HP Universal CMDB

for the Windows and Linux operating systems

Software Version: 9.01

Deployment Guide

Document Release Date: July 2010 Software Release Date: July 2010

Legal Notices

Warranty

The only warranties for HP products and services are set forth in the express warranty statements accompanying such products and services. Nothing herein should be construed as constituting an additional warranty. HP shall not be liable for technical or editorial errors or omissions contained herein.

The information contained herein is subject to change without notice.

Restricted Rights Legend

Confidential computer software. Valid license from HP required for possession, use or copying. Consistent with FAR 12.211 and 12.212, Commercial Computer Software, Computer Software Documentation, and Technical Data for Commercial Items are licensed to the U.S. Government under vendor's standard commercial license.

Acknowledgements

• This product includes software developed by Apache Software Foundation (http://www.apache.org/licenses).

- This product includes OpenLDAP code from OpenLDAP Foundation (http://www.openldap.org/foundation/).
- This product includes GNU code from Free Software Foundation, Inc. (http://www.fsf.org/).
- This product includes JiBX code from Dennis M. Sosnoski.
- This product includes the XPP3 XMLPull parser included in the distribution and used throughout JiBX, from Extreme! Lab, Indiana University.
- This product includes the Office Look and Feels License from Robert Futrell (http://sourceforge.net/projects/officelnfs).
- This product includes JEP Java Expression Parser code from Netaphor Software, Inc. (http://www.netaphor.com/home.asp).

Documentation Updates

The title page of this document contains the following identifying information:

- Software Version number, which indicates the software version.
- Document Release Date, which changes each time the document is updated.
- Software Release Date, which indicates the release date of this version of the software.

To check for recent updates, or to verify that you are using the most recent edition of a document, go to:

http://h20230.www2.hp.com/selfsolve/manuals

This site requires that you register for an HP Passport and sign-in. To register for an HP Passport ID, go to:

http://h20229.www2.hp.com/passport-registration.html

Or click the New users - please register link on the HP Passport login page.

You will also receive updated or new editions if you subscribe to the appropriate product support service. Contact your HP sales representative for details.

Support

Visit the HP Software Support web site at:

http://www.hp.com/go/hpsoftwaresupport

This web site provides contact information and details about the products, services, and support that HP Software offers.

HP Software online support provides customer self-solve capabilities. It provides a fast and efficient way to access interactive technical support tools needed to manage your business. As a valued support customer, you can benefit by using the support web site to:

- Search for knowledge documents of interest
- Submit and track support cases and enhancement requests
- Download software patches
- Manage support contracts
- Look up HP support contacts
- Review information about available services
- Enter into discussions with other software customers
- Research and register for software training

Most of the support areas require that you register as an HP Passport user and sign in. Many also require a support contract. To register for an HP Passport ID, go to:

http://h20229.www2.hp.com/passport-registration.html

To find more information about access levels, go to:

http://h20230.www2.hp.com/new_access_levels.jsp

Welcome to This Guide

Welcome to the HP Universal CMDB Deployment Guide. This guide introduces you to HP Universal CMDB, provides information on getting started, describes server installation, server hardening, and details the upgrade process.

This chapter includes:

- ➤ How This Guide Is Organized on page 13
- ➤ Who Should Read This Guide on page 14
- ➤ HP Universal CMDB Online Documentation on page 15
- ➤ Additional Online Resources on page 18
- ➤ Documentation Updates on page 19

How This Guide Is Organized

This guide contains the following parts:

Part I Introduction

Introduces the components that are installed during HP Universal CMDB installation, and provides the installation workflow and deployment choices.

Part II UCMDB Server Installation

Describes the installation procedure for the HP Universal CMDB server, including database configuration.

Part III Data Flow Probe Installation

Describes the installation procedure for the Data Flow Probe.

Part IV Upgrading HP Universal CMDB from Version 8.x to 9.0x

Explains the procedures for upgrading (migrating) HP Universal CMDB to version 9.01, and for migrating packages from version 8.04 to 9.01.

Part V High Availability and Capacity Planning

Describes the installation, startup, and configuration procedures so that HP Universal CMDB version 9.01 can be run in a high availability environment.

Part VI Hardening HP Universal CMDB

Explains the procedures for hardening the HP Universal CMDB Server and the Data Flow Probe.

Part VII Disaster Recovery

Describes the basic principles and guidelines on how to set up a Disaster Recovery system.

Part VIII Getting Started With HP Universal CMDB

Includes information on logging in to HP Universal CMDB for the first time immediately following installation, and the Start menu. Also includes information on accessing UCMDB through the IIS Web server.

Who Should Read This Guide

This guide is intended for the following users of HP Universal CMDB:

- ➤ HP Universal CMDB administrators
- ➤ HP Universal CMDB platform administrators
- ➤ HP Universal CMDB application administrators
- ➤ HP Universal CMDB data management administrators

Readers of this guide should be knowledgeable about enterprise system administration, have familiarity with ITIL concepts, and be knowledgeable about HP Universal CMDB.

HP Universal CMDB Online Documentation

HP Universal CMDB includes the following online documentation:

Readme. Provides a list of version limitations and last-minute updates. From the HP Universal CMDB DVD root directory, double-click **readme.html**. You can also access the most updated readme file from the HP Software Support Web site.

What's New. Provides a list of new features and version highlights. In HP Universal CMDB, select **Help** > **What's New**.

Printer-Friendly Documentation. Choose **Help > UCMDB Help**. The following guides are published in PDF format only:

- ➤ the *HP Universal CMDB Deployment Guide* PDF. Explains the hardware and software requirements needed to set up HP Universal CMDB, how to install or upgrade HP Universal CMDB, how to harden the system, and how to log in to the application.
- ➤ the *HP Universal CMDB Database Guide* PDF. Explains how to set up the database (MS SQL Server or Oracle) needed by HP Universal CMDB.
- ➤ HP Universal CMDB Discovery and Integration Content Guide. Explains how to run discovery to discover applications, operating systems, and network components running on your system. Also explains how to discover data on other data repositories through integration.

HP Universal CMDB Online Help includes:

- ➤ Modeling Guide. Enables you to manage the content of your IT Universe model.
- ➤ Data Flow Management Guide. Explains how to integrate HP Universal CMDB with other data repositories and how to set up HP Universal CMDB to discover network components.

- ➤ Administration Guide. Explains how to work with HP Universal CMDB.
- ➤ Developer Reference Guide. For users with an advanced knowledge of HP Universal CMDB. Explains how to define and use adapters and how to use APIs to access data.

Online Help is also available from specific HP Universal CMDB windows by clicking in the window and clicking the **Help** button.

Online books can be viewed and printed using Adobe Reader, which can be downloaded from the Adobe Web site (www.adobe.com).

Topic Types

Within this guide, each subject area is organized into topics. A topic contains a distinct module of information for a subject. The topics are generally classified according to the type of information they contain.

This structure is designed to create easier access to specific information by dividing the documentation into the different types of information you may need at different times.

Three main topic types are in use: **Concepts**, **Tasks**, and **Reference**. The topic types are differentiated visually using icons.

Topic Type	Description	Usage
Concepts	Background, descriptive, or conceptual information.	Learn general information about what a feature does.
Tasks	Instructional Tasks. Step-by- step guidance to help you work with the application and accomplish your goals. Some task steps include examples, using sample data. Task steps can be with or without numbering: ➤ Numbered steps. Tasks that are performed by following each step in consecutive order. ➤ Non-numbered steps. A list of self-contained operations that you can perform in any order.	 Learn about the overall workflow of a task. Follow the steps listed in a numbered task to complete a task. Perform independent operations by completing steps in a non-numbered task.
	Use-case Scenario Tasks. Examples of how to perform a task for a specific situation.	Learn how a task could be performed in a realistic scenario.

Topic Type	Description	Usage
Reference	General Reference. Detailed lists and explanations of reference-oriented material.	Look up a specific piece of reference information relevant to a particular context.
	User Interface Reference. Specialized reference topics that describe a particular user interface in detail. Selecting Help on this page from the Help menu in the product generally open the user interface topics.	Look up specific information about what to enter or how to use one or more specific user interface elements, such as a window, dialog box, or wizard.
Troubleshooting and Limitations	Troubleshooting and Limitations. Specialized reference topics that describe commonly encountered problems and their solutions, and list limitations of a feature or product area.	Increase your awareness of important issues before working with a feature, or if you encounter usability problems in the software.

Additional Online Resources

Troubleshooting & Knowledge Base accesses the Troubleshooting page on the HP Software Support Web site where you can search the Self-solve knowledge base. Choose **Help > Troubleshooting & Knowledge Base**. The URL for this Web site is http://h20230.www2.hp.com/troubleshooting.isp.

HP Software Support accesses the HP Software Support Web site. This site enables you to browse the Self-solve knowledge base. You can also post to and search user discussion forums, submit support requests, download patches and updated documentation, and more. Choose **Help > HP Software Support**. The URL for this Web site is www.hp.com/go/hpsoftwaresupport.

Most of the support areas require that you register as an HP Passport user and sign in. Many also require a support contract.

To find more information about access levels, go to:

http://h20230.www2.hp.com/new access levels.jsp

To register for an HP Passport user ID, go to:

http://h20229.www2.hp.com/passport-registration.html

HP Software Web site accesses the HP Software Web site. This site provides you with the most up-to-date information on HP Software products. This includes new software releases, seminars and trade shows, customer support, and more. Choose **Help > HP Software Web site**. The URL for this Web site is www.hp.com/go/software.

Documentation Updates

HP Software is continually updating its product documentation with new information.

To check for recent updates, or to verify that you are using the most recent edition of a document, go to the HP Software Product Manuals Web site (http://h20230.www2.hp.com/selfsolve/manuals).

Welcome to This Guide

Part I

Introduction

Introduction to HP Universal CMDB

This chapter includes:

Concepts

- ➤ HP Universal CMDB Overview on page 24
- ➤ Installation Procedure Overview on page 29
- ➤ HP Universal CMDB on VMware on page 31
- ➤ Migrating from Previous Versions on page 31

Tasks

➤ Change Memory Allocation for Applets on page 32

Concepts

A HP Universal CMDB Overview

This chapter introduces HP Universal CMDB, the main stages of the HP Universal CMDB installation, presents the installation workflow, provides prerequisite hardware, software, and configuration information, and helps you to get started.

This section includes the following topics:

- ➤ "About HP Universal CMDB" on page 24
- ➤ "HP Universal CMDB System Architecture" on page 26
- ➤ "HP Universal CMDB Deployment" on page 26
- ➤ "The Configuration Management Database (CMDB)" on page 27
- ➤ "Data Flow Management Mapping" on page 28
- ➤ "Topology Query Language (TQL)" on page 28
- ➤ "Document Conventions" on page 29

About HP Universal CMDB

HP Universal CMDB consists of a rich business-service-oriented data model with built-in discovery of configuration items (CIs) and configuration item dependencies, visualization and mapping of business services, and tracking of configuration changes.

HP Universal CMDB enables you to manage all the CIs contained in a managed world. A managed world refers to any self-contained environment that can be described using a topology model (defined with HP's Topology Query Language (TQL)). For example, the IT infrastructure of a large business represents a managed world, where the topology comprises multiple layers such as networks, protocols, databases, operating systems, and so on. You manage views to view the information in exactly the format you require.

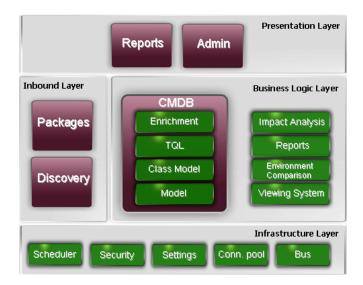

Additionally, the information contained in the results of each TQL is updated automatically with the latest data entering the configuration management database (CMDB). As a result, once a TQL and View have been defined, they continue to provide up-to-date information about the current state of your managed world. Views are displayed in multi-level maps that enable you to identify key CIs, as required. You can also create reports (in HTML, Excel or table format) about information collected by the system.

HP Universal CMDB addresses the following operational and functional needs:

- ➤ IT resources and application alignment. Automatic discovery of IT resources and their interdependencies from a business service perspective.
- ➤ **Problem resolution.** Understanding the causal relationships between CIs to locate and address the root cause of infrastructure problems and reduce troubleshooting time.
- ➤ Asset and change management control. Automatic detection of infrastructure changes, to enable automatic updating of all the relevant sub-systems.
- ➤ Customized state management (performance, change). Ability to define a CI management state.
- > Performance management and capacity planning.
- ➤ Architecture and infrastructure planning.
- ➤ Federation and reconciliation data. Retrieved from existing repositories and other CMDBs.

HP Universal CMDB System Architecture

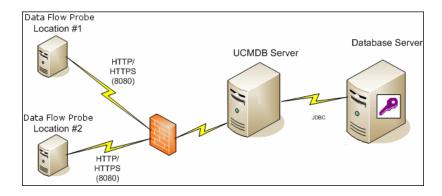

The following diagram provides a graphical overview of the HP Universal CMDB system architecture:

To set up an LDAP authentication method for logging in, see "HP Universal CMDB Login Authentication" on page 307.

HP Universal CMDB Deployment

The following diagram provides a graphical overview of a typical deployment of the HP Universal CMDB system.

The Configuration Management Database (CMDB)

The CMDB is the central repository for the configuration information gathered by HP Universal CMDB and the various third-party applications and tools.

The CMDB contains CIs and relationships that are created automatically from the discovery process or inserted manually. The CIs and relationships together represent a model of the components of the IT world in which your business functions.

The CMDB also stores and handles the infrastructure data collected and updated by Data Flow Management.

The IT model can be very large, containing thousands of CIs. To facilitate the management of these CIs, you work with the CIs in a View that provides a subset of the overall components in the IT world.

You use views (factory views supplied with HP Universal CMDB or defined in the Topology Map), to display and manage the CIs and relationships in the CMDB. The views enable you to focus on specific IT areas.

The CMDB also contains the TQL query definitions that are used to query and retrieve data from the CMDB, for presentation in:

- ➤ pattern views (views based on TQLs)
- ➤ the configuration item type (CIT) model (a repository for all CI types and relationship definitions)

Note: You can connect to the CMDB from other HP products. For details, refer to the product's installation documentation.

Data Flow Management Mapping

The discovery process is the mechanism that enables you to collect data about your system by discovering the IT infrastructure resources and their interdependencies (relationships). Data Flow can discover such resources as applications, databases, network devices, different types of servers, and so on. Each discovered IT resource is delivered and stored in the configuration management database (CMDB), where it is represented as a managed configuration item (CI).

Topology Query Language (TQL)

TQL is a language and tool for discovering, organizing, and managing IT infrastructure data. TQL is used to create queries that retrieve specific data from the configuration management database (CMDB) and display that data.

TQL queries constantly search the CMDB for changes that occur in the state of managed resources, and inform and update the relevant subsystems.

TQL extends the traditional query languages by adding two important capabilities:

- ➤ TQL enables HP Universal CMDB to draw conceptual relationships between configuration items (CIs), which represent their actual interdependencies. Using predefined operators, the different types of interconnections that exist between CIs can be established, and consequently the infrastructure design and performance are more accurately represented. This representation serves as a basis and a model for the discovery, arrangement, query, and management of complex infrastructures.
- ➤ TQL has a graphical aspect, consisting of visual symbols and syntax that represent the resources and their interconnections. This visualization of an IT infrastructure simplifies the understanding, monitoring, and managing of the IT business operations.

Document Conventions

- ➤ The HP Universal CMDB documentation assumes that the HP Universal CMDB Server and Data Flow Probe are installed in the default location, that is,
 - C:\hp\UCMDB\UCMDBServer and C:\hp\UCMDB\DataFlowProbe.
- ➤ Instructions for accessing components of the application always give the path from the left menu, for example, to view the Active Directory Topology query: Modeling > Modeling Studio > Resources > Root > Application > Active Directory.

A Installation Procedure Overview

During installation, the following HP Universal CMDB components are installed:

- ➤ HP Universal CMDB server
- ➤ Configuration management database (CMDB)
- ➤ History database
- ➤ HP Universal CMDB packages
- ➤ Data Flow Management (DFM) Probe (if a suitable license is present for details, see "Licensing Models for HP Universal CMDB" on page 43)

Important: HP Universal CMDB must **not** be installed more than once on a server even if the instances are installed in different folders or are different versions.

This section includes the following topics:

- ➤ "Installation Stages" on page 30
- ➤ "Launching HP Universal CMDB" on page 30

Installation Stages

The installation workflow contains the following main stages:

- **1** Set up the CMDB and History databases on Microsoft SQL Server or schemas on an Oracle Server.
 - For details, see "Deploying and Maintaining the Microsoft SQL Server Database" and "Deploying and Maintaining the Oracle Server Database" in the *HP Universal CMDB Database Guide* PDF.
- **2** You must obtain the appropriate HP Universal CMDB license and place it on a machine that is accessible from the machine on which you are installing HP Universal CMDB. For details, see "Licensing Models for HP Universal CMDB" on page 43.
- **3** Install the HP Universal CMDB server. For details, see Chapter 6, "HP Universal CMDB Installation on a Windows Platform" or Chapter 7, "HP Universal CMDB Installation on a Linux Platform."

At the end of the server installation, the installation procedure continues directly to the installation of the databases (CMDB and History). You can create a new database (Microsoft SQL Server) or schema (Oracle Server), or you can connect to an existing database or schema. For details, see Chapter 8, "UCMDB Server Configuration."

Note: Factory packages are deployed automatically only once on the first server startup.

- **4** Install the collectors (Data Flow Probes). For details, see "Data Flow Probe Installation" on page 113.
- **5** Set the UCMDB Server Service authentication permissions.

Launching HP Universal CMDB

For details, see "Accessing HP Universal CMDB" on page 347.

HP Universal CMDB on VMware

If you are deploying HP Universal CMDB on a VMware platform, the sizing guidelines for a regular installation are not applicable. The following general limitations and recommendations are applicable to a VMware installation:

- ➤ Performance of HP Universal CMDB on VMware can be expected to be slower than with a regular installation. A VMware platform is therefore not recommended for an enterprise deployment of HP Universal CMDB and is supported only for standard deployments. For deployment requirements, see "Server Hardware Requirements" on page 36.
- ➤ HP Universal CMDB capacities and performance vary according to the various server resources, such as CPU, memory, and network bandwidth, allocated to HP Universal CMDB components.
- ➤ ESX Server versions 3.5 to 4.0 should be used.
- ➤ A Gigabit network card should be used.
- ➤ It is highly recommended that you do not run a database server containing HP Universal CMDB databases on VMware if the database files reside on a VMware virtual disk.
- ➤ VMWare is the only virtualization technology supported by HP Universal CMDB for Windows.

The following HP Universal CMDB components are supported on VMware ESX Server versions 3.5 to 4.0:

- ➤ HP Universal CMDB
- ➤ Data Flow Probe

Migrating from Previous Versions

For details on upgrading HP Universal CMDB from version 8.0x to 9.01, see Chapter 11, "Upgrading HP Universal CMDB to Version 9.01."

For details on upgrading HP Universal CMDB from version 7.0x and 7.5x to 8.0x, refer to the version 8.04 documentation.

Tasks

Change Memory Allocation for Applets

Note: This section is relevant only if you are connecting to the HP Universal CMDB from a client machine using JRE 6u9 or earlier.

To work correctly the HP Universal CMDB applets may require more memory than is allocated by default, especially when you view very large topology maps or use the applet for a long time without restarting the browser.

To change the memory allocation, modify a file on the client machine (on the machine of the user who is using the applet):

- 1 On Windows machines, open the file: ..\Documents and Settings\ %userprofile%\ApplicationData\Sun\Java\Deployment\ deployment.properties.
- **2** Change the line with the latest Java version by adding to the end of it the text -XmxYYYm, where YYY is the amount of memory (in megabytes) to be allocated to the Java applet. For example,

deployment.javapi.jre.6u10.args=-Xmx256m

allocates 256 MB of memory to the applet.

The default value (if no -Xmx parameter exists) is 64 MB. You can experiment with the values 128 MB and 256 MB. It is recommended that you do not use more than 256 MB. If Java is unable to acquire the specified memory, it fails to load. In this case, set the memory allocation value to a lower value.

You can also make this change by selecting **Start** > **Settings** > **Control Panel**. Double-click the Java icon and click the **Java** tab. Click the **View** button for Runtime settings are used when an applet is executed. Make changes in the Java Runtime Parameters field according to the above instructions.

Note:

- ➤ Due to a technological limitation, when switching modes (for example from Admin to Application) or Managers before all applets have been downloaded to the browser, you may encounter a Fatal Error error message. In this case, clear the Java cache.
- ➤ To view the progress of the applet jars download, in the Java Console window, enter 5.
- ➤ For details on installing or updating Java on the client machine, see "Updating the Java Configuration" on page 176.

Chapter 1 • Introduction to HP Universal CMDB

HP Universal CMDB Support Matrix

This chapter includes:

Reference

- ➤ Server Hardware Requirements on page 36
- ➤ Server Software Requirements on page 37
- ➤ Server Database Requirements on page 40
- ➤ Client Software Requirements on page 41
- ➤ Capacity Planning Requirements on page 42

Reference

Server Hardware Requirements

	san I		
Computer/processor	Windows:		
	To fulfill the CPU requirements, you must have one of the following:		
	➤ Intel Dual Core Xeon Processor 2.4 GHz or higher		
	➤ AMD Opteron Dual Core Processor 2.4 GHz or higher		
	In addition to the above requirements, you must have the following number of CPU Cores, depending on your deployment configuration:		
	➤ Small deployment: 1 CPU		
	➤ Standard deployment: 4 CPU		
	➤ Enterprise deployment: 8 CPUs		
	Note : As HP Universal CMDB performance is dependent upon processor speed, to ensure proper HP Universal CMDB performance, it is recommended that you use the fastest possible processor speed.		
Memory	Windows:		
-	➤ Small deployment: 4 GB RAM		
	➤ Standard deployment: 8 GB RAM		
	➤ Enterprise deployment: 16 GB RAM		
Virtual memory/	Windows:		
Memory swap file	➤ Small deployment: 6 GB (Supported)		
	➤ Standard deployment: 12 GB		
	➤ Enterprise deployment: 24 GB		
	Note:		
	➤ The virtual memory for Windows should be at least 1.5 times the physical memory size.		
Free hard disk space	Minimum 30 GB (for logs, memory dumps, and so on)		
Display	Windows: Color palette setting of at least 256 colors (recommended: 32,000 colors)		

Server Software Requirements

Platform	OS version and edition	Supported	Recommended
x64	Windows 2003 Enterprise SP2 and R2 SP2	Yes	
x64	Windows 2008 Enterprise SP2 and R2	Yes	Yes
x64	Red Hat Linux 5 Enterprise/Advanced	Yes	
x64	SUSE Linux 11 Enterprise	No	
32-bit x86	Windows 2000, 2003/2008	No	64-bit required
Sun SPARC	Solaris 8,9 or 10	No	
Any	SUSE Linux 9, 10 Enterprise	No	
Any	Red Hat Linux 3, 4 Enterprise	No	
Itanium 64	Red Hat Linux 5 Enterprise/Advanced	No	

Note:

- ➤ Unsupported configurations are listed to ensure that there is no ambiguity on the scope of the Support Matrix.
- ➤ It is recommended that Dr. Watson be enabled and configured in automatic mode (after running Dr. Watson, Drwtsn32.exe, at least once). To set up automatic mode, search for **\\HKEY_LOCAL_MACHINE\Software**
 - \Microsoft\Windows NT\CurrentVersion\AeDebug in the Windows Registry and set the value of the Auto parameter to 1.
- ➤ Regardless of the operating system version, the entire Distribution (with OEM support) and the latest recommended Patch Cluster are required.

Chapter 2 • HP Universal CMDB Support Matrix

This section includes the following topics:

- ➤ "Supported Browsers" on page 38
- ➤ "Virtual Environments" on page 39

Supported Browsers

Browser	OS Version and Edition	Supported	Recommended
Internet Explorer 7 or higher	Windows XP 32/64 bit Windows Vista 32/64 bit Windows 7 32/64 bit Windows 2003 32/64 bit Windows 2008 32/64 bit	Yes	Yes
Internet Explorer 8	Windows XP 32/64 bit Windows Vista 32/64 bit Windows 7 32/64 bit Windows 2003 32/64 bit Windows 2008 32/64 bit	Yes	
Google Chrome	Windows XP Windows Vista Windows 7	Yes	
Firefox 3.5 or higher	Windows XP Windows Vista Windows 7 Windows 2003 Linux	Yes	
Safari 4.x	Windows	No	
Internet Explorer 6	Windows	No	

Virtual Environments

Virtual Environment	OS version and edition	Supported	Recommended
VMware ESX 4.0	Windows 2003 Standard/Enterprise SP2 and R2 SP2 Windows 2008 Standard/Enterprise SP2 and R2 Red Hat Linux 5 Enterprise/Advanced	Yes	Yes
VMware ESX versions 3.5 to 4.0	Windows 2003 Standard/Enterprise SP2 and R2 SP2 Windows 2008 Standard/Enterprise SP2 and R2 Red Hat Linux 5 Enterprise/Advanced	Yes	Older ESX 3.x versions may not provide adequate performance and may not be supported on all OS versions.
MS Hyper-V Server 2008 v1 and R2	Any	No	
Xen Hypervisor 3.x	Any	No	
ESXi	Any	No	

Server Database Requirements

BIT Set	OS Version and Edition	Database	Supported	Recommended
64-bit	Any	Oracle 10g, 11g Enterprise versions: Oracle: 10.2, 11.1.0.7 and 11.2	Yes	Yes
64-bit	Any	Oracle 10g, 11g Enterprise RAC versions: Oracle 10.2 and 11.2	Yes	Yes
Any	Windows 2003/2008 Enterprise	MS SQL Server 2005 Enterprise SP3	Yes	
Any	Windows 2003/2008 Enterprise	MS SQL Server 2008 Enterprise SP1	Yes	Yes
32-bit	Any	All	No	64-bit is required for Oracle
Any	Any	Oracle 9i	No	
Any	Any	DB2	No	

Oracle System Requirements

Refer to the Oracle installation guide for the specific Oracle platform. Additional information is available in the Oracle software distribution media as well as in the online Oracle documentation (http://otn.oracle.com/documentation/index.html). Windows database servers.

For details on the certified and supported database types, see "Software Requirements" in the *HP Universal CMDB Database Guide* PDF.

Microsoft SQL Server System Requirements

For Windows platform only.

For details on the certified and supported database types, see "Software Requirements" in the *HP Universal CMDB Database Guide* PDF.

Q Client Software Requirements

Screen resolution	Minimal resolution: 1024x768. It is recommended that you use 1280x1024. For wide screens (for example, for 15.4" laptops) the best resolution is 1600x1050.
Java Runtime Environment (for applet viewing)	1.6 family : the recommended version is 6u20 and the required version is 6u4 or later. 6u19 is not recommended because on every applet load a pop-up will open saying the applet contains a mix of signed and unsigned code.
	Note: The recommended JRE version is 6u20, which is also included on the UCMDB Server itself for local network download.
	To change the locally available JRE: 1 Place a new JRE deployment executable file in: C:\hp\UCMDB\UCMDBServer\deploy\ucmdb-ui\static\JRE 2 Restart the server.
	For details on working with applets, see "Change Memory Allocation for Applets" on page 32.
	If you are using Microsoft Internet Explorer, you can download the Sun JRE from the Java Web site (http://java.com/).
	After installation, verify that the browser is using the correct Java version: Click Tools > Internet Options > Advanced tab, and select the Java (Sun) check box. Click OK , then close the browser and reopen it.
Java caching	Enable Java caching on the client machine: Control Panel > Java > General tab > Temporary Internet Files > Settings > Keep temporary files on my computer.
Applet tag support	UCMDB applets support applet tag deployment only.
	To verify that the client machine supports applet tags, open the Java Control Panel. Click the Advanced tab and open Default Java for browsers . Verify that Microsoft Internet Explorer is selected.
Flash Player (to view charts in reports)	Acrobat Flash 8 or later.

Chapter 2 • HP Universal CMDB Support Matrix

Microsoft Excel (to view exported data)	Versions 2003 and 2007
Adobe PDF (to view exported data)	Versions 7.0, 8.1, and 9.1

Q Capacity Planning Requirements

For details, see Chapter 14, "HP Universal CMDB Large Capacity Planning."

Licensing Models for HP Universal CMDB

This chapter includes:

Concepts

➤ Licensing Models – Overview on page 44

Tasks

➤ Upgrade to the Integration or DDM Advanced License on page 47

Reference

Troubleshooting and Limitations on page 48

Concepts

Licensing Models – Overview

This section includes the following topics:

- ➤ "Licensing Levels" on page 44
- ➤ "Defined Terms and Definitions" on page 44
- ➤ "License for HP Software-as-a-Service" on page 45
- "License for HP ServiceCenter/Service Manager and Other Integrations" on page 45
- ➤ "Data Flow Probe Licensing" on page 46

Licensing Levels

- ➤ UCMDB Foundation License. The Foundation license includes UCMDB as the backbone component for BTO products. This version enables data flow between multiple instances of UCMDB, and integration with BTO products to enable solution deployment.
- ➤ **UCMDB Integration License.** The Integration license adds third party integrations on top of the UCMDB Foundation license.
- **UCMDB DDM Advanced License.** The DDM Advanced license includes all discovery capabilities to discover the IT infrastructure elements and feed that information as CIs and Relationships to the CMDB.

Defined Terms and Definitions

OS Instance. Each implementation of the bootable program that can be installed onto a physical system or a partition within the physical system. A physical system can contain multiple Operating System instances.

Managed Server. A computer system or computer system partition where a bootable program is installed. This does not include personal computers (or any computer primarily serving a single individual).

The HP Universal CMDB Server uses a server OS instance-based licensing scheme for the DDM Advanced license with a minimum purchase requirement of 100 OS instances. An OS instance counts both physical and virtual systems including the physical system hosting one or more virtual systems. The DDM Advanced license entitles the licensee to integrate third party (non-HP) data sources to extend discovery. Server data integration requires one license for each Managed Server to extend discovery. The Licensee is entitled to one DDMi license for every DDM OS instance.

Example: A VMware ESX Server hosting one virtual machine requires two licenses to use (LTUs).

License for HP Software-as-a-Service

All packages.

License for HP ServiceCenter/Service Manager and Other Integrations

The following packages are available:

- ➤ UCMDB7-SCSM
- ➤ SAR_Integration
- ➤ DDMI_Integration
- ➤ NNM_Integration
- ➤ SE_Integration
- ➤ SM_Integration

Note:

- ➤ The name of the license file is ucmdb_license.xml.
- ➤ You are asked for the location of the license file during installation. The default location of the license is: C:\hp\UCMDB\UCMDBServer\conf.
- ➤ Two weeks before the license expires, a reminder message is displayed for you to renew the license.

Data Flow Probe Licensing

You should install the Data Flow Probe, no matter which license you are running. If you have the Foundation license, the Probe is needed to run the Integration jobs (NNMi, SE, and DDMi). For details, see "Data Flow Probe Installation" on page 113.

Tasks

Upgrade to the Integration or DDM Advanced License

When you install HP Universal CMDB, you receive the Universal CMDB Foundation license. To obtain the file needed to upgrade to the Integration or DDM Advanced license, contact HP Software Support, then perform the following procedure:

To upgrade your license:

- **1** Obtain the appropriate file from HP Software Support.
- **2** Replace the ucmdb_license.xml file in the C:\hp\UCMDB\UCMDBServer \conf folder.
- **3** Use the JMX console to force a license change:
 - **a** Launch the Web browser and enter the server address, as follows: http://<UCMDB Server Host Name or IP>:8080/jmx-console.
 - **b** When prompted, enter the JMX Console authentication credentials (if you do not have these credentials, contact your system administrator).
 - **c** Under CMDB, click **service=UCMDB UI** to open the JMX MBEAN View page.
 - **d** Locate **getLicenseForCustomer** and enter the following information: In the force parameter box, select **True**.

In the ParamValue box for the parameter **customerId**, enter **1**. Click **Invoke**.

Note: To verify the type of license that is installed, select **False** and enter the customer ID. Details about the license are displayed.

Reference

Troubleshooting and Limitations

This section describes troubleshooting and limitations for UCMDB licensing.

➤ **Problem**: When integrating UCMDB with HP Storage Essentials, unable to run the **SE Integration by SQL** job with the Foundation license.

Solution: Perform the procedure in "Discover the SE Oracle Database" in the *HP Universal CMDB Discovery and Integration Content Guide*.

➤ **Problem**: When integrating UCMDB with HP Network Node Manager (NNMi), unable to run the **Layer2 by NNM** job with the Foundation license.

Solution: For details, see "Network Node Manager i (NNMi) Integration with HP Universal CMDB" in the HP Universal CMDB Discovery and Integration Content Guide.

Getting Started with HP Universal CMDB

This chapter includes:

Concepts

➤ Predeployment Planning on page 50

Tasks

- ➤ Get Started on page 53
- ➤ Basic Administration Tasks on page 54

Concepts

\lambda Predeployment Planning

Deploying HP Universal CMDB in an enterprise network environment is a process that requires resource planning, system architecture design, and a well-planned deployment strategy. The following checklist describes some of the basic issues that should be considered prior to installation. For comprehensive best practices documentation on deployment planning, consult with HP Professional Services.

Use the following checklist to review the basic issues that your organization should consider when planning the HP Universal CMDB deployment.

~	Step
	Define the goals of the project.
	Define the protocols to be used for Data Flow Management (DFM) and ensure that the protocols are available for use.
	Verify that you have access rights for the protocols to be used for DFM. Ask the system administrator for the user name and password for the relevant protocols.
	Define the speed and utilization of the network subnets to be discovered. You may find that you need to increase timeouts for some of the protocols.
	Verify whether the following applications use the default ports. If they are not using the default ports, check which ports they are using.
	➤ FTP
	➤ IBM HTTP Server
	➤ IIS
	➤ Microsoft SQL Server
	➤ Oracle Server ➤ SAP
	➤ SNMP
	➤ Siebel
	➤ WebLogic
	➤ WebSphere
	Identify the components to be discovered:
	Server hardware platform
	➤ Server operating system and version Network device types
	➤ Network device types

Chapter 4 • Getting Started with HP Universal CMDB

~	Step
	Install the following tools and utilities to help analyze discovery processes:
	➤ SNMP tool
	➤ WMI tool
	➤ LDAP browser
	➤ Log file tailer (for example, BareTail for Windows or a UNIX tail utility)
	Define what you want to do with HP Universal CMDB:
	➤ System component mapping
	➤ Root cause analysis
	➤ Impact analysis
	➤ Data center relocation/consolidation
	Analyze the IT processes and organizational structure and culture that can affect, or be affected by, the deployment.
	Analyze the organization's goals and identify the key IT-enabled business processes to achieve these goals.
	Identify the target users (those with a vested interest in the business processes), such as executives, LOB managers, application owners, system administrators, and security auditors.
	Align the project with current performance management practices.
	Define the project deliverables, including setting expectations regarding measurements, features, the deployment scope, and maturity levels.
	Identify the appropriate HP Universal CMDB functionality.
	Build a deployment roadmap.
	Define success criteria for the project.
	Decide how often you want to run DFM. For details, see "Discovery Scheduler Dialog Box" in the HP Universal CMDB Data Flow Management Guide.

Tasks

р Get Started

This section provides a basic, step-by-step roadmap for getting started with HP Universal CMDB.

1 Read about where to get help.

Learn about the various sources of assistance, including HP Professional Services and HP Software Support, as well as HP Universal CMDB Documentation. For details, see "Welcome to This Guide" on page 13.

2 Learn about the HP Universal CMDB components.

Learn about the components that power the HP Universal CMDB system. For details, see "HP Universal CMDB Overview" on page 24.

3 Plan your HP Universal CMDB deployment.

Create a complete deployment plan prior to installing HP Universal CMDB. Use the Predeployment Planning checklist to assist you. For indepth deployment planning best practices, consult your HP Professional Services representative. For details, see "Predeployment Planning" on page 50.

4 Install HP Universal CMDB components.

Install the Server (on a Windows or Linux system) and Data Flow Probe. For details, see "Installation Procedure Overview" on page 29 and Part II, "UCMDB Server Installation."

5 Log in to HP Universal CMDB.

Launch HP Universal CMDB. For details, see Chapter 26, "Accessing HP Universal CMDB."

6 Initiate system administration.

Set up the HP Universal CMDB system. For details, see "Administration" in the HP Universal CMDB Administration Guide.

Basic Administration Tasks

This section provides a checklist for basic administration and configuration tasks. You use this checklist to review the basic administration tasks required to set up the HP Universal CMDB system.

1 Set up Data Flow Management (DFM).

Licensed DDM users can run the discovery process to identify IT resources in the network infrastructure. For details, see the HP Universal CMDB Data Flow Management Guide.

2 When setting up DFM, request the following from the system administrator:

- ➤ Operating system credentials
- ➤ Network protocol credentials
- ➤ Application credentials

3 Set up users.

Define permissions for views. Permissions permit or deny users access to views, TQLs, and other components. For details, see "Setting Up and Working with Users" and "Security Manager" in the HP Universal CMDB Administration Guide.

4 Configure recipients of scheduled reports, including method of delivery.

For details, see "Reports" in the Modeling Guide.

5 Manually build your IT universe model by defining configuration items (CIs) and CI relationships in the model.

Divide the model into views that represent logical subsets of the overall model. Add CIs based on discovered network resources or manually define infrastructure components.

For details, see:

- ➤ "IT Universe Manager" in the Modeling Guide.
- ➤ "Modeling Studio" in the *Modeling Guide*.

5

HP Universal CMDB Services

This chapter includes:

Tasks

➤ View the Status of HP Universal CMDB Services on page 56

Reference

➤ HP Universal CMDB Services on page 57

Troubleshooting and Limitations on page 59

Tasks

View the Status of HP Universal CMDB Services

Select Start > Programs > HP UCMDB > HP Universal CMDB Server Status.

Note: If some services are not running, contact HP Software Support to try and resolve the problem.

