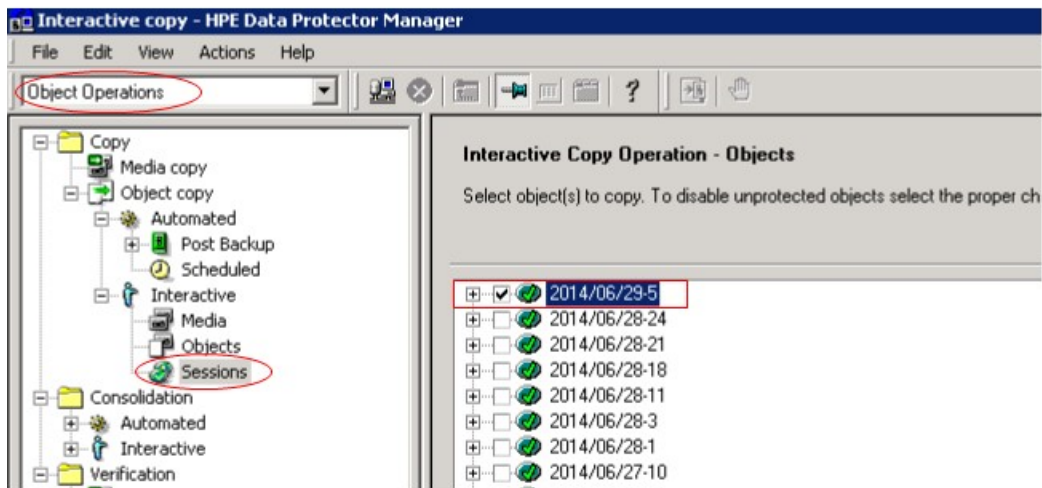

Data consistency issues during Cached GRE operations due to following reasons:

1. User has chosen a session which is a result of object copy.
2. Object copy is performed by aggregating many backup sessions into single object copy session as shown in the figure below:

Action

Choose individual session while performing object copy as shown in the figure below:

VMware GRE recovery

Problem

Recovery does not work when **data deduplication** service is enabled in the source VM.

Action

Enable **data deduplication** on mount proxy machine.

Loopback devices missing on Linux mount proxy for VMware GRE mount

Problem

The VMware GRE browsing fails with following error message on Linux mount proxy:

Error while trying to mount the restored disk(s)

Exception occurred while mounting disk

This can happen due to missing loopback devices on mount proxy.

Action

To enable the loopback functionality, load the loop kernel module or manually create loopback devices with the following command in shell:

```
for i in `seq 0 8`; do mknod -m660 /dev/loop$i b 7 $i; done
```

For more information on this issue, refer the [VDDK 6.0 release notes](#).

Documentation set

NOTE:

The documentation set available at the HPE support website at <https://softwaresupport.hpe.com/> contains the latest updates and corrections.

You can access the Data Protector documentation set from the following locations:

- Data Protector installation directory.
Windows systems: *Data_Protector_home\docs*
UNIX systems: */opt/omni/doc/C*
- **Help** menu of the Data Protector GUI.
- HPE Support website at <https://softwaresupport.hpe.com/>

Abbreviations

Abbreviations in the documentation map above are explained below. The documentation item titles are all preceded by the words “HPE Data Protector.”

Abbreviation	Documentation item	
Admin	Administrator’s Guide	This guide describes administrative tasks in Data Protector.
CLI	Command Line Interface Reference	This guide describes the Data Protector command-line interface, command options, and their usage as well as provides some basic command-line examples.
Concepts	Concepts Guide	This guide describes Data Protector concepts and zero downtime backup (ZDB) concepts and provides background information on how Data Protector works. It is intended to be used with the task-oriented Help.
DR	Disaster Recovery Guide	This guide describes how to plan, prepare for, test, and perform a disaster recovery.
Getting Started	Getting Started Guide	This guide contains information to get you started with using Data Protector. It lists installation prerequisites, provides instructions on installing and configuring a basic backup environment and procedures for performing backup and restore. It also lists resources for further information.
GRE Guide	Granular Recovery Extension User Guide for Microsoft SharePoint Server, Exchange and VMware	This guide describes how to configure and use the Data Protector Granular Recovery Extension for: <ul style="list-style-type: none"> • Microsoft SharePoint Server • Exchange Server • VMware vSphere
Help	Help	
Install	Installation Guide	This guide describes how to install the

Abbreviation	Documentation item	
		Data Protector software, taking into account the operating system and architecture of your environment. This guide details how to upgrade Data Protector, as well as how to obtain the proper licenses for your environment.
Integration Guide	Integration Guide	<p>This guide describes the integrations of Data Protector with the following applications:</p> <ul style="list-style-type: none"> • MSFT: Microsoft SQL Server, Microsoft SharePoint Server, and Microsoft Exchange Server. • IBM: Informix Server, IBM DB2 UDB, and Lotus Notes/Domino Server. • Oracle/SAP: Oracle Server, SAP R3, SAP MaxDB, and SAP HANA Appliance. • Sybase/NDMP: Sybase and Network Data Management Protocol Server. • Virtual Env: Virtualization environments integration with VMware vSphere, VMware vCloud Director, Microsoft Hyper-V, and Citrix XenServer.
Integration VSS	Integration Guide for Microsoft Volume Shadow Copy Service	This guide describes the integrations of Data Protector with Microsoft Volume Shadow Copy Service (VSS).
PA	Product Announcements, Software Notes, and References	This guide gives a description of new features of the latest release. It also provides information on installation requirements, required patches, and limitations, as well as known issues and workarounds.
Troubleshooting	Troubleshooting Guide	This guide describes how to troubleshoot problems you may encounter when using Data Protector.
ZDB Admin	ZDB Administrator's Guide	This guide describes how to configure and use the integration of Data Protector with HPE P4000 SAN Solutions, HPE

Abbreviation	Documentation item	
		P6000 EVA Disk Array Family, HPE P9000 XP Disk Array Family, HPE 3PAR StoreServ Storage, NetApp Storage, and EMC Symmetrix Remote Data Facility and TimeFinder. It is intended for backup administrators or operators. It covers the zero downtime backup, instant recovery, and the restore of filesystems and disk images.
ZDB IG	ZDB Integration Guide	This guide describes how to configure and use Data Protector to perform zero downtime backup, instant recovery, and standard restore of Oracle Server, SAP R/3, Microsoft Exchange Server, Microsoft SQL Server databases, and Virtual Environment for VMware .
