Support

Please visit the HP OpenView web site at:

<http://www.managementsoftware.hp.com/>

This web site provides contact information and details about the products, services, and support that HP OpenView offers.

You can also go directly to the support web site at:

<http://support.openview.hp.com/>

HP OpenView online software support provides customer self-solve capabilities. It provides a fast and efficient way to access interactive technical support tools needed to manage your business. As a valuable support customer, you can benefit by using the support site to:

- Search for knowledge documents of interest
- Submit and track progress on support cases
- Manage a support contract
- Look up HP support contacts
- Review information about available services
- Enter discussions with other software customers
- Research and register for software training

Most of the support areas require that you register as an HP Passport user and log in. Many also require a support contract.

To find more information about access levels, go to:

http://support.openview.hp.com/access_level.jsp

To register for an HP Passport ID, go to:

<https://passport.hp.com/hpp2/newuser.do>

Installing the Connector

The Oracle Internet Directory connector enables HP OpenView Select Identity to perform the following tasks in Oracle Internet Directory:

- Add, update, and remove users
- Retrieve user attributes
- Enable and disable users
- Verify a user's existence
- Change user passwords
- Reset user passwords
- Retrieve all entitlements
- Retrieve a list of supported user attributes
- Assign and unassign entitlements to and from users

It is a one-way, LDAP connector and pushes changes made to user data in the Select Identity database to a target Oracle server.

This connector is support on non-US platforms. This connector relies on the JNDI (LDAP's resource provider interface) to exchange data with LDAP.

The Oracle Internet Directory connector is packaged in the following files, which are located in the Oracle Internet Directory directory on the Select Identity Connector CD:

- `schema.jar` – contains the attribute mapping file for this system, which control how Select Identity fields are mapped to LDAP fields.
- `TALDAPv3.rar` – contains the connector's binary files

System Requirements

The Oracle Internet Directory connector is supported in the following environment:

Select Identity Version	Application Server	Database
3.0.2	WebLogic 8.1.2 on Windows 2000	SQL Server 2000
	WebLogic 8.1.2 on Windows 2003	SQL Server 2000
	WebLogic 8.1.2 on Solaris 9	Oracle 9i
	WebSphere 5.1.1 on Windows 2000	DB2 8.2 (or DB2 8.1 Service Pack 7)
3.3	WebLogic 8.1.4 on Windows 2000	SQL Server 2000

This connector is supported with Oracle Internet Directory 9.0.2 on Windows 2000.

Deploying on the Web Application Server

To install the Oracle Internet Directory connector on the Select Identity server, complete these steps:

- 1 Create a subdirectory in the Select Identity home directory where the connector's RAR file will reside. For example, you could create the `C:\Select_Identity\connectors` folder on Windows. (A connector subdirectory may already exist.)
- 2 Copy the `TALDAPv3.rar` file from the Select Identity Connector CD to the connector subdirectory.
- 3 If deploying the connector on WebLogic, complete the following steps. If deploying on WebSphere, skip to [Step 4 on page 10](#).
 - a Create a schema subdirectory in the Select Identity home directory where the connector's mapping file(s) will reside. For example, you could create the `C:\Select_Identity\schema` folder. (This subdirectory may already exist.)
 - b Extract the contents of the `schema.jar` file (on the Select Identity Connector CD) to the schema subdirectory.
 - c Ensure that the `CLASSPATH` environment variable in the WebLogic server startup script references the schema subdirectory.
 - d Start the application server if it is not currently running.
 - e Log on to the WebLogic Server Console.
 - f Navigate to **My_domain** → **Deployments** → **Connector Modules**.
 - g Click **Deploy a New Connector Module**.
 - h Locate and select the `TALDAPv3.rar` file from the list. It is stored in the connector subdirectory.
 - i Click **Target Module**.
 - j Select the **My Server** (your server instance) check box.
 - k Click **Continue**. Review your settings.
 - l Keep all default settings and click **Deploy**. The Status of Last Action column should display Success.