Reference

NOTICE HP Universal CMDB Services

The HP Universal CMDB Server services are described in the following table:

Service Name	Description of Service (where available)
autodiscovery	Responsible for Data Flow Management-related services.
classModel	Responsible for maintaining the class model in the CMDB.
cmdb_mod_not	Responsible for notifications of changes that occur in the CMDB.
cmdb_sys_tqls	Responsible for the conditions applied to TQL nodes, and the condition results that are stored in the system TQL.
cmdb_view	
configuration	Responsible for snapshots, CI change queries, and TQL/View History queries.
content-install	
correlation	
data-acquisition	
enrichment	
fcmdb	Responsible for retrieving federated data from external data sources for replication tasks and federated queries.
fcmdb-config	
fcmdb-	
management	
folders	
framework	
grouping	
historyDB	

Service Name	Description of Service (where available)
impact	Responsible for HP Universal CMDB impact, root cause, and correlation subsystems.
MAM BASIC	Responsible for user management, system parameters, and login/logout services.
mapping-engine model model_transformat ion	
model_update	Responsible for managing updates to the class model in the CMDB.
packaging	Responsible for packages. Packages are zip files containing resources that are structured in organized, predefined subdirectories.
reconciliation	The CMDB's data population reconciliation service. Responsible for the reconciliation engine of HP Universal CMDB.
report	Responsible for HP Universal CMDB report services, such as adding, editing, and removing System reports, calculation of Asset reports, Host Dependency reports.
scheduler	
security	
state_management tql	
tql_res_utils	Responsible for storing the calculations of query and Enrichment results.
view	Responsible for the viewing system in HP Universal CMDB.
world	A central repository for configuration information that is gathered from the various HP Universal CMDB and third-party applications and tools. This information is used to build HP Universal CMDB views.
	Note : The CMDB service is not necessarily run by the mercury_as process.

Troubleshooting and Limitations

Problem: UCMDB does not start automatically upon system restart.

Solution:

- 1 Select Start > Program > HP > UCMDB > Start UCMDB Server.
- **2** Open the Window **Services** dialog box and select the **UCMDB Server** service.
- **3** Open the **Properties** dialog box.
- **4** In the **General** tab, ensure that:
 - ➤ The **Path to executable** field points to the correct executable location.
 - ➤ The service is configured to automatically start (**Startup type** is **Automatic**).
- **5** In the **Log On** tab, ensure that:
 - ➤ The service uses the correct user for logon. For details on changing the service user, see "Change the HP Universal CMDB Server Service User" on page 108.
- **6** In the **Dependencies** tab, ensure that:
 - ➤ The service is configured to have no dependencies (<No Dependencies>).

Chapter 5 • HP Universal CMDB Services

Part II

UCMDB Server Installation

6

HP Universal CMDB Installation on a Windows Platform

This chapter includes:

Concepts

➤ Installation Prerequisites on page 64

Tasks

- ➤ Install UCMDB on page 66
- ➤ Configure the UCMDB Mail Server on page 73
- ➤ Uninstall UCMDB on page 74

Concepts

\lambda Installation Prerequisites

Note the following prior to installing HP Universal CMDB:

- ➤ It is highly recommended that you thoroughly read the introduction to this guide before commencing installation. For details, see Chapter 1, "Introduction to HP Universal CMDB."
- ➤ Do not install HP Universal CMDB on a drive that is mapped to a network resource.
- ➤ Due to Web browser limitations, the names of server machines running the HP Universal CMDB server should consist only of alphanumeric characters (a-z, A-Z, 0-9), hyphens (-), and periods (.).
 - If the names of the machines running the HP Universal CMDB servers contain underscores, it may not be possible to log in to HP Universal CMDB. In this case, you should use the machine's IP address instead of the machine name.
- ➤ Important: HP Universal CMDB must not be installed more than once on a server even if the instances are installed in different folders or are different versions.
- ➤ Database user and password names can contain alphanumeric characters from the database character set as well as the underscore sign. Names must begin with an alphabetic character and should not exceed 30 characters.
- ➤ The HP Universal CMDB program directory cannot contain non-English characters.
- ➤ For details on licensing, see Chapter 3, "Licensing Models for HP Universal CMDB."
- ➤ For details on troubleshooting login, see Chapter 28, "Available Troubleshooting Resources."

- ➤ Important: If you are upgrading your current version to 9.01, read the chapter "Upgrading HP Universal CMDB to Version 9.01" on page 133 before uninstalling your current version. In that chapter, the section "Upgrade Adapters" on page 148 explains how to avoid losing the adapter configuration files.
- ➤ Have the following information ready before beginning installation:
 - ➤ Information for setting the CMDB and CMDB History database parameters. If you plan to set these databases during server setup, see Chapter 8, "UCMDB Server Configuration."
 - ➤ If you plan to run the UCMDB server on a hardened platform (including using the HTTPS protocol), review the hardening procedures described in Part VI, "Hardening HP Universal CMDB."
 - ➤ Administrator's e-mail address. (Optional)
 - ➤ SMTP mail server name. (Optional)
 - ➤ SMTP sender name. This name appears on alerts sent from UCMDB. (Optional)

Tasks

🦒 Install UCMDB

The following procedure explains how to install HP Universal CMDB.

- **1** If you are installing from a network drive, connect to it.
- **2** Locate the UCMDB executable file: **HPUCMDB_Server_901.exe**.
- **3** Double-click the file to open the splash screen.

If the digital signature is valid, the splash screen opens:

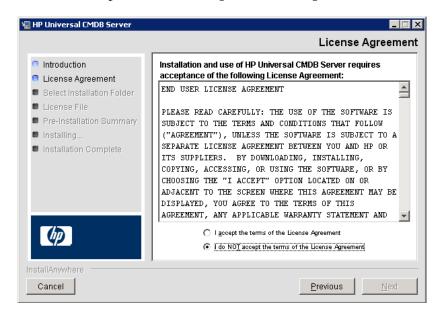

4 Choose the locale language and click **OK**.

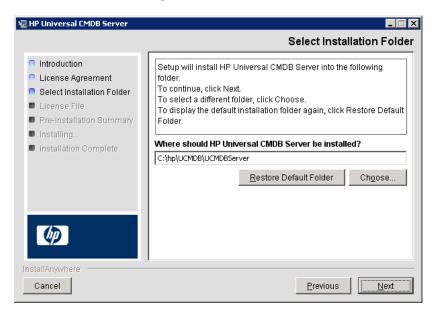

The Introduction dialog box opens.

5 Click **Next** to open the License Agreement dialog box.

Accept the terms of the license and click **Next** to open the Select Installation Folder dialog box.

Accept the default entry or click **Choose** to display a standard Browse dialog box. To install to a different directory, browse to and select the installation folder. The installation path should not contain spaces.

Tip: To display the default installation folder again, click **Restore Default Folder**.

Choose License Type File

Introduction
License Agreement
Select Installation Folder
License File
Pre-Installation Summary
Installing...
Installation Complete

UCMDB Foundation License
C UCMDB Integrations or DDM Advanced License
C UCMDB Integrations or DDM Advanced License

6 Click **Next** to open the Choose License Type File dialog box.

To install the Foundation license, accept the default entry. To install the Integrations or DDM Advanced license, select **UCMDB Integrations or DDM Advanced license**. For details on licensing, see Chapter 3, "Licensing Models for HP Universal CMDB."

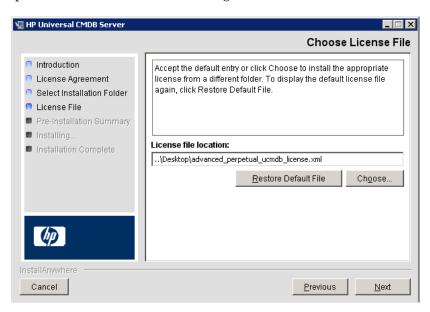

Previous :

<u>N</u>ext

If you select **UCMDB Foundation license**, skip to step 7.

Cancel

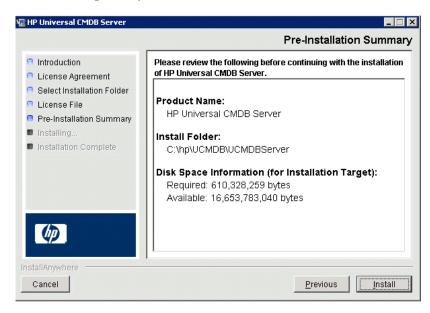

If you select **UCMDB Integrations or DDM Advanced license**, click **Next** to open the Choose License File dialog box.

Accept the default entry or click **Choose** to display a standard Browse dialog box. Browse to and select the folder where the license file is located. Select the license file (**ucmdb_license.xml**).

Tip: To display the default installation folder again, click **Restore Default File**.

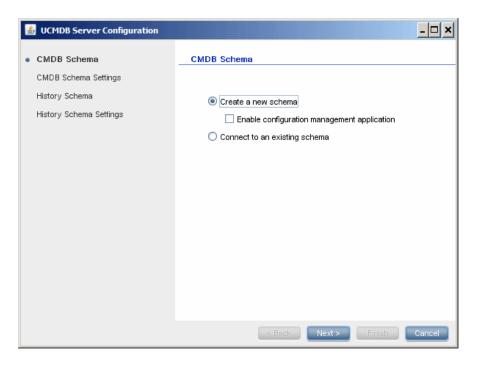

7 Click **Next** to open the Pre-Installation Summary dialog box that lists the installation options you have selected.

8 If you are satisfied with the summary, click **Install**. A message is displayed indicating that the installation is currently being performed.

Launch the Configuration Wizard

- **1** The next stage of the procedure is to launch the UCMDB Server Configuration Wizard (to set up the database or schema). Click **Yes** to continue with the configuration and open the Introduction dialog box.
 - If you are performing an upgrade to UCMDB 9.01 or if you prefer, you can set up the database or schema later. Access the UCMDB Server Configuration Wizard from the Windows Start menu. For upgrade continuation information see "Upgrade to UCMDB 9.01" on page 138.

During the following stages, you choose between creating a new database or schema (Microsoft SQL Server or Oracle Server), or connecting to an existing database or schema. You would probably create a new database or schema for a new installation of HP Universal CMDB and would connect to an existing schema or database when reinstalling a server or installing an additional server.

- ➤ For the introduction to creating or connecting to a database, see "Choosing the Database or Schema" on page 92.
- ➤ For the procedure for creating a Microsoft SQL Server database, see "Create a Microsoft SQL Server Database" on page 96.
- ➤ For the procedure for creating an Oracle schema, see "Create an Oracle Schema" on page 101.
- ➤ For the procedure for connecting to an existing Microsoft SQL Server database, see "Connect to an Existing Microsoft SQL Server Database" on page 105.

➤ For the procedure for connecting to an existing Oracle schema, see "Connect to an Existing Oracle Schema" on page 105.

Configure the UCMDB Mail Server

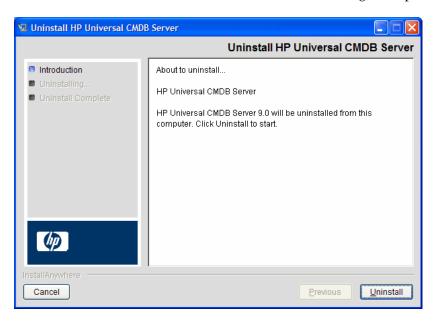

To configure the UCMDB Mail server:

- **1** In **Infrastructure Settings**, select the **Mail Settings** Category.
- **2** Define the **SMTP** server setting: enter the name of the SMTP server.
- **3** Edit the **SMTP server port** setting: the default value is 25.
- **4** As a backup for the main SMTP server, you can provide information about an alternative server. Repeat steps 2 and 3 but provide the name of the **Alternate SMTP server** and the **Alternate SMTP server** name.
- **5** Edit the setting for **Email sender** with the name to appear in reports that HP Universal CMDB sends.
- **6** To enable users to change the **Email sender** name inside the form that sends mail, change the value of **Sender editability** to **TRUE**. Otherwise, leave its value as **FALSE**.

Uninstall UCMDB

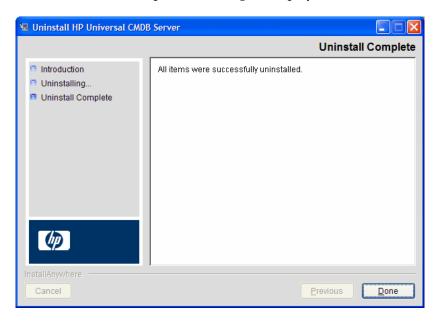

The following procedure explains how to uninstall HP Universal CMDB.

1 From the Start menu, choose Programs > HP > UCMDB > Uninstall UCMDB. The Uninstall HP Universal CMDB Server dialog box opens.

2 Click Uninstall.

When uninstall is complete, a message is displayed:

Chapter 6 • HP Universal CMDB Installation on a Windows Platform

HP Universal CMDB Installation on a Linux Platform

- ➤ If you plan to run the UCMDB server on a hardened platform (including using the HTTPS protocol), review the hardening procedures described in Part VI, "Hardening HP Universal CMDB."

Tasks

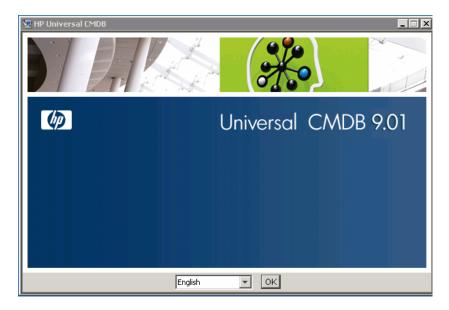

Install HP Universal CMDB

The following procedure explains how to install HP Universal CMDB.

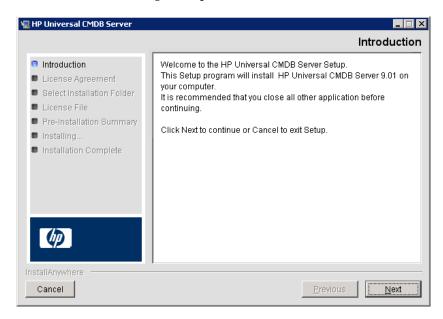

- 1 The HP Universal CMDB 9.01 Linux installation works as a graphic-based installation. Before running the installer, configure the **DISPLAY** environment variable to point to a running instance of an X Windows Server.
- **2** Locate the UCMDB executable file: **HPUCMDB_Server_901.bin**.
- **3** Type the following command: **sh** <**the path to the installation** file>/HPUCMDB_Server_901.bin.

The splash screen opens:

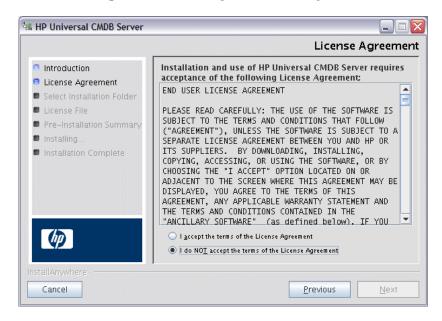

4 Choose the locale language and click **OK**.

The **Introduction** dialog box opens.

5 Click **Next** to open the **License Agreement** dialog box.

Accept the terms of the license and click **Next** to open the **Select Installation Folder** dialog box.

Enter a different path or click **Choose** to display a standard Browse dialog box. To install to a different directory, browse to and select the installation folder. The installation path should not contain spaces.

Tip: To display the default installation folder again, click **Restore Default Folder**.

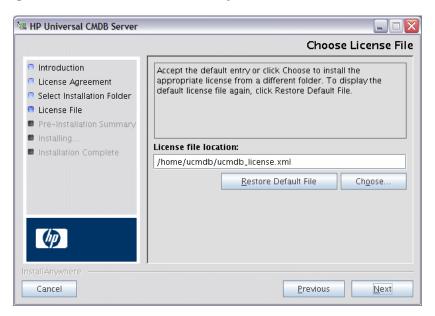

堰 HP Universal CMDB Server Choose License Type File Introduction If you are installing HP Universal CMDB Foundation Edition, click License Agreement Next. If you are installing UCMDB Integrations or DDM Advanced license, select this option and click Next (the relevant license file Select Installation Folder would need to be provided on the following installation step). 6 Click **Next** to open the Choose License Type File dialog box.

To install the Foundation license, accept the default entry. To install the Integrations or DDM Advanced license, select **UCMDB Integrations or DDM Advanced license**. For details on licensing, see Chapter 3, "Licensing Models for HP Universal CMDB."

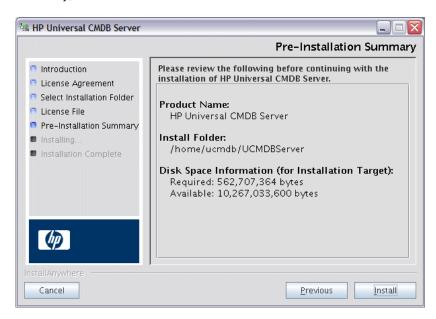

If you select **UCMDB Foundation license**, skip to step 7.

If you select **UCMDB Integrations or DDM Advanced license**, click **Next** to open the Choose License File dialog box.

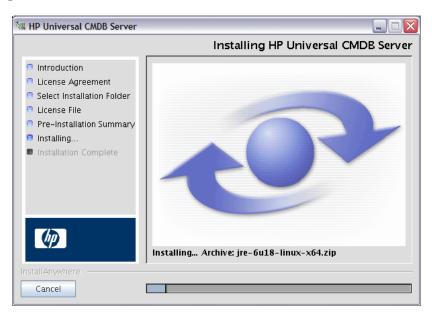

Click **Choose** to display a standard Browse dialog box. Browse to and select the folder where the license file is located. Select the license file (ucmdb_license.xml).

7 Click **Next** to open the Pre-Installation Summary dialog box that lists the installation options you have selected. If you are satisfied with the summary, click **Install**.

8 A message is displayed indicating that the installation is currently being performed.

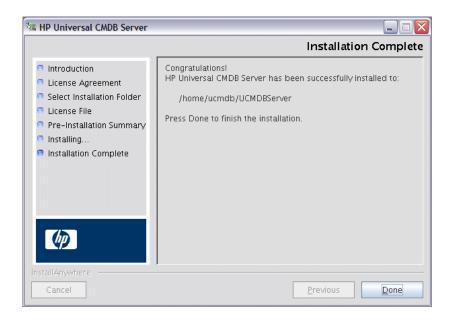

9 After the installation has completed the dialog prompts you to launch the **UCMDB Server Configuration Wizard** (to set up the database or schema).

10 Click **Yes** to continue with the configuration and open the Wizard dialog box.

If you prefer, you can set up the database or schema later by running the script **configure.sh** located in **bin** subfolder of the installation folder.

- 11 During the following stages, you choose between creating a new database or schema (Microsoft SQL Server or Oracle Server), or connecting to an existing database or schema. You would probably create a new database or schema for a new installation of HP Universal CMDB and would connect to an existing schema or database when reinstalling a server or installing an additional server. For the introduction to creating or connecting to a database, see "Choosing the Database or Schema" on page 92.
- **12** After you have finished the configuration in the Configuration Wizard the Installation Complete dialog box displays. Click **Done** to complete the installation.

Configure the UCMDB Mail Server

To configure the UCMDB Mail server:

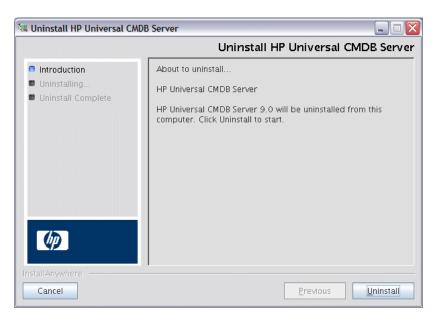

- **1** In **Infrastructure Settings**, select the **Mail Settings** Category.
- **2** Define the **SMTP** server setting: enter the name of the SMTP server.
- **3** Edit the **SMTP server port** setting: the default value is 25.

- **4** As a backup for the main SMTP server, you can provide information about an alternative server. Repeat steps 2 and 3 but provide the name of the **Alternate SMTP server** and the **Alternate SMTP server** name.
- **5** Edit the setting for **Email sender** with the name to appear in reports that HP Universal CMDB sends.
- **6** To enable users to change the **Email sender** name inside the form that sends mail, change the value of **Sender editability** to **TRUE**. Otherwise, leave its value as **FALSE**.

🦒 Uninstall UCMDB

The following provides a procedure for uninstalling UCMDB.

1 Execute the **Uninstall_UCMDBServer** script from the **UninstallerData** subfolder of the Installation folder.

2 From the same location select **Uninstall** to uninstall the HP Universal CMDB Server.

3 Click **Done** to complete the uninstall process.

Chapter 7 • HP Universal CMDB Installation on a Linux Platform

UCMDB Server Configuration

This chapter includes:

Concepts

- ➤ Choosing the Database or Schema on page 92
- ➤ Required Information for Setting Database Parameters on page 93

Tasks

- ➤ Access the UCMDB Server Configuration Wizard on page 96
- ➤ Create a Microsoft SQL Server Database on page 96
- ➤ Create an Oracle Schema on page 101
- ➤ Connect to an Existing Microsoft SQL Server Database on page 105
- ➤ Connect to an Existing Oracle Schema on page 105
- ➤ Restart the Server on page 106

Concepts

🚜 Choosing the Database or Schema

This chapter describes the second stage of the installation procedure, which is to launch the UCMDB Server Configuration Wizard (to set up the database or schema). For details on the first stage of the installation, see Chapter 6, "HP Universal CMDB Installation on a Windows Platform" or Chapter 7, "HP Universal CMDB Installation on a Linux Platform."

Note: It is highly recommended that you thoroughly read the introduction to this guide before commencing installation. For details, see Chapter 1, "Introduction to HP Universal CMDB."

During installation, you must decide whether you want to create the database users or use predefined users. HP Universal CMDB enables you to make this choice at the same time as you choose on which database you want to run the application:

Choose to create a database or schema user in the following cases:

- ➤ There are no existing database users.
- ➤ There are existing database users, but you want to initialize the database default contents.

Choose to connect to an existing database or schema user in the following cases:

➤ You want to upgrade to a newer version of HP Universal CMDB, and use the database contents you have from using the previous version of HP Universal CMDB.

- ➤ You do not want to change the database's default contents, for example, because you have data in your database or schema from a previous installation of the same release. In this case, Setup updates the necessary server configuration files with the database details and updates the database scripts configuration file. For details, see the HP Universal CMDB Database Guide PDF.
- ➤ Your database administrator provides instructions for creating the database users in advance according to company policy. To manually create Microsoft SQL Server databases or Oracle schemas, see the HP Universal CMDB Database Guide PDF.

Required Information for Setting Database Parameters

Before setting CMDB and CMDB history database parameters, you should prepare the information described in the following sections.

Deploying Microsoft SQL Server

You need the following information for both creating new databases and connecting to existing ones:

- ➤ Host name. The name of the machine on which Microsoft SQL Server is installed. If you are connecting to a non-default Microsoft SQL Server instance, enter the following: <host name>\<instance name>
- ➤ **Port.** The Microsoft SQL Server's TCP/IP port. HP Universal CMDB automatically displays the default port, **1433**.
- ➤ **Database name.** The name of the existing database, or the name that you will give your new database (for example, UCMDB History).
- ➤ User name and Password. (if you are using Microsoft SQL Server authentication) The user name and password of a user with administrative rights on Microsoft SQL Server. The default Microsoft SQL Server administrator user name is sa. Note that a password must be supplied.

You can create and connect to a database using Windows authentication instead of Microsoft SQL Server authentication. To do so, you must ensure that the Windows user running the HP Universal CMDB service has the necessary permissions to access the Microsoft SQL Server database. For information on assigning a Windows user to run the HP Universal CMDB service, see Chapter 10, "Changing the HP Universal CMDB Service User." For information on adding a Windows user to Microsoft SQL Server, see "Using Windows Authentication to Access Microsoft SQL Server Databases" in the HP Universal CMDB Database Guide PDF.

Deploying Oracle Server

Before setting CMDB and CMDB history database parameters, ensure that you have created at least one default tablespace for each user schema for data persistency purposes, and that at least one temporary tablespace is assigned to each user schema.

You need the following information for both creating a new user schema and connecting to an existing one:

- ➤ **Host name**. The name of the host machine on which Oracle Server is installed.
- ➤ **Port.** The Oracle listener port. HP Universal CMDB automatically displays the default port, **1521**.
- ➤ **SID.** The Oracle instance name that uniquely identifies the Oracle database instance being used by HP Universal CMDB.
- ➤ Schema name and password. The name and password of the existing user schema, or the name that you will give the new user schema (for example, UCMDB_FOUNDATION).

If you are creating a new user schema, you need the following additional information:

- ➤ Admin user name and password (to connect as an administrator). The name and password of a user with administrative permissions on Oracle Server (for example, a System user).
- ➤ **Default tablespace.** The name of the default tablespace you created for the user schema. For details on creating an HP Universal CMDB tablespace, see "Manually Creating the Oracle Server Database Schemas" in the HP Universal CMDB Database Guide PDF.
- ➤ Temporary tablespace. The name of the temporary tablespace you assigned to the user schema. The default Oracle temporary tablespace is temp.

Note: To create a new user schema, you must have user creation privileges.

Tasks

Access the UCMDB Server Configuration Wizard

If you did not set up the database or schema during installation, you can set it up by accessing the UCMDB Server Configuration Wizard from the Windows Start menu by selecting Start > Programs > HP UCMDB > Start HP **Universal CMDB Server Configuration Wizard.**

🏲 Create a Microsoft SQL Server Database

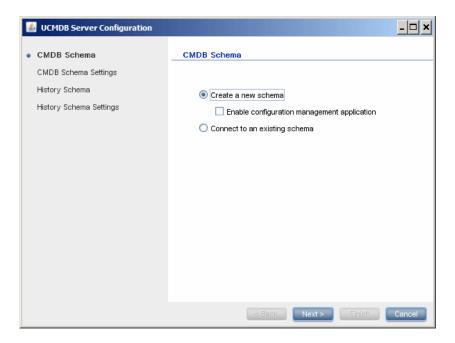

This section explains how to set up the Microsoft SQL Server database. There are two parts to this stage of the installation: setting up the CMDB and CMDB History databases.

Note: In UCMDB version 9.00 or later, the Foundations and CMDB databases are combined. For upgrade information see "Upgrading HP Universal CMDB to Version 9.01" on page 133.

To set up the Microsoft SQL Server database:

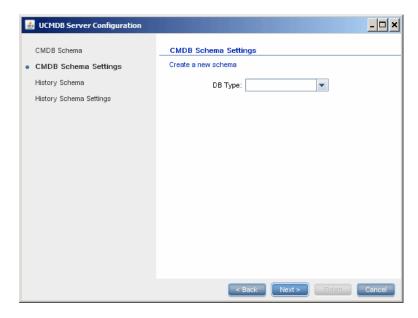

1 Following installation, click **Next** to open the CMDB Schema dialog box.

Note: If you have finished installation, you can access the UCMDB Server Configuration Wizard from the Windows Start menu. For details, see "Access the UCMDB Server Configuration Wizard" on page 96.

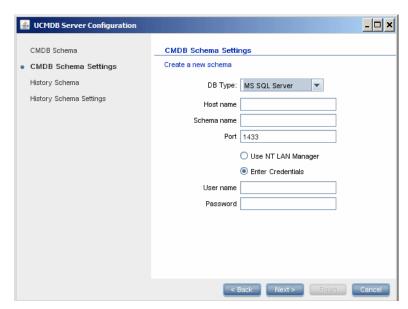

Select Create a new schema.

2 Click **Next** to open the CMDB Schema Settings dialog box.

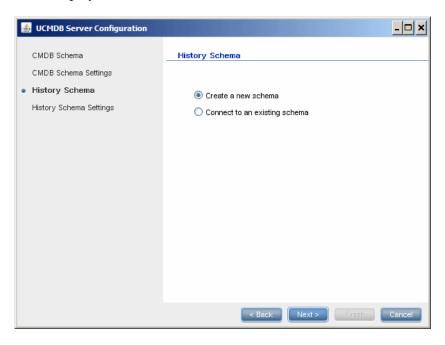

Select MS SQL Server.

3 Additional fields appear in the dialog box.

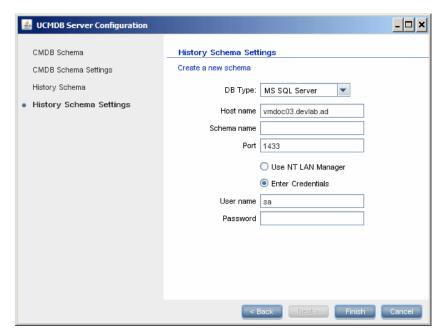

- **4** Enter the host name and database name and decide which authentication HP Universal CMDB should use to connect to the database server. For details on Windows authentication, see "Using Windows Authentication to Access Microsoft SQL Server Databases" in the *HP Universal CMDB Database Guide* PDF.
- **5** Click **Next**. The CMDB database is created. The History Schema dialog box is displayed.

Select Create a new schema.

6 Click **Next** to open the History Schema Settings dialog box.

Select **Microsoft SQL Server**. The values you entered for the CMDB settings are displayed in the box.

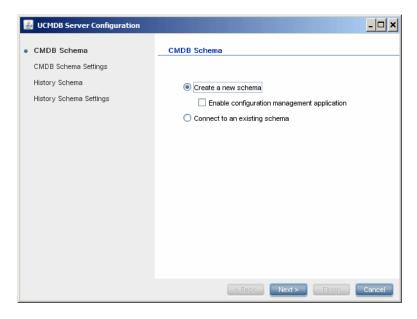

7 Click **Finish**. The CMDB History database is created.

Treate an Oracle Schema

This section explains how to set up the Oracle schema. There are two parts to this stage of the installation: setting up the CMDB schema and setting up the CMDB History schema.

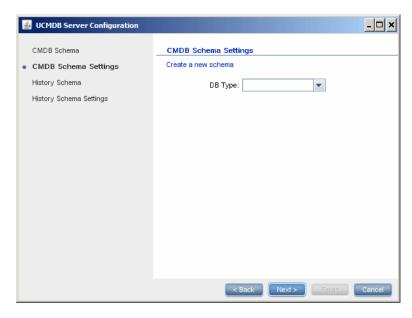

To set up the Oracle schema:

1 Following installation, click **Next** to open the CMDB Schema dialog box.

Select Create a new schema.

2 Click **Next** to open the CMDB Schema Settings dialog box.

Select Oracle Server.

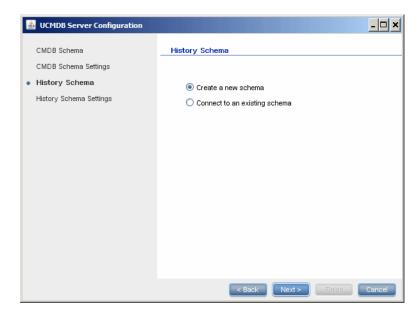

UCMDB Server Configuration _ | □ | × | CMDB Schema **CMDB Schema Settings** Create a new schema CMDB Schema Settings History Schema DB Type: Oracle History Schema Settings Host name Schema name Schema password Confirm Password Port 1521 SID Admin name Admin password Default tablespace Temporary tablespace

3 Additional fields appear in the dialog box.

Enter the details of the schema.

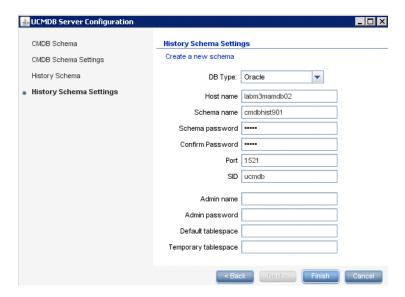

- ➤ **Schema name.** The schema name should be unique.
- ➤ **Default tablespace.** Update this field.
- ➤ **Temporary tablespace.** If your database administrator created a non-default temporary tablespace, enter that name; otherwise, enter **temp**.

4 Click **Next** to open the History Schema dialog box.

Select Create a new schema.

5 Click **Next** to open the History Schema Settings dialog box.

Select **Oracle Server**. The values you entered for the CMDB settings are displayed in the box.

6 Click **Finish**. The CMDB History database is created.

Connect to an Existing Microsoft SQL Server Database

This section explains how to connect to an existing Microsoft SQL Server database. There are two parts to this stage of the installation: connecting to the CMDB database and to the CMDB History database.

Follow the instructions for creating a Microsoft SQL Server database except for the following steps:

- ➤ In step 1 on page 96, select **Connect to an existing schema** and click **Next**.
- ➤ In step 5 on page 99, select **Connect to an existing schema** and click **Next**.

🦒 Connect to an Existing Oracle Schema

This section explains how to connect to an existing Oracle Server schema. There are two parts to this stage of the installation: connecting to the CMDB schema and to the CMDB History schema.

Follow the instructions for creating an Oracle Server schema except for the following steps:

- ➤ In step 1 on page 101, select Connect to an existing schema and click Next.
- ➤ In step 4 on page 104, select Connect to an existing schema and click Next.

Restart the Server

If you ran the UCMDB Server Configuration Wizard as part of HP Universal CMDB Server installation, you must start HP Universal CMDB on the server only after successfully setting the parameters for all the databases.

If you ran the UCMDB Server Configuration Wizard to modify previously defined database types or connection parameters, restart the HP Universal CMDB Server and the Data Flow Probe after successfully completing the parameter modification process.

HP Universal CMDB Server Service

This chapter includes:

Tasks

- ➤ Change the HP Universal CMDB Server Service User on page 108
- ➤ Start and Stop the HP Universal CMDB Server Service on page 109

Tasks

Thange the HP Universal CMDB Server Service User

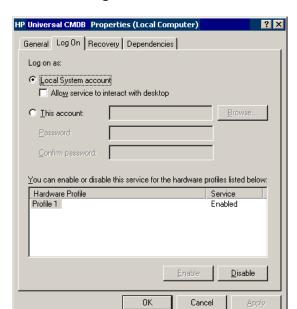

On a Windows platform, the HP Universal CMDB service, which runs all HP Universal CMDB services and processes, is installed when you run the Server and Database Configuration utility. By default, this service runs under the local system user. However, you may need to assign a different user to run the service (for example, if you are using NTLM authentication).

The user you assign to run the service must have the following permissions:

- ➤ sufficient database permissions (as defined by the database administrator)
- sufficient network permissions
- ➤ administrator permissions on the local server

To change the service user.

- 1 Disable HP Universal CMDB through the Start menu (**Start** > **Programs** > **HP UCMDB > Stop HP Universal CMDB Server**) or by stopping the HP Universal CMDB Server service. For details, see "Start and Stop the HP Universal CMDB Server Service" on page 109.
- 2 In Microsoft's Services window, double-click UCMDB Server. The UCMDB **Server Properties (Local Computer)** dialog box opens.

3 Click the **Log On** tab.

- **4** Select **This account** and browse to choose another user from the list of valid users on the machine.
- **5** Enter the selected user's Windows password and confirm this password.
- **6** Click **Apply** to save your settings and **OK** to close the dialog box.
- **7** Enable HP Universal CMDB through the Start menu (**Start > Programs > HP UCMDB > Start HP Universal CMDB Server**) or by starting the HP Universal CMDB Server service. For details, see "Start and Stop the HP Universal CMDB Server Service" on page 109.

eals Start and Stop the HP Universal CMDB Server Service

Access the Microsoft Services window and locate the UCMDB Server service. Open the UCMDB Server Properties (Local Computer) dialog box and start the service. If required, change the Startup Type to Automatic.

For details on starting and stopping UCMDB through the Start menu, see "Start and Stop the Server on the Windows Platform" on page 346.

Chapter 9 • HP Universal CMDB Server Service

Part III

Data Flow Probe Installation

10

Data Flow Probe Installation

This chapter includes:

Tasks

- ➤ Install the Data Flow Probe on page 114
- ➤ Upgrade the Probe on page 125
- ➤ Run Probe Manager and Probe Gateway on Separate Machines on page 125
- ➤ Configure the Probe Manager and Probe Gateway Components on page 126
- ➤ Connect a Data Flow Probe to a Non-Default Customer on page 127

Reference

➤ Data Flow Probe Installation Requirements on page 129

Tasks

Install the Data Flow Probe

Note: It is highly recommended to thoroughly read "Introduction to HP Universal CMDB" on page 23 before commencing installation. For more information on Data Flow Management read "Introduction to Data Flow Management" in the HP Universal CMDB Data Flow Management Guide.

The following procedure explains how to install the Data Flow Probe on a Windows platform.

The Probe can be installed before or after you install the HP Universal CMDB server. However, during Probe installation you must provide the server name, so it is preferable to install the server before installing the Probe.

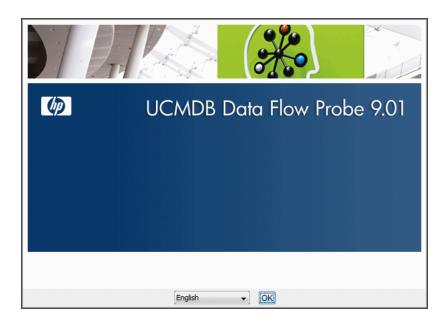

Verify that you have enough hard disk space available before beginning installation. For details, see "Data Flow Probe Installation Requirements" on page 129.

Note: For details on licensing, see "Licensing Models for HP Universal CMDB" on page 43.

To install the UCMDB Data Flow Probe:

- 1 Stop any existing DDM Probe instances (if you have a previous version running).
- **2** Extract UCMDB_00029.zip (Windows) or UCMDB_00030.zip (Linux) to a temporary directory.

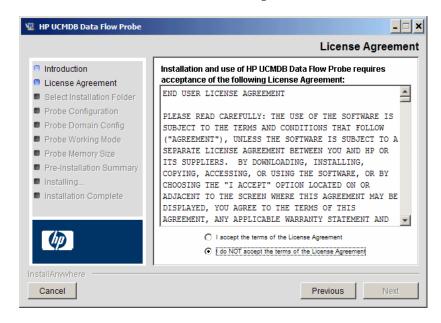

- 3 Uninstall any existing DDM Probe via Start > Programs > HP UCMDB (or HP DDM) > Uninstall DDM Probe (or Uninstall Data Flow Probe).
- Run **HPUCMDB_DataFlowProbe_901.exe** from the temporary directory you created previously.
- Follow the instructions in this section.
- Start the version 9.01 Data Flow Probe.

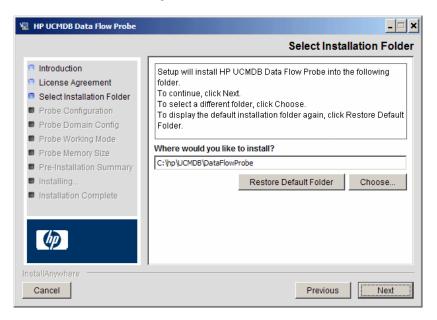

Choose the locale language and click **OK** to open the Introduction dialog box.

