Documentation updates

The title page of this document contains the following identifying information:

- Software Version number, which indicates the software version.
- Document Release Date, which changes each time the document is updated.
- Software Release Date, which indicates the release date of this version of the software.

To verify you are using the most recent edition of a document, go to https://softwaresupport.softwaregrp.com/group/softwaresupport/search-result?doctype=manuals?keyword=.

To check for recent software patches, go to https://softwaresupport.softwaregrp.com/group/softwaresupport/search-result?doctype=patches?keyword=.

This site requires that you register for a Passport and sign in. To register for a Passport ID, go to https://cf.passport.softwaregrp.com/hppcf/login.do.

Or click the **Register** link at the top of the Micro Focus Software Support page.

You will also receive updated or new editions if you subscribe to the appropriate product support service. Contact your Micro Focus sales representative for details.

The title page of this document contains the following identifying information:

- Software Version number, which indicates the software version.
- Document Release Date, which changes each time the document is updated.
- Software Release Date, which indicates the release date of this version of the software.

To verify you are using the most recent edition of a document, go to https://softwaresupport.softwaregrp.com/group/softwaresupport/search-result?doctype=online help.

This site requires that you register for a Passport and sign in. To register for a Passport ID, go to https://cf.passport.softwaregrp.com/hppcf/login.do.

You will also receive updated or new editions if you subscribe to the appropriate product support service. Contact your Micro Focus sales representative for details.

For information and details about the products, services, and support that Micro Focus offers, contact your Client Director.

Support

Visit the Micro Focus Software Support Online web site at https://softwaresupport.softwaregrp.com/.

This web site provides contact information and details about the products, services, and support that Micro Focus offers.

Micro Focus online support provides customer self-solve capabilities. It provides a fast and efficient way to access interactive technical support tools needed to manage your business. As a valued support customer, you can benefit by using the support web site to:

- Search for knowledge documents of interest
- Submit and track support cases and enhancement requests
- Manage software licenses
- Download new versions of software or software patches
- Access product documentation
- Manage support contracts
- Look up Micro Focus support contacts
- Review information about available services
- Enter into discussions with other software customers
- Research and register for software training

Most of the support areas require you to register as a Passport user and sign in. Many also require a support contract.

To register for a Passport ID, go to https://cf.passport.softwaregrp.com/hppcf/login.do.

Contents

Chapter 1: APM - Service Manager Integration Overview

You can integrate Service Manager with one or more of the APM components, as described below. Each integration can be performed separately.

NOTE:
In general, the following document is for integrating BSM/APM 9.2x with Service Manager 9.31.

For instructions on integrating BSM with earlier versions of Service Manager, see http://support.openview.hp.com/selfsolve/document/KM1303768/binary/BSM9.12_SM_Integration_Interactive_Docs.html. Download and extract the zip file contents; open the file **sm_interactive_document.htm** and follow the guidelines.

The options are as follows:

- **Downtime exchange between APM and Service Manager.** APM enables you to forward downtimes (also known as outages) from APM to Service Manager, and from Service Manager to APM. The downtime defined in APM is converted to a request for change in Service Manager, and vice versa. For details, see Downtime Exchange Between APM and Service Manager, on page 10.
- **Incident exchange between Service Manager and Operations Manager i.** APM enables you to forward events from Operations Management to Service Manager. Forwarded events and subsequent event changes are synchronized back from Service Manager to Operations Management. You can also drill down from Operations Manager events to Service Manager incidents. For details, see Incident Exchange between Service Manager and Operations Manager i.
- **View planned changes and incident details in Service Health.** This integration enables you to view planned changes and incident details in the Changes & Incidents tab in the 360° View page in Service Health. For details, see View Changes and Incidents in Service Health Using Standalone Universal CMDB, on page 21 and View Changes and Incidents in Service Health Using RTSM, on page 34.
- **Submit an incident through APM alerts.** Incidents are automatically opened incidents in Service Manager when a CI Status alert is triggered in APM. For details, see Generate Incidents in Service Manager When a APM Alert is Triggered.
- **View the Number of Open Incidents in Service Health and create SLAs (EMS).** This integration enables you to view the Number of Open Incidents in Service Health views and reports and to manage, in Service Level Management, SLAs over Serviceability KPIs based on Service Manager incidents (EMS option). For details, see View Incident Data in APM, and Manage SLAs Based on Service Manager, on page 45.

- The **Business Impact Report** integration is described in the *Closed Loop Incident Process (CLIP)* Guide. When deployed as part of the APM solution, Incident Management users can launch an impact report from an incident in context with the incident's affected CI. Service Desk Agents can validate the updated status of the Business Impact to categorize and prioritize the incident accordingly. For details, refer to the CLIP page in the Solutions Portal: https://softwaresupport.hp.com/group/softwaresupport/search-result/-/facetsearch/document/KM01663679.

  NOTE:
  - **Service Manager Query Security.** If you have set up an integration from APM to Service Manager, there is a CI context menu that enables you to access Service Manager from APM Service Health. This drill-down option is not available if you have enabled Service Manager query security.
  - **Troubleshooting Multiple Domains.** If APM and SM are in different domains, and you are using Internet Explorer as your browser, you may need to add the domains to the list of allowed domains in the Privacy tab (**Internet Options > Privacy > Sites**).

Chapter 2: Downtime Exchange Between APM and Service Manager

APM enables you to forward downtimes (also known as outages) from APM to Service Manager, and from Service Manager to APM. The downtime defined in APM is converted to an incident in Service Manager, and vice versa.

This section includes the following:

Integration Overview

The downtime integration between APM and Service Manager includes information exchanges in both of the following directions:

- **Service Manager > APM.** When you create a downtime RfC (request for change) in Service Manager, the RfC includes the CI that is under change and a start and end date/time of the downtime. If you do not want to waste effort with false alarms in your operations center, and do not want to have these times included in service availability reports, you can set up the integration so that these RfCs are translated to downtimes in APM.

  In this scenario, you install and set up a downtime adapter on your CMDB (whether you are working with a stand-alone uCMDB, or with RTSM). The RfC creates a planned downtime CI in the CMDB, and the adapter sends the planned downtime CI to APM to create a downtime.

- **APM > Service Manager.** When you define downtimes using APM (for example, every Monday and Saturday from 8:30 PM-9:30 PM), in order to proactively support end users, the help desk should be aware of such operational downtimes. After you set up the integration, downtimes in APM trigger events, which create corresponding incidents in Service Manager.

  In this scenario, when a downtime starts, APM generates an event. Using the event forwarding mechanism, the event generates an incident in Service Manager. When the downtime ends, an event is sent to close the downtime incident.

A single downtime can be defined on more than one CI. In the case of APM > Service Manager, a separate event is sent for each CI in the downtime.

Prerequisites

Supported Platforms

To set up the downtime integration, you must meet the following prerequisites:

- Service Manager 9.31 and higher.
- uCMDB 9.05 CUP 5 and higher with content pack 11 update 2, uCMDB 10.01 with content pack 12, uCMDB 10.20 with CUP1, or uCMDB 10.22 CUP 22.
- Before deploying the adapter verify that CP11 is installed. If CP11 is not installed, install the content pack. (This should be done whether you have upgraded to BSM 9.22 or above, or if you installed a version of BSM that is greater than or equal to 9.22.)

  NOTE:
  To see what version of RTSM is installed, access the RTSM JMX console: **http://<APM server>:21212/jmx-console/**. Click on **DAL services** and run **getCmdbVersion** to get the RTSM version. Click **Content Pack Services** and run **displayCurrentContentPackVersion** to get the content pack version.

- If the adapter is installed on the RTSM, and the adapter is working behind a reverse proxy, the DPS must have the correct certificates installed to send requests to the reverse proxy.
- If you have upgraded from BSM 9.1x, you need to manually redeploy the adapter. Open the Package Manager and delete the **BSMDowntimeAdapter** package. When it is deleted, redeploy the above package from the packages folder.

Installing the Content Pack for uCMDB 9.05

The following section is only relevant if you are using uCMDB 9.05, or upgrading from BSM 9.20 (which requires the content pack to be installed). If you have not yet installed the content pack, perform the following on your APM/uCMDB machine:

1. From the content pack installation zip file, copy the content pack zip file to the following location (depending on your environment):

   For RTSM: <APM data processing installation folder>\odb\content\content_packs

   For uCMDB: <Installation drive or folder>\HP\UCMDB\content\content_packs

   The main APM folder in Linux is located in: /opt/HP/BSM.

2. Access the following location with your browser:

   ```
   http://<APM DPS or uCMDB hostname>:21212/jmx-console/HtmlAdaptor?
   action=inspectMBean&name=UCMDB:service=Content Pack Services
   ```

3. In the method **installContentPack()**, enter the parameters:

a. Fill the parameter **customerID** with the value of **1.**

b. Enter the version number found in **version.dat**, located in the content pack zip file.

c. Invoke the method.

Global ID Generator

To enable the downtime integration, you must have a global ID generator configured in your environment.

If you are working with RTSM, perform the following to configure the global ID generator:

1. Access the following location with your browser:

   ```
   http://<APM hostname>:21212/jmx-console/HtmlAdaptor?action=
   inspectMBean&name=UCMDB:service=Multiple CMDB Instances Services
   ```

2. In the method **setAsGlobalIdGenerator()**, assign the value **1** to the parameter **customerID**, and click **Invoke**.

If you are working with uCMDB, perform the following to configure the global ID generator:

1. Access the following location with your browser: :

   ```
   http://<uCMDB hostname>:8080/jmx-console/HtmlAdaptor?action=
   inspectMBean&name=UCMDB:service=MultipleCMDB Instances Services.
   ```

2. In the method **setAsGlobalIdGenerator()**, assign the value **1** to the parameter **customerID**, and click **Invoke**.