- 4 If deploying the connector on WebSphere, complete the following steps:
 - a Stop the application server.
 - b Extract the contents of the `schema.jar` file (on the Select Identity Connector CD) to the `WebSphere\AppServer\lib\ext` directory.
 - c Start the application server.
 - d Log on to the WebSphere Application Server Console.
 - e Navigate to **Resources** → **Resource Adapters**.
 - f Click **Install RAR**.
 - g In the Server path field, enter the path to the `TALDAPv3.rar` file. It is stored in the subdirectory created in [Step 1](#).
 - h Click **Next**.
 - i In the Name field, enter a name for the connector.
 - j Click **OK**.
 - k Click the **Save** link (at the top of the page).
 - l On the Save to Master Configuraton dialog, click the **Save** button.
 - m Click **Resources** → **Resource Adapters**.
 - n Click the new connector.
 - o Click **J2C Connection Factories** in the Additional Properties table.
 - p Click **New**.
 - q In the Name field, enter the name of the factory for the connector. For the SQL connector, enter **eis/LDAPv3**.
 - r Click **OK**.
 - s Click the **Save** link.
 - t On the Save to Master Configuraton dialog, click the **Save** button.
 - u Restart WebSphere.
- 5 Modify the mapping file, if necessary. See [Understanding the Mapping File on page 11](#) for details.

After installing the connector, see [Configuring the Connector on page 18](#) about registering and configuring the connector in Select Identity.

Understanding the Mapping File

The Oracle Internet Directory connector is deployed with the `oid.xml` mapping file, which describes the attributes required by the system. The file is created in XML, according to SPML standards, and is bundled in a JAR file called `schema.jar`. The mapping file is used to map user account additions and modifications from Select Identity to the Oracle Internet Directory resource. When you deploy a resource using the Resources page of the Select Identity client, you can review this file.

You can create attributes that are specific to Select Identity using the Attributes page in the Select Identity client. These attributes can be used to associate Select Identity user accounts with system resources by editing the connector mapping file described in this chapter. This process becomes necessary because, for example, a single attribute “username” can have a different name on different resources, such as “login” for UNIX, “UID” for a database, and “userID” on a Windows server.

This file does not need to be edited unless you want to map additional attributes to your resource. If attributes and values are not defined in this mapping file, they cannot be saved to the resource through Select Identity.

General Information

The following operations can be performed in the mapping file:

- Add a new attribute mapping
- Delete an existing attribute mapping
- Modify attribute mappings

Here is an explanation of the elements in the XML mapping files provided by the Oracle Internet Directory connector:

- **<Schema>**, **<providerID>**, and **<schemaID>**

Provides standard elements for header information.

- **<objectClassDefinition>**

Defines the actions that can be performed on the specified object as defined by that name attribute (in the `<properties>` element block) and the Select Identity-to-resource field mappings for the object (in the `<memberAttributes>` block). For example, the object class definition for users defines that users can be created, read, updated, deleted, reset, and expired in LDAP.

- **<properties>**

Defines the operations that are supported on the object. This can be used to control the operations that are performed through Select Identity. The following operations can be controlled:

- Create (CREATE)
- Read (READ)
- Update (UPDATE)
- Delete (DELETE)
- Enable (ENABLE)
- Disable (DISABLE)
- Reset password (RESET_PASSWORD)
- Expire password (EXPIRE_PASSWORD)
- Change password (CHANGE_PASSWORD)

The operation is assigned as the name of the <attr> element and access to the operation is assigned to a corresponding <value> element. You can set the values as follows:

- true — the operation is supported by the connector
- false — the operation is not supported by the connector and will throw `PermissionException`
- bypass — the operation is not supported by the connector but will not throw an exception; the operation is simply bypassed

Here is an example:

```
<objectClassDefinition name="User" description="OID User">
  <properties>
    <attr name="CREATE">
      <value>true</value>
    </attr>
    <attr name="READ">
      <value>true</value>
    </attr>
    ...
  </properties>
</objectClassDefinition>
```

- **<memberAttributes>**

Defines the attribute mappings. This element contains <attributeDefinitionReference> elements that describe the mapping for each attribute. Each <attributeDefinitionReference> must be followed by an <attributeDefinition> element that specifies details such as minimum length, maximum length, and so on.

Each <attributeDefinitionReference> element contains the following attributes:

- Name — the name of the reference.
- Required— if this attribute is required in the provisioning (set to true or false).
- Conzero:tafield — the name of the Select Identity resource attribute.
- Conzero:resfield — the name of the physical resource attribute from the resource schema. If the resource does not support an explicit schema (such as UNIX), this can be a tag field that indicates a resource attribute mapping.