Click **Next** to continue to the License Agreement.

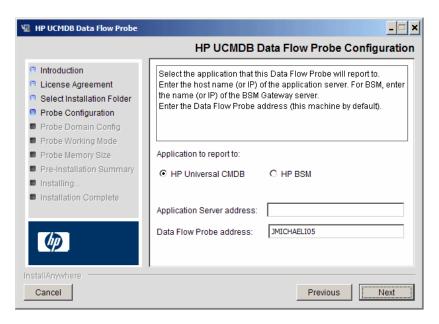

9 Accept the terms of the agreement and click **Next** to open the Select Installation Folder dialog box.

10 Accept the default entry or click **Choose** to display a standard Browse dialog box. To install to a different directory, browse to and select the installation folder.

Note: To restore the default installation directory, after selecting a directory in the Browse dialog box, click **Restore Default Folder**.

11 Click **Next** to open the HP UCMDB Data Flow Probe Configuration dialog box.

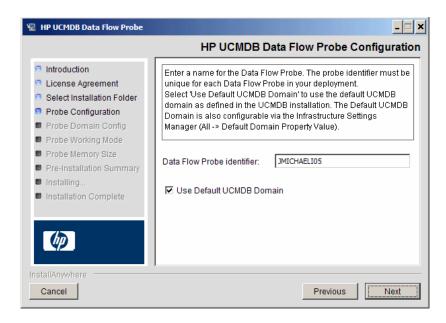

- ➤ Application to report to. Choose the application server with which you are working. You can use the Probe with either HP Universal CMDB or Business Service Management.
 - ➤ If you select **HP Universal CMDB**, in the **Application Server address** box, enter the name or the IP address of the HP Universal CMDB server to which the Probe is to be connected.
 - ➤ If you select HP BSM, in the **Application Server address** box, enter the IP or the DNS name of the Gateway Server.
- ➤ In the **Data Flow Probe address** box, enter the IP address or the DNS name of the machine on which you are currently installing the Probe, or accept the default.

12 If you do not enter the address of the application server, a message is displayed. You can choose to continue to install the Probe without entering the address, or to return to the previous page and add the address.

13 Click **Next** to open the HP UCMDB Data Flow Probe Configuration dialog box.

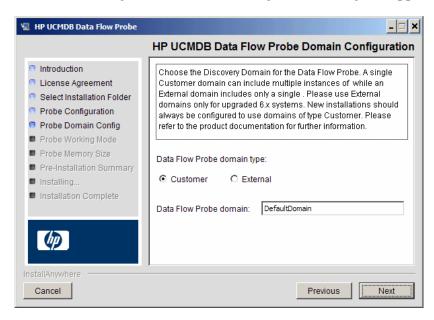

➤ In the **Data Flow Probe Identifier** box, enter a name for the Probe that will be used to identify it in your environment. This is the name that will appear in the user interface.

Important:

- ➤ The UCMDB Probe identifier must be unique for each Probe in your deployment.
- ➤ When installing the Probe in separate mode, that is, the Probe Gateway and Probe Manager are installed on separate machines, you must give the same name to the Probe Gateway and all its Managers. This name appears in UCMDB as a single Probe node. Failure to give the same name may prevent jobs from running.
- ➤ Select **Use Default CMDB Domain** to use the default UCMDB IP address or machine name, as defined in the UCMDB Server installation.

The Default UCMDB Domain is also configurable via the Infrastructure Settings Manager, available after installing HP Universal CMDB (Administration > Infrastructure Settings > Class Model Settings > Default Domain Property Value).

14 Click **Next**. If you cleared the **Use Default CMDB Domain** box in the HP UCMDB Data Flow Probe Configuration dialog box, the HP UCMDB Data Flow Probe Configuration Domain Configuration dialog box appears.

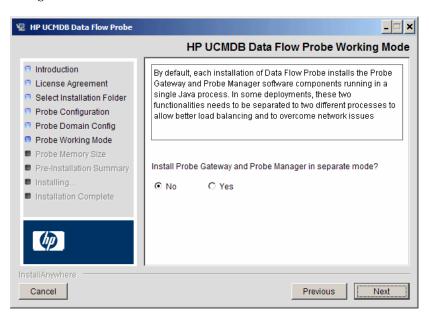

- ➤ Data Flow Probe domain type. Choose between Customer and External, depending on the type of domain on which the Probe is to be running:
 - ➤ **Customer.** Select if you are installing one or more Probes in your deployment.
 - ➤ **External.** Select if you are upgrading from version 6.x systems.

Important: For new installations, always select **Customer**.

➤ Data Flow Probe domain: If you are not using the default domain defined in UCMDB, enter the name of the domain here.

15 Click **Next** to open the HP UCMDB Data Flow Probe Working Mode dialog box.

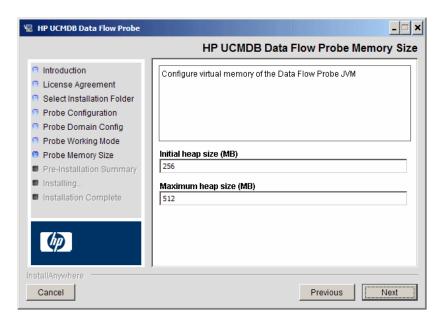

You can run the Probe Gateway and Manager as one Java process or as separate processes. You would probably run them as separate processes in deployments that need better load balancing and to overcome network issues.

Click **No** to run Probe Gateway and Probe Manager as one process.

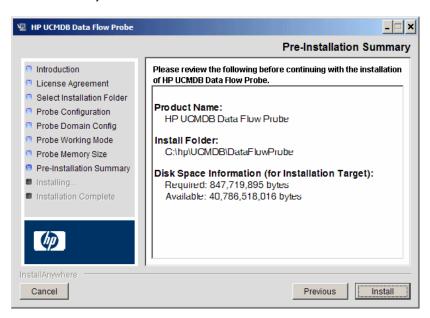

Click **Yes** to run Probe Gateway and Probe Manager as two processes. For details on the procedure, see "Run Probe Manager and Probe Gateway on Separate Machines" on page 125.

16 Click **Next** to open the HP UCMDB Data Flow Probe Memory Size dialog box.

Define the minimum and maximum memory to be allocated to the Probe. The values are measured in megabytes.

17 Click **Next** to open the Pre-Installation Summary dialog box and review the selections you have made.

18 Click **Install** to complete the installation of the Probe. When the installation is complete the Install Complete page is displayed.

Any errors occurring during installation are written to the following file: C:\hp\UCMDB\DataFlowProbe\HP_UCMDB_Data_Flow_Probe_Install Log.log.

- **19** Click **Done**. The following shortcut is added to the Windows **Start** menu: **Programs > HP UCMDB > Start Data Flow Probe**
- **20** Activate the Probe by selecting the shortcut.

You can run the Probe in a console. For details, see "Launch the Probe in a Console" in the *HP Universal CMDB Data Flow Management Guide*.

The Probe is displayed in HP Universal CMDB: access > Data Flow Management > Data Flow Probe Setup. For details see "Data Flow Probe Installation Requirements" on page 129.

Upgrade the Probe

This task describes how to upgrade the Data Flow Probe.

1 Uninstall the Old Probe

Uninstall all existing Probes. If a Probe is running, stop it before you uninstall it.

2 Install the New Probe

You should install the new Probe with the same configuration, that is, use the same Probe ID, domain name, and server name as for the previous Probe installation.

Run Probe Manager and Probe Gateway on Separate Machines

During installation, you can choose to separate the Probe Manager and Probe Gateway processes so that they run on separate machines. You must:

- **1** Install the Probe on both machines according to the procedure in "Install the Data Flow Probe" on page 114.
- **2** Choose **Yes** in step 15 on page 122.
- **3** Perform the configuration in "Configure the Probe Manager and Probe Gateway Components" on page 126.

Note:

- ➤ At least one Probe Gateway component must be installed: Gateway is connected to the UCMDB Server, receives tasks from the Server, and communicates with the collectors (Probe Manager).
- ➤ Several Probe Managers can be installed: Managers run jobs and gather information from networks.
- ➤ The Probe Gateway should contains a list of attached Managers.
- ➤ The Probe Managers must know to which Gateway they are attached.

P Configure the Probe Manager and Probe Gateway Components

This section explains how to set up the Data Flow Probe when the Probe Manager and Probe Gateway run as separate processes on two machines.

This section includes the following topics:

- ➤ "Set Up the Probe Gateway Machine" on page 126
- ➤ "Set Up the Probe Manager Machine" on page 127
- ➤ "Start the Services" on page 127

1 Set Up the Probe Gateway Machine

- **a** Open the following file:
- **b** Locate the line beginning probeMgr ip= and add the Manager machine name or IP address, for example:

oprobeMgr ip="OLYMPICS08">

c Open the following file:

C:\hp\UCMDB\DataFlowProbe\conf\DiscoveryProbe.properties

d Locate the lines beginning **appilog.collectors.local.ip** = and **appilog.collectors.probe.ip** = and enter the Gateway machine name or IP address, for example:

```
appilog.collectors.local.ip = STARS01
appilog.collectors.probe.ip = STARS01
```

2 Set Up the Probe Manager Machine

a In C:\hp\UCMDB\DataFlowProbe\conf\DiscoveryProbe.properties, locate the line beginning appilog.collectors.local.ip = and enter the Manager machine name or IP address, for example:

```
appilog.collectors.local.ip = OLYMPICS08
```

b Locate the line beginning **appilog.collectors.probe.ip** = and enter the Gateway machine name in uppercase, for example:

```
appilog.collectors.probe.ip = STARS01
```

3 Start the Services

- On the Probe Manager machine start the Manager service: Start > Programs > UCMDB > Start Data Flow Probe Manager.
- **b** On the Probe Gateway machine start the Gateway service: **Start** > **Programs** > **UCMDB** > **Start Data Flow Probe Gateway**.

P Connect a Data Flow Probe to a Non-Default Customer

You can connect a Data Flow Probe to a customer that is not the default. The default customer ID is **1**.

- 1 Open the following file in a text editor:C:\hp\UCMDB\DataFlowProbe\conf\DiscoveryProbe.properties.
- **2** Locate the **customerID** entry.
- **3** Update the value with the customer ID, for example, **customerId = 2**.

Chapter 10 • Data Flow Probe Installation

4 Restart the Probe so that it is updated with your changes.

Reference

🍳 Data Flow Probe Installation Requirements

This section includes the following topics:

- ➤ "Hardware Requirements" on page 129
- ➤ "Software Requirements" on page 129
- ➤ "Virtual Environment Requirements" on page 130

Hardware Requirements

Computer/processor	Windows: Pentium IV 2.4 GHz or later processor	
Memory	Windows: Minimum 1 GB RAM (Recommended: 2 GB RAM)	
Virtual memory (for Windows deployment)	Minimum 2 GB Note: The virtual memory size should always be at least twice the physical memory size.	
Free hard disk space	Windows: Minimum 4 GB (at least 4 GB for database software and data files) (Recommended: 20 GB hard disk)	
Display	Windows: Color palette setting of at least 256 colors (32,000 colors recommended)	

Software Requirements

Platform	OS Version and Edition	Supported	Recommended
32-bit x86/x64	Windows 2008 Standard/Enterprise editions, SP2 and R2	Yes	Yes
32-bit x86/x64	Windows 2003 Standard/Enterprise editions, SP2 and R2 SP2	Yes	
Any	Windows 7 Professional/Enterprise	No	
Any	Windows 2000	No	

Virtual Environment Requirements

Platform	OS Version and Edition	Supported	Recommended
VMware ESX 3.x	➤ Windows 2003 Standard/Enterprise editions SP2 and R2 SP2 ➤ Windows 2008 Standard/	Yes	
	➤ Windows 2008 Standard/ Enterprise SP2 and R2		
VMware ESX 4.0	 ➤ Windows 2003 Standard/Enterprise editions SP2 and R2 SP2 ➤ Windows 2008 Standard/ Enterprise SP2 and R2 	Yes	Yes
Pre ESX 3.5 (like 3.0.x versions)	 ➤ May not provide adequate performance ➤ Does not support Windows 2008 or Windows 7 	No	
ESXi VMware	All platforms	No	
MS Hyper-V	Server 2008 v1 and R2	No	
Xen Hypervisor 3.x	All platforms	No	

Part IV

Upgrading HP Universal CMDB from Version 8.x to 9.0x

11

Upgrading HP Universal CMDB to Version 9.01

This chapter includes:

Concepts

- ➤ Upgrade Prerequisites on page 134
- ➤ Upgrade Procedure Summary on page 135
- ➤ Input Parameters, Class Model, and Log Files on page 136

Tasks

- ➤ Uninstall UCMDB 8.0x on page 138
- ➤ Upgrade to UCMDB 9.01 on page 138
- ➤ Post Upgrade Procedures on page 147
- ➤ Upgrade Adapters on page 148

Reference

➤ Ordered Summary of Upgrade Steps on page 149

Troubleshooting and Limitations on page 219

Concepts

🚜 Upgrade Prerequisites

Important: It is highly recommended that you thoroughly read this chapter before commencing the upgrade procedure.

- ➤ The UCMDB 9.01 upgrade process upgrades UCMDB from version 8.0x to 9.01. This is an offline process during which all resources and data are transformed from the 8.0x class model to the new BTO Data Model (BDM) version 1.1.1.
 - To upgrade from version 8.0x to 9.00, first upgrade to the latest 8.0x version and install the latest Content Pack. The minimal requirement for the upgrade to UCMDB 9.00 is UCMDB version 8.04 on which DDM Content Pack 6 is installed.
- ➤ To upgrade from version 7.x to 9.01, first upgrade to the latest 8.0x version and install the latest Discovery and Integration Content Pack. For details refer to the version 8.0x documentation.
- ➤ If you plan to run the UCMDB server on a hardened platform (including using the HTTPS protocol), review the hardening procedures described in Part VI, "Hardening HP Universal CMDB."
- ➤ Hardware and operating system requirements are listed in "HP Universal CMDB Support Matrix" on page 35.
- ➤ Allocate enough space to your space table to enable temporary duplication of the CMDB schema.
- ➤ Backup the CMDB, History, and Foundation databases. In UCMDB 9.01 the Foundation and CMDB schemas are combined. Backup all three schemas individually to ensure the correct binding during the version 9.01 upgrade.

Note: As an added precaution, run your current UCMDB version against the backup schemas to make sure they are not corrupt.

- ➤ Run the database consistency tool to clean the CMDB schema from the following corrupted data:
 - ➤ Links where end objects are missing
 - ➤ CIs with missing information in some of the tables along the data model hierarchy

Upgrade Procedure Summary

This section lists the steps necessary for the upgrade process:

- **1** Backup the databases and uninstall prior versions of UCMDB.
- **2** Delete the entire installation folder.
- **3** Stop and uninstall the Data Flow Probe. For details, see "Upgrade the Probe" on page 125.
- **4** Reboot the UCMDB Server.
- **5** Install UCMDB 9.01. For details, see Chapter 6, "HP Universal CMDB Installation on a Windows Platform" or Chapter 7, "HP Universal CMDB Installation on a Linux Platform."
- **6** Run the upgrade tool. For details, see "Upgrade to UCMDB 9.01" on page 138.
- **7** Reboot the UCMDB Server.
- **8** Install Data Flow Probe version 9.00. For details, see Chapter 10, "Data Flow Probe Installation."
- **9** Reinstall any reverse proxies. For details, see Chapter 17, "Using a Reverse Proxy."

- **10** Reinstall LW-SSO. For details, see Chapter 20, "Lightweight Single Sign-On Authentication (LW-SSO) General Reference" and "Enable Login to HP Universal CMDB with LW-SSO" on page 312.
- **11** Reinstall SSL configurations. For details, see Chapter 16, "Enabling Secure Sockets Layer (SSL) Communication."
- **12** Reinstall the LDAP configuration and mapping between LDAP users and groups. For details, see "Synchronize HP Universal CMDB User Roles With LDAP Groups" in the *HP Universal CMDB Administration Guide*.

\lambda Input Parameters, Class Model, and Log Files

This section includes the following topics:

- ➤ "Upgrade Input Parameters" on page 136
- ➤ "Modifying the Class Model Changes Files" on page 137
- ➤ "Log Files" on page 137

Upgrade Input Parameters

In addition to your schemas and taking into account your type of upgrade (**Full** or **Resource Only**), the upgrade process uses the following:

- ➤ Files describing the class model transformation being performed during the upgrade. These are files ending with _changes.xml located under the conf/upgrade directory.
- ➤ The out-of-the-box Class Model of version 8.04 and DDM Content Pack 6.00. This version enables the upgrade process to add missing class model entities before the upgrade.
- ➤ The out-of-the-box Data Model of version 9.01 and DDM Content Pack 6.00. This version enables the upgrade process to add missing class model entities after the upgrade procedure, and makes sure that the upgraded class model is compliant with UCMDB and Business Service Management.

Modifying the Class Model Changes Files

Class model changes files should not be modified after the completion of the **Validate Class Model** step. This refers to the out-of-the-box files, the automatic conflict resolution file, and any file manually placed under **conf/upgrade**. For details, see "Validate Class Model" on page 156.

If the class model changes files are changed, the upgrade wizard and the automatic conflict resolution file must be completely closed and re-opened for the changes to take effect correctly.

Log Files

During the upgrade the following logs files are used:

- ➤ upgrade.detailed.log. This is the main log file for the upgrade procedure. All upgrade actions are written to this log (unless otherwise stated in a specific upgrade step). Typically this file is between 30 MB to 70 MB in size.
- ➤ upgrade.short.log. A summary of the detailed log. All lines in this file appear in upgrade.detailed.log as well. This file should be used as a table of contents for the more detailed file, or as a general overview. Typically this file is less than 5 MB.
- ➤ upgrade.detailed.attribute_cleanup.log. This log file shows the progress of a complete cleanup of the class model so that an attribute is defined only once in a class hierarchy. All other definitions should be attribute override and all invalid attribute overrides are removed. This process occurs several times during the complete upgrade, during class model manipulation (validation with the previous class model, class model upgrade, and validation with the target class model). Typically the combined size of these log files (.log file and all roll-over files) can be hundreds of MBs.
- ➤ error.log. This file is not specific to the upgrade and contains all errors and warnings sent by any other log (unless specifically blocked). It can be used as a map and as a general overview of upgrade success.
- ➤ mam.packaging.log. This log is relevant only for the Redeploy Basic Packages step and includes all of that step's information. For details, see "Redeploy Basic Packages" on page 200.

Tasks

P Uninstall UCMDB 8.0x

This section is necessary if you intend to install your UCMDB version 9.01 Server on the same machine where you previously ran version 8.0x. If you are using two or more servers you do not need to uninstall 8.0x before upgrading to 9.01 and you can skip to the next step "Upgrade to UCMDB 9.01" on page 138.

To remove the UCMDB 8.0x server:

- 1 Click the Start > Programs > HP UCMDB > Stop HP Universal CMDB **Server.** A console window appears to let you know that the server has now been stopped.
- 2 Click the Start > Programs > HP UCMDB > Uninstall HP Universal CMDB Server.
- **3** Remove the entire ..\hp\UCMDB folder. For details, see "Uninstall UCMDB" on page 74.

Upgrade to UCMDB 9.01

The upgrade process consists of installing UCMDB 9.01 and then upgrading the data.

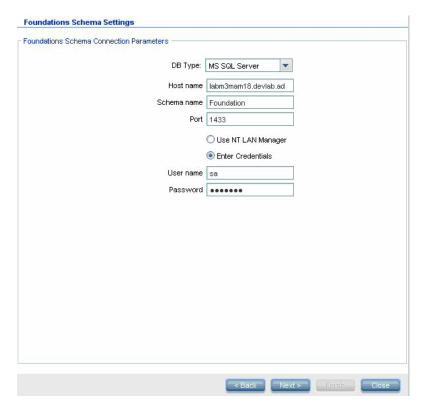

- **1** Stop all Data Flow Probes and uninstall them. Install a version 9.01 Probe. For the location of the **HPUCMDB_DataFlowProbe_901.exe** file, see "Install the Data Flow Probe" on page 114.
- **2** Install UCMDB 9.01 but do not set up the database or schema.

For the procedure for installing UCMDB 9.01, see "Install UCMDB" on page 66.

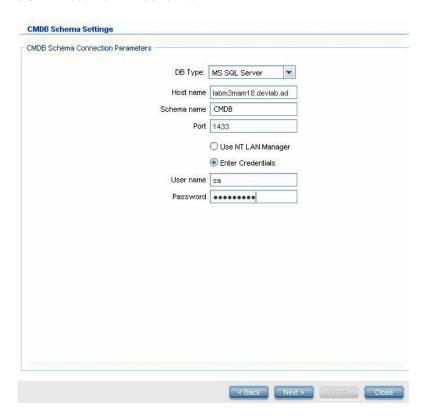

Caution: Following completion of the installation, do not continue with the UCMDB Server Configuration Wizard (to set up the database or schema). Click **No** and complete the installation. Instead, perform the following step.

- 3 Locate then launch the upgrade.bat file:C:\hp\UCMDB\UCMDBServer\tools\upgrade.bat
- **4** The **Preparing to Upgrade** install wizard opens. Click **Next** to open the UCMDB Server Upgrade window.
- **5** Select an **Oracle** or **MS SQL Server** database and set the **Foundations Schema** connection parameters.

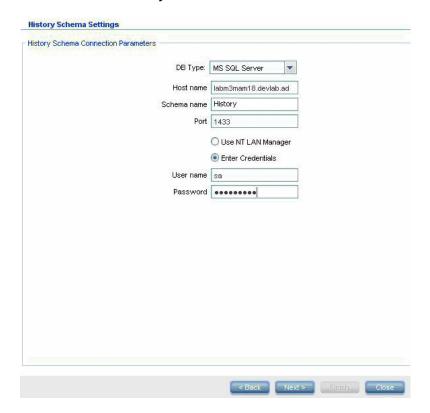

The **Schema name** should match the name of your previously replicated UCMDB 8.0x **Foundations** schema. For more details about the connection parameters see "Required Information for Setting Database Parameters" on page 93.

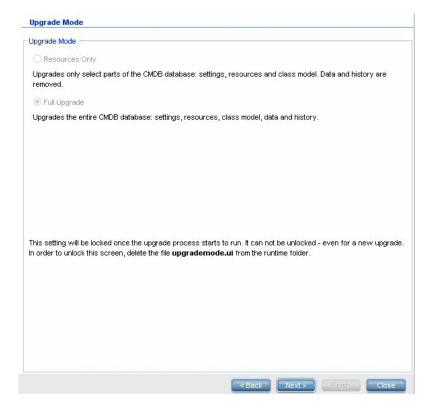

6 Click **Next** and set the **CMDB Schema** connection parameters. The **Schema name** should match the name of your previously replicated UCMDB 8.0x **CMDB** schema.

7 Click **Next** and set the **History Schema** connection parameters. The **Schema name** should match the name of your previously replicated UCMDB 8.0x **History** schema.

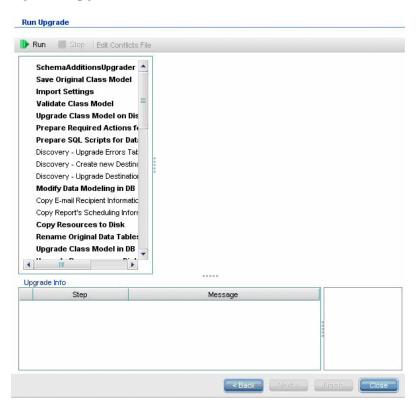

8 Click **Next** and select the Upgrade Mode:

- ➤ **Resources Only.** Upgrades only selected parts of the CMDB, not including data and history.
- ➤ Full Upgrade. Upgrades the entire CMDB, including data and history.

Click **Next**. The Run Upgrade screen lists the upgrade steps. Click **Run** to begin the upgrade.

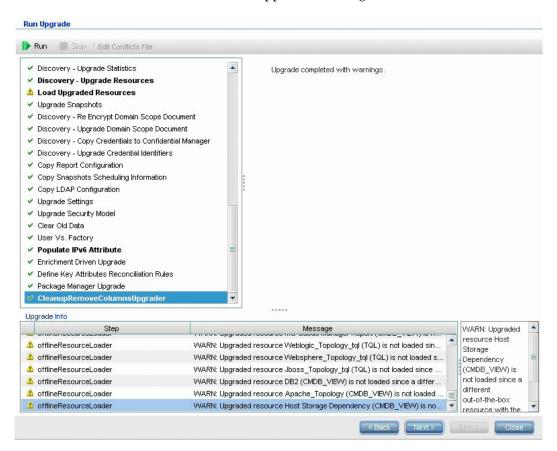

< Back Next > Finish Close

Run Upgrade Run Stop | Edit Conflicts File Upgrade progress for [SchemaAdditionsUpgrader] ⇒ SchemaAdditionsUpgrader ▲ Save Original Class Model Updating table: CCM_DISCOVERY_DESTS_RESULTS Import Settings Validate Class Model Upgrade Class Model on Dis Prepare Required Actions fo Prepare SQL Scripts for Data Discovery - Upgrade Errors Tak Discovery - Create new Destina Discovery - Upgrade Destination Modify Data Modeling in DB Copy E-mail Recipient Informatic Copy Report's Scheduling Inforr Copy Resources to Disk Rename Original Data Table: Upgrade Class Model in DB Upgrade Info Step Message

10 The Run Upgrade screen indicates the progress of each step.

11 Upgrade can take a long time to complete. To terminate the upgrade at any point click the red **stop** button. Steps that either complete with a warning or fail to run are logged in the **Upgrade Information** pane. To see this information, highlight the row where the **upgrade step** appears: relevant information appears to the right.

🚏 Post Upgrade Procedures

The following steps may be necessary after the upgrade.

Reverse Proxy

Unless the upgraded system is going to run the same environment as the version 8.0x system, after the upgrade, reconfigure the reverse proxy. For configuration details, see Chapter 17, "Using a Reverse Proxy."

SSL

Reinstall SSL configurations. For details, see Chapter 16, "Enabling Secure Sockets Layer (SSL) Communication."

LW-SSO

Reinstall LW-SSO. For details, see Chapter 20, "Lightweight Single Sign-On Authentication (LW-SSO) – General Reference" and "Enable Login to HP Universal CMDB with LW-SSO" on page 312.

LDAP

Reinstall the LDAP configuration and mapping between LDAP users and groups. For details, see "Synchronize HP Universal CMDB User Roles With LDAP Groups" in the *HP Universal CMDB Administration Guide*.

JMX Console

The default administrator's user and password are sysadmin.

Delete Foundation Schema

The Foundation schema is no longer used after the upgrade and can be deleted.

🦒 Upgrade Adapters

For all out-of-the-box adapters: if you modified an adapter configuration in a previous version, it is highly recommended that you save all adapter files from that version, and redo the modifications on the adapter files of version 9.01.

For all non out-of-the-box adapters: you must redeploy the adapters in version 9.01. For details, see "Package Manager" in the *HP Universal CMDB Administration Guide*.

Important: All adapters must be compatible with the new BDM model. If you made changes to existing out-of-the-box adapters, you must make the same changes to the adapter files in the 9.01 version. That is, do not copy files from version 8.04 and overwrite the files in version 9.01.

Reference

💐 Ordered Summary of Upgrade Steps

The upgrade process is a multi-step process comprising an ordered list of steps. Each step performs a specific task. This section describes the steps that comprise the complete upgrade process and includes the following subjects:

- ➤ "Description of Upgrade Steps" on page 149
- ➤ "Links to Upgrade Steps" on page 150

Description of Upgrade Steps

For each step in the upgrade procedure, the following is described:

- ➤ The function of the step.
- ➤ Whether the step is critical a step is considered critical in the following cases:
 - ➤ Skipping it would prevent the UCMDB server from starting after upgrade.
 - ➤ Skipping it would induce critical configuration or data loss which cannot be restored after upgrade.
 - ➤ Skipping it would prevent a critical component from operating properly after the upgrade.
- ➤ If the step can be re-run in case of failure during the upgrade, whether or not this step can be re-run over the same schemas.
- ➤ Implications of failure If this upgrade step fails, what is the effect on the UCMDB? If the step can be re-run, what can be done to resolve the issue(s)?

➤ Relevant log information – Important messages from the log file that are typical to this upgrade step, and the meaning of each message. Unless otherwise specified, all messages appear in the following logs: \runtime\log\upgrade.detailed.log (possibly duplicated to \runtime\log\upgrade.short.log). For log information see "Log Files" on page 137.

Links to Upgrade Steps

The following links list the upgrade steps (and relevant sub-steps) in order. To re-run a specific step, right-click on the step from the Upgrade Wizard in the **Steps** pane and select **Re-run**.

- **1** "Schema Additions" on page 153
- **2** "Save Original Class Model" on page 154
- **3** "Import Settings" on page 155

Schema Additions

Functionality

This step adds the new required tables and columns to the CMDB.

Is Critical

Yes

Can be re-run

Yes

Implication of Failure

The complete success of this step is critical for the CMDB to function correctly.

Functionality

Saves the complete class model, prior to the upgrade, to disk under /runtime/original-class-model.xml.

Is Critical

Yes

Can be re-run

Yes

Implication of Failure

Probable reasons for failure are:

- ➤ Permission issues (not enough permission)
- ➤ Database connectivity issues (the database cannot be connected)
- ➤ Locking (tables cannot be modified)

Relevant Log information

- ➤ "Updating table: ..." When updating a specific table in the database.
- ➤ "Initializing default customer registration" when updating the global "customer" information.

Save Original Class Model

Functionality

Saves the complete class model, prior to the upgrade, to disk under /runtime/original-class-model.xml.

Is critical

Yes

Can be re-run

Yes

Implication of Failure

Failure in this step means that the existing user class model could not be read from the CMDB. It is likely that the cause is a corrupt class model definition. The only solution for this kind of failure is to manually edit the class model definition in the database before trying to re-run the step.

Another reason for failure may be that the CMDB has no permissions to write to the \runtime folder. Read/Write/Create folders permissions are needed for the entire installation folder (although most Write commands are done only to the \runtime folder).

Relevant Log information

Failures in the **cmdb.classmodel.log** or **error.log** that may indicate which entity in the class model failed to load. For more information see "Log Files" on page 137.

Import Settings

Functionality

Copies relevant settings from the old Foundation database to the management table in the CMDB.

Is critical

Yes

Can be re-run

Yes

Implication of Failure

Failure in this step means that your settings are not properly migrated and that the CMDB factory default values are used instead. If the aging mechanism is left on, large portions of the CMDB data model might be removed when the CMDB first starts up.

The probable cause of failure in this step is an incorrectly configured (or non-existent) Foundations database. The best solution for this is to properly configure the Foundations database using the upgrade wizard. If the database has been damaged or a new database is desired, it is possible to create an empty Foundations database using the CMDB 8.0x database wizard.

To override the aging mechanism

Edit the \conf\settings.override.properties file: add the line model.aging.is.aging.enabled=false and restart the Upgrade Wizard.

To restart the aging mechanism

When you are ready to return the aging to its previous state, edit the \conf\settings.override.properties file, remove the line model.aging.is.aging.enabled=false, and restart the CMDB.

Relevant Log information

- ➤ "Fetch old settings" when retrieving the settings from the 8.0x Foundations database.
- ➤ "Set new settings" when writing the settings to the new management database.
- ➤ "Aging mechanism has been disabled" when the aging mechanism has been disabled. It is recommended that the aging mechanism remains disabled until a full massive discovery has been run at least once.

Validate Class Model

Functionality

Ensures your old class model, read from /runtime/original-class-model.xml is aligned with the expected out of the box class model so it can be accessible for the class model transformations that are part of the upgrade process. Validate Class Model uses the old class model, the predefined transformations and the out-of-the-box class models as input and generates a modified class model after adding the missing class model entities to your disk under: /runtime/original-fixed-class-model.xml.

Note: If at the beginning of this step the **original-class-model.xml** does not exist, it is re-read from the database.

Is critical

Yes

Can be re-run

Yes

Implication of Failure

This step fails check one of the following:

Attribute mismatch - the **attribute** type is different from the out-of-the-box class model attribute types. Type conversion is not supported.

Class or Attribute Conflict - the new class or attribute name defined by the user is being allocated to a new out-of-the-box class or attribute. If this happens a new additional transformation file is automatically generated and saved to disk under /runtime/added-class-model-changes.xml and the upgrade process fails. The new transformation file defines an additional transformation aimed at solving the conflicts by renaming your classes and attributes. Run the upgrade again to include these new transformations and allow the upgrade to proceed. Before re-running the upgrade you can also manually modify these actions by choosing different names for example.

Note: If a conflict resolution file has been created or if you edit it via the UI, you must close the upgrade wizard completely and re-open it in order to correctly reload these changes.

Relevant Log information

- ➤ Missing entity or unsupported additional entity in the user class model produce a warning to the log file. The warning contains the type of the entity, name, and location in the class model hierarchy, and the action that is taken to handle the entity (if any).
- ➤ "Attribute type change is not allowed. Attribute <name> in Class <name> change type from <old-type> to <new-type>": In case of attribute type change, an error is produced with the name of the attribute and its class.
- ➤ "Class hierarchy change may cause upgrade problems in Class '<name>' ":
 The class '<name>' has changed its location in the class model hierarchy.
 The upgrade can handle specific kinds of hierarchy change, and at this point in the upgrade there is not enough information to decide in the matter.
- ➤ "Class removal is not allowed in Class <name>. Class was added": The user class model is missing a factory class, so the class is forced back into the user class model. This can happen as a result of class removal by the user or as a result of failure in CP6 deployment.

- ➤ "Class Qualifier addition of type <name> is not allowed. The qualifier was removed in Class <name>": Certain types of class qualifiers are not allowed to be added by the user. If the user added one of them, this message appears and the class qualifier is removed from the class.
- ➤ "Class Qualifier removal of type <name> is not allowed in Class <name>. The qualifier was added": We expect to find in each factory class certain factory class qualifiers, if those qualifiers are missing, we force them back to the class.
- ➤ "Attribute removal is not allowed. Attribute <name> in Class <name>. The Attribute was added": The user class model is missing a factory attribute in a factory class, so the attribute is forced back into the class. This can happen as a result of attribute removal by the user or as a result of failure in CP6 deployment.
- ➤ "Attribute Qualifier addition of type <name> in new attribute <name> is not allowed. The qualifier was removed in Class <name>": New attributes are attributes created by the user in a factory class. We do not allow the user to add specific types of attribute qualifiers on new attributes. The attribute qualifier was removed from the attribute in the user class model.
- ➤ "Attribute Qualifier addition of type <name> in existing attribute <name> is not allowed. The qualifier was removed in Class <name>": We do not allow the user to add specific types of attribute qualifiers on factory attributes. The attribute qualifier was removed from the attribute in the user class model.
- ➤ "Attribute Qualifier addition of type <name> in new attribute <name> is not allowed. The qualifier was removed from the attribute override in Class <name>": New attributes are attributes created by the user in a factory class. The user also added override on the new attribute in a subclass. We do not allow the user to add specific types of attribute qualifiers on new attributes or its overrides. The attribute qualifier was removed from the attribute override in the user class model.
- ➤ "Attribute Qualifier addition of type <name> in existing attribute <name> is not allowed. The qualifier was removed from the attribute override in Class <name>": We do not allow the user to add specific types of attribute qualifiers on factory attributes or its overrides. The attribute qualifier was removed from the attribute override in the user class model.

- ➤ "Attribute Qualifier removal <name> is not allowed. Attribute <name> in Class <name>": The user removed attribute qualifier that came with the out of the box class model. We do not allow removing specific type of attribute qualifiers from factory attributes.
- ➤ "Attribute Qualifier removal <name> in override is not allowed. Attribute <name> in Class <name>": The user removed attribute qualifier in attribute override that came with the out of the box class model. We do not allow removing specific type of attribute qualifiers from factory attribute override.
- ➤ "Valid Link <name> removal is not allowed": Valid link was removed by the user or failed to deploy from CP6. The valid link was forced back into the user class model.
- ➤ "Calculated Link <name> removal is not allowed. Class <name>":
 Calculated link was removed by the user or failed to deploy from CP6.
 The calculated link was forced back into the user class model.
- ➤ "TypeDef <name> removal is not allowed": Factory TypeDef (Enum or List) is missing in the user class model, and it is forced back in. The TypeDef could be missing as a result of removal by the user or as a result of failure in CP6 deployment.
- ➤ "Enum entry removal is not allowed. Enum <name> with Enum entry key <key> and Enum entry value <value>": An Enum entry is missing in a TypeDef of type Enum, the entry is forced back into the Enum. The Enum entry could have been deleted by the user or failed to deploy from CP6.
- ➤ "List entry removal is not allowed. List <name> with List entry value <value>": A List entry is missing in a TypeDef of type List, the entry is forced back into the List. The List entry could have been deleted by the user or failed to deploy from CP6.
- ➤ "Enum entry addition can cause conflicts. Enum <name> with Enum entry key <key> and Enum entry value <value>": User added an entry to a **TypeDef** of type **Enum**. At this point in the upgrade, there is not enough information to determine if the added entry causes the upgrade to fail.
- ➤ "List entry addition can cause conflicts. List <name> with List entry value <value>": User added an entry to a TypeDef of type List. At this point in the upgrade, there is not enough information to determine if the added entry causes the upgrade to fail.

- ➤ In case of attribute type change, an error is produced with the name if the attribute and its class.
- ➤ Hierarchy change also produces a warning, with the name of the class that changed its parent class.
- ➤ Problem with the user class model produces the following error message: "User class model is not valid for upgrade"
- ➤ Problem with class model transformations produces the following error message: "Upgrade configuration files are not valid"

Upgrade Class Model on Disk

Functionality

Uses the class model generated in the previous step (see "Validate Class Model" on page 156): /runtime/original-fixed-class-model.xml together with the predefined transformation files to generate the upgraded class model and saves it to disk under /runtime/upgraded-class-model.xml.

Is critical

Yes

Can be re-run

Yes

Implication of Failure

If this step fails it means that the class model cannot currently be upgraded properly. A possible solution is to edit the problematic classes in the 8.0x UCMDB instance and re-run the upgrade. Another possible solution is to edit the class model changes files as described in the "Validate Class Model" on page 156 step. If such editing is done, it is important to **re-run** the **Validate class model** step before continuing with the upgrade.