Step 1: Send APM Downtime Events to Service Manager

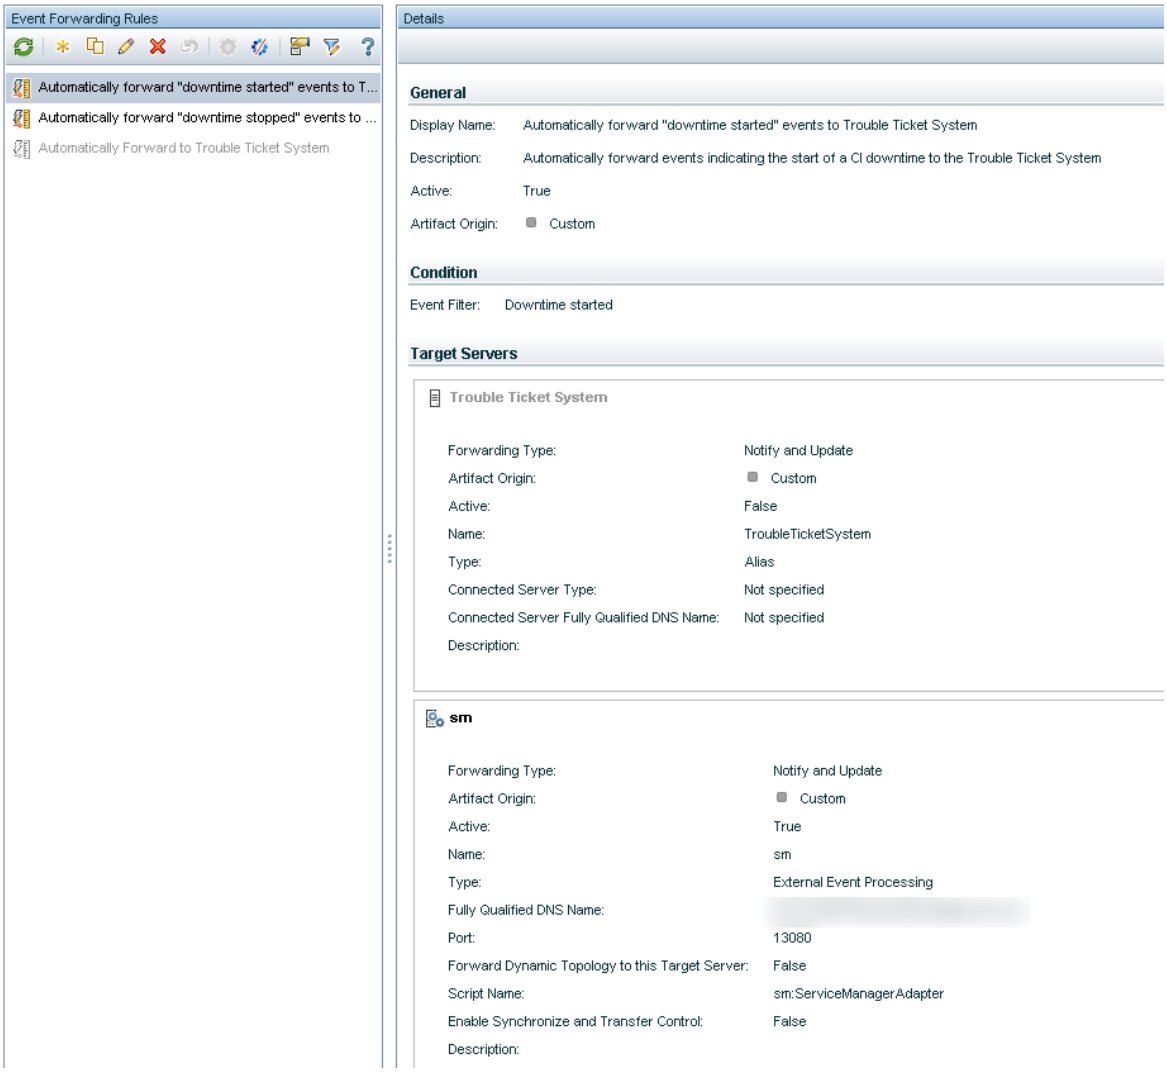
To enable APM to send downtime definitions to Service Manager, you must edit an infrastructure setting as described below. This procedure generates events in Operations Bridge Manager (OBM ex OMi); you can then use the event forwarding mechanism to generate incidents in Service Manager when a downtime in APM begins and ends.

NOTE:
These steps are related only to an internal RTSM under APM and not for an external UCMDB.

1. Access the following location in APM: **Infrastructure Settings > Foundations > Downtime**.
2. Change the value of the parameter **Downtime Send Event** to **true**.
3. Integrate OBM with APM (see Part II: Operations Bridge Manager - Application Performance Manager Integration of the OMi Integrations Guide (https://softwaresupport.softwaregrp.com/km/KM02256128/OMi_10.11_Integration_guide.pdf)).

A corresponding forwarding rule that configures forwarding downtime start and end events from APM to Service Manager should be configured in the Event Forwarding Rule dialog box. The forwarding rule should be based on the ETI Hint, as follows:

- ETI Hint equals ignore case “downtime: start”
- ETI Hint equals ignore case “downtime: end”



For details on how to use the event forwarding mechanism to generate incidents in Service Manager, refer to the section "Event Forwarding" in the *APM Application Administration Guide*.

Downtime events use the following formats:

- **Downtime Start**

Event field	APM Downtime
Severity	Normal

Event field	APM Downtime
Category	Downtime Notification
Title	Downtime for <CI Type><Affected CI Name>started at <Downtime Start Time>
Key	<APM Downtime ID>:<Affected CI ID>:downtime-start
SubmitCloseKey	False
OutageStartTime	<Downtime Start Time>
OutageEndTime	<Downtime End Time>
CiName	<Affected CI Name>
CiId	<Affected CI Global ID>
CiHint	GUCMDB:<Affected CI Global ID>|UCMDB:<Affected CI ID>
HostHint	GUCMDB:<Related Host Global ID>|UCMDB:<Related Host ID>
EtiHint	downtime:start

- **Downtime End**

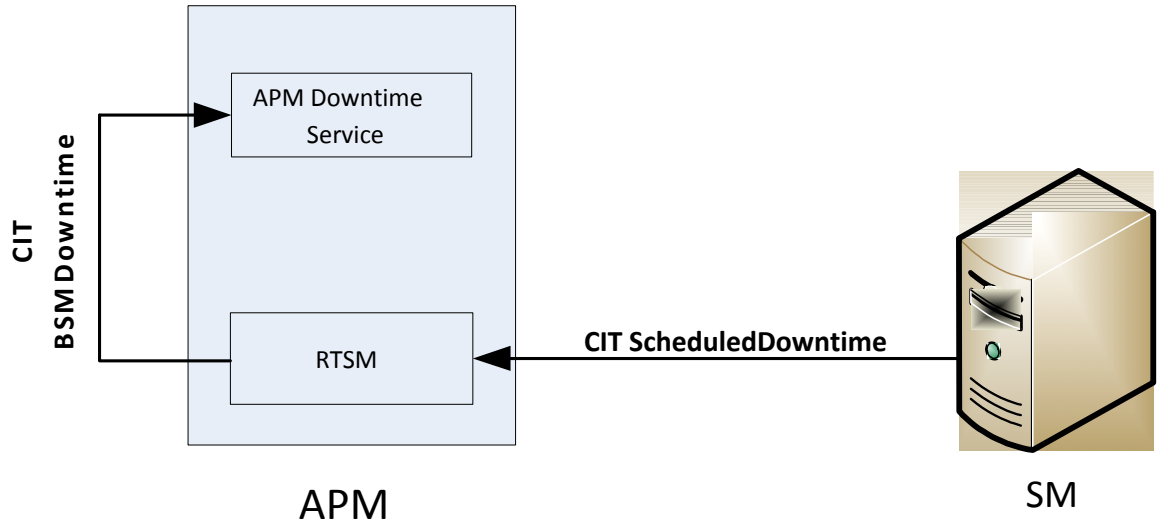
Event field	APM Downtime
Severity	Normal
Category	Downtime Notification
Title	Downtime for <CI Type><Affected CI Name> ended at < Downtime End Time>
Key	<APM Downtime ID>:<Affected CI ID>:downtime-stop
SubmitCloseKey	true
CloseKeyPattern	<APM Downtime ID>:<Affected CI ID>:downtime-start
EtiHint	downtime:end
LogOnly	true

Step 2: Integrate Service Manager Downtimes With APM

Integrating Service Manager downtimes with APM consists of:

- Creating an instance of the **ScheduledDowntime** CIT in RTSM/uCMDB
- Creating an instance of the **BSMDowntime** CIT in APM

The following image shows the data flow when using RTSM:



Important:

- Following the initial integration, a large amount of data may be communicated from Service Manager to APM. We recommend that you perform this procedure during off-hours, to prevent negative impact on system performance.
- You should configure both parts of the integration as one flow, without a significant time lag between setting up the two parts. If you set up the Service Manager > uCMDB/RTSM part, and then wait a long time before setting up the uCMDB/RTSM > APM adapter part, the number of downtimes communicated to APM initially may be extremely high.

Configuring Service Manager to Send Downtimes

NOTE:

- The following provides the basic steps for Service Manager configuration. For details, see the Service Manager documentation.

- SMBSM_DOWNTIME is available in Service Manager 9.32 and above.
- This document provides a basic description of how to configure SMBSM_DOWNTIME integration. For details, see the Service Manager documentation.

1. Log in to Service Manager as **System.Admin**.
2. Click **Tailoring > Integration Manager > Add** to add the Service Manager Integration Suite (SMIS) configuration for SMBSM_DOWNTIME. The Integration Template Selection page appears.
3. From the Integration Template drop-down list, select **SMBSM_DOWNTIME**, and click **Next**. The Integration Instance Information page appears.
4. In the **Interval Time(s)** field, type the running frequency data. Set this value based on your configuration item (CI) scheduled downtime data volume for the period.
5. In the **Max Retry Times** field, type the maximum number of retries. Since you are not connecting to another system, type **0**.
6. In the **Log File Directory** field, type the full path for the log file. By default, the log name is **sm.log**.
7. Click **Next**. The Integration Instance Parameters page appears.
8. Click the **General Parameters** tab.
9. Configure the SMIS settings.
   a. Assign a value for **WithdrawDowntime** (options are **true** or **false**). **True** means that when you make a change using **Change Phase**, if the change has a valid outage, a prompt appears enabling you to reject the outage.
   b. In the **Category** column, assign the value **Change** for change categories and **Task** for task categories.
   c. Assign values for the parameters in the **Change** category.

      If you only want outages of one change category after your desired phase has been approved, in the **Value** column, set the phase.

      If your category workflow has multiple paths with different final approval phases, use a semicolon (**;**) to separate the phases.
   d. Assign a unique identifier for your Service Manager deployment to the **sm.host** parameter. This identifier represents your Service Manager server.

      Do not use a colon (:) in this field.
   e. Assign a value to the **sm.reference.prefix** parameter. This value is used to populate the External Process Reference of Scheduled Downtime CI in UCMDB.

      Service Manager automatically appends a colon (:) at the end of the value.

f. Click **Next**, **Next**, **Finish**.

g. Select the **SMIS**.

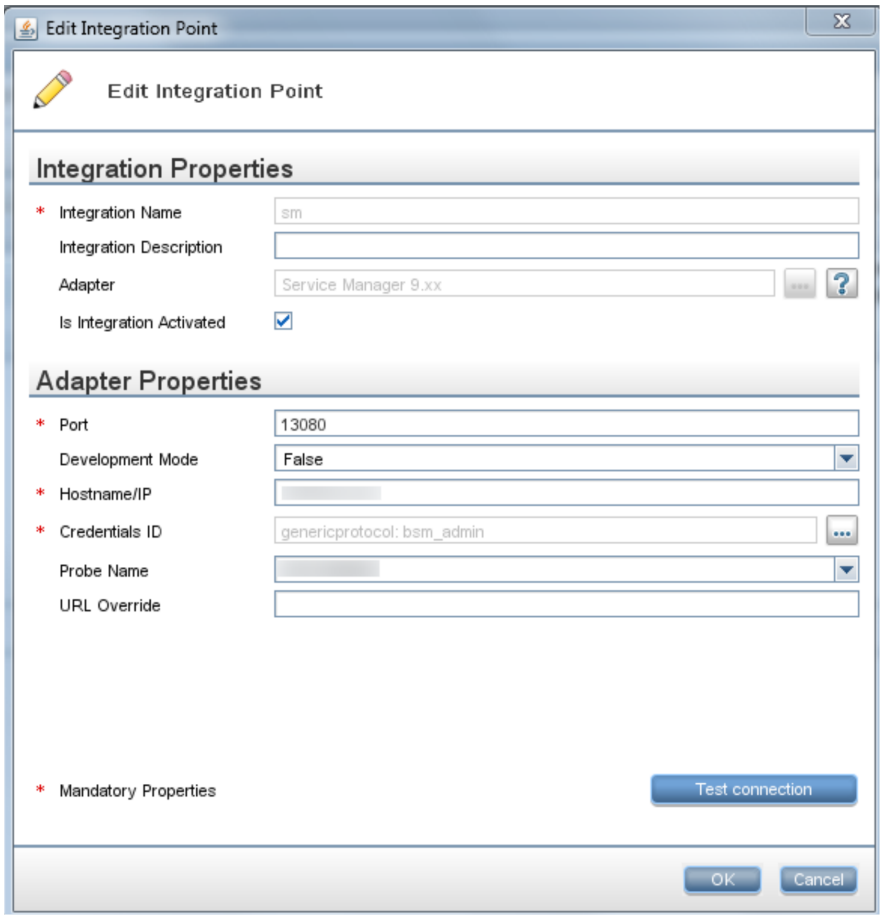
h. Click **Enable**.

i. Click **Yes**.

