Conceptual Data Model - Layers

Business Enablement

Models the business functions, services, processes, and activities. A business service can represent either a business or an IT provided service. A business service is a service that a business provides to another business (B2B) or that one organization provides to another within a business (e.g. payment processing). An IT service is a business service that the IT organization provides to support business services or IT's own operations. Example: employee provisioning, backup and recovery, and self-service help desk. A business service is distinguished from an Infrastructure Service in that it typically has an associated end-user (customer), business application, and service level agreement.

DependsOn

Application and Services

Models applications and their decomposition, down to the level of elements that are deployable. An application is a set of components supporting a business activity, seen as a whole and known by a specific name. Applications are logical compositions. Additionally, this layer includes the notion of a business transaction as defined by the HP Software BSM offering.

Also included are infrastructure services with focus on a technical subject area that are in support of one or more business services and processes. Examples include voice and network services, database services, naming services, desktop services, and Windows administration services.

DependsOn

Software

Individual installations of software elements. These are physical components (executables) that can be deployed, or are deployed, on a logical system.

Virtualzes
RunsOn
InstalledOn

Infrastructure

Used to model both logical (virtualization and clustering) and physical (storage devices, network devices, and servers) systems.

LocatedAt

Facilities

Models such things as location, site, building, room, rack, etc.

Process Related Verticals

Operations

Models entities related to operation processes like incidents, problems, KPIs, etc.

Financial/Asset

Models the entities related to asset and financial management processes. Examples include:
asset, cost center, contract, and purchase order

PMO

Models the entities related to the project and portfolio management processes.

Development

Models the entities related to application development and testing activities