Relevant Log Information

General messages (all top level class model entities):

- ➤ "Adding non-modified <entity type> <entity name>" the entity was not modified between the user and the target class model and can also appear in the form "Adding un-upgraded..."
- ➤ "Adding <entity type> <name>" An upgraded entity is added to the target class model.
- ➤ "Skipping <entity type> <name> Dropped in upgrade" the entity is to be explicitly removed in the upgrade.
- ➤ Can also appear in the form "Not adding..."
- ➤ "Skipping <entity type> <name> exists in new basic CM" The entity exists in the basic class model and its definition there is used.
- ➤ "Adding new <entity type> <name>" A new entity, specified to be added during the upgrade, is added to the target class model.
- ➤ "Skipping adding new <entity type> <name> exists in new basic CM" A new entity, specified to be added during the upgrade, is not added to the target class model since it is already specified by the basic class model.

Calculated links related messages:

➤ "Skipping calculated link <name> - exists in new basic CM, adding only triplets." – The calculated link exists in the basic class model, but triplets from the user class model are added to it to preserve query (TQL) results.

Class related messages:

- ➤ "About to upgrade class <name>" this message is written before a class is to be upgraded. If a failure occurs, this message can be used to track which class caused the failure.
- ➤ "Skipping class <name> already added as a calculated link." the class was already added as part of a calculated link. See previous log messages to know what actually occurred with that class.
- ➤ "skipping adding new class <name> extends <parent name> which does not exist" The class is not added since its parent cannot be found in the target class model.

➤ Valid link related messages:

- ➤ "Skipping adding new valid link <name> <end> class <class name> does not exist." The valid link cannot be added since a class (end1 / end2 / link) cannot be found in the target class model.
- ➤ "Duplicate CITs found: <names>" due to an error these CI types have been added twice to the target class model. This error is unrecoverable without editing the upgrade class model changes files and rerunning the "validate" and "class model upgrade" steps again.
- ➤ "Adding <old name> > <new name> to rename map." the rename map is used to identify old classes names to new classes names.
- ➤ "Mismatch between incremental rename map and changes util! Using incremental rename map. Incremental: <old name> > <new name>. Util: <old name2> > <new name2>." the actual rename map and the upgrade definition do not agree. This should be noted for verification since it might indicate a problem in the class model upgrade. This message does not, in itself, stop the upgrade process.

Valid links validation:

- ➤ "Start removing invalid links." Valid links are to be checked and invalid ones (no end 1 / end 2 / link class) are removed.
- ➤ "Link <entity> <name> does not exist in target class model Removing valid link <name>". The valid link entity (end 1 / end 2 / link class) does not exist in the target class model and so the valid link must be removed for the entire class model to be valid. Later, this might cause some resources (TQLs, Views...) to fail the upgrade.
- ➤ "Done removing invalid links." When this sub-step is complete.

For a user's class with key attributes different than its parent the complete set of key attributes is being restored. Each key attribute which was removed from its out-of-the-box ancestors and was added produces the following log info message:

➤ "Added ID qualifier to attribute <attribute name> in class <class name>"

Prepare Required Actions for Data Upgrade

Functionality

Uses the /runtime/ original-class-model.xml, the /runtime/upgraded-class-model.xml and the class model transformations to deduce the actions required to perform the data transformation. Saves the analysis result to disk under /runtime/data-upgrade-actions.xml. This step skips CI types listed in upgrade/DataModelUpgradeConfig.xml (app-infra.jar) that causes the data upgrade to omit data that cannot be upgraded.

Is critical

Yes

Can be re-run

Yes

Implication of Failure

Failure in this step means that the upgrade could not deduce the actions needed to transform the data model from the previous version class model to the target class model. Configuration and data upgrade cannot continue without this step being completed.

Relevant Log information

Initial analysis

In this section, **DI** means data items – CIs or Links.

General information

This step regards the data upgrade configuration as a series of copy rules with possible transformation and conditions.

A source for an attribute can be either:

- ➤ A property on the source DI
- ➤ A constant value for all DIs of a specific concrete class.

The logs for this step are nested (using indentations). An indented log message is usually preceded by a header that determines the context of the analysis.

Class rules types

- ➤ Modified, Moved, Merged DIs that belong to rules marked as one of these should be copied to the new data model (with possible transformations)
- ➤ Added, Deprecated These CITs are new. As such, they cannot have any DIs.
- ➤ Removed These CITs are explicitly removed during the upgrade. Their DIs are not copied to the target class model (unless otherwise noted by another rule).

Attribute rule types

- ➤ Added The rule defines an attribute that is either new or keeps its name.
- ➤ **Deprecated, Modified** The rule defines a transformation on an existing attribute that is being renamed.
- ➤ **Removed** The rule defines that this attribute should not exist in the target DI.
- ➤ Default rule / Default action: defined on a specific CIT. This means that the target CIT name is the same as the source CIT name. Attributes of DIs defined in the target CIT level are copied from attributes with the same name in the source CIT level. Attributes from the parent CIT use the parent CIT rules.

General class or rule analysis

- ➤ "Rule type for class <name> is <type>" Analysis for the specified class is about to start.
- ➤ "Class <name> added to added CITs." The CIT is new. As such, no DIs can exist for it. It is added to a reference list "added CITs" in the xml.
- ➤ "Class <name> added to removed CITs." The CIT is marked to be removed along with all of its DIs.

- ➤ "Change has empty class name." Warning that the requested transformation is invalid and no action is to be taken. Cause: invalid transformation definition.
- ➤ "Target CIT name is <name>", "Source CIT name is <name> (from <origin>)" DIs of the source CIT are to be copied to the target CIT.
- ➤ "Target CIT <name> does not exist in target class model, skipping rule!." Warning that the target CIT was not properly created. The entire rule is to be skipped since it cannot be completed. Cause: invalid transformation definition or bad class model upgrade.
- ➤ "Source CIT <name> does not exist in source class model, skipping rule!."

 Warning that the source CIT cannot be found in the user class model.

 The entire rule is to be skipped since it cannot be completed. Cause: invalid transformation definition, bad class model upgrade or the user class model (after fixes) not conforming to the 8.0x class model.
- ➤ "Source CIT <name> does not exist in source class model, skipping rule, adding to added CITs!." Warning that the rules do not match the actual class model. The source CIT cannot be found, so the target CIT is to handled as if it's a new CIT (no data upgrade). Cause: invalid transformation definition, bad class model upgrade or the user class model (after fixes) not conforming to the 8.0x class model.
- ➤ "Source CIT is empty." / "Target CIT is empty." Warning that the transformation rule is invalid. The rule is skipped. Cause: invalid transformation definition.

Copy condition analysis

➤ "Could not create copy condition for source CIT <name> - CIT does not exist in old class model." – The class has a condition on which DIs should be copied, but that source CIT does not exist in the user class model. Warns that the condition is to be ignored. Cause: invalid transformation definition or the user class model (after fixes) not conforming to the 8.0x class model.

- ➤ "Could not create copy condition for source CIT <name> and attribute <attribute name> CIT exists but does not have the attribute." The class has a condition on which DIs should be copied, but that attribute in the source CIT does not exist in the user class model. Warns that the copy instruction is to be ignored. Cause: invalid transformation definition or the user class model (after fixes) not conforming to the 8.0x class model.
- ➤ "Copy condition attribute: <name>, Type: <type>, Operator: <operator>." / "Copy condition value: <value>." The condition that A DI would be copied (not discarded) using this rule is that the value of the attribute maintains the indicated condition (for example, ipport not-equal to 3).
- ➤ "Attribute condition.attribute name is empty." The attribute name is empty. Warns that the copy condition is invalid and is not to be used (all DIs are to be copied). Cause: invalid transformation definition.
- ➤ "Copy condition value is empty." The copy condition value is empty. Warns that the copy condition is invalid and is not to be used (all DIs are to be copied). Cause: invalid transformation definition.

General attribute analysis

- ➤ "Entering copy attribute analysis" Analysis for attributes is about to start.
- ➤ "Rule type for attribute <old name> > <new name> is <rule type>." Analysis for this rule is about to start. Note: type "MERGED" and "MOVED" are not applicable for attribute rules.
- ➤ "Rule type changed from <original type> to ADDED no old name or oldName == Name." While the rule is defined as modified, the actual data action should treat this attribute as "added" since there is either no change in the attribute name or there is no such old attribute (difference between the user class model and the expected 8.0x class model).
- ➤ "No target class <name> in new class model." Warns that the target class cannot be found in the target class model and this attribute rule is to be skipped. Cause: bad class model upgrade.
- ➤ "No target attribute <name> in target class <class name> in new class model." Warns that the target attribute in the target class cannot be found in the target class model and this attribute rule is to be skipped. Cause: bad class model upgrade.

- ➤ "Attribute <name> in class <class name> in new class model is declared STATIC_ATTRIBUTE. Skipping rule." Static attributes live on the CIT, not the actual DI. As such, they should not be copied during the data upgrade.
- ➤ "Attribute <name> in class <class name> in new class model is of simple list type. Skipping rule." value lists (multiple values) are handled in a different upgrade step and are skipped here.
- ➤ "Attribute <name> is a root class attribute that is not duplicated to concrete classes. Skipping rule." The specific rule is skipped because the attribute is should not be copied to the concrete class tables in the database.

Copy attribute from class analysis

- ➤ "Copy attribute from class." This attribute value is determined by the concrete class of the DI.
- ➤ "Attribute constant value: <value>" For this concrete class, the attribute value is the specified one.

Copy attribute from attribute analysis

- ➤ "Copy attribute from attribute" This attribute value is determined by another attribute.
- ➤ "Old attribute name: <name>." Applicable to "added" attribute the source attribute is the indicated one.
- ➤ "Source attribute name (from enum): <name>." / "Source attribute name (from OldName): <name>." Applicable to "modified" attribute the source for this rule either is constant ("from enum") or another attribute ("from OldName").

Mapped transformation inside copy attribute

- ➤ "Entering map transformation analysis." The source should be transformed using a source > target map (dictionary).
- ➤ "Adding transformation: <old value> > <new value>." The old value is to be replaced with the new value.

➤ "From value is empty." / "To value is empty." – The from/to value is empty, and this transformation does not occur. Cause: invalid transformation definition.

Added attribute (new or not renamed) analysis

- ➤ "Copy attribute from default value: <name>." The attribute has no attribute source, so its value is determined by the new default value.
- ➤ "Attribute name is empty." / "Attribute default value is empty." This attribute rule is invalid and is not used. Cause: invalid transformation definition.

Modified attribute (renamed) analysis

- ➤ "Copy attribute from source value: <name>." The attribute value is determined by another attribute in the source DI.
- ➤ "Attribute name is empty." / "Attribute default value is empty." this attribute rule is invalid and is not used. Cause: invalid transformation definition.

Common attribute analysis

- ➤ "Completing and adding." Entering the common analysis stage for this attribute rule.
- ➤ "Attribute was not properly completed." The common analysis stage failed, the attribute rule is not used. This must be preceded by one of the following:
- ➤ "Target CIT empty." The target CIT is empty. Cause: invalid rule.
- ➤ "Target CIT does not exist in new class model." The target CIT is empty. Cause: invalid rule or bad class model upgrade.
- ➤ "Target attribute name is empty." The target attribute name is empty. Cause: invalid rule.
- "Target attribute <name> does not exist in target CIT in new class model!"
 The attribute was not found in the target class model. Cause: invalid rule or bad class model upgrade.
- ➤ "Cannot determine target type <name>." The target attribute type is invalid. Cause: bad class model upgrade.

- ➤ "Source CIT name is empty." the source CIT is empty. Cause: invalid rule, bad class model upgrade or previous error in data actions analysis.
- ➤ "Source attribute name is empty." / "Source attribute is null." the source CIT is empty. Cause: invalid rule, bad class model upgrade or previous error in data actions analysis.

Types

- ➤ "Setting new type <type>." / "Setting old type <type>." The attribute was determined to be of the specified type. This is later used to create the correct SQL type-cast.
- ➤ "Target attribute is <name>." / "Source attribute is <name>." The attribute name is the specified one.
- ➤ "Constant value requires new type declaration. New type and old type are <type>." The attribute should be filled from a constant value with the specified type.

Default values

- ➤ "Target default value is <value>." the target attribute has a default value. This value is used if the original DI property was empty.
- ➤ "Source default value is <value>." If the DI original property was equal to the old default value, it is transformed into the new default value.

Size limits

- ➤ "New size set <size> set from default." / "Constant value new size is <size>." the target attribute is of type string. As such, it must have a size limit. None was specified so the default size limit is used (50 chars).
- ➤ "Old size is <size>, setting truncate flag." the target size limit is less than the source size limit. Values may be truncated.
- ➤ "New size is <size>." A new size limit was specified.

Miscellaneous

➤ "Attribute did not pass validation. " – Final validation failed, the attribute rule is not used. Actual cause must be looked for in messages from the actual action building. This must be preceded by one of the following:

- ➤ "No target attribute." For some reason the target attribute name remained empty.
- ➤ "Target attribute does not exist in target class model" The target attribute does not exist in the target class model.
- ➤ "No source." the attribute source (source attribute or constant value) remained undetermined.
- ➤ "Source attribute does not exist in source class model"
- ➤ "Source attribute size limit > Target attribute size limit but truncate needed flag is false."
- ➤ "Target attribute target type is missing."
- ➤ "Target attribute source type is missing."
- ➤ "Target attribute source and target types are not the same, but attribute source is of type CONSTANT_VALUE."
- ➤ "Instruction for target attribute already exists." values for the target attribute in this specific CIT are already generated by some other rule.
- ➤ "Value transformation source is empty." / "Value transformation target is empty." the value map transformation is invalid.

Relevant Log information

Post analysis

Rules Flattening

The rules defined in the class model changes have been converted to actions. This stage will now copy rules from parent classes to children classes to create a complete non-trivial rule-set disconnected from the class hierarchy

- ➤ "Flatten rules stage" stage starts.
- ➤ "Building class to direct children map." starting to build a complete class to children dictionary.
- ➤ "Class <child name> is a child of <parent name>."
- ➤ "Class appeared twice." warns that a class was found twice. Most likely that the class model is not valid.

- ➤ "Building by target and by source rules map." starting to build two class to rules dictionaries one is source class to rule, the other is target class to rule
- ➤ "Found rule from <source> to <target>."
- ➤ "Adding this rule will corrupt the by target map." / "By source map already contains this CIT." warns that the rule cannot be added to the map because another instance of it already exists under a different target/source class. The rule will be ignored for children classes.
- ➤ "Entering DFS over target class model." Starting the "flattening" stage by going over the class model, from top to bottom.
- ➤ "Visiting <class> (added <children> children)." starting to handle the specified class. Found that this class has the specified children and will handle them later.
- ➤ "No rule for <name>, it exists in old class model and it was not explicitly added or removed adding default rule." A default rule will be used to copy DIs of this CIT.
- ➤ "Visiting rule from <source class name>." starting to look at attribute rules from the specified source CIT. During this stage the source tree will be checked from the bottom (the specified CIT) up (to root) in order to collect the correct set of rules. The bottom-most rule that generate a value for a target attribute is the one used.
- ➤ "Visiting source class <name>." the specified source class is to be checked.
- ➤ "Found rule from source class <source> to <target>." about to check the specified attribute copy rule.
- ➤ "Rule matches for flattening." The can be applied over the target class (the rule target class is the 'current' target class or a parent of that class).
- ➤ "Going over source rules with targets: <targets>." about to start investigating the rule with the given target attributes.
- ➤ "Rule to <target> is not mapped attribute exists in concrete source class and concrete target class." The rule is not used since the attribute exists in the source concrete class and the target concrete class (it should be copied as-is).

- ➤ "Rule to <target> is not mapped." The specified target attribute still doesn't have any value generator rule.
- ➤ "Rule is not in ignore list adding to target attribute rules." the specified rule will be used to generate values for the target attribute.
- ➤ "Attribute did not pass validation." attribute rule did not pass validation. See previous section about possible validation messages and causes.
- ➤ "Rule is in ignore list not added." attribute was marked as "do not copy", so it can't be used.
- ➤ "Going over ignore list: <attributes>." If an attribute was removed, it will appear in this list. Attributes from this list should not be copied to the target attribute. Since the investigation is done bottom-up, this list is created and added to on each CIT level.
- ➤ "Adding ignored attribute <name>." found an attribute in the "do not copy" list. Adding it to the current ignore list so that this attribute would not be copied if seen in the parent CIT.
- ➤ "Going over copy conditions." Copies the copy conditions (whether the DI should be copied at all). This is also copied from the parent class (bottom-most rule wins)
- ➤ "Copy condition is for attribute name < name>." found a copy condition that depends on the specified attribute.
- ➤ "Adding copy condition for attribute name <name> with values <values>." the attribute was not yet constrained by any other copy condition. Now it's constrained by the 'current' copy condition.

Abstract classes elimination stage

Abstract CITs do not have DIs (or tables under the new DB model). Rules that have been created for these CITs (flattening process, errors, mismatch between user 8.0x class model and expected) will now be deleted:

- ➤ "Remove abstract classes stage" stage starts.
- ➤ "Removing rule from <source name> to <target name> <source/target> is abstract in new class model." this copy rule is removed because either the source CIT or target CIT are marked as abstract.

Trivial rules stage

If an attribute with the same name exists in the source CIT and the attribute name is not part of "attributes not to copy" collection a default rule will be added for it.

- ➤ "Found rule from <source class> to <target class>" processing the specified rule.
- ➤ "Adding CMDB_ID rule." all CITs should have a rule to copy the CMDB ID column.
- ➤ "Target class <class name> is a link. Adding <end1> and <end2> rules." all link classes should have two rules to copy the end1 column and end2 column.
- ➤ "Checking attribute <name>." processing the specified attribute
- ➤ "Attribute <name> has qualifier STATIC_ATTRIBUTE, skipping." the attribute is static, so it should not be copied.
- ➤ "Attribute <name> is CmdbSimpleList, skipping." multi values attributes are handled in a different upgrade step, so no rule is needed
- ➤ "Attribute <name> appears in root, skipping." attribute appears in "root" class and it's not duplicated to the leaves tables, so no rule is needed.
- ➤ "Attribute is not mapped, nor in "do not copy" list." attribute should be copied using a default rule.
- ➤ "Found source attribute with the same name creating default copy rule."

 an attribute with the same name was found in the source class model, so it's going to be the source for the default rule.
- ➤ "No source attribute, checking default value.", "Found non empty default value creating default constant copy rule. Default value: <value>."
 There is no source attribute with the same name, so the default value (if exists) will be used as a source for the default rule. If the second message does not appear, then no rule will be used and the attribute value will remain empty.
- ➤ "completing and adding.", "Attribute was not properly completed.", "Attribute did not pass validation." These messages have the same meaning as in the initial stage.

Prepare SQL Scripts for Data Upgrade

Functionality

Analyzes the /runtime/data-upgrade-actions.xml, generates the actual SQL statements that should be executed in the database to upgrade the data and saves it to disk under /runtime/data-upgrade-script.sql.

Is critical

Yes

Can be re-run

Yes

Implication of Failure

Failure in this step means that the upgrade could not convert the actions (from the xml) to the SQL statements needed to transform the data model from the previous version class model to the target class model. Configuration and data upgrade cannot continue without this step being completed.

Possible fixes for errors: Remove the offending action (entire class or just the attribute) from the data upgrade actions XML. This would result in a possible data loss (that class / attribute would not be copied) but would enable the upgrade to continue.

Relevant Log information

➤ "Could not create cast for <source class> > <target class>, on <source> > <target attribute>." – the SQL generator did not find the correct way to transform the type of the source (attribute or constant) to the type of the target attribute. Possible causes are unsupported type casts (not all possible type conversions are supported) or a bad analysis (error / bad definitions / unexpected user class model changes). The effect is that this attribute values would not be cast. During the actual SQL invocation this might fail the statement. This error should not stop the upgrade process.

- ➤ "Could not create copy condition for <source class> > <target class>." –
 The SQL generator could not understand conditional copy clause.
 Possible causes are unsupported conditions (not all possible conditions are supported) or a bad analysis (error / bad definitions / unexpected user class model changes). The effect is that this copy condition will not take place and all CIs of the source CIT type would be copied. This error should not stop the upgrade process.
- ➤ "Default value exceeding 4000 characters is ignored. Table: . Column: <column>" The default value set for this column is too large to fit into the SQL statement. Possible cause is a too big default value in the user class model. The effect is as if no default value exists for this column. This error should not stop the upgrade process.

Discovery – Upgrade Errors Table

Functionality

Upgrades discovery errors data (stored in CCM_DISCOVERY_ERRORS table in the CMDB) - replaces error messages by error codes with parameters (discovery runtime information).

Is critical

No

Can be re-run

Yes

Implication of Failure

Information regarding discovery errors will be lost. Skipping this step will require you to truncate the **CCM_DISCOVERY_ ERRORS** table in the CMDB and re-activate all discovery jobs after the server is back up.

Relevant Log Information

- ➤ "Starting upgrade 'CCM_DISCOVERY_ERRORS' table"
- ➤ "Upgrade 'CCM_DISCOVERY_ERRORS' table was successfully finished!"
- ➤ "Failed to upgrade 'CCM_DISCOVERY_ERRORS' table"

Discovery - Create New Destination IPs Table

Functionality

Creates a new table in the CMDB named **CCM_DISCOVERY_DEST_IPS**. The new table holds the IPs of each one of the destinations. The information is extracted from the **CCM_DISCOVERY_DESTS** table (discovery runtime information).

Is critical

No

Can be re-run

Yes

Implication of Failure

Information regarding discovery destinations will be lost. Skipping this step requires you to truncate the CCM_DISCOVERY_DEST_IPS table in the CMDB and re-activate all discovery jobs after the server is back up.

Relevant Log Information

- ➤ "Starting upgrade 'CCM_DISCOVERY_DEST_IPS' table"
- ➤ "Upgrade 'CCM_DISCOVERY_DEST_IPS' table was successfully finished!"
- ➤ "Failed to upgrade 'CCM_DISCOVERY_DEST_IPS' table"

Discovery – Upgrade Destinations Table

Functionality

Renames CI types in **CCM_DISCOVERY_DESTS** table in the CMDB (discovery runtime information).

Is critical

No

Can be re-run

Yes

Implication of Failure

Information regarding discovery destinations will be lost. Skipping this step would require the user to truncate the **CCM_DISCOVERY_DESTS** table in the CMDB and re-activating all discovery jobs after the Server is up.

Relevant Log Information

- ➤ "Starting upgrade 'CCM_DISCOVERY_DESTS' table"
- ➤ "Upgrade 'CCM_DISCOVERY_DESTS' table was successfully finished!"
- ➤ "Failed to upgrade 'CCM_DISCOVERY_DESTS' table"
- ➤ "Ci type [old CI type] has been upgraded to [new CI type]" indicates that the class [old CI type] was renamed to [new CI type].
- ➤ "failed to update [old CI type], skipped" indicates that a CI type could not be changed according to new schema. It might due to data inconsistency in CMDB or wrong CI type defined by the user. Does not affect the discovery functionality, but can affect the display of destination in UI.

Modify Data Modeling in DB

Functionality

Modify CMDB structure to the new 9.01 structure.

Is critical

Yes

Can be re-run

No

Implication of Failure

Failure means that the DB schemas are not in a correct format for the new UCMDB. The upgrade process cannot continue without this step. To try and run this step again, restore the CMDB and History schemas from backup, delete the \runtime folder and run the upgrade tool from the beginning.

Relevant Log information

None

Copy E-mail Recipient Information

Functionality

Copies e-mail recipient information from the **EmailRecipient** data table to the **EN_UI_RECIPIENTS** management table in the CMDB. (In UCMDB 8.x the recipient data was modeled as a CI). **EmailRecipient** is later removed as part of the data upgrade.

Is Critical

No

Can be re-run

Yes, if class model upgrade hasn't run yet.

Implication of Failure

Scheduled reports are not sent. Users must add recipients through the Recipients Manager or through the upgraded scheduled jobs themselves.

Relevant Log information

- ➤ Get an indication of the existing number of recipients: "Number of EmailRecipients in the CMDB is x"
- ➤ If the upgrade fails: "Failed to handle Recipient"
- ➤ If it succeeds: "RecipientUpgrader is complete"

Copy Report's Scheduling Information

Functionality

Copies scheduled reports configuration from Foundation database to new management table in the CMDB.

Is Critical

No

Can be re-run

Yes

Implication of Failure

Your scheduled reports will not be upgraded and you will need to redefine them.

Relevant Log information

- ➤ For success: "Upgrade of scheduled report finished successfully"
- ➤ For overall failure: "failed to upgrade scheduled reports"
- ➤ For failure on specific job: "failed to upgrade scheduled report of job name <job name>"

Copy Resources to Disk

Functionality

Extract queries, views, reports, enrichments, and correlations from the database and store them to disk. The Resources are stored under a /runtime/1/<resource type>/<sub folder>/. Resource type can be one of the following:

- ➤ bacviews old resource type, does not exist in 9.0.
- ➤ bundles used to define a resource group. Allows many to many relationship.
- ➤ cmdbview new view definition, undergo class model upgrade only.
- ➤ Correlations correlation rules, undergo class model upgrade only.
- ➤ Enrichments enrichment rules, undergo class model upgrade only.
- ➤ goldmaster gold master report definition, undergo class model upgrade only.
- ➤ Patterns queries (TQLs), undergo both structure and class model upgrade.
- ➤ reports topology reports, undergo structure upgrade to become cmdbview and after that class model upgrade.

- ➤ singlepatternref perspective based query, undergo class model upgrade only.
- ➤ viewrefs perspective based view, undergo class model upgrade only.
- views old view definitions, undergo structure upgrade to become cmdbview.

Sub folder can be one of the following:

- ➤ db original resources.
- ➤ structure resources after structure upgrade.
- ➤ classmodel resources after class model upgrade.

Resources are upgraded in two phases:

- ➤ **Structure upgrade** upgrades the resources from old to new format. This step is performed for patterns, views and topology reports. Upgraded resources are put under the **structure** directory, with the exception of views and reports, which are both upgraded to the **cmdbview/structure** folder. Resources without a structure upgrade are copied from the **db** to the **structure** sub folder.
- ➤ Class model upgrade upgrades the resources according to class model transformations. This affects all resources. Upgraded resources are put into the classmodel sub folder.

In addition to the resources, some additional data is copied: **bundles** (resource grouping) and **bacviews** (handles to views). These are maintained as unchanged during the upgrade.

Is Critical

Yes

Can be re-run

Yes

Implication of Failure

Resources cannot be upgraded, since none exist on the disk for upgrade. Do not try to continue without completing this step.

Relevant Log information

Retrieve resources from DB messages:

- ➤ "got <number> < resource-type> from database": Specify how many resources were retrieved from the DB for each type of resource. This message is followed by the list of resource names.
- ➤ "did not succeed to read <resource-type> from database ": Consult the exception that comes with the message for problem description.
- ➤ "did not success to write <resource-type> to disk!": Check the accompanying exception for reason. Verify write permissions exist and enough disk space.
- ➤ "Could not write resource <name>": Check the accompanying exception for reason. Verify write permissions exist and enough disk space.
- ➤ "did not success to write resource bundles to disk!" : Check the accompanying exception for reason. Verify write permissions exist and enough disk space.

Remove resources from DB messages:

- ➤ "did not success to remove all <resource-type> from database ": Consult the exception that comes with the message for problem description.
- ➤ "did not success to remove from database all <resource-type> additional data for <resource-type>": Consult the exception that comes with the message for problem description.

Rename Original Data Tables

Functionality

Rename your old data tables, adding the TEMP_ prefix to the names of all CDM tables.

Is Critical

Yes

Can be re-run

No

Implication of Failure

The upgrade process should be run again from the beginning after fixing the problem. Restore the DB schemas, delete the "runtime" folder, and start the upgrade from the beginning.

Relevant Log information

None

Upgrade Class Model in DB

Functionality

Truncate class model tables in the CMDB, removing old class model definitions, uses the /runtime/upgraded-class-model.xml to populate the class model tables with the upgraded class model data and creates the new data tables (CDM tables) in their upgraded structure.

Is Critical

Yes

Can be re-run

Yes

Implication of Failure

Failure implies that the new class model was not loaded into the DB. The upgrade cannot continue without the new class model.

Relevant Log information

None

Upgrade Resources on Disk

Functionality

Reads original queries, views, reports, enrichments and correlations from disk, upgrade and store them upgraded on disk. It is important to know that resources using classes which are being removed during the upgrade are not being upgraded and won't be loaded to the upgraded UCMDB. Similarly, queries using attributes which are being removed during the upgrade, as a property condition, will also be removed. Aside from the class model transformations applied over these resources, the following changes are being made:

- ➤ Views are redefined to match the new view definition.
- ➤ Topology reports are redefined as views. UCMDB 9.0 introduces the new concept which considers reports and views as different visualization of the same data.
- ➤ Queries are being saved in a new, more human readable, XML format.

Is Critical

Yes

Can be re-run

Yes

Implication of Failure

Failure in the entire step will result in failure of the entire upgrade. In this case, after performing the necessary fixes, it is possible to re-run the upgrade from this step.

Failure to upgrade individual resource can be handled by running this step again or after the upgrade has finished. The failed resources should be updated manually in order to fix the problem that caused them to fail in upgrade.

General Log Messages

➤ "Removing all the following resources: [list-of-resources-names>] of type <name> due to filter_resources.xml configuration file": The configuration file filter_resources.xml contains all the names and types of old resources from UCMDB 8.0x that does not exist in UCMDB 9.0. All those resources will be removed in the upgrade process. This log message specifies all those resources.

Pattern Upgrade

- ➤ "About to upgrade pattern structure for the following patterns (<number-of-patterns>) list-of-pattern-names>.": List the pattern names that are about to be upgraded.
- ➤ "About to check if pattern <name> should be removed.": Notifies before checking if needs to upgrade this pattern or not. If the pattern will be removed, the next message will inform of such an action.
- ➤ "Pattern <name> should be removed has template instance group id.": All patterns within the group template instance are removed in the upgrade.
- ➤ "About to remove unneeded pattern <name>.": Pattern that are not upgraded, like pattern <name>, can be located under the path "\runtime\upgrade\<customer-id>\patterns\ unupgradeable\<patternname>.xml". The pattern is not upgraded and therefore would not exist in the post-upgrade resources.
- ➤ "About to check if pattern <name> should be upgraded.": Notifies before checking if this pattern will be upgraded. The messages to follow specify the reasons for upgrading a pattern.
- ➤ "Pattern <name> _should_ be upgraded, about to upgrade.": Going to upgrade the pattern. The following messages will specify the parts of the pattern that were upgraded.
- ➤ "About to write patterns to disk after structure upgrade (<number-of-patterns>):{list-of-pattern-names>}.": These patterns can be found under "\runtime\upgrade\<customer-id>\patterns\structure"
- ➤ "About to upgrade pattern <name>": Starting the class model upgrade in the pattern.

- ➤ "Pattern <name> was upgraded.": The pattern was upgraded and is located under "\runtime\upgrade\<customer-id>\patterns\classmodel".
- ➤ "Pattern <name> did not need upgrade.": All the class model entities in the pattern are already compatible with 9.0. The pattern can be found under "\runtime\upgrade\<customer-id>\patterns\classmodel".
- ➤ "Pattern <name> is not valid after upgrade.": The pattern was removed and was not upgraded. It is probably because at least one class model entity does not exist in the class model anymore.
- ➤ "Could not upgrade pattern <name>": Check the following exception for problem description.

Single Pattern Reference

➤ "About to upgrade single pattern reference <name>": The result resources can be located under "\runtime\upgrade\<customerid>\singlepatternref\classmodel"

Enrichment Upgrade

- ➤ "About to upgrade enrichment <name>": Enrichment does not need structure upgrade, so we start directly with the class model upgrade.
- ➤ "Couldn't obtain pattern <name> for enrichment definition<name> ": Pattern does not exist for the current enrichment.
- ➤ "Enrichment <name> was upgraded.": The enrichment was upgraded and is located under "\runtime\upgrade\<customerid>\enrichments\classmodel".
- ➤ "Enrichment <name> did not need upgrade.": All the class model entities in the enrichment are already compatible with 9.0. The enrichment can be found under "\runtime\upgrade\<customer-id>\ enrichments \classmodel".
- ➤ "Enrichment <name> is not valid after upgrade.": The enrichment was removed and was not upgraded. It is probably because at least one class model entity does not exist in the class model anymore.

Correlation Upgrade

- ➤ "About to upgrade correlation <name>": Correlation does not need structure upgrade, so we start directly with the class model upgrade.
- ➤ Correlation <name> was upgraded.": The correlation was upgraded and can be found under "\runtime\upgrade\<customerid>\correlations\classmodel".

Gold Master Report Upgrade

- ➤ "About to upgrade gold master definitions for class model changes.": Gold master does not need structure upgrade, so we start directly with the class model upgrade.
- ➤ "Got <number> gold master definitions.": Number of gold masters in the system.
- ➤ "Gold master report <name> was upgraded for class model changes." The report was upgraded and is located under "\runtime\upgrade\<customerid>\goldmaster\classmodel".
- ➤ "Gold master report <name> was not changed." .": All the class model entities in the report are already compatible with 9.0. The report can be found under "\runtime\upgrade\<customer-id>\ goldmaster\classmodel".

View Upgrade

- ➤ "About to upgrade view <name> structure."
- ➤ "Could not upgrade template view [bac view name: [<name>], mam name: [<name>]] <reason>": A common reason is "Pattern by name [<name>] not found". This can happen after the pattern is removed in the pattern upgrade stage. The list of removed patterns is in the log message "Removing all the following resources: [list-of-resources-names>] of type <name> due to filter_resources.xml configuration file".
- ➤ "View <name> structure was upgraded by a previous depending view.": View was previously upgraded. No need to upgrade again.

- ➤ "View <name> structure was upgraded.": The view can be found under "\runtime\upgrade\<customer-id>\cmdbview\classmodel" or "\runtime\upgrade\<customer-id>\bacviews\classmodel", according to the view type.
- ➤ "Could not upgrade view <name>": The accompanying exception can elaborate on the reason for the failure. The view would not be upgraded and will be in one of the folders "\runtime\upgrade\<customerid>\cmdbview\unupgradeable" or "\runtime\upgrade\<customerid>\bacviews\unupgradeable", according to the view type.
- ➤ "About to upgrade view <name>": Start to upgrade the class model entities in the view.
- ➤ "Class model transformation for view <name> finished.": The view can be found under "\runtime\upgrade\<customer-id>\cmdbview\classmodel".
- ➤ "Could not upgrade view <name>".": The views can be found under "\runtime\upgrade\<customer-id>\ cmdbview \ unupgradeable".
- ➤ "About to copy unchanged BacViews.": The views can be found under "\runtime\upgrade\<customer-id>\bacviews\classmodel".

Report Upgrade

- ➤ "About to upgrade report <name> structure."
- ➤ "Upgrading report <name> with tql name <name>."
- ➤ "Report pattern <name> for report <name> was not found.": Upgraded pattern was not found on the disk for the current report. If the pattern was not moved to version 9.0 (after upgrade or as is) it will be under "\runtime\upgrade\<customer-id>\patterns\ unupgradeable\", and this message will be produced. The report can be found under "\runtime\upgrade\<customer-id>\reports\structure".
- ➤ "Report <name> was upgraded to view <name>.": Finished upgrading report. The report can be found under "\runtime\upgrade\<customerid>\cmdbview\structure". The class model upgrade will be done by the view upgrade.
- ➤ "Could not upgrade report structure <name>": Search the reason for the failure in the exception. The report can be found under "\runtime\upgrade\<customer-id>\reports\ unupgradeable\".

Upgrade Data

Functionality

Executes SQL statements from /runtime/data-upgrade-script.sql, it reads data from the old data tables, the TEMP tables, performs the required transformation and populates the new data tables (CDM tables) with the upgraded data.

Note: This step doubles the space consumed by the CMDB. After the upgrade finishes, this space is released.

Is Critical

Yes

Can be re-run

No

Implication of Failure

Data in DB is not upgraded.

Relevant Log information

None.

Create Temporary Removed Cls Table

Functionality

Creates new temporary table in the CDMB database named **UPGRADE_REMOVED_ELEMENTS** to hold the IDs and types of all objects removed during the upgrade (were not copied from old to new data tables) to be used by subsequent steps.

Is Critical

Yes

Can be re-run

Yes

Implication of Failure

Failure means that the "Upgrade List Attribute Table" and "Handle non-Consistent Data" steps cannot be executed.

Relevant Log information

None.

Populate Root Table

Functionality

Copies upgraded relevant attribute values from leaf data tables to the root table (CDM ROOT).

Is Critical

Yes

Can be re-run

No

Implication of Failure

The root table would not be populated and all CIs would not exist in the UCMDB. Failure is equivalent for deleting all the data from the UCMBD. To recover, start the upgrade procedure from the beginning.

Relevant Log information

None.

Upgrade List Attribute Table

Functionality

Upgrade attributes of type list which are stored in a separate table.

Is Critical
Yes
Can be re-run
No
Implication of Failure
All attributes of type list will have wrong values.
Relevant Log information
None.
Delete Legacy Configuration Tables
Functionality
Removes tables no longer needed in CMDB.
Is Critical
No
Can be re-run
Yes
Implication of Failure
The tables that are meant to be deleted will stay in the CMDB schema, but would not disrupt the normal behavior of the UCMDB. It is possible to manually remove these tables.
Relevant Log information
None.
Upgrade History DB
Functionality

Upgrade history database. History database may hold huge amount of data, during this step we keep reference to the last upgraded data so in case of failure the upgrade will continue from the point it was stopped.

Is Critical

Yes

Can be re-run

Yes

Implication of Failure

This step can be re-run multiple times and can recover from failure using designated recovery files, located under **runtime/upgrade** folder. Each file contains the status of a sub step; together it holds the status of the entire history upgrade. File names are:

- ➤ recovery_for_history_cleanup.txt
- > recovery for history class remove upgrader.txt
- ➤ recovery_for_history_attribute_remove_upgrader.txt
- ➤ recovery_for_history_attribute_rename_upgrader.txt
- ➤ recovery_for_history_class_rename_upgrader.txt
- ➤ recovery_for_history_snapshot_upgrader.txt

Skipping this step result in a loss of historical data and requires creating a new history schema via the configuration wizard.