Integrating SM RFC Downtimes with RTSM/uCMDB

To integrate SM RFC downtimes with RTSM/uCMDB, populate (synchronize) RTSM/uCMDB with the downtime CIs.

1. Log in to RTSM/uCMDB.
   - In APM, access **Admin > RTSM Administration > Data Flow Management > Integration Studio**
   - In uCMDB, access **Administration > Data Flow Management > Integration Studio**
2. Verify that the integration point in front of the Service Manager exists and is active.



3. Click **Test connection** and verify that the connection succeeds.

4. In the **Population** tab, add the following integration jobs:
   a. **DT Population** based on **CLIP Down Time Population** TQL
   b. **DT Relationship** based on **CI To Down Time CI With Connection** TQL

   NOTE:
   You must run the integration jobs in the order shown above.

5. Log in to the Service Manager server. Select the **Configuration Management** tab and select **Resources > Configuration Item Relationships**.
6. Add a relation between the **Upstream CI** (for example, any business service instance) and the **Downstream CI** (the affected CI), and click **Add**.
7. In the **Change Management** tab, select **Changes > Open New Change** to open a new request for change (RfC). Verify the **Service**, **Affected CI**, and **Scheduled DownTime Start/End** field are completed.

   NOTE:
   The **Service** and **Affected CI** values should be equal to the **Upstream/Downstream CI** values you set in the previous step.

8. Click **More > Change Phase**. Move the **RfC** phase to the **Change Approval** phase.
9. Log in to Service Manager as user **Change.Approver**. Open the **Approval In** box and approve the change.
10. Wait for **SMBSM_DOWNTIME/DT Population/DT Relationship** to run. By default, it runs every minute.
11. Log in to RTSM/uCMDB.
    - In APM, access **Admin > RTSM Administration > Data Flow Management > Modeling Studio**
    - In uCMDB, access **Administration > Data Flow Management > Modeling Studio**
12. In Modeling Studio, search for **ScheduledDowntime CI**. A downtime CI is created with a relationship to the affected CI.

Push CIT ScheduledDowntime to CIT BSMDowntime by BSMDowntimeAdapter

1. If you are using uCMDB, deploy the adapter as follows:
   a. In uCMDB, access **Administration > Package Manager**.

      In APM, access **Admin > RTSM Administration > Administration > Package Manager**.

b. Click **Deploy package to server**, and import the adapter's zip file from `<APM DPS installation path>\odb\conf\factory_packages\BSMDowntimeAdapter.zip`.

2. Create the integration point credentials:
   a. In uCMDB, access **Data Flow Management > Data Flow Probe Setup**.

      In APM, access **Admin > RTSM Administration > Data Flow Management > Data Flow Probe Setup**

      NOTE:
      You do not need a Probe to perform this integration; nevertheless you create credentials using the Data Flow Probe Setup tab.

   b. Click **Add domain or probe**, and enter a name and description of your choice.
   c. Expand the submenus and select **HTTP protocol**.
   d. Click the plus sign (Add new connection details) and enter the APM Gateway host name, Port 80, and the APM username and password. Leave the Trust fields blank. When you are done, click **OK** to save the credentials.
3. Create a new integration point:
   a. In uCMDB, access **Data Flow Management > Integration Studio**.

      In APM, access **Admin > RTSM Administration > Data Flow Management > Integration Studio**.

   b. Click **New integration point**, enter a name and description of your choice, and select:
      - In APM: **BSMDowntimeAdapter**
      - In uCMDB: **SM scheduled Downtime Integration into APM**
   c. Enter the following information for the adapter:
      - APM Gateway hostname and port
      - Communication protocol
      - The integration point credentials you just created
      - Context root (if you have a non-default context root).
   d. Click **OK**, then click the **Save** button above the list of the integration points.
4. Click the **Statistics** tab in the lower pane, to track the number of downtimes that are created or updated. By default, the integration job runs every minute. If a job failed, you can click the **Query Status** tab and double-click the failed job to view more details about the error.

Troubleshooting

- If there is an authentication error, verify that the APM credentials entered for the integration point are correct.

- An unclear error message with an error code generally indicates a communication problem. Check the communication with APM. If no communication problem is found, restart the MercuryAS process.

  NOTE:

  - A failed job is repeated until the problem is fixed.
  - Each BSMDowntime can be found in APM Downtime Management (**Admin > Platform > Downtime Management**).

Chapter 3: View Changes and Incidents in Service Health Using Standalone Universal CMDB

This integration enables you to view planned changes and incident details in the Changes & Incidents tab in the 360° View page in Service Health, when you are using a standalone Universal CMDB.

This task describes how to configure the Service Manager - APM federated integration in order to allow both products to share information and data.

NOTE:
Beginning with UCMDB version 9.05, a new SM adapter (ServiceManagerAdapter9-x) is supplied with UCMDB out of the box, in addition to the legacy adapter (ServiceManagerAdapter7-1).

- For SM versions 9.30 and 9.31, use ServiceManagerAdapter9.xx.
- For SM versions 9.20 and earlier, use ServiceManagerAdapter7-1.

This section includes the following:

Prerequisites

- **Data-Flow Probes (for SM 9.3x).** If you are using SM 9.30 or 9.31, before you begin you must install *two* data-flow probes - one with UCMDB as its target, and another with the APM Gateway Server as its target. When you configure the integration points, you will select these probes.
- **Trusted Sign-on and LW-SSO.** If you want Service Manager to use the SSL-based Trusted Sign-on protocol and LW-SSO, configure it according to the instructions in the Service Manager online help if you have not already done so. In addition, see *Configuring Service Manager to Use the SSL-based Trusted Sign-On and LW-SSO* in the Service Manager documentation library.

Step 1: Load .unl Files to Provide External Access to Service Manager

This procedure enables APM to query incidents and changes:

1. Copy the following files from the APM 9.x installation folder to a local directory:
   - SM_Integration/SM_Unloads/SM7.1/ucmdbIntegration7_1x.unl
   - SM_Integration/SM_Unloads/SM7.1/BACExtAccess_71_v1.unl
2. Before loading these .unl files, apply the fix described in https://softwaresupport.softwaregrp.com/group/softwaresupport/search-result/-/facetsearch/document/KM1015767. This is required because the .unl file expects the name attribute in the EXTACCESSM1 table to be length 50 in the database, but its default out-of-the-box length is 100. You therefore need to reduce the size of the attribute, load the unl file, then increase the size again. These steps are for the SQL Server, but you can refer to the KM document for the equivalent Oracle syntax.
   a. Database field truncation may result in data loss if data in the field exceeds the default length, so first check the size of data in the field: `Select NAME, LEN(NAME) from EXTACCESSM1 order by 2 desc`

b. Reduce the size of the field: `alter table EXTACCESSM1 alter column NAME VARCHAR(50)`

c. Load the ucmdbIntegration7_1x.unl file as described in the following steps. When you are done, you will increase the size of the field back to what it was originally.

3. In Service Manager, type **db** in the command line text widget in the menu bar at the top of the client display.
4. Right-click the white background and select **Import/Load** from the context menu that appears.
5. Click the folder icon at the end of the File Name box. and navigate to the .unl file you copied from APM. Select the file, and click **Open**.
6. Click **Load FG** on the toolbar to load the file. If you receive a message saying "The file you are loading will change the keys...", click **Yes**.
7. Increase the size of the field back to what it was originally: `alter table EXTACCESSM1 alter column NAME VARCHAR(100)`
8. Repeat the above steps for the BACExtAccess_71_v1.unl file.

Step 2: Configure the Service Desk Adapter Time Zone

Configure the time zone so Incidents and Planned Changes have the correct time definitions:

1. In Service Manager, select **Navigation pane > Menu navigation > System Administration > Base System Configuration > Miscellaneous > System Information Record**.
2. Within the **Date Info** tab, open the <APM DPS root directory>/odb/runtime/fcmdb/CodeBase/<ServiceManagerAdapter9-x or ServiceDeskAdapter7-1>/serviceDeskConfiguration.xml file.
3. Find the row that includes the following string:

   <globalConnectorConfig><![CDATA[<global_configuration><date_pattern>MM/dd/yy HH:mm:ss</date_pattern><time_zone>US/Pacific</time_zone>

   and check the date and time format, and time zone. Note that the date is case-sensitive. Change either Service Manager or the xml file so that they both match each other's settings.

   NOTE:
   Specify a time zone from the Java time zone list that matches the time zone used in Service Manager; for example, America/New York.

4. Restart the corresponding server to make the change take effect. (If you changed the time zone on SM, restart the Service Manager server; if you changed the time zone on APM, restart the APM server.)

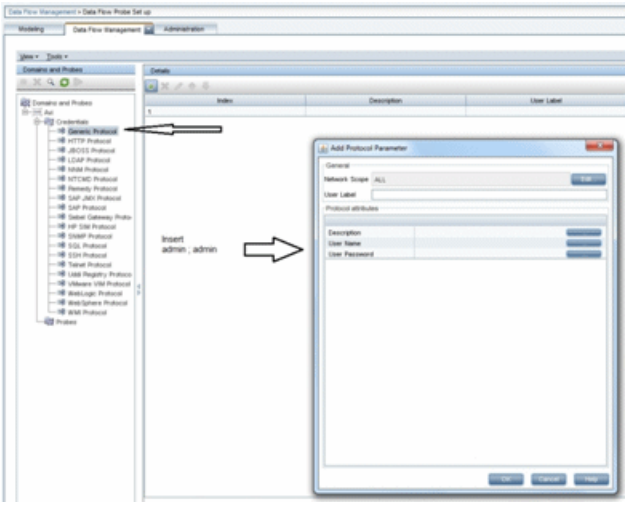
Step 3: Verify that the UCMDB is the Global ID Generator

1. Log in to the JMX Console (http://<UCMDB server>:8080/jmx-console/).
2. Go to **Multiple UCMDB Instances Services**.
3. Click **getIsGlobalIdGenerator**. Verify that the call returns **true**. For more details, refer to the RTSM Best Practices guide.

For SM versions 9.20 and earlier, proceed with the next step. For SM versions 9.30 and 9.31, skip to Step 5: Configure SM Adapter in UCMDB, on the next page.

Step 4 (for SM 9.20 and earlier only): Add a Domain

1. In APM, select **Admin > RTSM Administration**, click the **Data Flow Management** tab, and select **Data Flow Probe Setup**.
2. In the **Domains and Probes** pane, click  .
3. In the **Add New Domain** dialog box, enter a new domain name and click **OK**. This creates a new domain and its protocols.
4. Within the domain you added, select **Credentials > Generic Protocol**, and click the **Add new connection details** button in the right pane. In the **Add Protocol Parameter** dialog box that opens, insert the SM administrator credentials.



Step 5: Configure SM Adapter in UCMDB

1. Within the UCMDB user interface, access **Data Flow Management** > **Adapter Management**.
2. In the resources window, select **ServiceManagerAdapter9-x** or **ServiceManagerAdapter7-1** > **Configuration files**.
3. Select **ServiceManagerAdapter9-x/sm.properties** or **ServiceManagerAdapter7-1/sm.properties**.
4. In the window on the right side of the screen, modify the **use.global.id** parameter, set it to **false**, and click **OK**.