- `Concero:isKey` — An optional attribute that, when set to true, specifies that this is the key field to identify the object on the resource. Only one `<attributeDefinitionReference>` can be specified where `isKey="true"`. This key field does not need to be the same as the key field of the identity object in Select Identity.
- `Concero:init` — An optional attribute that identifies that the attribute is initialized with the value of the attribute passed in from Select Identity.

Here is an example:

```
<memberAttributes>
  <attributeDefinitionReference name="User Name"
    required="true" concero:tafield="[User Name]"
    concero:resfield="cn" concero:isKey="true"
    concero:init="true" />
  ...
```

The interpretation of the mapping between the connector field (as specified by the `Concero:tafield` attribute) and the resource field (as specified by the `Concero:resfield` attribute) is determined by the connector. The Oracle Internet Directory connector has code to interpret the mappings in one way, as follows:

- The connector attribute names are specified in square braces, like this: [xyz]. The value of attribute xyz is taken from the UserModel during provisioning.
 - Composite attributes can be specified in the Oracle Internet Directory connector mapping file. To do this, specify [attr1] xxxx [attr2] as the connector attribute. This specifies that the value of the attr1 and attr2 attributes should be combined with the string xxxx to form a mapping for the specified resource field. Oracle Internet Directory connector has code to handle these composite mappings.
- **<attributeDefinition>**
 Defines the properties of each object's attribute. For example, the attribute definition for the HomeDir attribute defines that it must be between zero and 100 characters in length and can contain the following letters, numbers, and characters: a-z, A-Z, 0-9, @, +, and a space.

Here is an excerpt from the `oid.xml` file:

```
<attributeDefinition name="GroupName" description="GroupName"
type="xsd:string" >
  <properties>
    <attr name="minLength">
      <value>1</value>
    </attr>
    <attr name="maxLength">
      <value>8</value>
    </attr>
    <attr name="pattern">
      <value><![CDATA[[a-zA-Z0-9@]+]]> </value>
    </attr>
  </properties>
</attributeDefinition>
```

- **<concono:entitlementMappingDefinition>**
Defines how entitlements are mapped to users.
- **<concono:objectStatus>**
Defines how to assign status to a user.
- **<concono:relationshipDefinition>**
Defines how to create relationships between users.

Oracle Internet Directory Mapping Information

The following are the attribute mappings supported for Oracle Internet Directory. These are listed in the `oid.xml` mapping file. You can add, modify, or delete attributes once you are familiar with the contents of this file. You can edit the Select Identity resource attributes; they reflect the identity

information as seen in Select Identity. The physical resource attributes are literal attributes of user accounts on the Oracle server. These attributes cannot be changed.

Select Identity Resource Attribute	OID LDAP Attribute	Description
UserName	uid	Key field on the resource
Password	userpassword	Password
Email	mail	Mail ID
MailHost	mailHost	Mail host
FirstName	givenName	First name
LastName	sn	Last name
Common Name(FirstName+LastNa me)	cn	Common name
Employee ID	employeeNumber	Employee ID
Business Phone	telephoneNumber	Business phone
Address1	postalAddress	Postal address
Address2	roomNumber	Room number
City	l	City
State	st	State
Zip	postalCode	Zip code
Title	title	Title
Business category	businessCategory	Business category
DepartmentNumber	departmentNumber	Departmant number
Description	description	Description
CarLicense	carLicense	Car license

Select Identity Resource Attribute	OID LDAP Attribute	Description
FacsimileTelephoneNumber	facsimileTelephoneNumber	Fax telephone number
HomePhone	homePhone	Home phone
HomePostalAddress	homePostalAddress	Home postal address
Initials	initials	Initials
InternationaliSDNNumber	internationaliSDNNumber	International SDN number
LabeledURI	labeledURI	Labeled URI
Mobile	mobile	Mobile number
Pager	pager	Pager number
PhysicalDeliveryOfficeName	physicalDeliveryOfficeName	Physical delivery office name
PostOfficeBox	postOfficeBox	Post office box
PreferredDeliveryMethod	preferredDeliveryMethod	Preferred delivery method
PreferredLanguage	preferredLanguage	Preferred language
RegisteredAddress	registeredAddress	Registered address
Street	street	Street
TeletexTerminalIdentifier	teletexTerminalIdentifier	Teletex terminal identifier
TelexNumber	telexNumber	Telex number
IsEnabled	orclisenabled	Enables and disables the user in the resource

Configuring the Connector

After you deploy the connector on the application server, you must configure Select Identity to use the connector by deploying it in the Select Identity client. The following provides an overview of the procedures you must complete in order to deploy your connector. It also provides connector-specific information you must provide when configuring Select Identity to use the connector.