Relevant Log Information

General Log Messages

Failure produces the following message:

- ➤ "History DB upgrader failed, but is not failing upgrade process..." and the progress reports produce one of the following messages:
- ➤ "INFO <step name> is upgrading chunk <current chunk number> out of <total number of chunks>"

- ➤ "No upgrade is needed. Upgrade was finished in the previous upgrade": This is not the first time the History DB was run. In the previous time, the upgrade finished successfully.
- ➤ "<step-name> is upgrading chunk <number> out of <number>": Specify the progress for each step of the upgrade.
- ➤ "Executing SQL statement on attributes between event id <number> and <number>. Statement: <SQL-statement>": Perform update or remove attributes of specific type (specified in the SQL-statement).
- ➤ "old Class <name> has history attributes of types tof-names>": For each class that needs to be removed /updated, list all the attribute types that needs handling.
- ➤ "Create auxiliary tables for History DB upgrade": This is a pre-upgrade step for collecting relevant data.
- ➤ "The history DB has <number> events": Information message with number of history events currently held in the history database.
- ➤ "The Chunk between rows <number> and <number>, translate to events IDs between <number> and <number>": Each chunk works on a range of rows in the History DB, which is translated to a SQL statement for a range of history events IDs.
- ➤ "Collect non-history data from the history DB": We perform cleaning operations on the History DB to clean it from non-existing or non-history class model elements. This step collects the relevant data, to be handled later on.
- ➤ "Recover cleanup data from file <name>": The upgrade was run before. Relevant data for cleaning the schema was collected before and available in the file.
- ➤ "Collect data from table for type <name>": Cleaning data is collected separately for each attribute type.
- ➤ "Class <name>, attribute <name> is monitored in history DB": list all the attributes for each class in the class model that has entry in the History DB.
- ➤ "Summary of all collect data from History DB": The following log messages will contains the collected data grouped by class name.

- ➤ "Class <name>, attributes [list-of-names>] are monitored in history DB": Lists again all attributes for all classes that has entries in the History DB, grouped by class name.
- ➤ "Cleanup problems found in the history DB:": The following log messages specify all the data that needs to be removed from the History DB, because its inconsistent with the class model.
- ➤ "Class <name> exists in history DB but not in class model. The class will be removed from the history DB."
- ➤ "Link Class <name> is not marked as monitored for change. The class will be removed from the history DB. (Link classes must have the qualifier TRACK_LINK_CHANGES to be monitored)"
- ➤ "Attribute <name> in Class <name> exists in history DB but not in class model. The attribute will be removed from the history DB."
- ➤ "Attribute <name> in Class <name> exists in history DB but not marked as monitored for change. The attribute will be removed from the history DB "
- ➤ "Class <name> has no attributes marked as monitored for change. The class will be removed from the history DB."
- ➤ "Get colliding rules": In case of attribute merge that needs to be done as part of the changes in the class model, we need to identify those attributes, and handle them.
- ➤ "Skipped Attribute name: <name> Class name: <name> was not found in old ClassModel": non-meaningful log message
- ➤ "Classes list-of-names> have history qualifiers": Those classes has attribute that can potentially be merged. The next stage will verify it.
- ➤ "Classes t-of-names> has renamed attributes with CopyAttributeFromAttribute": Those classes has attributes that were the data source for the data of the merged attributes.
- ➤ "Add remove data to configuration for merge rules":
 - ➤ "Attribute <name> in Class <name> has colliding renaming rules": This attribute has at least two attribute in the old class model that are mapped to it.

- ➤ "Attribute <name> in Class <name> will receive its value from <oldattribute-name>": Determine the data source of the attribute.
- ➤ "Attribute <name> in Class <name> has more than one rename (including alias) without copyAttributeFromAttribute rule": All merged attributes are not defined as the data source for the new attribute. Select one old attribute arbitrarily as the data source.
- ➤ "In class <name> the following attributes will be removed because of merging: clist-of-old-attribute-names>": Summary of all attribute per class to be removed as a result of the merging.
- ➤ "Removes history events that contain removed class model classes": This step finds all classes that need to be removed from the History DB.
- ➤ "Class remove rule: oldClassName (object) = <name>"
- ➤ "Class remove rule: oldClassName (link) = <name>"
- ➤ "Class remove rule: oldClassName (cleanup) = <name>": The rule was created in the cleaning stage.
- ➤ "Executing SQL statement for remove class between event id <number> and <number>. Statement: < SQL-statement>": Perform remove classes in the current chunk
- ➤ "Removes history events that contain removed class model attributes": This step finds all attributes that need to be removed from the History DB.
- ➤ "Attribute remove rule: oldClassName = <name>, oldAttributeName <name>, attribute type = <name>"
- ➤ "Attribute remove rule (cleanup): oldClassName = <name>, oldAttributeName <name>, attribute type = <name>": The rule was created in the cleaning stage.
- ➤ "Upgrades records that contain renamed class model attributes": This step finds all attributes that need to be renamed in the History DB.
- ➤ "Attribute rename rule: oldClassName = <name>, oldAttributeName <name>, new attribute name = " <name>, attribute type = <name>"

"Upgrades records that contain renamed class model classes": This step finds all classes that need to be renamed in the History DB.

"Class rename rule: oldClassName (object) = <name> new class name = <name>"

"Class rename rule: oldClassName (object) = <name> new class name = <name>"

"Executing SQL statement for rename class between event id <number> and <number>. Statement: <SQL-statement>"

"Upgrades records that contain snapshot result": This step finds all snapshots that need to be upgraded in the History DB.

"Executing SQL statement on snapshots between event id <number> and "ExecuteBatch for snapshot is done in seconds"

Handle non Consistent Data

Functionality

Perform the following:

- Remove links whose one of their end objects was removed during the upgrade.
- Perform recursive delete if necessary.
- Recalculate value for attribute defined as calculated-attribute for all objects and links.

Is Critical

No

Can be re-run

Yes

Implication of Failure

The data will be inconsistent, which can affect values of attributes that are calculated. Running the Database Consistency Tool after the upgrade is finished removes links only if one of their end objects is missing.

Relevant Log Information

In the upgrade short log the following information can be found:

- ➤ The number of removed objects and links during the upgrade "Found x objects/links that were removed during upgrade".
- ➤ The number of dangling links that are being removed "Found x dangling links".
- ➤ The number of objects that are being removed due to recursive-delete "Found x recursive-delete objects".
- ➤ Row for each type of object/link for attribute-recalculation is being performed "Updating calculated attributes for type CLASS_NAME (x instances, y bulks)".

Recalculate Non-Random Generated IDs

Functionality

Recalculates IDs for all objects for which the IDs are not random but rather being calculated as a function of their type and key properties.

Is Critical

Yes

Can be re-run

Yes

Relevant Log information

None

Populate Global ID

Functionality

Standalone UCMDB functions as a CMS and requires for each CI to have a global ID, this step populates the global ID column in root data table.

Is Critical

No

Can be re-run

Yes

Implication of Failure

Might cause the CIs not to have a global id. This can be significant problem when using integrations or complex deployments of UCMDB.

Workaround - the "Multiple CMDB Instances Services" can be used after the upgrade to fix this issue:

- ➤ If a global id generator server is needed, you'll need to make it a non global id and then make it a global id generator.
- ➤ If a non global id generator server is needed, you'll need to make it a global id generator and then make it a non global id generator.

Relevant Log information

None.

Discovery – Upgrade Configuration

Functionality

Re calculates IDs for discovery configuration CIs.

Is Critical

Yes

Can be re-run

No

Implication of Failure

Discovery might not function at all. Skipping this step will require you to perform the following:

Disable the Three Upgraders

- **1** Export user packages from old CMDB.
- **2** Upgrade all packages manually via the packages upgrade tool.
- **3** Before the upgrade process, remove the following instances of discovery configuration CIs from CMDB:
- ➤ 'domain'.
- ➤ 'discoveryjob'.
- ➤ 'discoverymodule'.
- ➤ 'cmdbclass'.
- ➤ 'discoverypattern'.
- ➤ 'discoverywizard'.
- ➤ 'discoveryprobegateway'.
- ➤ 'discoveryprobemanager'.
- ➤ 'discoveryresource'.
- ➤ 'discoverytql'.
- ➤ 'triggers'.
- ➤ 'management'.
- **4** After the upgrade process, import the upgraded packages.

Relevant Log Information

- ➤ "Starting upgrade Discovery Configuration CIs"
- ➤ "Upgrade Discovery Configuration CIs was successfully finished!"
- ➤ "Failed to upgrade some Discovery Configuration CIs"
- ➤ "About to get discovery configuration CIs and links from server."
- ➤ "Finish getting discovery configuration CIs and links from server." load instances of discovery configuration CIs from CMDB
- ➤ "About to remove old Discovery Configuration CIs."

- ➤ "Finish removing old Discovery Configuration CIs." remove old CIs from CMDB. CIs now exist in the cache only. Failure in this step might cause data loss.
- ➤ "About to update discovery configuration CIs."
- ➤ "Finish updating [amount of CIs] discovery configuration CIs." update the CIs and save in CMDB.
- ➤ "Failed to add CI [new CI id, CI type], (old CI [old CI id]) skipped." A specific CI failed to be updated in schema. For more details check error log.
- ➤ "About to update links related to discovery configuration CIs."
- ➤ "Finish updating links related to discovery configuration CIs." recreating links between CIs. Failure in this step might cause data to be inconsistent.

Federation - Remove old Configuration

Functionality

Removes old federation configuration data (new configuration is being deployed).

Is Critical

Yes

Can be re-run

Yes

Implication of Failure

Might cause the federation/replication not to work.

Workaround – the **Model Services** > **deleteByClassType** JMX can be used to remove all instances of **fcmdb_configuration** CIT.

Relevant Log information

Log messages can be found in the log file **cmdb.model.audit.short.log** and **cmdb.model.audit.detailed.appender**.

Redeploy Basic Packages

Functionality

Deploys the CMDB factory packages. Class model updates in this step are restricted to additions only in order for the factory packages not to remove user-added attributes.

Is Critical

No

Can be re-run

Yes

Implication of Failure

In case of failure, it is possible to redeploy these packages from the UCMDB itself. However, any addition made by the user to these classes could possibly be lost in the redeploy.

Relevant Log information

Log information can be found in the log file mam.packaging.log.

Validate Upgraded Class Model

Functionality

Validates that upgraded class model is BDM- and CMS-compliant by comparing it with an out class 9.01 class model. Missing class model entities are being added.

The class model existing in the database before this step (upgraded + packages) is written to \runtime\upgraded-after-packages-class-model.xml. The updated class model is written to \runtime\upgraded-fixed-after-packages-class-model.xml.

If the class model is changed during this step, it is updated back to the database.

Is Critical

No

Can be re-run

Yes

Implication of Failure

Failure in this stage does not fail the entire upgrade process. However, it should be taken seriously, since the failure means that the user class model is incomplete and not CMS and Business Service Management compliant.

Relevant Log information

See relevant Log information for the "Validate Class Model" on page 156 step.

Discovery – Upgrade Statistics

Functionality

Renames CI types in the **CCM_DISCOVERY_STATS** table in the CMDB (discovery history information).

Is Critical

No

Can be re-run

Yes

Implication of Failure

Statistic information of previous discovery executions will be lost. Skipping this step would require the user to truncate CCM_DISCOVERY_STATS table in the CMDB.

Relevant Log Information

- ➤ "Starting upgrade CCM_DISCOVERY_STATS table"
- ➤ "Upgrade 'CCM_DISCOVERY_STATS' table was successfully finished!"
- ➤ "Failed to upgrade 'CCM_DISCOVERY_STATS' table"

- ➤ "Ci type [old CI type] has been upgraded to [new CI type]" indicates that and old CI type has been renamed to new CI type.
- ➤ "failed to update [Old CI type], skipped" indicates that a CI type could not be changed according to new schema. It might be caused due to data inconsistency in the CMDB or that the wrong CI type was defined by the user. Does not affect the discovery, however the row in the statistics panel relating to this CI will appear in red.

Discovery – Upgrade Resources

Functionality

Upgrades discovery resources – patterns, jobs, and modules (discovery configuration data).

Is Critical

Yes

Can be re-run

Yes

Implication of Failure

Same as the step for "Discovery – Upgrade Configuration" on page 197.

Relevant Log Information

- ➤ "Starting upgrade discovery resources"
- ➤ "Upgrade discovery resources have been successfully finished!"
- ➤ "Upgrade discovery resources have been finished. Failed to upgrade the following resources:
 - ➤ [resource name1]
 - ➤ [resource name2]
 - **>** ...
- ➤ "File containing resources to filter, "upgrade/filtered_resources.xml", not found" cannot find file which holds the list of resources to remove during the upgrade, no resources would be removed.

- ➤ "Resource [resource name] of type [subsystem] was successfully updated" indicates that the resource was successfully upgraded.
- ➤ "Failed to upgrade res [resource name] of type [subsystem] The resource might be already compatible with new schema. Please check resource manually." Resource was not upgraded. Please check resource manually after CMDB starts. On most cases such errors will come after another log message with more details.

Load Upgraded Resources

Functionality

Loads the upgraded resources created in the previous step "Discovery – Upgrade Resources" on page 202 from the disk to the database.

Note: Upgraded resources from the factory packages take precedence over user resources. This means that if the same resource (name and type) exists in both the factory packages and the upgraded resources folder, the final version is the one from the factory packages.

Is Critical

Yes

Can be re-run

Yes

Implication of Failure

The upgraded resources will not be loaded in to the database. The factory resources are already in the database, as a result of the step "Redeploy Basic Packages" on page 200. Only the user resources will be missing from the database.

Relevant Log information

- ➤ "got <count> <type> from disk": Specifies the number of resources for each type retrieved from the disk. The message is followed by list of those resources.
- ➤ "Could not get resources map all resources will be deployed from disk":

 The factory packages that has been deployed to the DB, cannot be retrieved. The factory resources cannot take precedence over the user resources, so all the user resources will be loaded into the DB, and will run over the factory resources with the same name and type.
- ➤ "did not success to add business view enrichment <name>": Look for the problem description in the attached exception.
- ➤ "did not success to add gold master definition <name>": Look for the problem description in the attached exception.
- ➤ "Resource <name> does not exist in CMDB and should be added": The resource is a user resource and will be loaded into the DB.
- ➤ "Resource <name> could not be loaded because of missing dependencies: dist-of-names>.": The resource cannot be loaded into the DB since other resources that it needs does not exists in the DB. After the upgrade is finished, it is possible to re-run this step to load these resources.
- ➤ "Upgraded resource <name> and out-of-the-box resource are the same, not loading upgraded resource.": The factory resource was not changed by the user.
- ➤ "Upgraded resource <name> is not loaded since a different out-of-the-box resource with the same type and name already exists.": The user changed the factory resource, and going to lose the changes he/she made.
- ➤ "Failed to add <type> <name>": The resource of the specific type was not loaded.

Upgrade Snapshots

Functionality

Upgrade snapshot data is stored in the CMDB.

Is Critical

No

Can be re-run

Yes

Relevant Log information

None.

Discovery – Re-Encrypt Domain Scope Document

Functionality

Re-encrypts the Domain Scope Document from DES encryption (used in 8.0x) to AES encryption.

Is Critical

No

Can be re-run

Yes

Implication of Failure

Discovery might not function at all. Skipping this step will require that you do the following:

- **1** Export the Domain Scope Document from the old CMDB.
- **2** After the upgrade process, import the Domain Scope Document. For details, see "Export and Import the domainScopeDocument (DSD) File in Encrypted Format" on page 285.

Relevant Log Information

- ➤ "Upgrade process of DomainScopeDocument re-encryption to AES had been started"
- ➤ "Upgrade process of DomainScopeDocument re-encryption to AES had been finished successfully"
- ➤ "Upgrade process of DomainScopeDocument re-encryption to AES had been failed"

- ➤ "DSD is empty doing nothing..". indicates that Domain Scope Document is empty and therefore this step is redundant and won't do anything.
- ➤ "The DSD already encrypted by AES doing nothing..." Indicates that Domain Scope document is already encrypted by AES step is redundant and won't do anything.
- ➤ "The DSD is encrypted by 3DES..." indicates that Domain Scope Document is encrypted by 3DES – therefore it will be re-encrypted by AES.
- ➤ "Failed to decrypt DSD by 3DES" indicates that the encryption process of Domain Scope Document failed this step failed to re-encrypt Domain Scope Document by AES need to import Domain Scope Document to the UCMDB system after the upgrade process.
- ➤ "Failed to encrypt DSD by AES" step failed, need to import the Domain Scope Document to the UCMDB system after the upgrade process.
- ➤ "Got empty DSD after AES encryption" step failed, need to import the Domain Scope Document to UCMDB system after the upgrade process.
- ➤ "Got empty DSD after 3DES decryption" step failed, need to import the Domain Scope Document to UCMDB system after the upgrade process.
- ➤ "Failed to decrypt the DSD by AES and 3DES" step failed; need to import the Domain Scope Document to UCMDB system after the upgrade process.

Discovery - Upgrade Domain Scope Document

Functionality

Renames CI types and attributes in the domain scope document.

Is Critical

No

Can be re-run

Yes

Implication of Failure

Same as for the step "Discovery – Re-Encrypt Domain Scope Document" on page 205.

Relevant Log Information

- ➤ "Upgrade process of DomainScopeDocument data has been started"
- ➤ "DomainScopeDocument data has been successfully upgraded"
- ➤ "Failed to upgrade DomainScopeDocument data"

Copy Credentials to Confidential Manager

Functionality

Extracts credentials information out of the domain scope document into the confidential manager. Credentials information in the Domain Scope Document are replaced by Confidential Manager identifiers. For details, see "Confidential Manager" on page 315.

Is Critical

No

Can be re-run

Yes

Implication of Failure

Same as for the step "Discovery – Re-Encrypt Domain Scope Document" on page 205.

Relevant Log Information

- ➤ "Upgrade process of DomainScopeDocument insertion to Confidential Manager had been started"
- ➤ "Upgrade process of DomainScopeDocument insertion to Confidential Manager had been finished successfully"
- ➤ "Upgrade process of DomainScopeDocument insertion to Confidential Manager had been failed"

Discovery - Upgrade Credential Identifiers

Functionality

Upgrade **credential_id** attribute over the CIs in the CMDB to match the confidential manager identifiers.

Is Critical

No

Can be re-run

Yes

Implication of Failure

Credential attribute of existing CIs contains wrong data. Skipping this step would require you to run massive discovery to reconstruct the data.

Relevant Log Information

- ➤ "Upgrade process of credentials_id's update had been started"
- ➤ "Upgrade process of credentials_id's update had been finished successfully"
- ➤ "Upgrade process of credentials_id's update had been failed"
- ➤ "Failed to get layout (and update credentials id) for object of type <type>"
 indicates that the upgrade process for type <type> failed, meaning that
 the CIs of type <type> might contain obsolete credentials ids; after the
 upgrade process is done, need to re-run massive discovery on the system.

Copy Report Configuration

Functionality

Copies reports configuration from Foundation database to new management database.

Is Critical

No

Can be re-run

Yes

Implication of Failure

Favorite filters from 8.0x will not be upgraded and their scheduling will not be available.

Relevant Log information

"failed to upgrade report: <report name>

Copy Snapshots Scheduling Information

Functionality

Copies snapshots scheduling data from Foundation database to new management tables in the CMDB. Also, removes scheduled jobs of types which are no longer relevant ("run TQL", "rebuild views" and "package deploy").

Is Critical

No

Can be re-run

Yes

Implication of Failure

Scheduled snapshots will not be upgraded and user will have to redefine them.

Relevant Log information

Failed to handle **schedulerJob** [**<schedulerJob.toString**()>]

Upgrade Settings

Functionality

Rename CI types in selected settings.

Is Critical

No

Can be re-run

Yes

Implication of Failure

If class names existed in the settings manager and their name was changed by class model upgrader, you may encounter odd application behavior depending on the setting.

Example: Root CIT and its relationship is defined. Additional setting is frontend URL. If a load balancer is defined, you may need to redefine the frontend URL. Reverse proxy settings are not affected.

Relevant Log information

➤ "SettingsClassModelUpgrader failed" or a specific one with the prefix "failed to upgrade"

Upgrade Security Model

Functionality

Upgrades permissions according to the new ACL Model.

➤ Is Critical

No

Can be re-run

Yes

Implication of Failure

Some permissions will be aligned with new ACL model but some will not. Administrator will need to go inside Security Manager and verify that all permissions are as required and if not set accordingly.

Relevant Log information

➤ "Role [<role name>] failed to get permissions due to the following error:...

Clear Old Data

Functionality

Removes old data tables ("TEMP" tables).

Is Critical

No

Can be re-run

Yes

Implication of Failure

The UCMDB will work correctly, but could be slower due to "garbage" left in those tables. It is possible to manually remove all the tables with the prefix **TEMP**.

Relevant Log information

None.

User vs. Factory

Functionality

Comparing upgraded class model to an out of the box class model to decide for each class model entity whether it is a user's entity or a factory's entity.

Is Critical

No

Can be re-run

Yes

Implication of Failure

All class model entities will be mark as factory entities. Certain operations on the class model are closed for user over factory entities.

Relevant Log information

The following messages alert to problems in the data model. The entity specified in the message is a factory entity that is missing in the user class model. This can suggest a previous problem in the deployment of Content Pack 6.00 or in the upgrade process. The probable steps are:

- ➤ "Validate Class Model", "Validate Class Model" on page 156
- ➤ "Upgrade Class Model on Disk", "Upgrade Class Model on Disk" on page 160
- ➤ "Upgrade Class Model in DB", "Upgrade Class Model in DB" on page 182
- ➤ "Redeploy Basic Packages", "Redeploy Basic Packages" on page 200
- ➤ "Validate Upgraded Class Model", "Validate Upgraded Class Model" on page 200.
- ➤ "!!! Class <name> doesn't exist in the upgraded class model"
- ➤ "!!! Class <name> is missing qualifiers in the upgraded class model. The qualifiers are: clist-of-names>"
- ➤ "!!! Attribute <name> in Class <name> is missing from the upgraded class model."
- ➤ "!!! Attribute <name> in Class <name> is missing qualifiers in the upgraded class model. The qualifiers are: list-of-names>"
- ➤ "!!! Attribute Override <name> was removed in Class <name> and is missing qualifiers in the upgraded class model. The qualifiers are: list-of-names>"
- ➤ "!!! Attribute Override <name> in Class <name> is missing qualifiers in the upgraded class model. The qualifiers are: list-of-names>"
- ➤ "!!! Class <name> is missing method <name> in the upgraded class model."
- ➤ "!!! Method <name> in Class <name> is missing qualifiers in the upgraded class model. The qualifiers are: list-of-names>"

- ➤ "!!! Valid Link <name> is missing in the upgraded class model."
- ➤ "!!! Valid Link <name> is missing qualifiers in the upgraded class model.

 The qualifiers are st-of-names>"
- ➤ "!!! Calculated Link <name> with Class <name> is missing in the upgraded class model"
- ➤ "!!! Calculated Link <name> with Class <name> is missing triplet in the upgraded class model. The triplet is <triplet>"
- ➤ "!!! Enum <name> doesn't exist in the upgraded class model"
- ➤ "!!! List <name> doesn't exist in the upgraded class model"
- ➤ "!!! Enum entry with key <number> and value <value> in Enum <name> doesn't exist in the upgraded class model"
- ➤ "!!! List entry <value> in List <name> doesn't exist in the upgraded class model"

Populate IPv6 Attribute

Functionality

Copies the IP value from the "name" attribute to the new "IpAddressValue" attribute in the "IpAddress" class in IPv6 normalized form.

Is Critical

Yes

Can be re-run

Yes

Implication of Failure

Discovery might not work.

Workaround - An update should be done on IPs and IP subnet in the CMDB. The update can be done manually from the UI (one at a time).

Relevant Log information

Relevant log messages can be found in the log file **cmdb.reconciliation.log**.

Enrichment Driven Upgrade

Functionality

Invokes predefined enrichments to update data as part of the upgrade process.

- 1. Update name attribute at J2EE Domain to remove suffix (all characters after '@').
- 2. Update name attribute at Cluster Resource Group, fill it with the suffix from the value of its host key attribute (all characters after ':').
- 3. Removes old report archive CIs which are not being upgraded.

Is Critical

No

Can be re-run

Yes

Define Key Attributes Reconciliation Rules

Functionality

Adds a reconciliation rule of type 'key-attributes' to any user's CI type with key attributes.

Is Critical

No

Can be re-run

Yes

Implication of Failure

A user defined CIT that was identified by key attributes in 8.00 will use its parent reconciliation rule.

The key attribute identification rule can be added later on from a package/reconciliation JMX.

Relevant Log information

None.

Package Manager Upgrade

Functionality

Updates packaging information stored in the UCMDB server model.

The configuration file of the Package Manager Upgrade is stored in **upgrade\PackageManagerUpgrader\config.xml** (**cmdb.jar**). The configuration lists obsolete sub-systems and the sub-systems rename rules.

The Package Manager Upgrade tool performs the following steps:

- **1** Removes resources of obsolete subsystems from packages
- **2** Renames old subsystem names to the new ones
- **3** Updates the names of the class model resources used by Package Manager
 - **a** Changes class names in class definitions
 - **b** Changes class names in the definitions of valid links
 - **c** Changes class names in the triplets of the calculate link definitions
- **4** Removes non-existing resources from packages

Is Critical

No

Can be re-run

Yes

Implication of Failure

Incorrect packaging information may cause creation of incorrect package files during package export and may cause failures when trying to undeploy a package.

Relevant Log information

None.

Resource Only Upgrade – the Different Steps

Resource Only upgrade uses only part of the steps mentioned. The steps are:

- 1 Save Original Class Model,
- Import Settings, "Import Settings" on page 155
- Validate Class Model, "Validate Class Model" on page 156
- Upgrade Class Model on Disk, "Upgrade Class Model on Disk" on page 160
- Prepare Required Actions for Data Upgrade, "Prepare Required Actions for Data Upgrade" on page 163
- Prepare SQL Scripts for Data Upgrade, "Prepare SQL Scripts for Data Upgrade" on page 174
- Modify Data Modeling in DB, "Modify Data Modeling in DB" on page 177
- Copy E-mail Recipient Information, "Copy E-mail Recipient Information" on page 178
- Copy Resources to Disk, "Copy Resources to Disk" on page 179
- Copy Report's Scheduling Information, "Copy Report's Scheduling Information" on page 178
- Truncate Data Tables New step for Resource only upgrade (see details below)
- 12 Rename Original Data Tables, "Rename Original Data Tables" on page 181
- Upgrade Class Model in DB, "Upgrade Class Model in DB" on page 182
- Upgrade Resources on Disk, "Upgrade Resources on Disk" on page 182
- Upgrade Data, "Upgrade Data" on page 188
- Populate Root Table, "Populate Root Table" on page 189
- Upgrade List Attribute Table, "Upgrade List Attribute Table" on page 189
- Delete Legacy Configuration Tables, "Delete Legacy Configuration Tables" on page 190

- Recalculate non Random Generated IDs, "Recalculate Non-Random Generated IDs" on page 196
- Populate Global ID, "Populate Global ID" on page 196
- Discovery Upgrade Configuration, "Discovery Upgrade Configuration" on page 197
- Redeploy Basic Packages, "Redeploy Basic Packages" on page 200
- Validate Upgraded Class Model, "Validate Upgraded Class Model" on page 200
- Discovery Upgrade Resources, "Discovery Upgrade Resources" on page 202
- 25 Load Upgraded Resources, "Load Upgraded Resources" on page 203
- Discovery Re Encrypt Domain Scope Document, "Discovery Re-Encrypt Domain Scope Document" on page 205
- Discovery Upgrade Domain Scope Document, "Discovery Upgrade Domain Scope Document" on page 206
- Discovery Copy Credentials to Confidential Manager, "Copy Credentials to Confidential Manager" on page 207
- Discovery Upgrade Credential Identifiers, "Discovery Upgrade Credential Identifiers" on page 208
- Copy Report Configuration, "Copy Report Configuration" on page 208
- Copy Snapshots Scheduling Information, "Copy Snapshots Scheduling Information" on page 209
- Copy LDAP Configuration, "Copy LDAP Configuration" on page 213
- Upgrade Settings, "Upgrade Settings" on page 209
- Upgrade Security Model, "Upgrade Security Model" on page 210
- Clear Old Data, "Clear Old Data" on page 211
- User Vs. Factory, "User vs. Factory" on page 211
- Define Key Attributes Reconciliation Rules, "Define Key Attributes Reconciliation Rules" on page 214
- Package Manager Upgrade, "Package Manager Upgrade" on page 215

Truncate Data Tables

Functionality

Removes all non-relevant data from the CMDB and History schemas. All non-configuration data that is not needed for the Resource Only upgrade is deleted in this step.

Is Critical

Yes

Can be re-run

Yes

Implication of Failure

Non-upgraded data will stay in the CMDB and History schemas. Since part of the data would not be upgraded in the next steps, the system behavior after the upgrade will finish is unpredictable.

Relevant Log information

- ➤ "Truncating table <name>": Removing all data from the specified table.
- ➤ "Table <name> will not be truncated (data is needed for resources upgrade)": The table contains configuration data, and we do not delete this data.
- ➤ "Query to delete unrelevant data from root table: <SQL-statement>": The statement that removes all irrelevant data from the root table.

Troubleshooting and Limitations

This section describes troubleshooting and limitations for upgrading from UCMDB 8.0x to UCMDB 9.01.

Validate Data Model Conflict

Validate Data model uses the old Data model, the predefined transformations and the out of the box Data models as input, generates a modified Data model, after the addition of missing Data model entities, to disk under "\runtime\old-class-model.xml."

If a conflict is detected, as is the case when a new class or attribute name defined by the user is being allocated to a new out of the box class or attribute, a new additional transformation file is generated and saved to disk under "\runtime\added-class-model-changes.xml" and the upgrade process fails.

The new transformation file defines an additional transformation aimed to solve the conflicts by renaming classes and attributes. Running the upgrade again, will include these new transformations and enable the upgrade to proceed.

Resources Were Not Loaded to the Upgraded UCMDB

It is important to know that resources using classes which are being removed during the upgrade are not being upgraded and will not be loaded to the upgraded UCMDB. Similarly, queries using attributes as a property condition are also removed during the upgrade. Except for the Data model transformations applied over these resources, the following changes are also being made:

- ➤ Views are redefined to match the new view definition.
- ➤ Topology reports are redefined as views. In UCMDB 9.01 reports and views are seen as different visualization of the same data.
- ➤ Queries are now saved in a new, more readable XML format.

Chapter 11 • Upgrading HP Universal CMDB to Version 9.01

Troubleshooting and Limitations on page 225

Concepts

🚜 Package Migration Utility – Overview

This chapter explains how to use the package migration utility to migrate custom packages in HP Universal CMDB (UCMDB) from version 8.04 to version 9.01.

Custom packages created before upgrading the system to version 9.01 may contain resources that are not supported in the new version. To reduce the risk of problems in such custom packages, it is recommended that you migrate these packages offline using the provided Package Migration Utility before deploying the packages in the UCMDB version 9.01 system.

Using the Package Migration Utility to migrate custom packages offline provides the following benefits:

- ➤ No downtime is required.
- ➤ Migration of custom packages can be completed before they are deployed in the system, thereby reducing risk.
- ➤ You can migrate your packages, then immediately deploy them and rediscover the data.
- ➤ HP content packages can be migrated in a single process, reducing the risk of corrupted content.

The Package Migration Utility enables you to perform the migration on custom packages offline, without the need for a running server.

Tasks

Migrate a Custom Package

The following procedure explains how to migrate custom packages to HP Universal CMDB version 9.01.

To migrate custom packages:

- 1 Place the custom packages to be migrated in a separate directory together with the packages on which the upgraded resources depend. For example:
 - ➤ If a custom package contains a view or enrichment rule which relies on a TQL definition that resides in another package, place the package containing the TQL definition in the directory with the custom package.
 - ➤ If a custom package has a reference to a custom class definition which is not supplied by any of the factory packages, place the package with the custom class definition in the directory with the custom package.
- **2** Ensure that you have the old class model definition XML files, that is, the class model of the UCMDB version (such as 7.0 or 7.5) with which your package was created.

To create the class model, access the JMX console, navigate to **CMDB Class Model Services** and run the **exportClassModelToXML** method.

- **3** Run the script:
 - ➤ Windows: C:\hp\UCMDB\UCMDBServer\tools\packupgrade.bat
 - Solaris:
 C:/hp/UCMDB/UCMDBServer/2f/packupgrade/bin/packupgrade.sh

The syntax for running the script is shown below. (This information can also be displayed by running the script without arguments.)

 $\label{lem:packupgrade} $$ \operatorname{CLASS_MODEL_DEF_FILE} [-u \{ \operatorname{UPGRADE_CONFIG_FILE} \}] [-u \{ \operatorname{CONFIG_FILE}] [-u \{ \operatorname{CONFIG_FILE} \}] [-u \{ \operatorname{CONFIG_FILE}] [-u \{ \operatorname{CONFIG$

-i. Login to the JMX console.

- -cm {CLASS_MODEL_DEF_FILE}. File name of the old class model definition; this file can be created via JMX: navigate to the Class Model Services in the JMX console and invoke the exportClassModelToXml method.
- -u {UPGRADE_CONFIG_FILE}. The upgrade configuration file;
- **-exclude (package(s))**. The package to exclude or the list of package names to be excluded, separated with commas.
- -filterResources {file path of filtered resources list}. Exclude resources listed in the given XML file (the XML file should conform to the schema\filtered_resources.xsd file.
- -fullCM. Changes the class model upgrade to full mode. In full mode, new packages are created and the class model is treated as a whole, enabling more validations and corrections. In full mode, the packages cover the entire out-of-the-box class model (at least). By default, upgrade is done in partial mode which does not assume completeness.
- -analyzeDataActions {DATA_ACTIONS_FILE}. Analyzes the changes and generates the data actions analysis file with the given file name. Implies -fullCM.
- **-outputFullCM {OUTPUT_FULL_CM_FILE}**. Outputs the new full class model to a file. Implies **-fullCM**.
- -out {OUTPUT_DIR}. Directory path for upgraded packages.
- **-doNotCreateNewPackages**. If this option is given, the upgrader does not create any new package file.
- **{INPUT_DIR}**. The directory path of the packages to be upgraded.
- Environment variables. **ucmdb.home**. Must point to the product directory (usually **C:\hp\UCMDB\UCMDBServer** for standalone UCMDB).
- **4** Locate the migrated packages in the output directory you provided. Deploy your migrated packages in the UCMDB version 9.01 system.

Reference

Troubleshooting and Limitations

- ➤ The Package Migration Utility has been verified only for packages compatible with UCMDB 8.04.
- ➤ Enrichment definition packages that refer to deleted or updated CI types cannot be updated using the Package Migration Utility.
- ➤ Partial migration is not supported. The Package Migration Utility does not create a new package if one or more of the resources cannot be migrated successfully.

Chapter 12 • Upgrading Packages from Version 8.04 to 9.01

Part V

High Availability and Capacity Planning

13

HP Universal CMDB High Availability

This chapter includes:

Concepts

➤ Best Practices for the HP Universal CMDB High Availability Solution on page 230

Tasks

- ➤ Install HP Universal CMDB in High Availability Mode on page 232
- ➤ Configure Network High Availability on page 235
- ➤ Configure Full Site on page 236

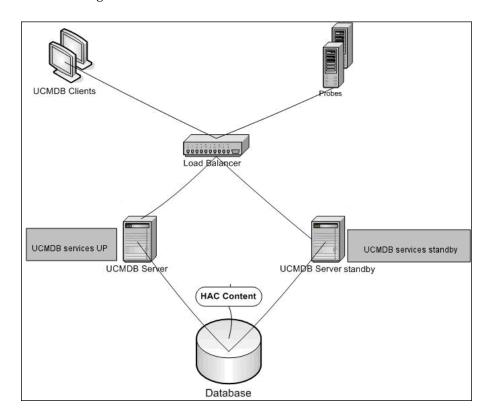

Concepts

Best Practices for the HP Universal CMDB High

Availability Solution

This section outlines best practices for field implementation of the HP Universal CMDB High Availability solution.

Solution diagram:

- ➤ All external access to the HP Universal CMDB application is via the load balancer.
- ➤ Two or more servers are configured.

- ➤ HP Universal CMDB services run on all the servers in the cluster, but the customer components are only active on the active server.
- ➤ Load balancer with:
 - ➤ Configured per cluster.
 - ➤ Keep alive to http://<UCMDB-Server:port>/ping?clusterId=<clusterId>.
 - ➤ Session stickiness.
 - ➤ Round robin policy for the servers.
- ➤ Each server is connected to two separate networks:
 - ➤ Front-end (for load balancer access)
 - ➤ Back-end (for database and High Availability Controller communication)

Tasks

🏲 Install HP Universal CMDB in High Availability Mode

This section describes the installation, startup, and configuration procedures when HP Universal CMDB is run in high availability mode.

This section includes the following topics:

- ➤ "Install the Server" on page 232
- ➤ "Complete Server Startup" on page 233
- ➤ "Configure the Server" on page 233
- ➤ "Configure the Load Balancer" on page 234
- ➤ "Configure the Probe" on page 234

1 Install the Server

a Run the server installation on two or more machines without running the configuration wizard (select **No** at the wizard prompt).

Note: The machines used for the primary and backup UCMDB servers should have similar hardware (especially the same amount of memory) and should be running the same operating system.

- **b** Run the configuration wizard on all servers you have installed.
 - ➤ To run the wizard from a Windows platform, select **Start** > **Programs** > HP UCMDB > Start HP Universal CMDB Server Configuration Wizard.

The first time the wizard runs, select the **Create new DB** option. The other times, select the **Connect to** option.

2 Complete Server Startup

- **a** Start the first server. Wait until the startup process is completed.
- **b** Install the servers. The typical configuration is two servers: one active and the other backup.
- c Run the configuration wizard on one of the installed servers. Select Create new schema.
- **d** Run the configuration wizard on the other servers. Select **Connect to existing schema** and provide the details of the schema you created for the first server.
- **e** Run the first server. Open the Server Management Tool, located at: C:\hp\UCMDB\UCMDBServer\tools\server_management.bat. For the server name, enter localhost or the name of the server. Enter the user name and password of the system user (the default is **sysadmin** and **sysadmin**). The connection from the tool to the HP Universal CMDB server is done via HTTPS. If there is a problem with the connection, make sure that **SSL** mode is configured (**Enable HTTPS connections** should be set to **true**). In the Server Management Tool, select the **Clusters** tab. Click the asterisk button to create a new cluster. On the right side of the opened window, add the machine names of all the servers you installed. Set one of them to be active.