Step 6: Configure the SM-UCMDB Integration: Create an Integration Point

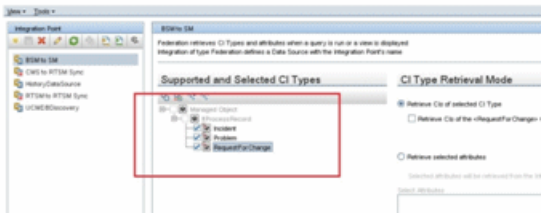
1. Within the UCMDB user interface, select **Data Flow Management > Integration Studio**.
2. In the Integration Point pane, select **Create New Integration Point**. The Create New Integration Point dialog box opens. Enter the following:

Name	Recommended Value	Description
Integration Name	**SM Integration**	The name you give to the integration point.
Adapter	**<user defined>**	Select the appropriate adapter for the version of SM that you are using.
Is Integration Activated	**selected**	Select this check box to create an active integration point.
Hostname/IP	**<user defined>**	The name of the SM server.
Port	**<user defined>**	The port through which you access SM.
Credentials	**<user defined>**	• For SM 9.20 and earlier, select the user credentials created in Step 4 (for SM 9.20 and earlier only): Add a Domain, on the previous page. • For SM 9.30 and 9.31, in the default domain select Generic Protocol, and enter the credentials of the SM administrator.

Name	Recommended Value	Description
Probe Name (for ServiceManagerAdapter9-x only)	**<user defined>**	If you are using ServiceManagerAdapter9-x, select the probe which reports to *CMS* (see Prerequisites, on page 22).

NOTE:
It is recommended to click the **Test Connection** button to verify that the details entered are working before continuing.

3. In the **Integration Point** pane, click the Integration Point you just created, and click the **Federation** tab in the right pane.
4. In the **Supported and Selected CI Types** area, verify the **Incident**, **Problem**, and **Request for Change** CITs are selected.



Step 7: Configure the SM-UCMDB Integration: Set Up Data Push Jobs

Depending on your adapter version, perform the following:

For ServiceManagerAdapter9-x:

1. Edit the **SM Push** job, and select **Scheduler Definition**.
2. For the **Repeat** field, you can select **Changes Sync/All Data Sync**.
3. Set the **Repeat Every** field to **1 Day**, and click **OK**.

For ServiceManagerAdapter7-1:

1. Edit the **SM Topology Comparison Push** job, and select **Scheduler Definition**.
2. For the **Repeat** field, select **interval**.
3. Set the **Repeat Every** field to **1 Day**, and click **OK**.
4. Edit the **SM History-based Push** job, and select **Scheduler Definition**.
5. For the **Repeat** field, select **interval**.
6. Set the **Repeat Every** field to **1 Day**, and click **OK**.

Step 8: Configure the SM-UCMDB Integration: Run Data Push Jobs

1. In the Integration Point pane, select the correct integration.
2. Select the **Data Push** tab. The Job Definition pane is displayed.
3. Select your job and click **Synchronize All** to run the push job.

   NOTE:
   For ServiceManagerAdapter7-1, run this first for the **SM History-based Push** job, then repeat for the **SM Topology Comparison Push** job.

4. When the Confirm synchronizing window is displayed, click **Yes**.
5. Click the **Statistics** tab to view the progress of the synchronization.
6. Click **Refresh** to view the updated synchronization status.

Step 9: Configure the SM-UCMDB Integration: Add UCMDB Connection Information to SM

1. Log on to your UCMDB system as an administrator. Verify that all UCMDB services are running.
2. Log on to your SM system as an administrator.
3. Select **System Administration > Base System Configuration > Miscellaneous > System Information Record**.
4. Select the **Active Integrations** tab.
5. Select the **Universal CMDB** option. The form displays the UCMDB Web service URL field.
6. In the UCMDB Web service URL field, enter the URL to the UCMDB Web service API. The URL has the following format:

   http://<UCMDB server name>:<port>/axis2/services/ucmdbSMService.

7. In the UserId dialog box, enter your UCMDB user name and password and click **Save**.

Step 10: Configure the APM-UCMDB Integration: Deploy CMS_to_RTSM_Sync.zip on UCMDB

1. Copy the file CMS_to_RTSM_Sync.zip located on the APM-DPS machine file system under **HPBSM\odb\conf\factory_packages** to the file system on the UCMDB machine.
2. Within the UCMDB user interface, select the **Administration** tab.
3. Select **Package Manager > Deploy Packages to server (from local disk).**
4. Click the **Add** button and select the file **CMS_to_RTSM_Sync.zip** through the file system browser.
5. Select **Deploy**.

Step 11: Configure the APM-UCMDB Integration: Create an Integration Point on APM

1. Within the APM user interface, select **RTSM Administration > Data Flow Management > Integration Studio.**
2. In the Integration Point pane, select **Create New Integration Point**. The Create New Integration Point dialog box opens. Enter the following:

Name	Recommended Value	Description
Integration Name	**<user defined>**	The name you give to the integration point.
Adapter	**UCMDB 9.x**	Select the adapter type from the drop-down list.
Is Integration Activated	**selected**	Select this check box to create an active integration point.
Hostname/IP	**<user defined>**	The name of the UCMDB server, load balancer, or reverse proxy.
Port	**<user defined>**	The port through which you access UCMDB, load balancer, or reverse proxy.

Name	Recommended Value	Description
Credentials	**<user defined>**	If credentials appear in the Credentials column, select them. If no credentials appear, select **Generic Protocol** and click the **Add new connection details for selected protocol type** button. Enter the following information: • **Description.** Enter **UCMDB**. • **User Name.** Enter the UCMDB user name. The default value is **admin**. • **User Password.** Enter and confirm a password.
Probe Name (for ServiceManagerAdapter9-x only)	**<user defined>**	If you are using ServiceManagerAdapter9-x, select the probe which reports to *APM* (see Prerequisites, on page 22).

3. Click the **Add** icon on the right side of the window and add Job definitions as follows:
   a. Name the **Job definition**.
   b. Select the **Allow Delete** check box.
   c. Click the **Add** icon in the Job definition window.
   d. From the pop up window, browse to **root - CMS sync** and select the **ActiveDirectory_sync** job and click **OK**.
   e. Select the **Scheduler definition** check box.
   f. In the Repeat window, select **Cron**.
   g. For the Cron expression, enter the following string: *** 0/10 * * * ? *** .
   h. Adjust other settings as needed.
   i. When finished, click **OK** and save the integration.
   j. Repeat steps **a** to **i** and configure the following jobs:
      - **FailoverCluster_Sync**
      - **IIS_Sync**
      - **SOA_Sync**
      - **BusinessAndFacilities_Sync**
      - **ExchangeServer_Sync**

- **Virtualization_Sync**
- **Siebel_Sync**
- **Credentials_Sync**
- **Basicinfrastructure_Sync**
- **J2EE_Sync**
- **SAP_Sync**

4. Browse to UCMDB on port 21212 (for example, http://<DPS_host>.<domain>:21212), and select the **JMX Console**.
5. Log on to the JMX console.
6. From the UCMDB section, select **UCMDB:service=Multiple CMDB Instances Services**.
7. Invoke:
   a. **setAsGlobalIdGenerator** and verify it succeeded.
   b. **getGlobalIdGeneratorScopes** and verify it succeeded.
8. Within APM, access **RTSM Administration > Data Flow Management > Integration Studio.**
9. Select the Integration Point that you have configured.
10. In the Job definition section, click **Synchronize All** to run the synchronization.

    The Integration Point should be active and the jobs are displayed properly.

Step 12: Configure the APM-UCMDB Integration: Create an Integration Point on the CMS

1. Log into UCMDB and select **Data Flow Management > Integration Studio.**
2. In the Integration Point pane, select **Create New Integration Point**. The Create New Integration Point dialog box opens. Enter the following:

Name	Recommended Value	Description
Integration Name	**<user defined>**	The name you give to the integration point.
Adapter	**UCMDB 9.x**	Select the adapter type from the drop-down list.
Is Integration Activated	**selected**	Select this check box to create an active integration point.

Name	Recommended Value	Description
Hostname/IP	**<user defined>**	The name of the APM server, load balancer, or reverse proxy.
Port	**<user defined>**	The port through which you access APM, load balancer, or reverse proxy.
Credentials	**<user defined>**	If credentials appear in the Credentials column, select them. If no credentials appear, select **Generic Protocol** and click the **Add new connection details for selected protocol type** button. Enter the following information: • **Description.** Enter **UCMDB**. • **User Name.** Enter the UCMDB user name. The default value is **admin**. • **User Password.** Enter and confirm a password.
Probe Name (for ServiceManagerAdapter9-x only)	**<user defined>**	If you are using ServiceManagerAdapter9-x, select the probe which reports to the *CMS* (see Prerequisites, on page 22).

3. Click the **Add** icon on the right side of the window and add Job definitions as follows:
   a. Name the **Job definition**.
   b. Select the **Allow Delete** check box.
   c. Click the **Add** icon in the Job definition window.
   d. From the pop up window, browse to **root - CMS sync** and select the **ActiveDirectory_sync** job and click **OK**.
   e. Select the **Scheduler definition** check box.
   f. In the Repeat window, select **Cron**.
   g. For the Cron expression, enter the following string: *** 0/10 * * * ? *** .
   h. Adjust other settings as needed.
   i. When finished, click **OK** and save the integration.

j. Repeat steps **a** to **i** and configure the following jobs:

- **FailoverCluster_Sync**
- **IIS_Sync**
- **SOA_Sync**
- **BusinessAndFacilities_Sync**
- **ExchangeServer_Sync**
- **Virtualization_Sync**
- **Siebel_Sync**
- **Credentials_Sync**
- **Basicinfrastructure_Sync**
- **J2EE_Sync**
- **SAP_Sync**

4. Browse to UCMDB on port 8080 (for example, http://yourUCMDBhost.domain:8080), and select the **JMX Console**.
5. Log on to the JMX console.
6. From the UCMDB section, select **UCMDB:service=Multiple CMDB Instances Services**.
7. Invoke:
   a. **setAsGlobalIdGenerator** and verify it succeeded.
   b. **getGlobalIdGeneratorScopes** and verify it succeeded.
8. Within UCMDB, access **Data Flow Management > Integration Studio.**
9. Select the Integration Point that you have configured.
10. In the Job definition section, click **Synchronize All** to run the synchronization.

    The Integration Point should be active and the jobs are displayed properly.

Step 13 (Optional): Add CI Types to the Service Health Changes and Incidents Component

By default, APM Service Health displays information on incidents and requests for change for the following CI types: Business Service, Siebel Application, Business Application, and Node.

If you want to view change and incident information for other CITs, perform the procedure described in How to Customize the Changes and Incidents Component, on page 42.

Step 14 (Optional): Map Siebel Application CITs

To create a mapping between the **Hand Held Devices** or **Display Device** CIT in Service Manager with **Siebel Application** CITs in APM, perform one of the following procedures:

- In Service Manager, select **Main page > To Do > Queue: Configuration Item > New > New** and click **Device**. In the Configuration Item field enter the exact name (case sensitive) of the APM CI that corresponds to the **Siebel Application** CIT in APM.
- Create a new population job that includes the **Hand Held Devices** or **Display Device** CIT. Those CITs correspond to the Siebel application CITs. For details about how to create a population job, see "Data Push Tab" in the *Modeling Guide*.

Result

You can now view planned changes and incident details in the Changes & Incidents tab in the 360° View page in Service Health.

Both products can now share information and data.

Troubleshooting

If you are not seeing expected incidents in APM, perform the following:

1. On the Data Processing Server, search the **odb\odb\Error.log** file for **Error Code 802**.
2. In this error message, locate the following string: **property [<*category or incident_status*>=<*attribute value*>[STRING]] is defined as attribute**.

