

How to test connection to SMTP server from Linux

- **Use the following command:**

```
echo "test email " > testConnection.txt && curl -4 -v -u "  
<username>@<domain>.com:<password>" --ssl-reqd smtp://smtp.office365.com  
--mail-from <username>@<domain>.com --mail-rcpt  
<username>@<domain>.com --upload-file ./testConnection.txt
```

- **Type here a final question about your topic?**

From where this command should be executed from?

R/ If this is just for a general test, it can be run from the SMAX master or worker that hosts the platform pods, if the test requires to test the network availability, its preferable to be executed from the offline platform directly.