Note: After saving the file, answer **Yes** to the question about switching all existing customers to the active server.

f Run all the other servers.

3 Configure the Server

a Access Infrastructure Settings: Administration > Infrastructure Settings> General Settings category.

- **b** Locate and change the following settings:
 - ➤ Is Frontend URL from Settings Enabled? should be set to true.
 - ➤ **Frontend URL** should be set to the load balancer's URL. The required format is **URI**://<server name>:<port>.

4 Configure the Load Balancer

Define the virtual IP for the two HP Universal CMDB servers with the following configuration:

- ➤ Select the port defined in the infrastructure settings.
- ➤ There should be a round robin policy for the servers.
- ➤ Session stickiness should be maintained.
- ➤ Configured per cluster.
- ➤ The keep alive address for the session is: http://<UCMDB-Server:port>/ping?clusterId=<clusterId>. An active server in the cluster returns HTTP response 200 (OK). A non-active server returns HTTP response 503 (service unavailable).

Note: It is important for the load balancer to provide the cluster ID in the keep alive request, because a server can belong to several clusters, being active in one and passive in another.

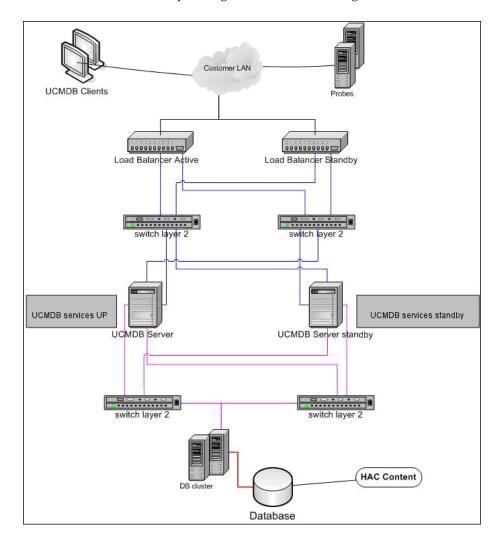

5 Configure the Probe

- **a** Run the Probe installation on the Probe machine with the load balancer virtual IP address as the HP Universal CMDB server name.
- **b** Start the Probe.

🏲 Configure Network High Availability

To deploy network high availability, connect load balancers and databases via switches to servers using spanning tree Intel NIC mode (for Windows) .

Full Network Redundancy configuration solution diagram:

? Configure Full Site

- ➤ The back-end network should be defined on the prime interface (the interface bound to the server name). If it is not defined this way, edit the etc/hosts file to define the back-end interface as bound to the server name.
- ➤ During the server installation, the back-end hostname/IP should be defined as the HP Universal CMDB server/IP.

14

HP Universal CMDB Large Capacity Planning

This chapter includes:

Concepts

- ➤ Large Capacity Planning Overview on page 238
- ➤ Managed Hosts and Host-Related CIs on page 239

Tasks

- ➤ UCMDB Server Configuration on page 241
- ➤ Oracle Database Configuration on page 242

Reference

- ➤ System Test Setup on page 243
- ➤ System Test Results on page 244

Concepts

Large Capacity Planning Overview

Using the default configuration, HP Universal CMDB can work with a deployment of up to 12.5 million objects and links. To work with a larger deployment, you must implement the following configuration:

- ➤ Increase the CMDB heap to 8 GB. For details, see "UCMDB Server Configuration" on page 241.
- ➤ If working with an Oracle database, set up the Oracle Database SGA as follows: 4 GB supported, 8 GB recommended. For details, see "Oracle Database Configuration" on page 242.

The following table displays the maximum supported number of CIs and links for a UCMDB deployment:

Database/Operating System	Windows	Linux
MS SQL Server	40 million CIs and links	12.5 million CIs and links
Oracle	40 million CIs and links (Configuration required as described in this section)	40 million CIs and links (Configuration required as described in this section)

Note: The system capacity for some configurations is still being tested. Once completed, the capacity planning chapter will be updated on the HP Software Product Manuals Web site (http://h20230.www2.hp.com/selfsolve/manuals).

For more details on:

- ➤ The changes you must make to the system configuration to support this capacity, see "UCMDB Server Configuration" on page 241.
- ➤ How you can improve performance, see "Oracle Database Configuration" on page 242.
- ➤ The setup used for capacity testing, see "System Test Setup" on page 243.
- ➤ Performance results of the system test run on UCMDB 9.01, see "System Test Results" on page 244.

Managed Hosts and Host-Related Cls

When planning capacity, among other issues, you should consider the ratio of managed hosts in your CMDB to host-related CIs. Host-related CIs include all CIs of types which are subclasses of Application Resource, Host Resource, or Software Element.

The following table lists the number of host-related CIs you can discover for each managed host in your environment. This number depends on the size of your deployment and the number of managed hosts: The more managed hosts you maintain in the CMDB, the fewer host-related CIs you can discover for each managed host.

For example, in an Enterprise deployment if you are running 89,600 managed hosts, you can discover 160 host-related CIs for each managed host. If you are running only 28,000 managed hosts, you can discover 500 resource CIs for each managed host.

Deployment	Number of Managed Hosts/Host-Related CIs	
Enterprise	89600/160 - 28800/500	
Standard	9000/160 – 3000/500	
Small	4500/160 – 1000/500	

Note: The numbers in the table include only CIs and not links.

Tasks

UCMDB Server Configuration

For the system to support 40 million CIs and links, you should update the following parameters on the UCMDB Server:

Windows:

- ➤ C:\hp\UCMDB\UCMDBServer\bin\wrapper-platform.conf wrapper.java.initmemory=2048 wrapper.java.maxmemory=8192
- ➤ C:\hp\UCMDB\UCMDBServer\conf\settings.override.properties dal.object.condition.max.result.size=50000000 dal.use.memory.instead.temp.table.high.threshold.oracle=6000000 dal.joinf.max.result.size=4000000

Linux:

- ➤ /opt/hp/UCMDB/UCMDBServer/bin/wrapper-platform.conf wrapper.java.initmemory=2048 wrapper.java.maxmemory=8192
- ➤ /opt/hp/UCMDB/UCMDBServer/bin/settings.override.properties dal.object.condition.max.result.size=50000000 dal.use.memory.instead.temp.table.high.threshold.oracle=6000000 dal.joinf.max.result.size=4000000

Oracle Database Configuration

When working on a system containing 40 million objects and links, you can improve performance by increasing the Oracle SGA size to 6 to 8 GB (the recommended configuration). This improves the performance of both the TQL calculation for several types of TQLs, as well as for data-in operations performed on the system.

Reference

System Test Setup

The system capacity for the system test was 40 million CIs and links.

The following hardware was used for the test:

Role	Machine Type	СРИ	Memory	VM/ Swap	OS + 3rd Party SW
CMDB	HP Proliant BL460c G6	2 x Intel Xeon Processor 2.533 GHz Quad core	16 GB	Windows: 24 GB Linux: 16 GB	Win2008R2 64-bit Red Hat Enterprise Linux Server release 5.5
Data Flow Probe	HP ProLiant DL 140 G2	2 * 3.0 GHz CPU	2 MB	3 MB	Windows 2003 Server EE
Database	HP Proliant BL460c G6	2 x Intel Xeon Processor 2.933 GHz Quad core	32 GB	51 GB	Win2008R2 64-bit REHL 5.4

The following software version was used for the test:

➤ Oracle Database 11g, Release 11.2.0.1.0

The following business flows were tested as part of the system test:

➤ TQL Calculation

TQLs (queries) were divided into sub groups according to the result size (<100, <1000, and <10000), according to the data set that the TQL retrieves and according to the TQL configuration:

- ➤ Like Condition
- ➤ Like, Ignore case

Chapter 14 • HP Universal CMDB Large Capacity Planning

- ➤ Perspective
- ➤ Different number of hierarchies in the TQL results (1-5)
- ➤ Compound
- ➤ Sub-graph
- ➤ JoinF

➤ Data-in

The data-in scenario in the system test included insertion, updates, and deletion.

➤ Enrichments

Enrichment scenarios included insert, update, and delete.

System Test Results

Following a 24-hour load test, with a scenario that includes query execution, data-in, and enrichment execution, the following results have been achieved:

- ➤ The system was stable throughout the run. No restarts, memory leaks, or any other degradation over time was observed.
- ➤ System performance is acceptable: For most TQLs (queries) the 90% percentile is below 1 second of calculation time.

Part VI

Hardening HP Universal CMDB

15

Introduction to Hardening

This chapter includes:

Concepts

- ➤ Hardening Overview on page 248
- ➤ Hardening Preparations on page 249

Tasks

- ➤ Deploy HP Universal CMDB in a Secure Architecture on page 251
- ➤ Change User Name or Password for the JMX Console on page 252

Concepts

Hardening Overview

This section introduces the concept of a secure HP Universal CMDB application and discusses the planning and architecture required to implement security. It is highly recommended that you read this section before proceeding to the hardening discussion in the following sections.

HP Universal CMDB is designed so that it can be part of a secure architecture, and can therefore meet the challenge of dealing with the security threats to which it might be exposed.

The hardening guidelines deal with the configuration required to implement a more secure (hardened) HP Universal CMDB.

The hardening information provided is intended primarily for HP Universal CMDB administrators who should familiarize themselves with the hardening settings and recommendations prior to beginning the hardening procedures.

It is highly recommended that you use a reverse proxy with HP Universal CMDB to achieve a secure architecture. For details on configuring a reverse proxy for use with HP Universal CMDB, see Chapter 17, "Using a Reverse Proxy."

If you must use another type of secure architecture with HP Universal CMDB other than described in this document, contact HP Software Support to determine which architecture is the best one for you to use.

For details on hardening the Data Flow Probe, see Chapter 19, "Hardening the Data Flow Probe."

Important:

- ➤ The hardening procedures are based on the assumption that you are implementing only the instructions provided in these chapters, and that you are not performing other hardening steps documented elsewhere.
- ➤ Where the hardening procedures focus on a particular distributed architecture, this does not imply that this is the best architecture to fit your organization's needs.
- ➤ It is assumed that the procedures included in the following chapters are to be performed on machines dedicated to HP Universal CMDB. Using the machines for other purposes in addition to HP Universal CMDB may yield problematic results.
- ➤ The hardening information provided in this section is not intended as a guide to making a security risk assessment for your computerized systems.

\lambda Hardening Preparations

- ➤ Evaluate the security risk/security state for your general network, and use the conclusions when deciding how to best integrate HP Universal CMDB into your network.
- ➤ Develop a good understanding of the HP Universal CMDB technical framework and HP Universal CMDB security capabilities.
- ➤ Review all the hardening guidelines.
- ➤ Verify that HP Universal CMDB is fully functioning before starting the hardening procedures.
- ➤ Follow the hardening procedure steps chronologically in each chapter. For example, if you decide to configure the HP Universal CMDB server to support SSL, read Chapter 16, "Enabling Secure Sockets Layer (SSL) Communication" and then follow all the instructions chronologically.

Chapter 15 • Introduction to Hardening

➤ HP Universal CMDB does not support basic authentication with blank passwords. Do not use a blank password when setting basic authentication connection parameters.

Tip: Print out the hardening procedures and check them off as you implement them.

Tasks

The Deploy HP Universal CMDB in a Secure Architecture

Several measures are recommended to securely deploy your HP Universal CMDB servers:

➤ DMZ architecture using a firewall

The secure architecture referred to in this document is a typical DMZ architecture using a device as a firewall. The basic concept of such an architecture is to create a complete separation, and to avoid direct access between the HP Universal CMDB clients and the HP Universal CMDB server.

➤ Secure browser

Internet Explorer and FireFox in a Windows environment must be configured to securely handle Java scripts, applets, and cookies.

> SSL communication protocol

Secure Sockets Layer protocol secures the connection between the client and the server. URLs that require an SSL connection use a secure version (HTTPS) of the Hypertext Transfer Protocol. For details, see "Enabling Secure Sockets Layer (SSL) Communication" on page 255.

> Reverse proxy architecture

One of the more secure and recommended solutions suggests deploying HP Universal CMDB using a reverse proxy. HP Universal CMDB fully supports secure reverse proxy architecture. For details, see "Using a Reverse Proxy" on page 265.

Note: When the UCMDB Server is configured to connect with reverse proxy, mutual authentication using SSL between the reverse proxy server and the Data Flow Probe is not supported. For details, see "Enable SSL Between UCMDB Server and Data Flow Probe with Mutual Authentication" on page 292.

Change User Name or Password for the JMX Console

The JMX console uses system users, that is, cross-customer users in a multitenant environment. You can log in to the JMX console with any system user name. The default name and password is **sysadmin/sysadmin**.

You change the password either through the JMX console or through the Server Management tool.

To change the default user name or password through the JMX console:

- **1** Launch a Web browser and enter the following address: http://localhost.<domain name>:8080/jmx-console.
- **2** Enter the JMX console authentication credentials, which by default are:
 - ➤ Login name = sysadmin
 - ➤ Password = **sysadmin**
- **3** Locate **UCMDB:service=Security Services** and click the link to open the JMX MBEAN View page.
- $\textbf{4} \ \ Locate \ the \ \textbf{changeSystemUserPassword} \ operation.$
 - ➤ In the userName field, enter sysadmin.
 - ➤ In the **password** field, enter a new password.
- **5** Click **Invoke** to save the change.

To change the default user name or password through the Server Management tool:

➤ For Windows, run the following file: C:\hp\UCMDB\UCMDBServer\tools\server_management.bat.

Chapter 15 • Introduction to Hardening

16

Enabling Secure Sockets Layer (SSL) Communication

This chapter includes:

Tasks

- ➤ Enable SSL on the Server Machine With a Self-Signed Certificate on page 256
- ➤ Enable SSL on the Server Machine With a Certificate from a Certification Authority on page 258
- ➤ Enable SSL on the Client Machines on page 260
- ➤ Enable SSL on the Client SDK on page 261
- ➤ Change the Server Keystore Passwords on page 261
- ➤ Enable or Disable HTTP/HTTPS Ports on page 263

Tasks

P Enable SSL on the Server Machine With a Self-Signed Certificate

These sections explain how to configure HP Universal CMDB to support communication using the Secure Sockets Layer (SSL) channel.

HP Universal CMDB uses Jetty 6.1 as the default Web server.

1 Prerequisites

- a Before starting the following procedure, remove the old server.keystore located inC:\hp\UCMDB\UCMDBServer\conf\security\server.keystore
- Place the HP Universal CMDB keystore (JKS type) in the C:\hp\UCMDB\UCMDBServer\conf\security folder.

2 Generate a Server Keystore

- **a** Create a keystore (JKS type) with a self-signed certificate and matching private key:
 - ➤ From C:\hp\UCMDB\UCMDBServer\bin\jre\bin, run the following command:

keytool -genkey -alias hpcert -keystore C:\hp\UCMDB\UCMDBServer\conf\security\server.keystore

The console dialog box opens.

- ➤ Enter the keystore password. If the password has changed, run the changeKeystorePassword JMX method, in Security Services. If the password has not changed, use the default hppass password.
- ➤ Answer the question, **What is your first and last name?** Enter the HP Universal CMDB Web server name. Enter the other parameters according to your organization.

➤ Enter a key password. The key password MUST be the same as the keystore password.

A JKS keystore is created named **server.keystore** with a server certificate named **hpcert**.

- **b** Export the self-signed certificate to a file:
 - ➤ From C:\hp\UCMDB\UCMDBServer\bin\jre\bin, run the following command:

keytool -export -alias hpcert -keystore C:\hp\UCMDB\UCMDBServer\conf\security\server.keystore -storepass <your password> -file hpcert

3 Place the Certificate in the Client's Trusted Store

After generating **server.keystore** and exporting the server certificate, for every client that needs to communicate with HP Universal CMDB over SSL using this self-signed certificate, place this certificate in the client's trusted stores.

Limitation: There can be one server certificate only in **server.keystore**.

4 Disable HTTP Port 8080

For details, see "Enable or Disable HTTP/HTTPS Ports" on page 263.

Note: Check that HTTPS communication works before closing the HTTP port.

5 Restart the Server

6 Display HP Universal CMDB

To verify that the UCMDB Server is secure, enter the following URL in the Web browser: https://<UCMDB Server name or IP address>:8443/ucmdb-ui.

Figure 2015 Enable SSL on the Server Machine With a Certificate from a Certification Authority

To use a certificate issued by a Certification Authority (CA), the keystore must be in Java format. The following example explains how to format the keystore for a Windows machine.

1 Prerequisites

Before starting the following procedure, remove the old **server.keystore** located in **C:\hp\UCMDB\UCMDBServer\conf\security\server.keystore**.

2 Generate a Server Keystore

- **a** Generate a CA signed certificate and install it on Windows.
- **b** Export the certificate into a *.pfx file (including private keys) using Microsoft Management Console (mmc.exe).
 - ➤ Enter any string as the password for the **pfx** file. (You are asked for this password when converting the keystore type to a JAVA keystore.)
 - The .pfx file now contains a public certificate and a private key and is password protected.
- Copy the .pfx file you created to the following folder:C:\hp\UCMDB\UCMDBServer\conf\security.
- d Open the command prompt and change the directory toC:\hp\UCMDB\UCMDBServer\bin\jre\bin.

➤ Change the keystore type from **PKCS12** to a **JAVA** keystore by running the following command:

keytool -importkeystore -srckeystore c:\hp\UCMDB\UCMDBServer\conf\security\<pfx file name> -srcstoretype PKCS12 -destkeystore server.keystore

You are asked for the source (.pfx) keystore password. This is the password you supplied when creating the pfx file in step b.)

- **e** Enter the destination keystore password. This password must be the same as defined previously in the **changeKeystorePassword** JMX method, in Security Services. If the password was not changed, use the default **hppass** password.
- **f** After generating the certificate, disable HTTP port 8080. For details, see "Enable or Disable HTTP/HTTPS Ports" on page 263.
- **g** If you used a password other than **hppass** or the password used for the .pfx file, run the **changeKeystorePassword** JMX method and make sure that the key has the same password.

Note: Check that HTTPS communication works before closing the HTTP port.

3 Restart the Server

4 Verify the Server Security

To verify that the UCMDB Server is secure, enter the following URL in the Web browser: https://<UCMDB Server name or IP address>:8443/ucmdb-ui.

Limitation: There can be one server certificate only in **server.keystore**.

P Enable SSL on the Client Machines

If the certificate used by the HP Universal CMDB Web server is issued by a well-known Certificate Authority (CA), it is most likely that your Web browser can validate the certificate without any further action.

If the CA is not trusted by the Web browser, you should either import the entire certificate trust path or import the certificate used by HP Universal CMDB explicitly into the browser's trust store.

The following example demonstrates how to import the self-signed **hpcert** certificate into the Windows trust store to be used by Internet Explorer.

To import a certificate into the Windows trust store:

- Locate and rename the hpcert certificate to hpcert.cer.
 In Windows Explorer, the icon shows that the file is a security certificate.
- **2** Double click **hpcert.cer** to open the Internet Explorer Certificate dialog box.
- **3** Follow the instructions for enabling trust by installing the certificate with the Certificate Import Wizard.

Note: Another method of importing the certificate issued by the UCMDB Server to the Web browser is by logging in to UCMDB, and installing the certificate when the untrusted certificate warning is displayed.

eals Enable SSL on the Client SDK

You can utilize HTTPS transportation between the client SDK and the server SDK:

- **1** On the client machine, in the product that embeds the client SDK, locate the transportation setting and make sure it is configured to HTTPS, and not HTTP.
- **2** Download the CA certificate/self-signed public certificate to the client machine, and import it into the **cacerts** trust store on the JRE that is going to connect to the server.

Use the following command:

Keytool -import -alias <CA name> -trustcacerts -file <server public certificate path> - keystore <path to client jre trusted cacerts store (e.g. x:\program files\java\jre\lib\security\cacerts)>

eals Change the Server Keystore Passwords

After installing the Server, the HTTPS port is open and the store is secured with a weak password (the default **hppass**). If you intend to work with SSL only, you must change the password.

The following procedure explains how to change the **server.keystore** password only. However, you should perform the same procedure for changing the **server.truststore** password.

Note: You must perform every step in this procedure.

1 Start the UCMDB Server

2 Execute the password change in the JMX console

a Launch the Web browser and enter the Server address, as follows: http://<UCMDB Server Host Name or IP>:8080/jmx-console.

You may have to log in with a user name and password.

- **b** Under UCMDB, click **UCMDB:service=Security Services** to open the JMX MBEAN View page.
- **c** Locate and execute the **changeKeystorePassword** operation.

This field must not be empty and must be at least six characters long. The password is changed in the database only.

3 Stop the UCMDB Server

4 Run commands

From C:\hp\UCMDB\UCMBServer\bin\jre\bin, run the following commands:

a Change the store password:

keytool -storepasswd -new <new_keystore_pass> -keystore C:\hp\UCMDB\UCMDBServer\conf\security\server.keystore -storepass <current keystore pass>

b The following command displays the inner key of the keystore. The first parameter is the alias. Save this parameter for the next command:

keytool -list -keystore C:\hp\UCMDB\UCMDBServer\conf\security\server.keystore

c Change the key password (if the store is not empty):

keytool -keypasswd -alias <alias> -keypass <currentPass> -new <newPass> -keystore C:\hp\UCMDB\UCMDBServer\conf\security\server.keystore

d Enter the new password.

- **5 Start the UCMDB Server**
- 6 Repeat the procedure for the Server truststore

Enable or Disable HTTP/HTTPS Ports

- **1** Log on to HP Universal CMDB.
- **2** Access Infrastructure Settings (Administration > Infrastructure Settings).
- **3** Enter either **http** or **https** in the **Filter** (by Name) box to display the HTTP settings.
 - ➤ Enable HTTP(S) connections. True: the port is enabled. False: the port is disabled.
- **4** Restart the server to apply the change.

Limitation: The HTTPS port is open by default; closing this port prevents **Server_Management.bat** from functioning.

Chapter 16 • Enabling Secure Sockets Layer (SSL) Communication

17

Using a Reverse Proxy

This chapter describes the security ramifications of reverse proxies and contains instructions for using a reverse proxy with HP Universal CMDB. Security aspects of a reverse proxy are discussed but not other aspects such as caching and load balancing.

This chapter includes:

Concepts

- ➤ Reverse Proxy Overview on page 266
- ➤ Security Aspects of Using a Reverse Proxy Server on page 267

Tasks

- ➤ Configure a Reverse Proxy Using Infrastructure Settings on page 269
- ➤ Configure a Reverse Proxy Using the JMX Console on page 270
- ➤ Apache 2.0.x Example Configuration on page 271

Concepts

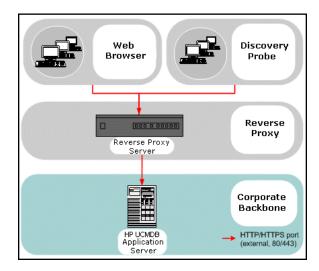

Reverse Proxy Overview

A reverse proxy is an intermediate server that is positioned between the client machine and the Web servers. To the client machine, the reverse proxy appears to be a standard Web server that serves the client machine's HTTP protocol requests.

The client machine sends ordinary requests for Web content, using the name of the reverse proxy instead of the name of a Web server. The reverse proxy sends the request to one of the Web servers. Although the response is sent back to the client machine by the reverse proxy, it appears to the client machine as if it is being sent by the Web server.

HP Universal CMDB supports a reverse proxy in DMZ architecture. The reverse proxy is an HTTP mediator between the Data Flow Probe and the Web client and the HP Universal CMDB server.

Note: Different types of reverse proxies require different configuration syntaxes. For an example of an Apache 2.0.x reverse proxy configuration, see "Apache 2.0.x – Example Configuration" on page 271.

Security Aspects of Using a Reverse Proxy Server

A reverse proxy server functions as a bastion host. The proxy is configured to be the only machine addressed directly by external clients, and thus obscures the rest of the internal network. Use of a reverse proxy enables the application server to be placed on a separate machine in the internal network.

This section discusses the use of a DMZ and reverse proxy in a back-to-back topology environment.

The following are the main security advantages of using a reverse proxy in such an environment:

- ➤ No DMZ protocol translation occurs. The incoming protocol and outgoing protocol are identical (only a header change occurs).
- ➤ Only HTTP access to the reverse proxy is allowed, which means that stateful packet inspection firewalls can better protect the communication.
- ➤ A static, restricted set of redirect requests can be defined on the reverse proxy.
- ➤ Most of the Web server security features are available on the reverse proxy (authentication methods, encryption, and so on).
- ➤ The reverse proxy screens the IP addresses of the real servers as well as the architecture of the internal network.
- ➤ The only accessible client of the Web server is the reverse proxy.
- ➤ This configuration supports NAT firewalls (as opposed to other solutions).
- ➤ The reverse proxy requires a minimal number of open ports in the firewall.

Chapter 17 • Using a Reverse Proxy

➤ The reverse proxy provides good performance compared to other bastion solutions.

Tasks

Configure a Reverse Proxy Using Infrastructure Settings

The following procedure explains how to access Infrastructure Settings to enable a reverse proxy configuration:

To enable a reverse proxy configuration:

- **1** Access Infrastructure Settings (**Administration** > **Infrastructure settings**).
- **2** In the Categories pane, select the **General Settings** option.
- **3** Change the **Frontend URL** setting. Enter the address, for example, https://my_proxy_server:443/.
- **4** Change the **Is Frontend URL from settings enabled?** to true.

Important: Once you have made this change, you cannot access the HP Universal CMDB server directly through a client. However, you can change the reverse proxy configuration using the JMX console on the server machine. For details, see "Configure a Reverse Proxy Using the JMX Console" on page 270.

Configure a Reverse Proxy Using the JMX Console

The following procedure explains how to make changes to the reverse proxy configuration by using the JMX console on the HP Universal CMDB server machine.

To change a reverse proxy configuration:

1 On the HP Universal CMDB server machine, launch the Web browser and enter the following address:

http://<machine name or IP address>.<domain_name>:8080/jmx-console

where **<machine** name or **IP** address> is the machine on which HP Universal CMDB is installed. You may have to log in with the user name and password.

- **2** Click the **UCMDB-UI** > **UCMDB-UI:name=UI** Server frontend settings link.
- **3** In the **setUseFrontendURLBySettings** field, enter the server proxy URL, for example, **https://my_proxy_server:443**/.
- 4 Click Invoke.
- **5** To disable/enable this setting, use the **enableUseFrontendURLBySettings** or **disableUseFrontendURLBySettings** methods.
- **6** To see the value of this setting, use the **showFrontendURLInSettings** method.

🏲 Apache 2.0.x – Example Configuration

Below is a sample configuration file that supports the use of an Apache 2.0.x reverse proxy in a case where both Data Flow Probes and application users connect to HP Universal CMDB.

Note:

- ➤ In the example below, the HP Universal CMDB machine's DNS name is UCMDB_server.
- ➤ Only users with a knowledge of Apache administration should make this change.
- **1** Open the **<Apache machine root directory>\Webserver\conf\httpd.conf** file.
- **2** Enable the following modules:
 - ➤ LoadModule proxy_module modules/mod_proxy.so
 - ➤ LoadModule proxy_http_module modules/mod_proxy_http.so

3 Add the following lines to the httpd.conf file:

ProxyRequests off <Proxy *> Order deny, allow Deny from all Allow from all </Proxy> ProxyPass /mam http://UCMDB server/mam ProxyPassReverse /mam http://UCMDB server/mam ProxyPass /mam images http://UCMDB server/mam images ProxyPassReverse /mam images http://UCMDB server/mam images ProxyPass /mam-collectors http://UCMDB server/mam-collectors ProxyPassReverse /mam-collectors http://UCMDB server/mam-collectors ProxyPass /ucmdb http://UCMDB server/ucmdb ProxyPassReverse /ucmdb http://UCMDB server/ucmdb ProxyPass /site http://UCMDB server/site ProxyPassReverse /site http://UCMDB server/site ProxyPass /ucmdb-ui http://UCMDB server/ucmdb-ui ProxyPassReverse /ucmdb-ui http://UCMDB server/ucmdb-ui ProxyPass /site http://UCMDB server/status ProxyPassReverse /site http://UCMDB server/status ProxyPass /site http://UCMDB_server/jmx-console ProxyPassReverse /site http://UCMDB server/jmx-console ProxyPass /site http://UCMDB_server/axis2 ProxyPassReverse /site http://UCMDB server/axis2 ProxyPass /site http://UCMDB server/icons ProxyPassReverse /site http://UCMDB server/icons ProxyPass /site http://UCMDB server/ucmdb-api ProxyPassReverse /site http://UCMDB server/ucmdb-api ProxyPass /site http://UCMDB server/ucmdb-docs ProxyPassReverse /site http://UCMDB server/ucmdb-docs ProxyPass /site http://UCMDB server/ucmdb-api/8.0 ProxyPassReverse /site http://UCMDB_server/ucmdb-api/8.0

4 Save your changes.

18

Hardening Data Flow Management

This chapter includes:

Concepts

- ➤ Hardening Data Flow Management Overview on page 274
- ➤ Credentials Encryption with Confidential Manager on page 276

Tasks

- ➤ Manage the Storage of Credentials on page 278
- ➤ Generate or Update the Encryption Key on page 279
- ➤ Export and Import the domainScopeDocument (DSD) File in Encrypted Format on page 285

Concepts

🚜 Hardening Data Flow Management Overview

Discovery credentials entered in the Data Flow Probe Setup window are saved in the UCMDB database, and managed by the Confidential Manager. On the Probe side, the credentials are saved in an encrypted file termed a domain scope document (DSD). This DSD contains discovery domain data. Each discovery domain entry in the document contains the network scope for the domain's Probes and the credentials the Probes may use when communicating with remote machines.

Note: Security features related to HP Business Service Management user management—for example, authentication and authorization—are not discussed here.

This section includes the following topics:

- ➤ "Basic Security Assumptions" on page 274
- ➤ "Credentials Encryption Management" on page 275
- ➤ "HTTPS\SSL Configuration" on page 276

Basic Security Assumptions

Note the following security assumptions:

- ➤ You have secured the HP Universal CMDB Server and Probe file systems for authorized access only.
- ➤ You have secured the UCMDB Server JMX console to enable access to UCMDB system administrators only, preferably through localhost access only.

Credentials Encryption Management

Note the following guidelines for managing credential encryption:

- ➤ The domainScopeDocument (DSD) file is encrypted using standard, symmetric encryption. The DSD file is encrypted during transfer and at its location (the key is stored on the server database and the Probe file system). The encryption uses an AES algorithm with a default key of 192 bytes (but you can decide the length of the encryption/decryption key and other security parameters). For details on changing the key size, see "Update an Encryption Key" on page 282.
- ➤ A default, symmetric key is distributed with the UCMDB installation. As all default keys are identical, you should replace this key with a locally-generated key.
- ➤ The DSD file is exportable and importable in encrypted file form. To import a file you should supply the matching key used for the encryption of the file. Perform the import and export operations through the server's JMX console (the Discovery Manager service). For details, see "Export and Import the domainScopeDocument (DSD) File in Encrypted Format" on page 285.
- ➤ You can exchange the key while the system is up to keep the consistency of the system without losing any data. This is managed through the server's JMX console. For details, see "Generate or Update the Encryption Key" on page 279.
- ➤ When a key is updated, you can automatically distribute the new key to the Probes. This option is easier to deploy but is considered less secure. The new key is encrypted using the old key. To achieve better security, you can change the key manually. For details, see "Generate a New Encryption Key" on page 280.
- ➤ The key for DSD encryption is itself encrypted using DPAPI and is stored on the Probe and UCMDB server file systems (in encrypted format—and not in clear text). DPAPI relies on the Windows user password in the encryption process. Therefore, to ensure that the Probe can read the key, the Probe should always run under the same Windows user that was used during the Probe's installation (it is possible to change the user password). (DPAPI is a standard method to protect confidential data—such as certificates and private keys—on Windows.)

HTTPS\SSL Configuration

You can configure communication between the HP Universal CMDBServer and the Data Flow Probe to use HTTPS\SSL. This enables better DSD security during transit.

Note: As a result of using SSL, other aspects (for example, discovery tasks and gathered results) of the HP Universal CMDB product may become more secure.

🖧 Credentials Encryption with Confidential Manager

Note the following guidelines for managing credential encryption:

➤ The domainScopeDocument (DSD) file on the UCMDB Server contains credentials IDs only. Credentials details are stored on Confidential Manager.

For details, see Chapter 22, "Confidential Manager."

➤ The DSD file on the Data Flow Probe contains full credentials information. This copy is encrypted using standard symmetric encryption.

When the UCMDB Server updates the Probe with a new copy of the DSD, the following process occurs:

- **1** A new copy of DSD is created. This copy contains full credentials information that has been loaded from Confidential Manager.
- **2** The DSD copy is encrypted using standard symmetric encryption and transferred to the Data Flow Probe.

The encryption uses an AES algorithm with a default key of 192 bytes. However, you can decide the length of the encryption and decryption keys and other security parameters. For details on changing the key size, see "Update an Encryption Key" on page 282.

- ➤ A default, symmetric key is distributed with the UCMDB installation. As all default keys are identical, you should replace this key with a locally generated key.
- ➤ The DSD file is exportable and importable in encrypted file format. To import a file you should supply the matching key used for the encryption of the file. Perform the import and export operations through the Server's JMX console (the Discovery Manager service). For details, see "Export and Import the domainScopeDocument (DSD) File in Encrypted Format" on page 285.

Tasks

Manage the Storage of Credentials

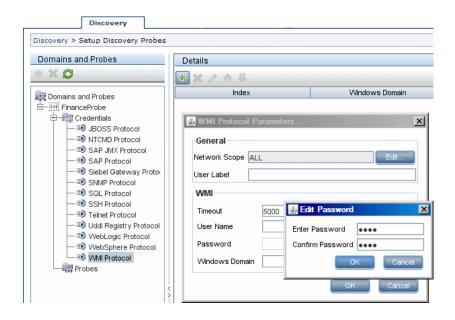

This section explains how to manage the DSD file.

This section includes the following tasks:

- ➤ "View Credentials Information (Data Direction: CMDB to HP Universal CMDB)" on page 278
- ➤ "Update Credentials (Data Direction: HP Universal CMDB to CMDB)" on page 279

1 View Credentials Information (Data Direction: CMDB to HP Universal CMDB)

Passwords are not sent from the CMDB to the application. That is, HP Universal CMDB displays asterisks (*) in the password field, regardless of content:

2 Update Credentials (Data Direction: HP Universal CMDB to CMDB)

➤ The communication in this direction is not encrypted, therefore you should connect to the UCMDB Server using https\SSL, or ensure connection through a trusted network.

Although the communication is not encrypted, passwords are not being sent as clear text on the network. They are encrypted using a default key and, therefore, it is highly recommended to use SSL for effective confidentiality in transit.

- ➤ The password field is limited to 40 characters. The length of the password is not limited in other ways since it is saved only in a file.
- ➤ You can use special characters and non-English characters as passwords.

🧚 Generate or Update the Encryption Key

You can generate or update an encryption key for probe encryption and the transport of credentials from server to Probe. In each case DFM creates a new encryption key based on parameters that you supply (key length, extra PBE cycles, JCE provider). You can also disable DPAPI encryption.

The result of running the **generateEncryptionKey** method is a new generated encryption key. This key is stored only in the **secured_storage.bin** file and its name and details are not known. If you reinstall an existing Probe, or connect a new Probe to the UCMDB Server, this new generated key is not recognized by the new Probe.

In these cases, it is preferable to use the **changeEncryptionKey** method to change encryption keys. This way, when you reinstall a Probe or install a new Probe, you can import the existing key (whose name and location you know) by running the **importEncryptionKey** method on the Probe JMX console.

Note:

- ➤ The difference between the methods used to create a key (generateEncryptionKey) and to update a key (changeEncryptionKey) is that generateEncryptionKey creates a new, random encryption key, while changeEncryptionKey imports an encryption key whose name you provide.
- ➤ Only one encryption key can exist on a system, no matter how many Probes are installed.

This section includes the following tasks:

- ➤ "Generate a New Encryption Key" on page 280
- ➤ "Update an Encryption Key" on page 282
- ➤ "Retrieve Encryption Key File Name" on page 283
- ➤ "Disable DPAPI Encryption" on page 283
- ➤ "Manually Change the Encryption Key When Probe Manager and Probe Gateway Installed on Separate Machines" on page 284
- ➤ "Define Several JCE Providers for the Server" on page 284

Generate a New Encryption Key

You can generate a new key to be used by the UCMDB Server and Data Flow Probe for encryption/decryption. DFM replaces the old key with the new generated key, and distributes this key among the Probes.

To generate a new encryption key through the JMX Console:

- 1 Launch the Web browser and enter the server address, as follows: http://<UCMDB Server Host Name or IP>:8080/jmx-console.
 - You may have to log in with a user name and password.
- **2** Under UCMDB, click **UCMDB:service=Discovery Manager** to open the JMX MBEAN View page.

- **3** Locate the **generateEncryptionKey** operation.
 - ➤ In the **customerId** parameter box, enter **1** (the default).
 - ➤ **keySize**. The length of the encryption key (the length can be 128, 192, or 256).
 - ➤ usePBE. True: use additional PBE hash cycles. False: do not use additional PBE hash cycles.
 - ➤ **jceVendor**. You can choose to use a non-default JCE provider. If the box is empty, the default provider is used.
 - ➤ autoUpdateProbe. True: The server distributes the new key to the Probes automatically. False: The new key should be placed on the Probes manually.
 - ➤ exportEncryptionKey. True: In addition to creating the new password and storing it in secured storage, the Server exports the new password to the file system (C:\hp\UCMDB\UCMDBServer\conf\server\ discovery\key.bin). This option enables you to update Probes manually with the new password. False: The new password is not exported to the file system.

To update Probes manually, set **autoUpdateProbe** to **False** and **exportEncryptionKey** to **True**.

Important:

Make sure that the Probe is up and connected to the server. If the Probe goes down, the key cannot reach the Probe.

If you have changed the key before the Probe goes down, once the Probe is up again, the key is sent again to the Probe. However, if you have changed the key more than once before the Probe goes down, you must change the key manually through the JMX console. (Select **False**).

4 Click **Invoke** to generate the encryption key.

Update an Encryption Key

You use the **changeEncryptionKey** method to import an encryption key.