   This indicates that a certain attribute value is missing in RTSM.
3. Access **RTSM Administration > CI Type Manager**.
4. From the **CI Types** menu, select **System Type Manager**, and open **Category** or **Incident Status** (depending on the error message) for editing.
5. Click the Add button (+), and add the missing attribute value (exactly as it appears in the error message) to the list of values.

Chapter 4: View Changes and Incidents in Service Health Using RTSM

This integration enables you to view planned changes and incident details in the Changes & Incidents tab in the 360° View page in Service Health, when you are working with RTSM. For details, see "Changes and Incidents" in the Service Health part of the *APM User Guide*.

This section includes the following:

Prerequisite

If you are using SM versions 9.30 or 9.31, before you begin you must install a data-flow probe with the APM Gateway Server as its target. When you configure the integration point, you will select this probe for the integration.

Step 1: Configure the Service Desk Adapter Time Zone

Configure the time zone so Incidents and Planned Changes have the correct time definitions:

1. In Service Manager, select **Navigation pane > Menu navigation > System Administration > Base System Configuration > Miscellaneous > System Information Record**.
2. Within the **Date Info** tab, open the <APM DPS root directory>/odb/runtime/fcmdb/CodeBase/ServiceManagerAdapter9-x or ServiceDeskAdapter7-1/serviceDeskConfiguration.xml file.
3. Find the row that includes the following string:

   <globalConnectorConfig><![CDATA[<global_configuration><date_pattern>MM/dd/yy HH:mm:ss</date_pattern><time_zone>US/Pacific</time_zone>

   and check the date and time format, and time zone. Note that the date is case-sensitive. Change either Service Manager or the xml file so that they both match each other's settings.

   NOTE:
   Specify a time zone from the Java time zone list that matches the time zone used in Service Manager; for example, America/New York.

4. Restart the corresponding server to make the change take effect. (If you changed the time zone on SM, restart the Service Manager server; if you changed the time zone on APM, restart the APM server.)

Step 2: Create an Integration User Account in Service Manager

This integration requires an administrator user account for APM to connect to Service Manager. This user account must already exist in both APM and Service Manager.

To create a dedicated integration user account in Service Manager:

1. Log in to Service Manager as a system administrator.
2. Type **contacts** in the Service Manager command line, and press ENTER.
3. Create a new contact record for the integration user account.
   a. In the **Full Name** field, type a full name. For example, RTSM.
   b. In the **Contact Name** field, type a name. For example, RTSM.
   c. Click **Add**, and then OK.
4. Type **operator** in the Service Manager command line, and press ENTER.
5. In the **Login Name** field, type the username of an existing system administrator account, and click **Search**.

   The system administrator account displays.
6. Create a new user account based on the existing one:

a. Change the **Login Name** to the integration account name you want (for example, rtsm).

b. Type a **Full Name**. For example, RTSM.

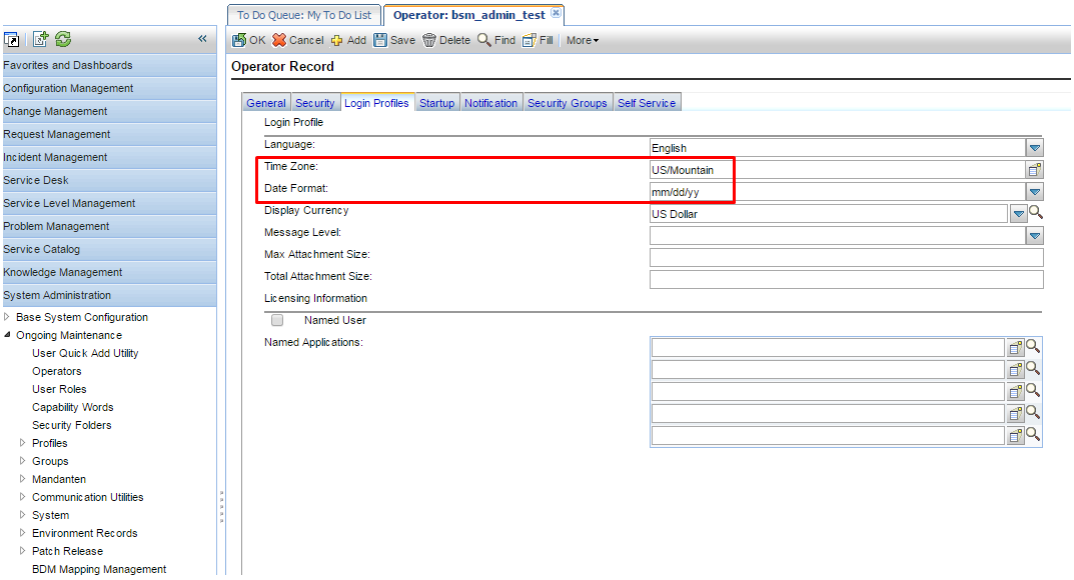
c. In the **Contact ID** field, click the **Fill** button and select the contact record you have just created.

d. Click **Add**.

e. Select the **Security** tab, and change the password.

f. Click the **Login Profiles** tab, and review the information in the **Time Zone** and **Date Format** sections. If necessary, update this information according to the Service Desk Adapter Time Zone configuration you performed in Step 1: Configure the Service Desk Adapter Time Zone, on page 34.

NOTE:
A Time Zone or Data Format mismatch could cause limited functionality in the integration.



g. Click **OK**.

The integration user account is created. Later you will need to add this user account (username/password) in RTSM, and then specify this user account in the **Credentials ID** field when creating an integration point in RTSM administration.

Step 3: Add the APM Connection Information in Service Manager

The integration requires the APM connection information to obtain CI attribute information from the APM system, and display it in the Actual State section in the Service Manager configuration item form.

1. Log in to Service Manager as a system administrator.
2. Click **System Administration > Base System Configuration > Miscellaneous > System Information Record**.
3. Click the **Active Integrations** tab.
4. Select the **Universal CMDB** option.

   The form displays the UCMDB web service URL field.
5. In the UCMDB webservice URL field, type the URL to the Universal CMDB web service API. The URL has the following format: **http://<UCMDB server name>:<port>/axis2/services/ucmdbSMService**

   Replace <UCMDB server name> with the host name of your APM server, and replace <port> with the communications port your APM server uses.
6. In **UserId** and **Password**, type the user credentials required to manage CIs on the APM system. For example, the out-of-the-box administrator credentials are **admin/ admin**.
7. Click **Save**. Service Manager displays the message: **Information record updated**.
8. Log out of the Service Manager system.
9. Log back into the Service Manager system with an administrator account. The **Actual State** section will be available in CI records pushed from APM.

Step 4: Create an Integration Point in APM

A default RTSM 9.05 installation already includes the ServiceManagerAdapter9-x package. To use the integration package, you must create an integration point listing the connection properties for the integration.

To create an integration point:

1. Access the JMX console (in case of distributed deployment) on the DPS server.
2. Navigate to **UCMDB:service=Security Services**.
3. Create a new user with the name and password that you created in SM, using the JMX **createUser**:

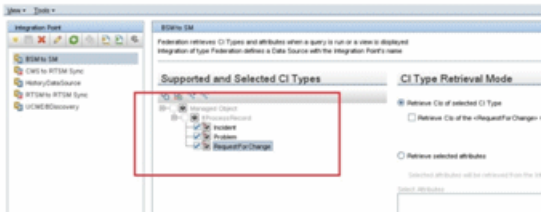
- **CustomerId** = 1
- **userName** = <userName>
- **password** = <password>

4. Assign the user Administrator Role using the JMX **setRolesForUser** from the same section:
   - **CustomerId** = 1
   - **userName** = <userName>
   - **roles** = Admin
5. In APM, select **Admin > RTSM Administration**, click the **Data Flow Management** tab, and select **Integration Studio**.
6. In the Integration Point pane, select **Create New Integration Point**. The Create New Integration Point dialog box opens. Enter the following:

Name	Recommended Value	Description
Integration Name	**SM Integration**	The name you give to the integration point.
Adapter	**<user defined>**	Select BTO Products > Service Manager > **Service Manager 9.xx**. This adapter, which supports CI/ relationship Data Push from RTSM to Service Manager, and Population and Federation from Service Manager to RTSM.
Is Integration Activated	**selected**	Select this check box to create an active integration point.
Hostname/IP	**<user defined>**	The name of the SM server.
Port	**<user defined>**	The port through which you access SM.
Credentials	**<user defined>**	Click **Generic Protocol**, click the **Add** button to add the integration user account you created in Step 2: Create an Integration User Account in Service Manager, on page 35, and then select it. This account must exist in both Service Manager and APM.
Probe Name (for ServiceManagerAdapter9-x only)	**<user defined>**	Select the probe that you installed for this integration.

NOTE:
It is recommended to click the **Test Connection** button to verify that the details entered are working before continuing.

7. In the **Integration Point** pane, click the Integration Point you just created, and click the **Federation** tab in the right pane.
8. In the **Supported and Selected CI Types** area, verify the **Incident**, **Problem**, and **Request for Change** CITs are selected.

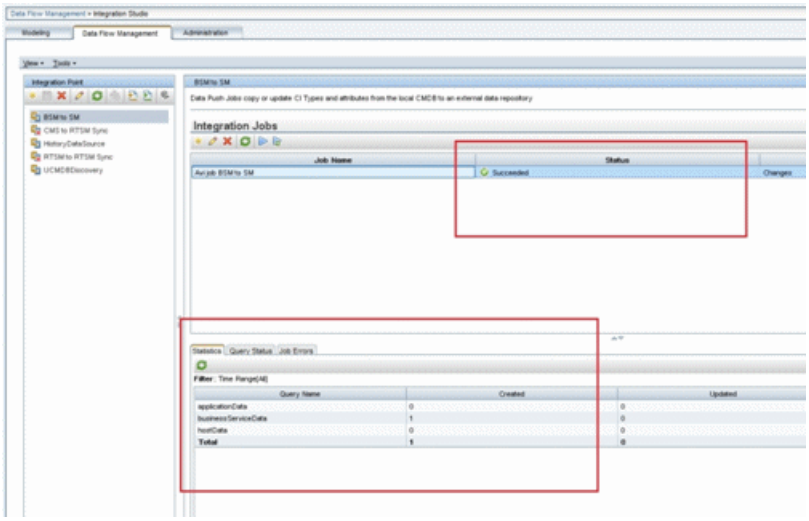


Step 5: Create New Jobs to Synchronize Between APM and Service Manager

1. In the same location as step 5 above, click the **Data Push** tab.
2. In the New Integration Job dialog box, click the + icon on the left.
3. In the Available Queries dialog box, select the relevant queries for the job.

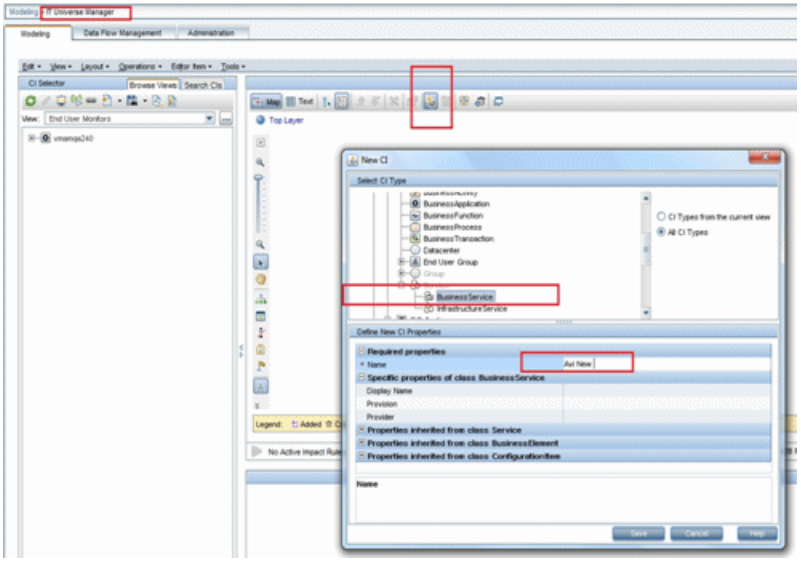
Step 6: Run the Job

When you run the job, the CIs are synchronized between APM and Service Manager.

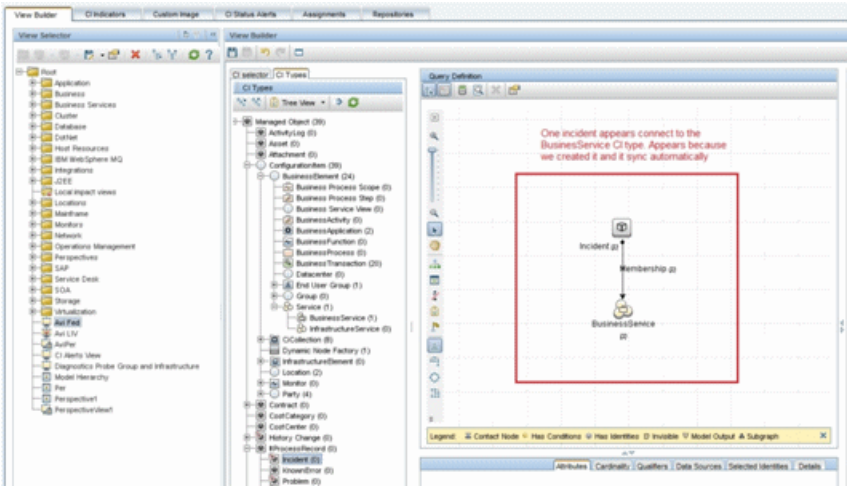


Step 7: Test the Configuration

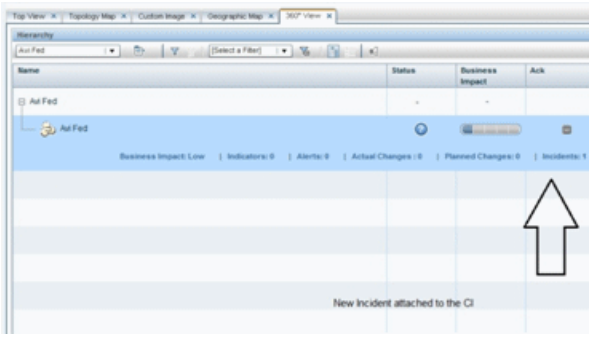
1. In APM, select **Admin > RTSM Administration**, click the **Modeling** tab, and select **IT Universe Manager**.
2. In the **CI Selector** pane, select the relevant view, and click  in the right pane.
3. In the **New CI** dialog box that opens, create a new CI with the **BusinessService** type.



4. Create a TQL in **Admin > Service Health > View Builder** that includes only BusinessService CI Types (CITs).
5. Click the **Calculate** button. The relevant CI appears in view.
6. Click the **Data Push** tab, and run the job in order to synchronize with Service Manager.
   A message that the job was successful should be issued.
7. In Service Manager, create a new incident for the new CI that you created above:
   a. Select **Incident Management > Open New Incident**.
   b. **Important:** Start by entering the name of the CI you want to attach to the incident in the **Affected CI** field. This creates the Incident Id.
   c. Enter the CI name in the **Affected Service** field and click to search.
   d. Enter any incident detail.
      The incident is automatically attached to the CI.
8. In APM, create a TQL with the CI Type you created connected to the Incident CI Type in a membership relationship link.
9. Click the **Calculate** button. One incident appears connected to the BusinessService CI Type because this test created it and it is synchronized automatically.



10. Delete the incident from the TQL and save the TQL to be a view. The TQL is only used for the test.
11. Select **Application > Service Health**, and click the **360 View** tab. Check that the new incident is attached to the CI.



Step 8 (Optional): Add CI Types to the Service Health Changes and Incidents Component

By default, APM Service Health displays information on incidents and requests for change for the following CI types: Business Service, Siebel Application, Business Application, and Node.

If you want to view change and incident information for other CITs, perform the procedure described in How to Customize the Changes and Incidents Component, on page 42.

Troubleshooting

If you are not seeing expected incidents in APM, see Troubleshooting, on page 33

Chapter 5: How to Customize the Changes and Incidents Component

By default, incidents and requests for change are displayed for the following CI types: Business Service, Siebel Application, Business Application, and Node. If you want to view change and incident information for other CITs, perform the following procedure:

1. Within **Admin > RTSM Administration > Modeling Studio**, copy one of the TQLs within the **Console** folder, and save your copy with a new name. These default TQLs perform the following:

TQL name	Description
CollectTicketsWithImpacts	Retrieves Service Manager incidents for the selected CI, and for its child CIs which have an Impact relationship.
CollectTicketsWithoutImpacts	Retrieves Service Manager incidents for the selected CI.
CollectRequestForChangeWithImpacts	Retrieves Service Manager requests for change, for the selected CI, and for its child CIs which have an Impact relationship.
CollectRequestForChangeWithoutImpacts	Retrieves Service Manager requests for change, for the selected CI.

2. Edit the new TQL as needed. You can add CITs as described in Naming Constraints for New Request for Change TQLs, on the next page.
3. Access **Admin > Platform > Setup and Maintenance > Infrastructure Settings**:
   - Select **Applications**.
   - Select **Service Health Application**.
   - In the **Service Health Application - Hierarchy (360)** area, enter the name of the new TQL you have create in the corresponding infrastructure setting.

   Note that by default these infrastructure settings contain the default TQL names. If you enter a TQL name that does not exist, the default value will be used instead.

After you modify the infrastructure setting, the new TQL will be used, and the Changes and Incidents component will show this information for the CITs you have defined.

Naming Constraints for New Request for Change TQLs

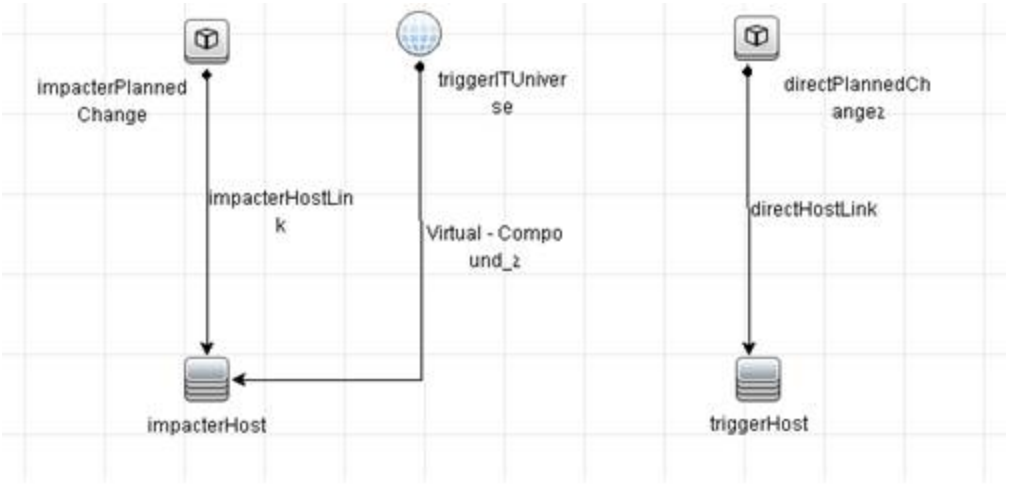
The following naming constraints should be followed in the request for change *without* impact TQL (see the TQL example below, on the right side of the image):

- The request for change CI type should start with **directPlannedChange**.
- The CI type related to the request for change should start with **trigger**.

The following naming constraints should be followed in the request for change *with* impact TQL (see the TQL example below, on the left side of the image):

- **impacterPlannedChange** represents the request for change CI type.
- The CI type related to the request for change should start with **impacter**.
- **triggerITUniverse** represents the "impacted" child CIs.

Examples of request for change TQLs:



Naming Constraints for New Incident TQLs

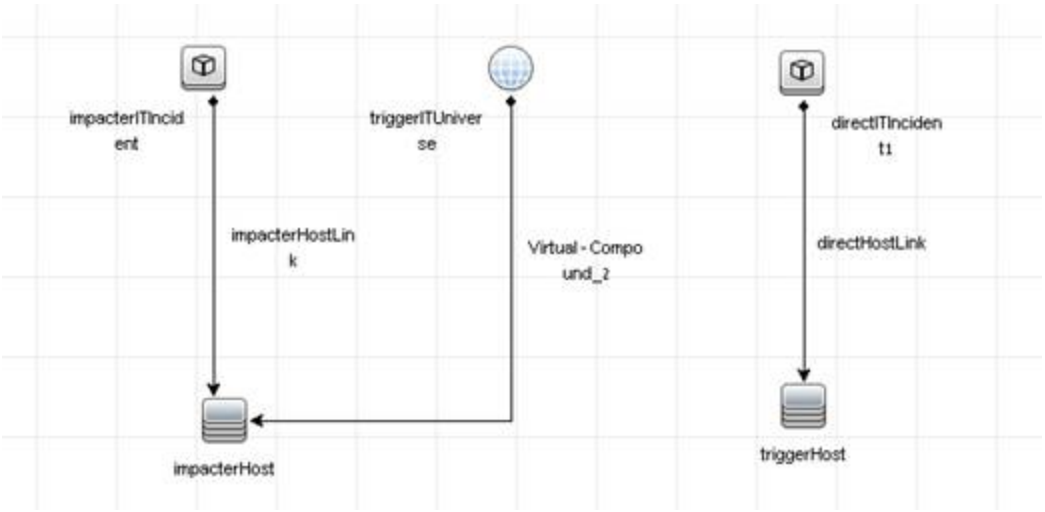
The following naming constraints should be followed in the incidents *without* impact TQL (see the TQL example below, on the right side of the image):

- The incident CI type should start with **directITIncident**.
- The CI type related to the incident should start with **trigger**.

The following naming constraints should be followed in the incidents *with* impact TQL (see the TQL example below, on the left side of the image):

- **impacterITIncident** represents the incident CI type.
- The CI type related to the incident should start with **impacter**.
- **triggerITUniverse** represents the "impacted" child CIs.

Examples of incident TQLs:



Chapter 6: View Incident Data in APM, and Manage SLAs Based on Service Manager

This integration enables you to view the Number of Open Incidents in Service Health, and manage SLAs over Serviceability KPIs based on SM incidents, using EMS configuration.