To update an encryption key through the JMX Console:

- 1 Launch the Web browser and enter the server address, as follows: http://<UCMDB Server Host Name or IP>:8080/jmx-console.
 - You may have to log in with a user name and password.
- **2** Under UCMDB, click **UCMDB:service=Discovery Manager** to open the JMX MBEAN View page.
- **3** Locate the **changeEncryptionKey()** operation.
 - ➤ In the **customerId** parameter box, enter **1** (the default).
 - ➤ newKeyFileName. Enter the name of the new key.
 - ➤ **keySizeInBits**. The length of the encryption key (the length can be 128, 192, or 256).
 - ➤ usePBE. true: use additional PBE hash cycles. false: do not use additional PBE hash cycles.
 - ➤ **jceVendor**. You can choose to use a non-default JCE provider. If the box is empty, the default provider is used.
 - ➤ autoUpdateProbe. Leave as True for the server to automatically distribute the changed key to the Probes.
 - Select **False** to distribute the changed key manually using the Probe JMX console.

Important:

Make sure that the Probe is up and connected to the server. If the Probe goes down, the key cannot reach the Probe.

If you have changed the key before the Probe goes down, once the Probe is up again, the key is sent again to the Probe. However, if you have changed the key more than once before the Probe goes down, you must change the key manually through the JMX console. (Select **False**).

4 Click **Invoke** to generate and update the encryption key.

Retrieve Encryption Key File Name

When you change an encryption key on the server (by using the **changeEncryptionKey** method), you may not want the new key to be downloaded automatically to the Probes because of security concerns. You can download the encryption key file to a Probe manually.

To prevent automatic download, run the importEncryptionKey method:

- 1 Place the encryption key file in the C:\hp\UCMDB\DataFlowProbe\runtime\probeManager\binaryData directory.
- **2** Launch the Web browser and enter the Probe address, as follows: http://localhost:1977/.

You may have to log in with a user name and password.

- **3** Under the Probe domain, click **type=MainProbe** to open the MBean View page.
- **4** Locate the **importEncryptionKey** method.
- 5 Enter the name of the encryption key file that resides in the C:\hp\UCMDB\DataFlowProbe\runtime\probeManager\binaryData directory.

This file contains the key to be imported.

6 Click the **importEncryptionKey** button.

Disable DPAPI Encryption

The key is encrypted with DPAPI on the file system. You can disable this encryption.

To disable encryption with DPAPI:

1 Launch the Web browser and enter the server address, as follows: http://<UCMDB Server Host Name or IP>:8080/jmx-console.

You may have to log in with a user name and password.

- **2** Under UCMDB, click **UCMDB:service=Discovery Manager** to open the JMX MBEAN View page.
- **3** Locate the **setDPApiUsage()** operation and enter the following properties:
 - ➤ In the **customerId** parameter box, enter **1** (the default).
 - ➤ useDPAPI. true: use DPAPI. false: do not use DPAPI.
- **4** Click **Invoke** to disable the DPAPI encryption.

Manually Change the Encryption Key When Probe Manager and Probe Gateway Installed on Separate Machines

- 1 On the Probe Manager machine, start the Probe Gateway service: **Start** > **Programs** > **HP UCMDB** > **Probe Gateway**.
- **2** Import the key from the server, using the Probe Gateway JMX. For details, see "Generate a New Encryption Key" on page 280.
- **3** After the encryption key is imported successfully, stop the Probe Gateway service.

Define Several JCE Providers for the Server

When generating an encryption key through the JMX Console, you can define several JCE providers with the **changeEncryptionKey** and **generateEncryptionKey** methods.

To change the default JCE provider:

- **1** Register the JCE provider jar files at the **\$JRE_HOME/lib/ext** directory.
- **2** Copy the jar files to the **\$JRE_HOME** directory:
 - ➤ For the **UCMDB Server**: **\$JRE_HOME** resides at:
 - C:\hp\UCMDB\UCMDBServer\bin\jre
 - ➤ For the **Data Flow Probe**: **\$JRE_HOME** resides at:
 - ➤ C:\hp\UCMDB\DataFlowProbe\bin\jre
- **3** Add the provider class at the end of the provider list in the **\$JRE_HOME\lib\security\java.security** file.

- **4** Update the **local_policy.jar** and **US_export_policy.jar** files to include unlimited JCE policies. You can download these jar files from the Sun site.
- **5** Restart the UCMDB Server and the Data Flow Probe.
- **6** Locate the JCE vendor field for the **changeEncryptionKey** or **generateEncryptionKey** method, and add the name of the JCE provider.

P Export and Import the domainScopeDocument (DSD) File in Encrypted Format

You can export and import DSD files in encrypted format. (You would probably import a DSD file during recovery following a system crash or during upgrade.)

- ➤ When exporting the DSD file, you must enter a password (of your choosing). The file is encrypted with this password. The encryption key used for storing the DSD file in the UCMDB database is no longer used.
- ➤ When importing the DSD file, you must use the same password that was defined when the DSD file was exported.

Important: If you exported the domainScopeDocument file from UCMDB version 8.02, to import the file to your present version, copy the password from the contents of the key.bin file located on the version 8.02 system.

To export or import a DSD file:

- 1 Launch the Web browser and enter the server address, as follows: http://<UCMDB Server Host Name or IP>:8080/jmx-console.
 - You may have to log in with a user name and password.
- **2** Under UCMDB, click **UCMDB:service=Discovery Manager** to open the JMX MBEAN View page.
- **3** Locate the **ExportDomainScopeDocument** or **importDomainScopeDocument** operation and enter the existing file name and password.

Chapter 18 • Hardening Data Flow Management

4 Click **Invoke** to export or import the domainScopeDocument file.

The location of the saved domainScopeDocument file is the C:\hp\UCMDB\UCMDBServer\conf\server\discovery\<customer_dir> directory.

19

Hardening the Data Flow Probe

This chapter includes:

Tasks

- ➤ Set the MySQL Database Encrypted Password on page 288
- ➤ Set the JMX Console Encrypted Password on page 290
- ➤ Enable SSL Between UCMDB Server and Data Flow Probe with Mutual Authentication on page 292
- ➤ Enable SSL on the Data Flow Probe with Basic Authentication on page 292
- ➤ Connect the Data Flow Probe by Reverse Proxy on page 293
- ➤ Control the Location of the domainScopeDocument File on page 294

Tasks

Set the MySQL Database Encrypted Password

This section explains how to encrypt the password for the MySQL database user.

1 Create the Encrypted Form of a Password (AES, 192-bit key)

a Access the Data Flow Probe JMX console: Launch a Web browser and enter the following address: http://<Data Flow Probe machine name or IP address>:1977. If you are running the Data Flow Probe locally, enter http://localhost:1977.

You may have to log in with a user name and password.

Note: If you have not created a user, use the default user name **admin** and the password admin to log in.

- **b** Locate the **Type=MainProbe** service and click the link to open the JMX MBEAN View page.
- **c** Locate the **getEncryptedDBPassword** operation.
- **d** In the **DB Password** field, enter the password to be encrypted.
- e Invoke the operation by clicking the **getEncryptedDBPassword** button.

The result of the invocation is an encrypted password string, for example:

66,85,54,78,69,117,56,65,99,90,86,117,97,75,50,112,65,53,67,114,112,65,61,61

2 Stop the Data Flow Probe

Start > Programs > HP UCMDB > Stop Data Flow Probe

3 Run the set_dbuser_password.cmd Script

This script is located in the following folder: C:\hp\UCMDB\DataFlowProbe\tools\dbscripts \set_dbuser_password.cmd

Run the **set_dbuser_password.cmd** script with the new password as an argument, for example, **set_dbuser_password < my_password>**.

The password must be entered in its unencrypted form (as plain text).

4 Update the Password in the Data Flow Probe Configuration Files

- **a** The password must reside encrypted in the configuration files. To retrieve the password's encrypted form, use the **getEncryptedDBPassword** JMX method, as explained in page 288.
- Add the encrypted password to the following properties in theC:\hp\UCMDB\DataFlowProbe\conf\DiscoveryProbe.properties file.
 - ➤ appilog.agent.probe.jdbc.pwd

For example:

```
appilog.agent.probe.jdbc.user = mamprobe
appilog.agent.probe.jdbc.pwd =
66,85,54,78,69,117,56,65,99,90,86,117,97,75,50,112,65,53,67,114,112,65,6
1,61
```

➤ appilog.agent.local.jdbc.pwd

5 Start the Data Flow Probe

Start > Programs > HP UCMDB > Start Data Flow Probe

The clearProbeData.bat Script: Usage

The **clearProbeData.bat** script recreates the database user with a password that is provided as an argument to the script.

After you set a password, each time you execute the **clearProbeData.bat** script, it retrieves the database password as an argument.

After running the script:

- Review the following file for errors:C:\hp\UCMDB\DataFlowProbe\runtime\log\probe_setup.log
- Delete the following file, as it contains the database password:
 C:\hp\UCMDB\DataFlowProbe\runtime\log\probe_setup.log

eals Set the JMX Console Encrypted Password

This section explains how to encrypt the password for the JMX user. The encrypted password is stored in the DiscoveryProbe.properties file. Users must log in to access the JMX console.

1 Create the Encrypted Form of a Password (AES, 192-bit key)

a Access the Data Flow Probe JMX console: Launch a Web browser and enter the following address: http://<Data Flow Probe machine name or IP address>:1977. If you are running the Data Flow Probe locally, enter http://localhost:1977.

You may have to log in with a user name and password.

Note: If you have not created a user, use the default user name **admin** and the password **admin** to log in.

- **b** Locate the **Type=MainProbe** service and click the link to open the JMX MBEAN View page.
- **c** Locate the **getEncryptedKeyPassword** operation.
- **d** In the **Key Password** field, enter the password to be encrypted.
- **e** Invoke the operation by clicking the **getEncryptedKeyPassword** button.

The result of the invocation is an encrypted password string, for example:

85,-9,-61,11,105,-93,-81,118

2 Stop the Data Flow Probe

Start > Programs > HP UCMDB > Stop Data Flow Probe

3 Add the Encrypted Password

Add the encrypted password to the following property in the C:\hp\UCMDB\DataFlowProbe\conf\DiscoveryProbe.properties file.

appilog.agent.Probe.JMX.BasicAuth.Pwd

For example:

appilog.agent.Probe.JMX.BasicAuth.User=admin appilog.agent.Probe.JMX.BasicAuth.Pwd=-85,-9,-61,11,105,-93,-81,118

Note: To disable authentication, leaves these fields empty. If you do so, users can open the main page of the Probe's JMX console without entering authentication.

4 Start the Data Flow Probe

- **a** Start > Programs > HP UCMDB > Start Data Flow Probe
- **b** Test the result in a Web browser.

Figure 1 Enable SSL Between UCMDB Server and Data Flow Probe with Mutual Authentication

Note: In version 9.01, this functionality is not supported. Instead, you should use basic authentication. For details, see "Enable SSL on the Data Flow Probe with Basic Authentication" on page 292.

P Enable SSL on the Data Flow Probe with Basic Authentication

To set basic authentication:

- 1 Locate the following file: C:\hp\UCMDB\DataFlowProbe\conf\ DiscoveryProbe.properties.
- **2** Remove the comment markers (#) from the following properties, and enter the relevant credentials:

appilog.agent.Probe.BasicAuth.Realm= appilog.agent.Probe.BasicAuth.User= appilog.agent.Probe.BasicAuth.Pwd=

The credentials should match those defined on the UCMDB server.

Connect the Data Flow Probe by Reverse Proxy

Perform the following procedure to connect the Data Flow Probe by reverse proxy.

Note: Enabling mutual authentication when using SSL between the UCMDB Server and the Data Flow Probe is not supported when the connection is made by reverse proxy.

To configure the Data Flow Probe to work against a reverse proxy:

- Edit the discoveryProbe.properties file (located in C:\hp\UCMDB\DataFlowProbe\conf).
- **2** Set the **serverName** property to the reverse proxy server's IP or DNS name.
- **3** Save the file.

The following proxy server configuration is required if Data Flow Probes only are connected via a reverse proxy to HP Universal CMDB:

Requests for on the Reverse Proxy Server	Proxy Request to be Served by:
/mam-collectors	http://[HP Universal CMDB server]/mam-collectors

The following configuration is required if a SOAP adapter is used for replication via a reverse proxy to a secure (hardened) HP Universal CMDB:

Requests for on the Reverse Proxy Server	Proxy Request to be Served by:
/axis2	http://[HP Universal CMDB server]/axis2

Connecting the Data Flow Probe and Web Clients by Reverse Proxy

The following configuration is required if both Data Flow Probes and application users are connected via a reverse proxy to HP Universal CMDB:

Requests for on the Reverse Proxy Server	Proxy Request to be Served by:
/mam	[HP Universal CMDB server]/mam
/mam_images	[HP Universal CMDB server]/mam_images
/mam-collectors	[HP Universal CMDB server]/mam-collectors
/ucmdb	[HP Universal CMDB server]/ucmdb
/site	[HP Universal CMDB server]/site

eals Control the Location of the domainm ScopeDocument File

The Probe's file system holds (by default) both the encryption key and the domainScopeDocument file. Each time the Probe is started, the Probe retrieves the domainScopeDocument file from the server and stores it on its file system. To prevent unauthorized users from obtaining these credentials, you can configure the Probe so that the domainScopeDocument file is held in the Probe's memory and is not stored on the Probe file system.

To control the location of the domainScopeDocument file:

1 Open C:\hp\UCMDB\DataFlowProbe\conf\DiscoveryProbe.properties and change:

appilog.collectors.storeDomainScopeDocument=true

to:

appilog.collectors.storeDomainScopeDocument=false

The Probe Gateway and Probe Manager serverData folders no longer contain the domainScopeDocument file.

For details on using the domainScopeDocument file to harden DFM, see "Manage the Storage of Credentials" on page 278.

2 Restart the Probe.

Chapter 19 • Hardening the Data Flow Probe

20

Lightweight Single Sign-On Authentication (LW-SSO) – General Reference

This chapter includes:

Concepts

➤ LW-SSO Authentication Overview on page 298

Reference

- ➤ LW-SSO System Requirements on page 300
- ➤ LW-SSO Security Warnings on page 301

Troubleshooting and Limitations on page 303

Concepts

LW-SSO Authentication Overview

LW-SSO is a method of access control that enables a user to log on once and gain access to the resources of multiple software systems without being prompted to log on again. The applications inside the configured group of software systems trust the authentication, and there is no need for further authentication when moving from one application to another.

The information in this section applies to LW-SSO version 2.2 and 2.3.

This section includes the following topics:

- ➤ "LW-SSO Token Expiration" on page 298
- ➤ "Recommended Configuration of the LW-SSO Token Expiration" on page 298
- ➤ "GMT Time" on page 299
- ➤ "Multi-domain Functionality" on page 299
- ➤ "Get SecurityToken for URL Functionality" on page 299

LW-SSO Token Expiration

The LW-SSO Token's expiration value determines the application's session validity. Therefore, its expiration value should be at least the same value as that of the application session expiration value.

Recommended Configuration of the LW-SSO Token **Expiration**

Each application using LW-SSO should configure token expiration. The recommended value is 60 minutes. For an application that does not require a high level of security, it is possible to configure a value of 300 minutes.

GMT Time

All applications participating in an LW-SSO integration must use the same GMT time with a maximum difference of 15 minutes.

Multi-domain Functionality

Multi-domain functionality requires that all applications participating in LW-SSO integration configure the trustedHosts settings (or the **protectedDomains** settings), if they are required to integrate with applications in different DNS domains. In addition, they must also add the correct domain in the **lwsso** element of the configuration.

Get SecurityToken for URL Functionality

To receive information sent as a **SecurityToken for URL** from other applications, the host application should configure the correct domain in the **Iwsso** element of the configuration.

Reference

LW-SSO System Requirements

The following table lists LW-SSO configuration requirements:

Application	Version	Comments
Java	1.5 and higher	
HTTP Sevlets API	2.1 and higher	
Internet Explorer	6.0 and higher	Browser should enable HTTP session cookie and HTTP 302 Redirect functionality
FireFox	2.0 and higher	Browser should enable HTTP session cookie and HTTP 302 Redirect functionality
JBoss	JBoss 4.0.3	
Authentications	JBoss 4.3.0	
Tomcat Authentications	Standalone Tomcat 5.0.28	
	Standalone Tomcat 5.5.20	
Acegi	Acegi 0.9.0	
Authentications	Acegi 1.0.4	
Spring Security Authentication	Spring Security 2.0.4	
Web Services	Axis 1 - 1.4	
Engines	Axis 2 - 1.2	
	JAX-WS-RI 2.1.1	

🔍 LW-SSO Security Warnings

This section describes security warnings that are relevant to the LW-SSO configuration:

➤ Confidential InitString parameter in LW-SSO. LW-SSO uses Symmetric Encryption to validate and create a LW-SSO token. The initString parameter within the configuration is used for initialization of the secret key. An application creates a token, and each application using the same initString parameter validates the token.

Caution:

- ➤ It is not possible to use LW-SSO without setting the **initString** parameter.
- ➤ The **initString** parameter is confidential information and should be treated as such in terms of publishing, transporting, and persistency.
- ➤ The **initString** parameter should be shared only between applications integrating with each other using LW-SSO.
- ➤ The **initString** parameter should have a minimum length of 12 characters.
- ➤ Enable LW-SSO only if required. LW-SSO should be disabled unless it is specifically required.
- ➤ Level of authentication security. The application that uses the weakest authentication framework and issues a LW-SSO token that is trusted by other integrated applications determines the level of authentication security for all the applications.

It is recommended that only applications using strong and secure authentication frameworks issue an LW-SSO token.

- ➤ Symmetric encryption implications. LW-SSO uses symmetric cryptography for issuing and validating LW-SSO tokens. Therefore, any application using LW-SSO can issue a token to be trusted by all other applications sharing the same initString parameter. This potential risk is relevant when an application sharing an initString either resides on, or is accessible from, an untrusted location.
- ➤ User mapping (Synchronization). The LW-SSO framework does not ensure user mapping between the integrated applications. Therefore, the integrated application must monitor user mapping. We recommend that you share the same user registry (as LDAP/AD) among all integrated applications.

Failure to map users may cause security breaches and negative application behavior. For example, the same user name may be assigned to different real users in the various applications.

In addition, in cases where a user logs onto an application (AppA) and then accesses a second application (AppB) that uses container or application authentication, the failure to map the user will force the user to manually log on to AppB and enter a user name. If the user enters a different user name than was used to log on to AppA, the following behavior can arise: If the user subsequently accesses a third application (AppC) from AppA or AppB, then they will access it using the user names that were used to log on to AppA or AppB respectively.

- ➤ Identity Manager. Used for authentication purposes, all unprotected resources in the Identity Manager must be configured with the nonsecureURLs setting in the LW-SSO configuration file.
- ➤ LW-SSO Demo mode.
 - ➤ The Demo mode should be used for demonstrative purposes only.
 - ➤ The Demo mode should be used in unsecured networks only.
 - ➤ The Demo mode must not be used in production. Any combination of the Demo mode with the production mode should not be used.

🍳 Troubleshooting and Limitations

Known Issues

This section describes known issues for LW-SSO authentication.

➤ **Security context.** The LW-SSO security context supports only one attribute value per attribute name.

Therefore, when the SAML2 token sends more than one value for the same attribute name, only one value is accepted by the LW-SSO framework.

Similarly, if the IdM token is configured to send more than one value for the same attribute name, only one value is accepted by the LW-SSO framework.

- ➤ Multi-domain logout functionality when using Internet Explorer 7. Multi-domain logout functionality may fail under the following conditions:
 - ➤ The browser used is Internet Explorer 7 and the application is invoking more than three consecutive HTTP 302 redirect verbs in the logout procedure.

In this case, Internet Explorer 7 may mishandle the HTTP 302 redirect response and display an **Internet Explorer cannot display the webpage** error page instead.

As a workaround, it is recommended to reduce, if possible, the number of application redirect commands in the logout sequence.

Limitations

Note the following limitations when working with LW-SSO authentication:

➤ Client access to the application.

If a domain is defined in the LW-SSO configuration:

- ➤ The application clients must access the application with a Fully Qualified Domain Name (FQDN) in the login URL, for example, http://myserver.companydomain.com/WebApp.
- ➤ LW-SSO cannot support URLs with an IP address, for example, http://192.168.12.13/WebApp.

➤ LW-SSO cannot support URLs without a domain, for example, http://myserver/WebApp.

If a domain is not defined in the LW-SSO configuration: The client can access the application without a FQDN in the login URL. In this case a LW-SSO session cookie is created specifically for a single machine without any domain information. Therefore, the cookie is not delegated by the browser to another, and does not pass to other computers located in the same DNS domain. This means that LW-SSO does not work in the same domain.

➤ LW-SSO framework integration. Applications can leverage and use LW-SSO capabilities only if integrated within the LW-SSO framework in advance.

➤ Multi-Domain Support.

- ➤ Multi-domain functionality is based on the HTTP referrer. Therefore, LW-SSO supports links from one application to another and does not support typing a URL into a browser window, except when both applications are in the same domain.
- ➤ The first cross domain link using **HTTP POST** is not supported.

Multi domain functionality does not support the first HTTP POST request to a second application (only the HTTP GET request is supported). For example, if your application has an HTTP link to a second application, an HTTP GET request is supported, but an HTTP FORM request is not supported. All requests after the first can be either HTTP POST or HTTP GET.

➤ LW-SSO Token size:

The size of information that LW-SSO can transfer from one application in one domain to another application in another domain is limited to 15 Groups/Roles/Attributes (note that each item may be an average of 15 characters long).

➤ Linking from Protected (HTTPS) to non-protected (HTTP) in a multi-domain scenario:

Multi domain functionality does not work when linking from a protected (HTTPS) to a non-protected (HTTP) page. This is a browser limitation where the referrer header is not sent when linking from a protected to a non-protected resource. For an example, see: http://support.microsoft.com/support/kb/articles/Q178/0/66.ASP

➤ Third-Party cookie behavior in Internet Explorer:

Microsoft Internet Explorer 6 contains a module that supports the "Platform for Privacy Preferences (P3P) Project," meaning that cookies coming from a Third Party domain are by default blocked in the Internet security zone. Session cookies are also considered Third Party cookies by IE, and therefore are blocked, causing LW-SSO to stop working. For details, see: http://support.microsoft.com/kb/323752/en-us.

To solve this issue, add the launched application (or a DNS domain subset as *.mydomain.com) to the Intranet/Trusted zone on your computer (in Microsoft Internet Explorer, select Menu > Tools > Internet Options > Security > Local Intranet > Sites > Advanced), which causes the cookies to be accepted.

Caution: The LW-SSO session cookie is only one of the cookies used by the Third Party application that is blocked.

➤ SAML2 token.

- ➤ Logout functionality is not supported when the SAML2 token is used.

 Therefore, if the SAML2 token is used to access a second application, a user who logs out of the first application is not logged out of the second application.
- ➤ The SAML2 token's expiration is not reflected in the application's session management.
 - Therefore, if the SAML2 token is used to access a second application, each application's session management is handled independently.
- ➤ JAAS Realm. The JAAS Realm in Tomcat is not supported.
- ➤ Using spaces in Tomcat directories. Using spaces in Tomcat directories is not supported.

Chapter 20 • Lightweight Single Sign-On Authentication (LW-SSO) – General Reference

It is not possible to use LW-SSO when a Tomcat installation path (folders) includes spaces (for example, Program Files) and the LW-SSO configuration file is located in the **common\classes** Tomcat folder.

- ➤ Load balancer configuration. A load balancer deployed with LW-SSO must be configured to use sticky sessions.
- ➤ **Demo mode**. In Demo mode, LW-SSO supports links from one application to another but does not support typing a URL into a browser window, due to an HTTP referrer header absence in this case.

21

HP Universal CMDB Login Authentication

This chapter includes:

Concepts

➤ Set Up an Authentication Method on page 308

Tasks

- ➤ Enable and Define the LDAP Authentication Method on page 309
- ➤ Set a Secure Connection with the SSL (Secure Sockets Layer) Protocol on page 310
- ➤ Use the JMX Console to Test LDAP Connections on page 312
- ➤ Enable Login to HP Universal CMDB with LW-SSO on page 312
- ➤ Retrieve Current LW-SSO Configuration In Distributed Environment on page 314

Concepts

🚜 Set Up an Authentication Method

To perform authentication, you can work:

- ➤ Against the internal HP Universal CMDB service.
- > Through the Lightweight Directory Access Protocol (LDAP). You can use a dedicated, external LDAP server to store the authentication information instead of using the internal HP Universal CMDB service. The LDAP server must reside on the same subnet as all the HP Universal CMDB servers.

For details on , see "LDAP Mapping" in the HP Universal CMDB Administration Guide.

The default authentication method uses the internal HP Universal CMDB service. If you use the default method, you do not have to make any changes to the system.

These options apply to logins performed through Web services as well as through the user interface.

➤ Through LW-SSO. HP Universal CMDB is configured with LW-SSO. LW-SSO enables you to log in to HP Universal CMDB and automatically have access to other configured applications running on the same domain, without needing to log in to those applications.

When LW-SSO Authentication Support is enabled (it is disabled by default), you must ensure that the other applications in the Single Sign-On environment have LW-SSO enabled and are working with the same initString parameter.

Tasks

P Enable and Define the LDAP Authentication Method

You can enable and define the LDAP authentication method for an HP Universal CMDB system.

To enable and define the LDAP authentication method:

- 1 Select Administration > Infrastructure Settings.
- **2** In the Categories pane, locate and select the **LDAP General** category.
- **3** In the table, locate and select **LDAP server URL**.
- **4** Enter the LDAP URL value, using the format:

ldap://<ldapHost>[:<port>]/[<baseDN>][??scope]

For example:

ldap://my.ldap.server:389/ou=People,o=myOrg.com??sub

- **5** Locate **Enable LDAP authentication**, and select **True**.
- **6** In the Categories pane, locate and select the **LDAP Group Definition** category.
- **7** Locate **Groups base DN** and enter the distinguished name of the general group.
- **8** Locate **Root groups base DN** and enter the distinguished name of the root group.
- **9** In the Categories pane, locate and select the **LDAP General** category.
- **10** Locate Enable User Synchronization and verify that the value is set to True.
- 11 In the Categories pane, locate and select the LDAP General **Authentication** category.

- **12** Locate **Password of Search-Entitled User** and fill in the password.
- **13** Save the new values. To replace an entry with the default value, click **Restore Default**.
- **14** Map LDAP user groups to UCMDB user roles. For details, see "HP Universal CMDB Login Authentication" on page 307.

The default protocol used to communicate with the LDAP server is TCP, but you can change the protocol to SSL. For details, see "Set a Secure Connection with the SSL (Secure Sockets Layer) Protocol" on page 310.

P Set a Secure Connection with the SSL (Secure Sockets Layer) Protocol

Since the login process involves the passing of confidential information between HP Universal CMDB and the LDAP server, you can apply a certain level of security to the content. You do this by enabling SSL communication on the LDAP server and configuring HP Universal CMDB to work using SSL.

HP Universal CMDB supports SSL that uses a certificate issued by a trusted Certification Authority (CA). This CA is included with the Java runtime environment.

Most LDAP servers, including Active Directory, can expose a secure port for an SSL based connection. If you are using Active Directory with a private CA, you may need to add your CA to the trusted CAs in Java.

For details on configuring the HP Universal CMDB platform to support communication using SSL, see "Enabling Secure Sockets Layer (SSL) Communication" on page 255.

To add a CA to trusted CAs to expose a secure port for an SSL based connection:

- **1** Export a certificate from your CA and import it into the JVM that is used by HP Universal CMDB, using the following steps:
 - **a** On the UCMDB Server machine, access the **UCMDBServer\bin\JRE\bin** folder.
 - **b** Run the following command:

Keytool -import -file <your certificate file> -keystore C:\hp\UCMDB\UCMDBServer\bin\JRE\lib\security\cacerts

For example:

Keytool -import -file c:\ca2ss_ie.cer -keystore C:\hp\UCMDB\UCMDBServer\bin\JRE\lib\security\cacerts

- **2** Select Admin > Settings > Infrastructure Settings Manager. Select the Foundations context and choose LDAP Configuration from the list.
- **3** In the **LDAP Configuration LDAP General** table, access the LDAP Server URL dialog box by clicking the **Edit** button.
- **4** Enter the LDAP URL value, using the format

ldaps://<ldapHost>[:<port>]/[<baseDN>][??scope]

For example:

ldaps://my.ldap.server:389/ou=People,o=myOrg.com??sub

Note the **s** in **ldaps**.

5 Click **Save** to save the new value, **Restore Default** to replace the entry with the default value (a blank URL), or **Cancel** to close the dialog box without changing the value.

Use the JMX Console to Test LDAP Connections

This section describes a method of testing the LDAP authentication configuration using the JMX console.

- 1 Launch your Web browser and enter the following address: http://<server_name>:8080/jmx-console, where <server_name> is the name of the machine on which HP Universal CMDB is installed.
 - You may need to log in with a user name and password.
- **2** Under **UCMDB**, click **UCMDB-UI:name=LDAP Settings** to open the JMX MBEAN View page.
- **3** Locate java.lang.String testLDAPConnection.
- **4** In the **Value** box for the parameter **customer id**, enter the customer ID.
- **5** Click **Invoke**.

The JMX MBEAN Operation Result page indicates whether the LDAP connection is successful. If the connection is successful, the page also shows the LDAP root groups.

🏲 Enable Login to HP Universal CMDB with LW-SSO

To enable LW-SSO for HP Universal CMDB, use one of the following procedures:

Enable LW-SSO Through the JXM Console

- 1 Access the JMX console by entering the following address into your Web browser: http://<server_name>:8080/jmx-console, where <server_name> is the name of the machine on which HP Universal CMDB is installed.
- **2** Under **UCMDB-UI** click the **name=LW-SSO configuration** to open the JMX MBEAN View page.
- **3** Invoke the method **setLWSSOEnabled** with the parameter set to **True**.

Note: You also have to set the domain name of the machine on which UCMDB is installed and the init string using the methods **setLWSSODomain** and **setLWSSOInitString**.

- **4 Optional**. Set additional LW-SSO configuration parameters, using the relevant methods. For details about additional parameters, see "LW-SSO Authentication Overview" on page 298.
- **5** Invoke the method **reloadLWSSOConfiguration** to ensure that the configuration is loaded from the settings (the server does not need to be restarted).
- **6** To view the LW-SSO configuration as it is saved in the settings mechanism, invoke the **retrieveLWSSOConfigurationFromSettings** method.
- **7** To view the actual ,loaded LW-SSO configuration, invoke the retrieveLWSSOConfiguration method.

Enable LW-SSO Through UCMDB Infrastructure Settings

- **1** Log on to HP Universal CMDB.
- **2** Access Administration > Infrastructure Settings.
- **3** Set the domain name and initString parameter using the entries **LW-SSO** domain and **LW-SSO** init string.
- **4** Change the setting entry **LW-SSO enabling state** to **True**.
- **5** Optional. Set additional LW-SSO configuration parameters, using the relevant settings entries. For details about additional parameters, see "LW-SSO Authentication Overview" on page 298.
- **6** Restart the server.

Retrieve Current LW-SSO Configuration In Distributed Environment

When UCMDB is embedded in a distributed environment, for example, in a BSM deployment, perform the following procedure to retrieve the current LW-SSO configuration on the processing machine.

To retrieve the current LW-SSO configuration:

- **1** Launch a Web browser and enter the following address: http://localhost.<domain_name>:8080/jmx-console.
 - You may be asked for a user name and password.
- **2** Locate **UCMDB:service=Security Services** and click the link to open the JMX MBEAN View page.
- **3** Locate the **retrieveLWSSOConfiguration** operation.
- **4** Click **Invoke** to retrieve the configuration.

22

Confidential Manager

This chapter includes:

Concepts

- ➤ Confidential Manager Overview on page 316
- ➤ Security Considerations on page 316

Tasks

➤ Configure the HP Universal CMDB Server on page 317

Reference

- ➤ Definitions on page 319
- ➤ Encryption Properties on page 320

Concepts

🚜 Confidential Manager Overview

The Confidential Manager (CM) framework solves the problem of managing and distributing sensitive data for HP Universal CMDB and other HP Software products.

CM consists of two main components: the client and the server. These two components are responsible for transferring data in a secured manner."

- ➤ The CM client is a library used by applications to access sensitive data.
- ➤ The CM server receives requests from CM clients, or from third party clients, and performs the required tasks. The CM server is responsible for saving the data in a secure manner.

CM encrypts credentials in transport, in the client cache, in persistency, and in memory. CM uses symmetric cryptography for transporting credentials between the CM client and the CM server by using a shared secret. CM uses various secrets for encryption of cache, persistency, and transport according to the configuration.

For details guidelines for managing credential encryption on the Data Flow Probe, see "Credentials Encryption with Confidential Manager" on page 276.

Security Considerations

- ➤ You can use the following key sizes for the security algorithm: 128-, 192-, and 256-bits. The algorithm runs faster with the smaller key but it is less secure. The 128-bit size is secure enough in most cases.
- ➤ To make the system more secure, use MAC: set useMacWithCrypto to true. For details, see "Encryption Properties" on page 320. However, this parameter setting increases the database size.
- ➤ To leverage strong customer security providers, you can use the JCE mode.

Tasks

Tonfigure the HP Universal CMDB Server

When working with HP Universal CMDB, you should configure the secret and crypto-properties of the encryption, using the following JMX methods:

1 On the HP Universal CMDB Server machine, launch the Web browser and enter the Server address, as follows: http://<UCMDB Server Host Name or IP>:8080/jmx-console.

You may have to log in with a user name and password.

- **2** Under UCMDB, click **UCMDB:service=Security Services** to open the Operations page.
- **3** To retrieve the current configuration, locate the **CMGetConfiguration** operation.
 - Click **Invoke** to display the CM server configuration XML file.
- **4** To make changes to the configuration, copy the XML that you invoked in the previous step to a text editor. Make changes according to the table in "Encryption Properties" on page 320.
 - Locate the **CMSetConfiguration** operation. Copy the updated configuration into the **Value** box and click **Invoke**. The new configuration is written to the UCMDB Server.
- **5** To add users to Confidential Manager for authorization and replication, locate the **CMAddUser** operation. This process is also useful in the replication process. In replication, the server slave should communicate with the server master, using a privileged user.
 - **username**. The user name.
 - **customer.** The default is ALL CUSTOMERS.
 - **resource**. The resource name. The default is ROOT FOLDER.
 - **permission**. Choose between ALL PERMISSIONS, CREATE, READ, UPDATE, and DELETE. The default is ALL_PERMISSIONS.

Click Invoke.

6 If necessary, restart HP Universal CMDB.

Note:

In most cases there is no need to restart the Server. You may need to restart the Server when changing one of the following resources:

- ➤ Storage type
- ➤ Database table name or column names
- ➤ The creator of the databse connection
- ➤ The connection properties to the database (that is, URL, user, password, driver class name)
- ➤ Database type

Note:

- ➤ It is important that the UCMDB Server and its clients have the same transport crypto-properties. If these properties are changed on the UCMDB Server, you must change them on all clients. (This is not relevant for Data Flow Probe, because it runs on the same process with the UCMDB Server—that is, there is no need for the Transport cryptoconfiguration.)
- ➤ CM Replication is not configured by default, and can be configured if needed.
- ➤ If CM Replication is enabled, and the Transportation **initString** or any other crypto-property of the master changes, all slaves must adopt the changes.

Reference

Definitions

Storage crypto-properties. The configuration that defines how the server holds and encrypts the data (in database or file, which crypto-properties must encrypt or decrypt the data, and so on), how credentials are stored in a secure manner, how encryption is processed, and according to which configuration.

Transport crypto-properties. Transport configuration defines how the server and the clients encrypt the transportation between them, which configuration is used, how credentials are transferred in a secure manner, how encryption is processed, and according to which configuration. You must use the same crypto-properties for transport encryption and decryption, in both server and client.

Replications and replication crypto-properties. Data held securely by CM is securely replicated between several servers. These properties define how the data is to be transferred between slave server and master server.

Note:

- ➤ The database table that holds the CM server configuration is named: CM_CONFIGURATION.
- ➤ The CM Server default configuration file is located in app-infra.jar and is named defaultCMServerConfig.xml.

Encryption Properties

The following table describes encryption properties. For details on using these parameters, see "Configure the HP Universal CMDB Server" on page 317.

Parameter	Description	Recommended value
encryptTransportMode	Encrypt the transported data: ➤ true ➤ false	true
encryptDecryptInitString	Password for encryption	Longer than 8 characters
cryptoSource	Encryption implementation library to use: > lw > jce > windowsDPAPI > lwJCECompatible	lw
lwJCEPBECompatibilityMode	Support previous versions of lightweight cryptography: > true > false	true
cipherType	The type of cipher that CM uses. CM supports one value only: symmetricBlockCipher	symmetric BlockCipher
engineName	➤ AES ➤ Blowfish ➤ DES ➤ 3DES ➤ Null (no encryption)	AES

Parameter	Description	Recommended value
algorithmModeName	Mode of block encryption algorithm: ➤ CBC	CBC
algorithmPaddingName	Padding standards: ➤ PKCS7Padding ➤ PKCS5Padding	PKCS7Padding
keySize	Depends on algorithm (what engineName supports)	256
pbeCount	The number of times to run the hash to create the key from encryptDecryptInitString. Any positive number.	1000
pbeDigestAlgorithm	Hashing type: ➤ SHA1 ➤ SHA256 ➤ MD5	SHA256
encodingMode	ASCII representation of the encrypted object: ➤ Base64 ➤ Base64Url	Base64Url
useMacWithCrypto	Defines whether MAC is used with the cryptography: • true • false	false
тасТуре	Type of message authentication code (MAC): ➤ hmac	hmac

Chapter 22 • Confidential Manager

Parameter	Description	Recommended value
macKeySize	Depends on Mac algorithm	256
macHashName	The Hash Mac algorithm: ➤ SHA256	SHA256

Part VII

Disaster Recovery

23

Disaster Recovery Setup

This chapter includes:

Concepts

➤ Disaster Recovery Overview on page 326

Tasks

- ➤ Prepare the Disaster Recovery Environment on page 327
- ➤ Prepare the HP Universal CMDB Failover Instance for Activation on page 330
- ➤ Perform Startup Cleanup Procedure on page 330

Concepts

Disaster Recovery Overview

This chapter describes the basic principles and guidelines on how to set up a Disaster Recovery system, and the required steps to make a Secondary HP Universal CMDB system become the new Primary HP Universal CMDB system. The chapter covers a typical HP Universal CMDB environment consisting of one HP Universal CMDB server and one database server containing HP Universal CMDB database schemas.