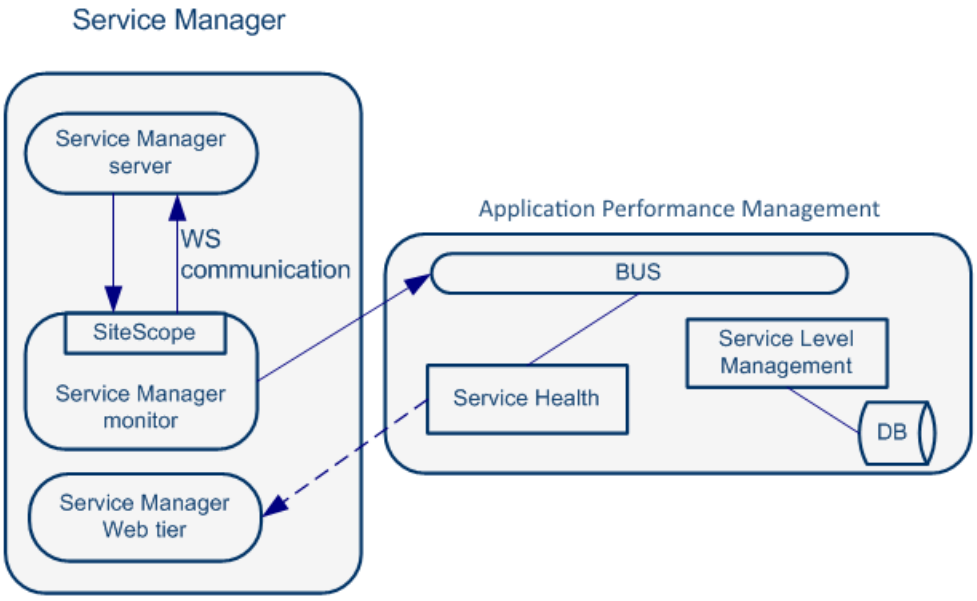
This section includes the following:

Overview: Understanding the Integration with EMS

The following sections describe the capabilities provided by the integration of Business Service Management and Service Manager with the EMS option.

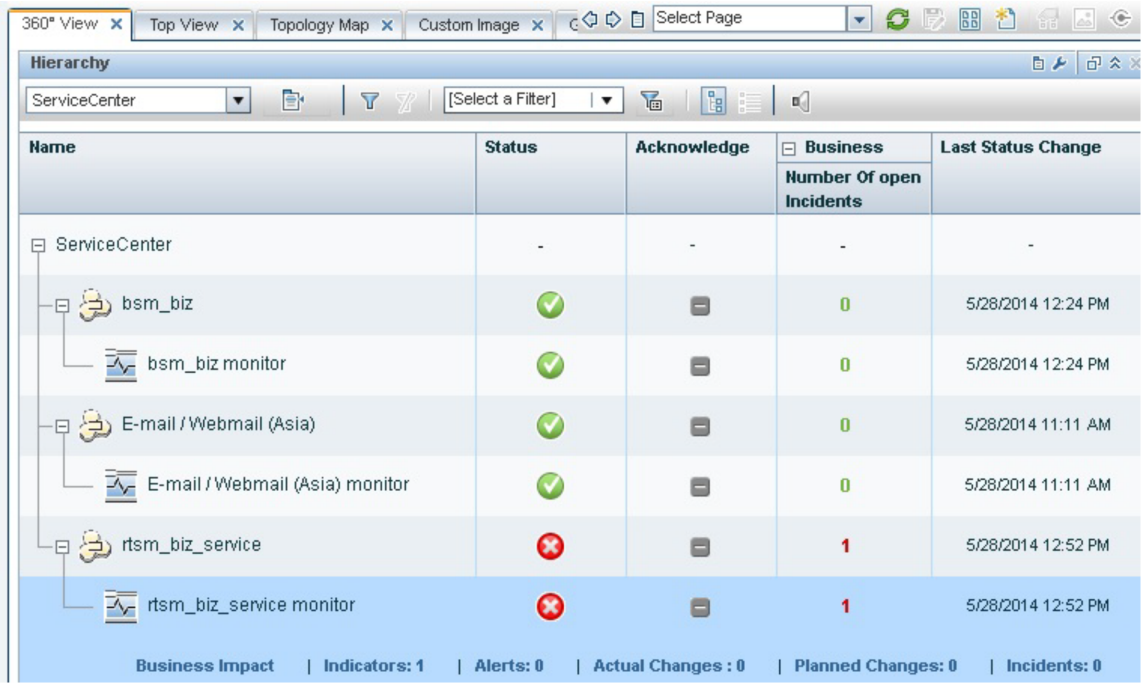
Architecture

The architecture of the integration of Service Health and Service Level Management with Service Manager is as follows:



You can work with one or more of the following options:

- **Number of Open Incidents KPI.** You can view the Number of Open Incidents KPI (based on data from Service Manager) at the business service level in the APM Service Health views and reports. For details about the views, see "View Topology" in the Service Health part of the *APM User Guide*. For example: the Operator/Application support can get visibility and alerts based on the Number of Open Incidents in APM Service Health alongside operational KPIs.
- **Drill down to Service Manager from EMS monitor level CIs.** You can drill down from Service Health views at the EMS monitor level business service level to Service Manager to view the details of the related incidents. For details about the available drill downs, see "Service Health Menu Options" in the Service Health part of the *APM User Guide*. For example: the support person can drill down to Service Manager to view the details on the open incidents of the selected service. Based on the number of incidents and their details, the support person can prioritize the issues that are the most important.



The assignment of the Service Manager EMS integration enriches the relevant CIs with the appropriate KPIs, rules, and context menus that are to be assigned automatically to the CIs when the condition occurs, and the assignment is running. For details, see "EMS Integrations Application Overview" in the Integrations Administration part of the *APM Application Administration Guide*.

Defining SLAs

You can define SLAs based on the serviceability KPIs (MTTR, MTBF, or MTBSI KPIs) that are calculated based on incidents that come from Service Manager. For details, see "Agreements" in the Service Level Management part of the *APM Application Administration Guide*.

For example: the Service Manager manages SLAs with operational KPIs (Availability, Performance, or other KPIs) and serviceability KPIs (MTTR, MTBF, or MTBSI KPIs) using APM Service Level Management. The Service Manager can review the SLAs statuses according to the service Availability, Performance, MTTR, and MTBF side-by-side.

Elements Created in the View by the Integration with Service Manager

The Service Manager integration creates the following elements:

Element	Service Health	Service Level Management
CIs	EMS Monitor CIs for the monitored Service Manager system, based on the samples sent by the SiteScope Service Manager Monitor. Status for these CIs can be viewed in Service Health in the Business Services, Service Manager, and the Service	

	Measurements views, and the CIs are available to add to SLAs in Service Level Management. Note: All Service Manager elements are currently mapped to Business Service CIs through EMS.	
Health Indicators	Ticketing EMS Monitor HI. For more information, see "Indicator Repository" in the Service Health part of the *APM Application Administration Guide*.	MTBF EMS Monitor HI, MTBSI EMS Monitor HI, and MTTR EMS Monitor HI. For more information, see "Indicator Repository" in the Service Level Management part of the *APM Application Administration Guide*.
KPIs	Number of Open Incidents KPI. For details, see "List of Service Health KPIs" in the Service Health part of the *APM Application Administration Guide*.	MTTR (Mean Time to Repair, MTBF (Mean Time Between Failures, and MTBSI (Mean Time Between System Incidents KPIs. For details, see "List of Service Level Management KPIs" in the Service Level Management part of the *APM Application Administration Guide*.
Rules and Toolips	The Number of Open Incidents KPI (attached to an EMS Monitor CI) uses the Number of Open Incidents monitor rule in Service Health and the Number of Open Incidents Sentence tooltip. The rule handles the samples sent to APM by the EMS system. For details on the rule, see List of Calculation Rules in Service Health" in the Service Health part of the *APM*	Each Service Manager KPI (attached to an EMS Monitor CI) uses its own monitor rule. For details on the rules, see "List of Service Level Management Business Rule Parameters" in the Service Level

	Application Administration Guide.	Management part of the *APM Application Administration Guide*.
Context Menu	The SC Menu. For details on the context menu, see "List of Context Menus" in the Service Health part of the *APM Application Administration Guide*.	N/A
Context Menu Item	The Service Manager context menu item. For details on the context menu, see "List of Context Menu Actions" in the Service Health part of the *APM Application Administration Guide*.	N/A

NOTE:
Only incidents for which you select a CI in the **Affected CI** field are retrieved by EMS. The CI listed in the **Affected CI** field represents an incident-related item. The default EMS settings only support the monitoring of Business Service CITs.

Prerequisites

The Service Manager server, Web tier, and Windows client components must be installed. For details, see Service Manager Installation guide.

Optional. If you want Service Manager to use the SSL-based Trusted Sign-on protocol, configure it according to the instructions in the Service Manager online help.

Optional. If you want Service Manager to use the LW-SSO, configure it according to the instructions in the Service Manager online help. APM must also be configured with LW-SSO.

NOTE:
Plan to put both the Service Manager Web tier and the webapp in the same container, so you can use the same certificate for both.

Step 1: Enable Access to Service Manager From Within Service Health

Disable the query security of the Service Manager application to enable accessing the application, through the right-click Service Manager menu option in Service Health. You still have the necessary capabilities to properly secure your system without the query hash.

To enable accessing Service Manager from within Service Health:

1. After installing and configuring LW-SSO, edit the web.xml file. The location of the file depends on the type of Web application server the Web tier is deployed on. It is usually located in the Service Manager home directory under the Apache home directory. The web.xml file can be located at:**\<J2EE webserver path>\webapps\<webtier>\WEB-INF**.
2. In the file, locate the **<!-- Specify the Service Manager server host and port location -->** section. This section should appear after the **honorUrlPort** section.
3. Verify that the following strings exists in the section:
   <init-param>
   <param-name>querysecurity</param-name>
   <param-value>false</param-value>
   </init-param>
4. Restart the Tomcat container using the Net stop tomcat and Net start tomcat commands.

Step 2: Define Service Manager Tables for External Access to the Clocks

To enable the integration, load the appropriate .unl to provide external access to the clocks table in Service Manager. This step enables the display of the Number of Incidents KPI in Service Health. This can be done as follows (note that the probsummary table is accessed by default without .unl):

- In Service Manager, manually within Service Manager if the tables are used for other external internal integrations. For details, refer to the Service Manager documentation.
- Using the configuration file supplied with Business Service Management to enable external access to the clocks table:
  1. Locate the **Clocks_extaccess_sm702_10Nov08.unl** available in the **Setup\SM_Unloads** directory in the electronic download package, and copy it to a local directory.
  2. Open the Service Manager client and connect to the server.
  3. Select **Tailoring > Database Manager**.
  4. In the menu on the upper right side of the Database Manager, select **Import/Load**.

5. Select the configuration file you copied to the local directory in the first step.
6. Click the **Load FG** button in the left top corner of the page.
7. Verify that the clocks table has the values described below. If the values do not match, edit the clocks table in Service Manager so that the values are the same as in the below table (for details on how to do that, see Service Manager documentation).

Field	Caption	Type
events[start]	start	DateTimeType
events[stop]	stop	DateTimeType
name	name	StringType
key.char	clockId	StringType
sysmodtime	sysmodtime	DateTimeType
type	type	StringType
Key.numeric	clockKey	DecimalType

Step 3: Correct the Clocks WSDL

Correct the clocks WSDL to enable the display of the Number of Incidents KPI in Service Health.

1. In the Service Manager client, select **Tailoring > Web Services > Web Service Configuration**, enter **Clocks** in the **Service Name** field, and click **Search**.
2. Click the **Fields** tab.
3. Add the following entry:

Field	Caption	Type
Total	temp	StringType

Note: The values in the table have no meaning.

4. Click **Save** and **OK**.
5. Click **Search** again, click the **Fields** tab and clear the new entry.
6. Click **Save** and **OK**.

Step 4: Add the Type Field to the logical.name Link Line

This step enables EMS to count incidents that were manually opened in Service Manager and to display of the Number of Incidents KPI in Service Health.

Note:

- For new customers, EMS calculates ONLY incidents that were manually opened after the tailoring process was applied. For existing customers, the previous Service Manager version is populating these fields and the integration works even after you upgrade to Service Manager to 7.10. Skip this step if you use other versions. Incidents opened by incident submission are always calculated.
- Perform this step before you configure the SiteScope Service Manager Monitor accessed in APM by clicking **Admin > Integrations > EMS Integration Admin**. Only incidents that were opened after this step are displayed in APM Service Health.

You add the Type field to the logical.name link line in the probsummary link record as follows:

In Service Manager, login with a System Administrator user (for example, **falcon**).

1. Select **Tailoring > Tailoring Tools > Links**.
2. Enter **probsummary** in the **Name** field and click **Search**.
3. Set the cursor on the first line that includes **logical.name** in the **Source Field Name** field (line 14).
4. Select **Select Line** in the **More** menu.
5. Make sure the following entries are present in the table:

Source Field	Target Field
logical.name	logical.name
company	company
type	type
initial.impact	default.impact
severity	problem.priority

6. Click **Save**, **Back**, and then **OK**.

Step 5: Create a Corresponding Service Manager User

This step enables the display of the Number of Incidents KPI in Service Health.

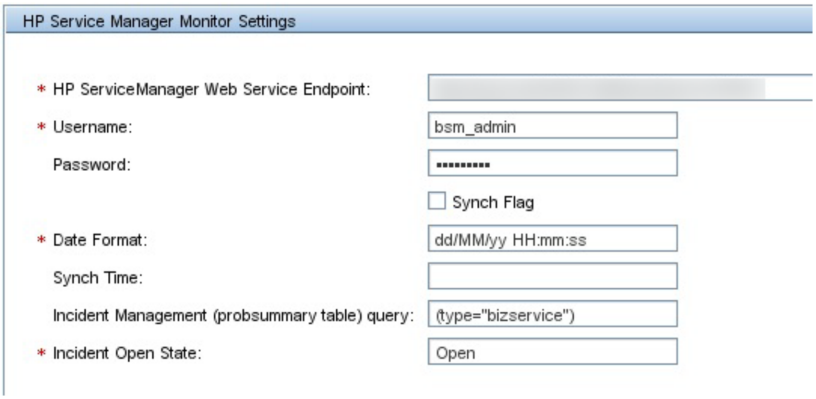
1. Create a dedicated user in Service Manager. The user should be used solely for the purposes of the Business Service Management/SiteScope integration.
2. Make sure that the Service Manager machine and the SiteScope machine share the same time zone.
3. Make sure that the Service Manager machine and the SiteScope machine use the same date format (SiteScope date format): **dd/mm/yy**.
4. When configuring the monitor, use the value for the **Username** and **Password** fields that you created in Service Manager.

Step 6: Configure the Service Manager Monitor in SiteScope

Configure the Service Manager monitor in SiteScope as follows:

1. Synchronize Service Manager and SiteScope so their time zones are the same. Match their System Time in the Windows or Unix operating system.
2. Make sure that the user you are using in SiteScope is the user you defined in Step 5: Create a Corresponding Service Manager User, above.
3. Make sure you have installed the SiteScope EMS license. Note that you do not require this license if SiteScope 11.0 or later is used.
4. Configure the Service Manager monitors in SiteScope as follows:
   a. Stop SiteScope.
   b. On the SiteScope operating system go to **<SiteScope root directory>\conf\ems\peregrine\lib\<SM version>** and copy **incidentAttributesMapping.conf** to **<SiteScope root directory>\conf\ems\peregrine**.
   c. On the SiteScope operating system go to **<SiteScope root directory>\conf\ems\peregrine\lib\<SM version>** and copy **peregrine.jar** to **<SiteScope root directory>\WEB-INF\lib**.
   d. Start SiteScope
   e. Create a new Service Manager monitor using the following fields:

- **Web Service**: <protocol>://<SMhost>:<SMport>/sc62server/PWS/
- **user name**: <user name defined in Step 5: Create a Corresponding Service Manager User, on the previous page>
- **user pass**: <password of user created in Step 5: Create a Corresponding Service Manager User, on the previous page>
- **incident management query**: <type of CI> should be the same as the **Type** field of the CI in Service Manager. For example, for the Business Service CI Type in SM, use **bizservice**.

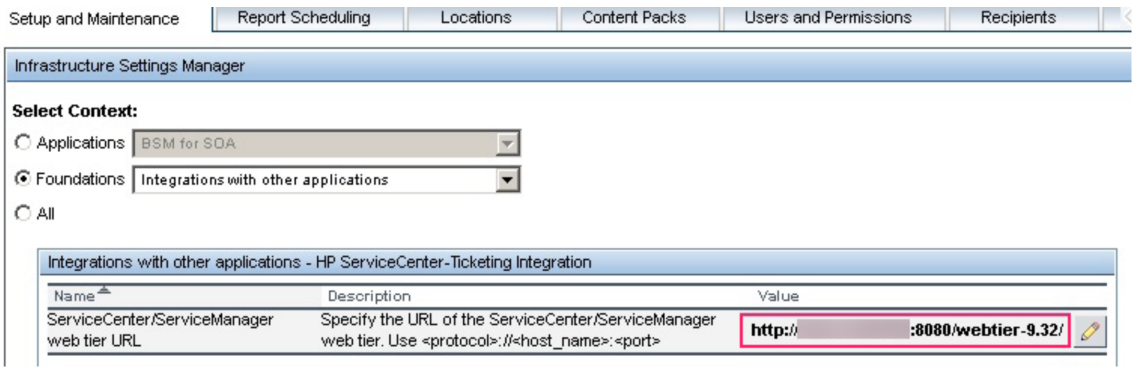


Step 7: Specify the Service Manager Web Tier URL in the Infrastructure Settings

The Service Manager URL is used when drilling down from APM to Service Manager using the **SC Menu** context menu item.

1. To specify the Service Manager URL, in APM, select **Admin > Platform > Setup and Maintenance > Infrastructure Settings**, select **Foundations**, and select **Integrations with other applications**.
2. In the Integrations with other applications - ServiceCenter - Ticketing Integration table, enter the appropriate URL in the **ServiceCenter/Service Manager web tier URL** entry, using the following format: **<protocol>://<host_name>:<port>/<web_app_name>/** where **host_name** is the name of the Service Manager server, **port** is the port number of the Service Manager server, and **web_app_name** is the name of the application.

The URL of Service Manager is, for example, **http://fando:8080/sm7/**.



Step 8: Customize the Service Manager EMS Integration Adapter and Check the Assignment – Optional

The Service Manager integration adapter is predefined. You can customize the configuration. Make sure that the assignment rule is running (it is running by default).

In APM, select **Admin > Integrations > EMS Integration Admin, select ServiceCenter** and click **Edit**. In the Edit Integration dialog box:

1. **Configure the Service Manager Monitor – Optional.** The monitor is used to retrieve data from the EMS system using System Availability Management Administration. The Service Manager Monitor is added to a SiteScope monitor group created for this monitor and other Integration Monitor types. It is recommended that you configure Integrations Monitors only after a connection between the SiteScope and Business Service Management is established. For details, go to "How to Work with the Service Manager Integration" in *Monitor Reference* in the SiteScope documentation library.

   Note: SiteScope cannot be deployed behind a firewall. SiteScope and the monitored system must be on the same LAN or special firewall configuration might be required.

2. **Activate the data assignment rule.** Make sure that the assignment rule is running.

   When the EMS monitor sample includes open incidents in its data source, the **Number of Open Incidents** KPI (2600), the **Number of Open Incidents** rule (2600), the **SC Menu** context menu (sc), the **Service Manager** context menu item, and the **Number of Open Incidents** tooltip (2600) are assigned to the EMS Monitor CI.

   You can use the EMS Integrations application to customize an Service Manager integration. The integration forwards the retrieved data captured from the Service Manager system by the SiteScope Service Manager monitor to APM, and creates the appropriate topology that is used to

display the data in Service Health. For details on the possible customizations, see "Edit Integration Dialog Box" in the Integrations Administration part of the *APM Application Administration Guide*.

Step 9: Specify the State and Severity of Open Incidents to Be Displayed – Optional

To modify the state and severity of the open incidents to be displayed, you can edit the parameters of the Number of Open Incidents rule parameters:

- **For the Number of Open Incidents KPIs attached to a specific EMS Monitor CI.** In APM, select **Admin > Service Health > Assignments > KPI Assignments**, select the **ServiceCenter** view and the EMS Monitor CI, edit the **Number of Open Incidents** rule, and edit the **Initial State, Final State,** and **Severity** parameters.
- **Globally, for all KPIs defined with the Number of Open Incidents rule**. In APM, select **Admin > Service Health > Repositories > Business Rules**, clone or override the **Number of Open Incidents** rule, and edit the **Initial State, Final State**, and **Severity** parameters.

For details on the parameters, see "List of Calculation Rules in Service Health" in the Service Health part of the *APM Application Administration Guide*.

NOTE:
The values available for the Initial State, Final State, and Severity parameters reflect the values defined in Service Manager. APM severity is correlated with Service Manager urgency.

Step 10: Include Service Manager CIs in Service Level Management Agreements

You can include Service Manager EMS Monitor CIs in your agreements in Service Level Management. Service Level Management contains KPIs and rules specifically configured for Service Manager EMS Monitor CIs. The MTTR, MTBF, and MTBSI KPIs and the MTTR, MTBF, and MTBSI rules are dedicated for this integration.

You also configure the incident initial and final state in those rules. For details, see "Service Level Management KPIs for System Incidents" in the Service Level Management part of the *APM Application Administration Guide*, and locate "Incident State and Severity Values".

Results

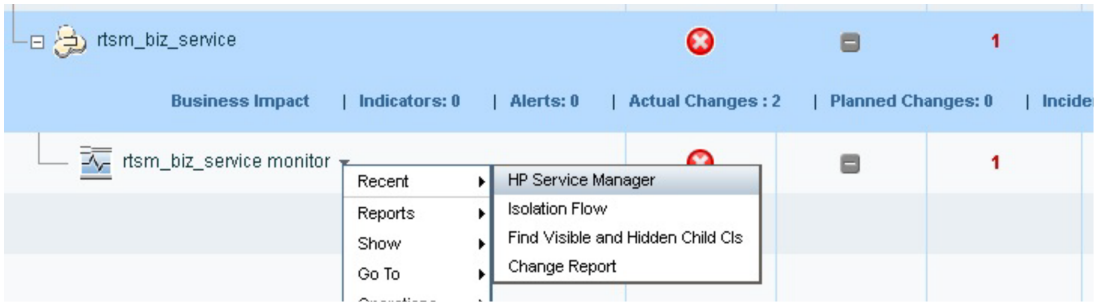
After the task is performed, Service Manager data is integrated into APM. You can:

- **View Service Manager Data in Service Health and Service Level Management:**

  SiteScope automatically creates the appropriate topology when Service Manager data is integrated into APM. Business Service Management adds the data to the Business Services, ServiceCenter, and Service Measurements views, and you can display these views in Service Health. The Business Service and EMS Monitor CIs are added to Service Level Management.

- **Drill down to Service Manager from Service Health views:**

  In Service Health, in the ServiceCenter, and Service Measurements views, use the **Service Manager** option available for **EMS Monitor** CIs under Business Service CIs, to access the relevant incident in the Service Manager application. For information about the Service Manager application, consult the Service Manager documentation.



Send documentation feedback

If you have comments about this document, you can contact the documentation team by email. If an email client is configured on this system, click the link above and an email window opens with the following information in the subject line:

Feedback on APM - Service Manager Integration Guide (Micro Focus Application Performance Management 9.50)

Add your feedback to the email and click **Send**.

If no email client is available, copy the information above to a new message in a web mail client, and send your feedback to docs.feedback@microfocus.com.

We appreciate your feedback!