Note:

- ➤ This chapter is a high level guide to introduce concepts of enabling disaster recovery.
- ➤ Disaster Recovery involves manual steps in moving various configuration files and updates to the HP Universal CMDB database schemas. This procedure requires at least one HP Universal CMDB administrator and one database administrator who is familiar with the HP Universal CMDB databases and schemas.
- ➤ There are a number of different possible deployment and configurations for HP Universal CMDB. To validate that the Disaster Recovery scenario works in a particular environment, it should be thoroughly tested and documented. You should contact HP Professional Services to ensure best practices are used in the design and failover workflow for any Disaster Recovery scenario.

Tasks

Prepare the Disaster Recovery Environment

Preparing the Disaster Recovery environment comprises the following stages:

- ➤ "Install HP Universal CMDB Software in the Failover Environment" on page 327
- ➤ "Configure System and Data Backup" on page 328

Install HP Universal CMDB Software in the Failover **Environment**

Install a second instance of HP Universal CMDB that matches your current production environment.

- ➤ Install exactly the same version of HP Universal CMDB in your backup environment, as that used in your production environment.
- ➤ To simplify issues with disparate capacities and deployments, the backup environment should be the same as your production environment.
- ➤ Do not run the Server and Database Configuration utility and do not create any databases.
- ➤ Do not start the Backup system.

Note: The Disaster Recovery environment should closely resemble the HP Universal CMDB production environment. The hardware, deployment, and versions should all be matched to prevent any loss of functionality when moving to the Failover system.

Configure System and Data Backup

This stage includes copying configuration directories to the Failover instance and configuring database log file shipping.

Copying Configuration Directories to the Failover Instance

Copy from the HP Universal CMDB Production instance to the same server type in the Failover instance, any files changed in the following directories:

- ➤ UCMDBServer\conf
- ➤ UCMDBServer\content\

Also copy any other files or directories in the system that are customized.

Note: It is recommended that you perform backups of HP Universal CMDB servers at least daily. Depending on the number and interval of configuration changes, it may be necessary to incorporate a faster interval to prevent a large loss of configuration changes in the event of losing the Production instance.

Microsoft SQL Server-Configure Database Log File Shipping

To provide the most up to date monitoring and configuration data, it is critical to enable log file shipping to minimize the time in data gaps. By using log file shipping you can create an exact duplicate of the original database, out of date only by the delay in the copy-and-load process. You then have the ability to make the standby database server a new primary database server, if the original primary database server becomes unavailable. When the original primary server becomes available again, you can make it a new standby server, effectively reversing the servers' roles.

The log file shipping must be configured for the following HP Universal CMDB databases:

- ➤ HP Universal CMDB database
- ➤ HP Universal CMDB History database

This section does not contain the specific steps to configure log file shipping. The HP Universal CMDB database administrator can use the following links as a guide to configure log file shipping for the appropriate version of database software that is used in the HP Universal CMDB environment:

Microsoft SQL Server 2000:

- ➤ <u>support.microsoft.com/default.aspx?scid=http://support.microsoft.com/support/sq</u> <u>l/content/2000papers/LogShippingFinal.asp</u>
- ➤ <u>www.microsoft.com/technet/prodtechnol/sql/2000/maintain/logship1.mspx</u>

Microsoft SQL Server 2005:

- ➤ msdn2.microsoft.com/en-us/library/ms188625.aspx
- ➤ msdn2.microsoft.com/en-us/library/ms190016.aspx
- ➤ msdn2.microsoft.com/en-us/library/ms187016.aspx

Oracle-Configure the Standby Database (Data Guard)

Oracle only has logs at the database level, not for each schema. This means that you cannot make a standby database on the schema level, and must create copies of the production system databases on your backup system.

Note: HP recommends that if Oracle is the database platform, Oracle 11i should be used to utilize Data Guard.

This section does not contain the specific steps to configure a Standby database. The HP Universal CMDB database administrator can use the following link as a guide to configure a Standby database for Oracle 11i:

http://download.oracle.com/docs/cd/B19306 01/server.102/b14239/toc.htm

Upon successful completion of the Backup database configuration, the HP Universal CMDB Failover database should be synchronized with the HP Universal CMDB Production database.

Prepare the HP Universal CMDB Failover Instance for Activation

When it is time to activate the Failover instance, perform the following steps in the Failover environment:

- ➤ Activate the Backup system, including its database.
- ➤ Ensure that all the latest database logs have been updated into the Failover environment's databases.
- ➤ Run the Perform Startup Cleanup Procedure (for details, see page 330) to remove any localization in the databases.

🕆 Perform Startup Cleanup Procedure

This procedure cleans up all the machine specific references in the configurations from the Production instance. It is needed to reset the database on the Backup system.

Note:

- ➤ Before starting the activation procedures, the HP Universal CMDB Administrator should ensure that the appropriate license has been applied to the Failover instance.
- ➤ HP recommends that an experienced database administrator perform the SQL statements included in this procedure.
- 1 Empty and update tables:

```
update CUSTOMER_REGISTRATION set CLUSTER_ID=null;
truncate table CLUSTER_SERVER;
truncate table SERVER;
truncate table CLUSTERS;
```

2 Run the Server and Database Configuration utility.

Run the Server and Database Configuration utility on each machine to reinitialize the needed tables in the database. To run the Server and Database Configuration utility, select **Start** > **Programs** > **HP UCMDB** > **Start HP Universal CMDB Configuration Wizard**.

Note:

- ➤ When running the Server and Database Configuration utility, make sure to reconnect to the same databases that were created for the Failover environment (that is, the one to which the backup data was shipped). Possible complete loss of configuration data will result if the utility is run on the Production instance.
- ➤ When prompted for the databases by the Server and Database Configuration utility, ensure that you enter the names of the new databases in the Failover environment.

3 Start the servers

If you want to perform disaster recovery from a High Availability system, start one of the HP Universal CMDB servers, run the System Configuration tool on that server to configure a cluster, and add new Failover servers to this cluster.

4 Bring up the Backup Environment

Start HP Universal CMDB in the Failover environment.

Chapter 23 • Disaster Recovery Setup

Part VIII

Getting Started With HP Universal CMDB

24

Accessing HP Universal CMDB Through the IIS Web Server

This chapter includes:

Concepts

Tasks

➤ Accessing HP Universal CMDB Through IIS Overview on page 336

- ➤ Set Up IIS to Enable Access to UCMDB Windows 2003 on page 337
- ➤ Set Up IIS to Enable Access to UCMDB Windows 2008 on page 340
- ➤ Configure the Data Flow Probe on page 343

Concepts

Accessing HP Universal CMDB Through IIS Overview

This chapter describes how to access HP Universal CMDB using the Microsoft Internet Information Services (IIS) Web server.

You can set up the IIS Web server to enable end users and clients of HP Universal CMDB (for example, the Data Flow Probe) to access the system via the IIS Web server. In this setup, end users and clients of HP Universal CMDB use the IIS machine's URL to access UCMDB, instead of using the UCMDB machine URL.

This section includes the following topics:

- ➤ "Software Required for Integration" on page 336
- ➤ "Supported Configurations" on page 336

Software Required for Integration

The following table describes the software required for integration:

IIS Web Server	Version 6.0, 7.X
HP Universal CMDB Server	Version 9.01 or later

Supported Configurations

The following configurations are supported for this integration:

- ➤ Windows 2003/8 64-bit, HP Universal CMDB 9.01 or later and IIS 6 or 7.X on the **same** server.
- ➤ Windows 2003/8 64-bit, HP Universal CMDB 9.01 or later and IIS 6 or 7.X on **separate** servers.

Tasks

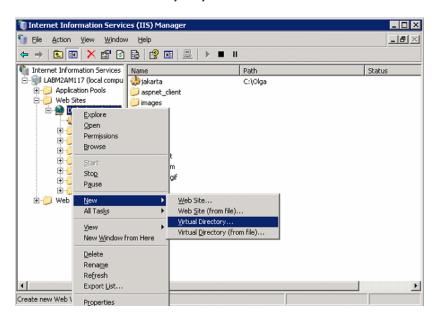

Set Up IIS to Enable Access to UCMDB – Windows 2003

This section outlines the procedure to integrate HP Universal CMDB and IIS for Windows 2003.

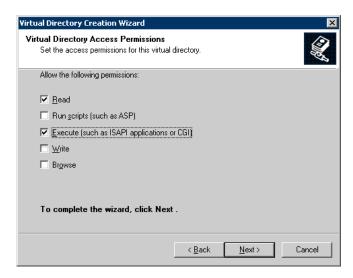

To manually integrate HP Universal CMDB and IIS:

- 1 If the HP Universal CMDB server does not reside on the same machine as IIS, copy all the files from the C:\hp\UCMDB\UCMDBServer\tools\iis integration directory to the c:\ucmdb iis folder on the IIS machine. On the IIS machine, modify the following files:
 - **a** In the workers.properties.minimal file, change the string worker.localAjp.host=localhost to the UCMDB server hostname.
 - **b** In the isapi_redirect.properties file:
 - ➤ the log file should point to a folder containing the integration logs, for example, c:\ucmdb iis\isapi.log.
 - ➤ the worker file should contain the location of the workers.properties.minimal file, for example, C:\ucmdb iis\workers.properties.minimal.
 - ➤ the worker mount file should contain the location of the uriworkermap.properties file, for example C:\ucmdb iis\uriworkermap.properties.
- **2** If the HP Universal CMDB server resides on the same machine as IIS, modify the isapi redirect.properties file in the C:\hp\UCMDB\UCMDBServer\tools\iis integration directory as follows:
- **a** the log_file should point to a folder containing the integration logs, for example, C:\hp\UCMDB\UCMDBServer\runtime\log\isapi.log.
- **b** the worker file should contain the location of the workers.properties.minimal file, for example, C:\hp\UCMDB\UCMDBServer\tools\iis integration\ workers.properties.minimal.

- the worker_mount_file should contain the location of the uriworkermap.properties file, for example
 C:\hp\UCMDB\UCMDBServer\tools\iis_integration\uriworkermap.pro perties.
- **3** Change the string worker.localAjp.host=localhost to the UCMDB server hostname (if the HP Universal CMDB server does not reside on the same machine as IIS).
- **4** Open the IIS management console. Run **inetmgr** from the command line.
- **5** Add a new virtual directory to your IIS Web site for **Windows 2003/IIS6**:

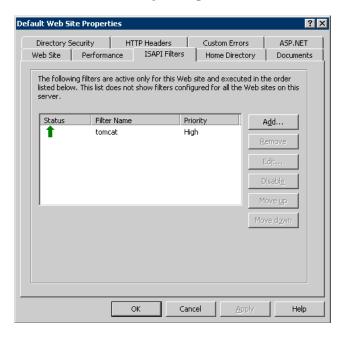

6 The Virtual Directory Creation Wizard window is displayed. The alias of the virtual directory must be jakarta. Its physical path should be C:\hp\UCMDB\UCMDBServer\tools\iis_integration. If the UCMDB server and the IIS server are running on separate machines, the path should be the directory on the IIS machine. Assign Execute access to the new virtual directory:

- 7 Open the **Default Web Site Properties** dialog box and add **isapi_redirect.dll** as an ISAPI filter to your IIS Web site. The name of the filter should reflect its task (for example, **tomcat**) and its executable must be **isapi_redirect.dll**. If the UCMDB server and the IIS server are running on separate machines, the executable must be **isapi_redirect.dll** in the directory where you copied it on the IIS machine.
- **8** Open Web Service Extensions, select All Unknown ISAPI Elements from the list, and click Allow.

9 Restart IIS (stop and start the IIS service) and make sure that the **tomcat** filter is marked with a green up arrow:

Set Up IIS to Enable Access to UCMDB – Windows 2008

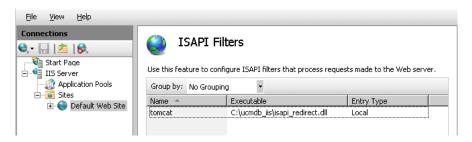

This section outlines the procedure to integrate HP Universal CMDB and IIS for Windows 2008.

To manually integrate HP Universal CMDB and IIS:

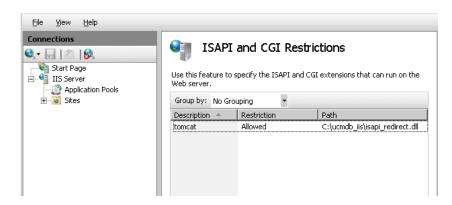

- 1 If the HP Universal CMDB server does not reside on the same machine as IIS, copy all the files from the
 - C:\hp\UCMDB\UCMDBServer\tools\iis_integration directory to the c:\ucmdb_iis folder on the IIS machine. On the IIS machine, modify the following files:
 - **a** In the workers.properties.minimal file, change the string worker.localAjp.host=localhost to the UCMDB server hostname.
 - **b** In the isapi_redirect.properties file:

- ➤ The **log_file** should point to a folder containing the integration logs, for example, **c:\ucmdb_iis\isapi.log**.
- ➤ The worker_file should contain the location of the workers.properties.minimal file, for example, C:\ucmdb_iis\workers.properties.minimal.
- ➤ The worker_mount_file should contain the location of the uriworkermap.properties file, for example C:\ucmdb_iis\uriworkermap.properties.
- 2 If the HP Universal CMDB server resides on the same machine as IIS, modify the isapi_redirect.properties file in the C:\hp\UCMDB\UCMDBServer\tools\iis_integration directory as follows:
 - **a** The **log_file** should point to a folder containing the integration logs, for example, **C:\hp\UCMDB\UCMDBServer\runtime\log\isapi.log**.
 - The worker_file should contain the location of the workers.properties.minimal file, for example,
 C:\hp\UCMDB\UCMDBServer\tools\iis_integration\ workers.properties.minimal.
 - The worker_mount_file should contain the location of the uriworkermap.properties file, for example
 C:\hp\UCMDB\UCMDBServer\tools\iis_integration\uriworkermap. properties.
- **3** Change the string worker.localAjp.host=localhost to the UCMDB server hostname (if the HP Universal CMDB server does not reside on the same machine as IIS).
- **4** Open the **IIS management console**. Run **inetmgr** from the command line.
- **5** Double-click **ISAPI** Filters.
- **6** Right-click the main window in the **IIS Management Console** and select **Add**.

Add **isapi_redirect.dll** as an ISAPI filter to your IIS Web site. The name of the filter should reflect its task (for example, **tomcat**) and its executable must be **isapi_redirect.dll**. If the UCMDB server and the IIS server are running on separate machines, the executable must be **isapi_redirect.dll** in the directory where you copied it on the IIS machine.

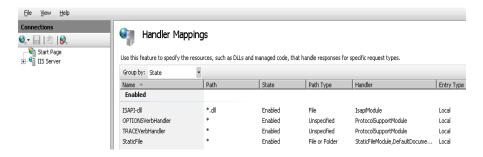

- **8** Add a new virtual directory to your IIS Web site: The alias of the virtual directory must be **jakarta**. The virtual directory must point to **C:\hp\UCMDB\UCMDBServer\tools\iis_integration** (if the folder resides on the same server as UCMDB) or to the directory that **iis_integration** was copied to, if it resides on a different server.
- Select the name of the IIS server from the **Connections** pane.
- Double-click **ISAPI** and **CGI** restrictions.
- Right-click and enter the same information you added in step 7 above.
- **12** Check the box to allow the **Execution Path** to execute.

Open Handler Mappings.

14 Select **ISAPI-dll**. Right-click and select **Edit Feature Permissions**. Click **Execute**.

- 15 Restart IIS.
- 16 In UCMDB, access Infrastructure Settings (Administration > Infrastructure Settings > General Settings). Change the enable AJP connections option to True and restart the UCMDB server.

Troubleshooting and Limitations

You cannot open the JMX Console from IIS. That is, basic authentication cannot be passed from Jetty.

Configure the Data Flow Probe

For Data Flow Probe configuration, change the following strings in the following file:

C:\hp\UCMDB\DataFlowProbe\conf\DiscoveryProbe.properties:

- ➤ serverName = <IIS host name>
- ➤ serverPort = <IIS HTTP port>, by default 80

The IIS URL (for example, http://<IIS hostname>/ucmdb) can now be used to access UCMDB, the JMX console, the UCMDB SDK, and so on.

Chapter 24 • Accessing HP Universal CMDB Through the IIS Web Server

25

Starting and Stopping the Server

This chapter includes:

Tasks

➤ Start and Stop the Server on the Windows Platform on page 346

Tasks

Start and Stop the Server on the Windows Platform

Note: For details on starting and stopping the UCMDB Server as a service, see "Start and Stop the HP Universal CMDB Server Service" on page 109.

During the installation of HP Universal CMDB, a start menu is added to the settings of the machine on which you installed UCMDB.

To access the HP Universal CMDB start menu, select **Start > Programs > HP UCMDB**. The menu includes the following options:

- **Start HP Universal CMDB Server Configuration Wizard.** Enables you to run the wizard to connect to an existing database or schema or to create a new database or schema. For details, see "Choosing the Database or Schema" on page 92.
- **Start HP Universal CMDB Server.** Click to start the server service.
- ➤ **Stop HP Universal CMDB Server.** Click to stop the server service.
- ➤ HP Universal CMDB Server Status. Click to open a Web page with information about the server. For details, see "HP Universal CMDB Services" on page 57.
- ➤ Uninstall HP Universal CMDB Server. Click to uninstall the server.

26

Accessing HP Universal CMDB

This chapter includes:

Concepts

➤ Accessing HP Universal CMDB Overview on page 348

Tasks

- ➤ Access HP Universal CMDB and its Components on page 349
- ➤ Enable Automatic Login on page 351
- ➤ Change Default Time Limit for User Inactivity Log Out on page 352

Concepts

🚜 Accessing HP Universal CMDB Overview

You access HP Universal CMDB using a supported Web browser, from any computer with a network connection (intranet or Internet) to the HP Universal CMDB Server. The level of access granted a user depends on the user's permissions. For details on granting user permissions, see "Set Up Users" in the HP Universal CMDB Administration Guide.

For details on Web browser requirements, as well as minimum requirements to successfully view HP Universal CMDB, see Chapter 2, "HP Universal CMDB Support Matrix."

For details on accessing HP Universal CMDB securely, see Part VI, "Hardening HP Universal CMDB."

For details on login authentication strategies that can be used in HP Universal CMDB, see "Set Up an Authentication Method" on page 308.

For login troubleshooting information, see Chapter 11, "Login Troubleshooting."

Tip: Click the **Help** button on the login page for complete login help.

Tasks

Access HP Universal CMDB and its Components

This section explains how to access the HP Universal CMDB components.

1 In the Web browser, enter the URL of the HP Universal CMDB Server, for example, http://<server name or IP address>.<domain name>:8080 where **<server** name or IP address>.**<domain** name> represents the fully qualified domain name (FQDN) of the HP Universal CMDB server.

If HP Universal CMDB is set up to work through a reverse proxy, enter https://cyclear https://cy or IP address of the proxy server.

If the correct Java version is not installed on your machine, you can choose to download the version from sun.com or from the UCMDB server. (If you log in without installing Java, you will not be able to view pages that need a Java applet to display correctly.) For details, see "Troubleshooting and Limitations" on page 174.

- **2** Click a link to work with HP Universal CMDB:
 - **a UCMDB Application**. Opens the login page. For details, see "Log In to HP Universal CMDB" on page 350.

Note: You can also access the login page by entering http://<server name or IP address>.<domain name>:8080/ucmdb.

- **b** Server Status. Opens the Server Status page. For details, see Chapter 5, "HP Universal CMDB Services."
- **c JMX Console**. Enables you to perform operations on the CMDB through the JMX console interface.
- **d** API Connection Test. Displays information about the HP Universal CMDB Server for you to use when running an API to the CMDB.

- **e** API Client Download. Downloads the UCMDB API jar file.
- **f** API Reference. Opens the HP UCMDB API Reference documentation.

Log In to HP Universal CMDB

- **a** Enter the default superuser login parameters:
 - ➤ User Login=admin, User Password=admin.
 - ➤ If HP Universal CMDB is installed in a multiple customer or multiple state environment (for example, HP Software-as-a-Service or Amber), a Customer field is displayed. Choose the Customer name from the list.
 - ➤ Select **Open in new window** to open the application in another browser window.
 - ➤ Remember me on this machine: Select for automatic login. That is, the next time you log in to UCMDB, you do not need to enter your user name and password.
- **b** Click **Log In**. After logging in, the user name appears at the top right of the screen.
- **c** (Recommended) Change the superuser password immediately to prevent unauthorized entry. For details on changing the password, see "Reset Password Dialog Box" in the *HP Universal CMDB Administration Guide*.
- **d** (Recommended) Create additional administrative users to enable HP Universal CMDB administrators to access the system. For details on creating users in the HP Universal CMDB system, see "Add New User Wizard" in the HP Universal CMDB Administration Guide.

Log Out

When you have completed your session, it is recommended that you log out of the Web site to prevent unauthorized entry.

To log out:

Click **Logout** at the top of the page.

🚏 Enable Automatic Login

Advanced login options enables you to automate login, limit login access, and provide direct login capabilities to specific pages in HP Universal CMDB.

When automatic login is enabled from the login page, the next time the user enters the URL to access HP Universal CMDB, the login page does not open, the login name and password do not have to be entered, and the default page that is set to open for the user opens automatically.

To enable automatic login:

- 1 In the HP Universal CMDB login page, select the option Remember me on this machine.
- **2** When completing your session, do not click **Logout** at the top of the page, but close the browser window.

Logging out disables the automatic login option, in which case you must enter the login name and password the next time you access HP Universal CMDB.

Guidelines for Using Automatic Login

Keep the following in mind when using this option:

- ➤ Using the **Logout** option at the top of the HP Universal CMDB page cancels the option. If a user has logged out, the next time the user logs in, the Login page opens and the user must enter a login name and password. This can be useful if another user must log in on the same machine using a different user name and password.
- ➤ This option could be considered a security risk and should be used with caution.

Thange Default Time Limit for User Inactivity Log Out

HP Universal CMDB includes an automatic logout feature which logs out when the system is inactive for a set time period. The default period is 1440 minutes (24 hours). After that time, a message appears with a 30-second countdown until logout.

This task describes how to adjust the time limit UCMDB stays open without any user input before automatically logging out.

To change the default logout time:

- 1 Select Administration > Infrastructure Settings > General Settings category > Inactive Allowed Time setting.
- **2** From the **Value** column select **Value**.
- **3** Enter a new time interval in minutes. All values for Inactive Allowed time are located in the Properties window: right-click **Inactive allowed time** Properties or double-click the **Inactive allowed time** setting.

27

Navigating HP Universal CMDB

This chapter includes:

Concepts

- ➤ Navigating the HP Universal CMDB User Interface on page 354
- ➤ Working with the HP Universal CMDB Documentation on page 356

Reference

➤ Menus and Options on page 359

Concepts

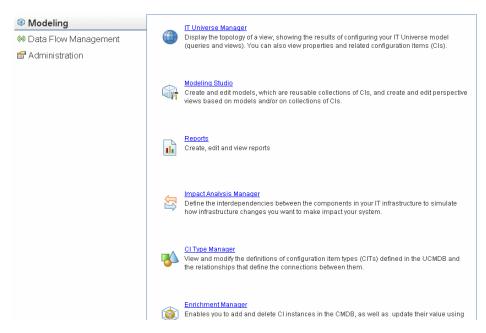

Navigating the HP Universal CMDB User Interface

HP Universal CMDB runs in a Web browser. You move around HP Universal CMDB using the following navigation functions:

➤ Navigation Bar. Enable quick navigation between modules. Click the category in the lower part of the bar and select the module from the icons in the upper part of the bar.

➤ Orientation Map. For each category, you can display a map with brief descriptions of each of the modules included by selecting Managers > Orientation Map.

➤ **Status Bar.** Provides information on the CMDB application and enables you to configure certain aspects of your interface.

➤ Collapse/Expand Arrows. Enable collapsing and expanding of panes with a single click.

Note: The Web browser **Back** function is not supported in HP Universal CMDB. Using the **Back** function does not always revert the current context to the previous context. To navigate to a previous context, use the breadcrumb function.

Working with the HP Universal CMDB Documentation

The following sections describe how to navigate and use the HP Universal CMDB documentation.

Navigating the UCMDB Help

UCMDB Help is an integrated help system that can be navigated in the following ways:

➤ From the home page. To access the home page, select UCMDB Help in the Help menu.

The home page is divided into the following tabs:

- ➤ Main Topics tab. The Main Topics tab organizes the various guides contained in the UCMDB Help into logical sections.
- ➤ **PDFs tab**. The PDFs tab is organized similar to the Main Topics tab, but provides links to the guides in PDF format.
- ➤ From the Navigation pane. To access the navigation pane if it is not being displayed, click the Show Navigation button.

The navigation pane is divided into the following tabs:

- ➤ Contents tab. The Contents tab organizes the various guides in a hierarchical tree, enabling direct navigation to a specific guide or topic.
- ➤ Index tab. The Index tab enables you to select a specific topic to display. Double-click the index entry to display the corresponding page. If your selection occurs in multiple documents, a dialog box is displayed enabling you to select a context.
- ➤ **Search tab.** The Search tab enables you to search for specific topics or keywords. Results are returned in ranked order.
- ➤ Favorites tab. The Favorites tab enables bookmarking specific pages for quick reference. Note that the Favorites tab is only available when using the Java implementation of UCMDB Help. If your browser does not support Java, the JavaScript implementation is automatically used and the Favorites tab is not displayed.

Documentation Library Functionality

The following functionality is available from the top frame in the Documentation Library main pane.

➤ Show Navigation button. Click to display the navigation pane, which includes the Contents, Index, Search, and Favorites tabs. For details on the Navigation pane, see "Working with the HP Universal CMDB Documentation" on page 356. Note that this button is only displayed when the navigation pane is closed.

➤ Show in Contents button. Click to highlight, in the Contents tab, the entry corresponding to the currently displayed page. Note that this button is only displayed when the navigation pane is open.

➤ **Previous and Next buttons.** Click to move forward or backward in the guide currently displayed.

➤ Send Documentation Feedback to HP button. Click to open your email client and send feedback to HP. An email message opens with the To and Subject fields already completed and a link to the current page in the message body. Make sure to complete the email by entering your feedback. Note that you must have an email client configured on the machine for this function to operate correctly.

➤ **Print button.** Click to print the currently displayed page.

Organization of Information into Topics

The material in most of the Documentation Library guides is organized by topic types. Three main topic types are in use: Concepts, Tasks, and Reference. The topic types are differentiated visually using icons. Below is an explanation of each topic type along with its corresponding icon:

➤ Concepts. Concept topics provide background, descriptive, or conceptual information. Read concept topics to get general information about what a feature does and how it works.

➤ Tasks. Task topics provide step-by-step guidance on how to complete specific tasks that are typically required to administer or use the software. Task topics also include scenarios for certain tasks. Read task topics and follow the steps listed to get a task done.

Chapter 27 • Navigating HP Universal CMDB

- ➤ Reference. Reference topics provide detailed lists and explanations of parameters, common user interface elements, and other reference-oriented material. Read reference topics when you need to look up some specific piece of reference information relevant to a particular context.
- 2
- ➤ **User Interface**. User Interface topics are a specialized form of reference topics that are used mainly for context-sensitive help. Help links from the software generally open the user interface topics.

➤ Troubleshooting and Limitations. Troubleshooting and limitations topics are a specialized form of reference topics that provide troubleshooting and list limitations of the feature. Read troubleshooting and limitations topics if you encounter unexpected behavior of the software. It is recommended that you review a feature's limitations before using it.

Reference

🙎 Menus and Options

The following categories are available in the lower part of the Navigation Bar:

Category	Description
Modeling	Click to open the Modeling menu, where you build and manage a model of your IT universe in the CMDB. For details, see "Modeling" in the <i>Modeling Guide</i> .
Data Flow Management	Click to open the Data Flow Management (DFM) menu, where you set up and run the DFM process to populate the IT Universe model with configuration items (CIs), and where you work with Integration Studio. For details, see the HP Universal CMDB Data Flow Management Guide. For details on DFM content, see the HP Universal CMDB Discovery and Integration Content Guide.
Administration	Click to open the Administration menu, where you configure infrastructure settings, users, roles, permissions, and schedules and work with the Package Manager. For details see the HP Universal CMDB Administration Guide.

Help Menu

You access the following online resources from the HP Universal CMDB Help menu:

- ➤ Help on this page. Opens the UCMDB Help to the topic that describes the current page or context.
- ➤ **UCMDB Help.** Opens the home page. The home page provides quick links to the main help topics.

- ➤ Troubleshooting & Knowledge Base. Opens the HP Software Support Web Site directly to the HP Software Self-solve knowledge base landing page. The URL for this Web site is http://support.openview.hp.com.
- ➤ HP Software Support. opens the HP Software Support Web Site. This site enables you to browse the knowledge base and add your own articles, post to and search user discussion forums, submit support requests, download patches and updated documentation, and more. The URL for this Web site is http://support.openview.hp.com.
- ➤ HP Software Web Site. Opens the HP Software Web site, which contains information and resources about HP Software products and services. The URL for this Web site is http://www.hp.com/managementsoftware.
- ➤ What's New? Opens the What's New document, which describes the new features and enhancements of the version.
- ➤ Content Pack Help. Describes the default, out-of-the-box content: what is being discovered, the credentials required in discovery, and how to troubleshoot the discovery results.
- ➤ **About HP Universal CMDB.** Opens the HP Universal CMDB dialog box, which provides version, license, patch, and third-party notice information.

Note: For information on high availability, see "HP Universal CMDB High Availability" on page 229.

28

Available Troubleshooting Resources

This chapter includes:

Troubleshooting Resources on page 361

Troubleshooting Resources

- ➤ Installation troubleshooting. Use to troubleshoot common problems that you may encounter when installing HP Universal CMDB, and the solutions to those problems. For details, see "Troubleshooting and Limitations" on page 174.
- ➤ Login troubleshooting. Use to troubleshoot possible causes of failure to log in to HP Universal CMDB. For details, see "Troubleshooting and Limitations" on page 174.
- ➤ HP Software Self-solve knowledge base. Use to search for specific troubleshooting information on a wide variety of topics. Located on the HP Software Support Web site, the HP Software Self-solve knowledge base can be accessed by selecting Troubleshooting & Knowledge Base from the HP Universal CMDB Help menu.
 - Note that only registered customers can access the resources on the HP Software Support Web site. Customers who have not yet registered can do so from this site.
- ➤ **HP Universal CMDB Log files.** Use to troubleshoot CMDB runtime problems. For details, see "CMDB Log Files" in the *HP Universal CMDB Administration Guide*.
- ➤ Data Flow Management log files. Use to troubleshoot DFM problems. For details, see "Data Flow Management Log Files" in the *HP Universal CMDB Administration Guide*.

Chapter 28 • Available Troubleshooting Resources

➤ Query log files. Use to view definitions for query parameter log files. For details, see "CMDB Log Files" in the *HP Universal CMDB Administration Guide*.

Working in Non-English Locales

This chapter includes:

Reference

- ➤ Installation and Deployment Issues on page 364
- ➤ Database Environment Issues on page 365
- ➤ Administration Issues on page 365
- ➤ Report Issues on page 365
- ➤ Multi-Lingual User (MLU) Interface Support on page 366

Reference

🍳 Installation and Deployment Issues

- ➤ If you use the Japanese, Chinese, or Korean language in your browser, you must ensure that the HP Universal CMDB server has East Asian languages installed. On the machine on which the HP Universal CMDB server is installed, you must select Control Panel > Regional & Language Options > Languages > Install files for East Asian languages.
- ➤ Installing HP Universal CMDB in an I18N environment is supported for HP Universal CMDB installed on a Windows platform. Other platforms are not supported (for example Solaris, UNIX, Linux, and so on). For details on installing HP Universal CMDB on a Windows platform, see "HP Universal CMDB Installation on a Windows Platform" on page 63.
- ➤ When logging on to HP Universal CMDB, the user password cannot include Japanese or Chinese characters, when the UCMDB server is installed on a Windows 2003 machine with a Japanese or Chinese operating system.
- ➤ The installation path for all HP Universal CMDB components must not contain non-English language characters.
- ➤ The Uprgrade Wizard for versions 9.00 and 9.01 does not support the non-English user interface. (The upgrade itself works properly.)

Database Environment Issues

- ➤ To work in a non-English language HP Universal CMDB environment, you can use either an Oracle Server database or a Microsoft SQL Server database. The OS Windows regional settings language of the database should be the same as that of the UCMDB Server. When using an Oracle Server database, the encoding of the database can also be UTF-8 or AL32UTF-8, which supports both non-English languages as well as multiple languages.
- ➤ When you create a new Oracle instance in an Oracle database, you must specify the character set for the instance. All character data, including data in the data dictionary, is stored in the instance's character set. For details on working with Oracle databases, see "HP Universal CMDB Installation on a Solaris Platform" on page 107.
- ➤ The Database Query Monitor can connect to an Oracle database but the Oracle user names and passwords must contain only English characters.

Administration Issues

➤ To support non-English characters, the encoding for HP Universal CMDB databases must be defined as UTF-8 or AL32UTF-8, or set to the specific language. For further details, see "Database Environment Issues" on page 365.

🤏 Report Issues

- ➤ HP Universal CMDB does not support Custom Report names that contain more than 50 multi-byte characters.
- ➤ Reports downloaded from HP Universal CMDB to Excel cannot be displayed properly on an operating system whose language differs from the data language.

When using Microsoft Office version 2007 or later, with the latest updates installed, this issue is not relevant because the data is saved in Unicode format.

Chapter 29 • Working in Non-English Locales

- ➤ If a report is created in one language locale and sent by email from another language locale, the report contains system information in the languages of the server and the original locale.
- ➤ If a report file name contains multi-byte characters (for example, in Japanese, Chinese, or Korean) and the report is sent as an email attachment, the name becomes unreadable.
- ➤ By default, Excel does not open UTF-8 encoded CSV documents correctly. After saving a report as a .csv file, you can import it into Excel by doing the following in Excel:
 - **a** On the **Data** menu, select **Import External Data**, and click **Import Data**.
 - **b** In the Files of type box, click **Text Files**.
 - **c** In the **Look in** box, locate and double-click the text file to be imported as an external data range.
 - **d** To specify how to divide the text into columns, follow the instructions in the Text Import Wizard, and click **Finish**.
- ➤ When exporting a CI instance to a PDF file, multi-byte characters (such as Japanese, Chinese, Korean, and so on) are not displayed in the PDF file.
- ➤ Charts in Topology reports which were defined in a non-English locale are not displayed properly in the Reports module.

🌂 Multi-Lingual User (MLU) Interface Support

Note: The following support matrix is relevant for version 9.00 (but not for version 9.01 or any other minor patches).

The HP Universal CMDB user interface can be viewed in the following languages in your Web browser:

Language	Localized UI	Localized Materials	Availability
English	Yes	Yes	Part of initial product release
French	Yes		Part of initial product release
Japanese	Yes	Yes	Media pack B
Korean	Yes		Part of initial product release
Simplified Chinese	Yes		Part of initial product release
Dutch	Yes		Media pack A
German	Yes		Part of initial product release
Portuguese	Yes		Media pack A
Russian	Yes		Media pack A
Spanish	Yes		Part of initial product release
Italian	Yes		Media pack A

Note: Complementary media packs are released within 90 days of the product release.

Use the language preference option in your browser to select how to view HP Universal CMDB. The language preference chosen affects only your local machine (the client machine) and not the HP Universal CMDB Server machine or any other user accessing the same HP Universal CMDB machine.

To set up and view HP Universal CMDB in a specific language:

- 1 Install the appropriate language's fonts on your local machine if they are not yet installed. If you choose a language in your Web browser whose fonts have not been installed, HP Universal CMDB displays the characters as squares.
- **2** If you are logged in to HP Universal CMDB, you must log out. Click **LOGOUT** at the top of the HP Universal CMDB window.
 - Close every open browser window or alternatively clear the cache.
- **3** If HP Universal CMDB is running on Internet Explorer, configure the Web browser on your local machine to select the language in which you want to view HP Universal CMDB (**Tools** > **Internet Options**).
 - **a** Click the **Languages** button and in the Language Preference dialog box, highlight the language in which you want to view HP Universal CMDB.
 - **b** If the language you want is not listed in the dialog box, click **Add** to display the list of languages. Select the language you want to add and click **OK**.
 - **c** Click **Move Up** to move the selected language to the first row.
 - **d** Click **OK** to save the settings.
 - **e** Display the HP Universal CMDB login window.
 - **f** From the Internet Explorer menu, select **View** > **Refresh**. HP Universal CMDB immediately refreshes and the user interface is displayed in the selected language.

Note: For details on viewing Web pages in Internet Explorer that are written in a different language, see http://support.microsoft.com/kb/306872/en-us.

Notes and Limitations

- ➤ There is no language pack installation. All translated languages included with the initial release are integrated into the HP Universal CMDB Multilingual User Interface (MLU).
- ➤ Data remains in the language it is entered in, even if the language of the Web browser changes. Changing the language of the Web browser on your local machine does not change the language of the data input definitions and configurations.
- ➤ You cannot deploy a package if the server locale is different than the client locale and the package name contains non-English characters. For details, see "Package Manager" in the HP Universal CMDB Administration Guide.
- ➤ You cannot create a package that contains resources (for example, views and queries) having non-English characters in their names, if the server locale is different from the client locale. For details, see "Package Manager" in the HP Universal CMDB Administration Guide.
- ➤ You cannot create a new user in Users and Roles if the name of the new user contains more than 20 East Asian characters. For details, see "Users and Roles" in the HP Universal CMDB Administration Guide.
- ➤ In Modeling Studio, you cannot create a new view if the view's name contains more than 18 Japanese characters. For details, see "Modeling Studio" in the *Modeling Guide*.
- ➤ The following pages appear only in English. They are not translated into any other language. For details, see "Working in Non-English Locales" on page 363:
 - ➤ HP Universal CMDB server status HTML page
 - ➤ HP Universal CMDB Login page
 - ➤ JMX Console page
 - ➤ API Connect Test page
- ➤ If you select languages on the client machine that are not supported by UCMDB MLU, HP Universal CMDB is displayed with the same system locale language as that running on the UCDMB Server machine.