- 1 Register the connector with Select Identity by clicking the **Deploy New Connector** button on the Connectors home page. Complete this procedure as described in the “Connectors” chapter of the *HP OpenView Select Identity Administrator Guide*.

After you deploy the connector, the connector properties will look similar to this:

[Home](#) > [Connectors](#) : **OID**

Connector Information	
* Connector Name:	OID
* Pool Name:	eis/LDAPv3

- 2 Deploy a resource that uses the newly created connector. On the Resources home page, click the **Deploy New Resource** button. Complete the steps in this procedure as described in the “Resources” chapter of the *HP OpenView Select Identity Administrator Guide*.

Field Name	Sample Values	Description
Resource Name	SampleResource	Name of the resource
Resource Type	OID	The connector that was deployed in Step 1 on page 18 .
Authoritative Source	No	Whether this resource is a system that is considered to be the authoritative source for user data in your environment. You must specify No because the connector cannot synchronize account data with the Select Identity server.
Associate to Group	Selected	Whether the system uses the concept of groups. For this connector, select this option.
Access URL	ldap://Host name:3060	Access URL for the OID LDAP Server
Suffix	dc=india,dc=hp,dc=com	DN of the root suffix
Login Name	cn=orcladmin	Administrator user name
Password	Admin123	Password of the administrator
User Suffix	cn=Users	User suffix name
User Object Class	top,person,organizationalPerson,inetorgperson,orclprivilegegroup,orcluser,orcluserV2	Object class of the groups in LDAP user store
Group Suffix	cn=Groups	Group suffix name

Field Name	Sample Values	Description
Group Object Class	Top, groupofuniquenames	Object class of the groups in LDAP user store
Mapping File	oid.xml	The attribute mapping XML file

After you deploy the resource, the Access Info properties for the resource will look similar to the following snapshots.

Resource Access Information	
* Resource Name:	OID
Access URL:	ldap://localhost:3060
Suffix:	dc=asiapacific,dc=hpqcorp,dc=net
Login Name:	cn=orcladmin
Password:	*****
* User Suffix:	cn=Users
* User Object Class:	top,person,organizationalPerson,inetorgperson,orclprivilegegroup,orcluser,orcluserV2
* Group Suffix:	cn=Groups,cn=OracleContext
* Group Object Class:	top,groupofuniquenames
* Mapping File:	oid.xml

- 3 Create the `IsEnabled` attribute. This attribute is used internally by the connector to enable or disable the user in the OID LDAP user store. After a user is disabled, he or she will not be able to log in to the OID LDAP resource.

Create other attributes that link Select Identity to the connector. For each mapping in the connector's mapping file, create an attribute using the Attributes capability on the Select Identity client. Refer to the "Attributes" chapter in the *HP OpenView Select Identity Administrator*

Guide for more information. After you create the attributes for the connector, the View Attributes page for the resource will look similar to this:

(Resource Name=OID)				
<< < Page <input type="text" value="1"/> of 2 > >>				Total Records:39
Name	Min Length	Max Length	Attribute Mapped To	Authorative
Address 1	1	128	Addr1	N
Address 2	1	128	Addr2	N
Business Phone	1	50	PhBusiness	N
BusinessCategory	1	128	BusinessCategory	N
CarLicense	1	128	CarLicense	N
City	1	128	City	N
DepartmentNumber	1	128	Department	N
Description	1	1024	Description	N
DestinationIndicator	1	128	DestinationIndicator	N
DisplayName	1	128	DisplayName	N
Email	1	128	Email	N
Employee ID	1	128	EmployeeID	N
EmployeeType	1	128	EmployeeType	N
FacsimileTelephoneNumber	1	32	Fax	N
FirstName	1	128	FirstName	N
HomePhone	1	32	PhHome	N
HomePostalAddress	1	128	PostalAddress	N
Initials	1	128	Initials	N
InternationalISDNNumber	1	16	InternationalISDNNumber	N
LabeledURI	1	128	LabeledURI	N

- 4 Create a Service that will use the newly created resource. To do so, click the **Deploy New Service** button on the Services home page. Complete this procedure as described in “Services” of the *HP OpenView Select Identity Administrator Guide*. You will reference your new resource created in [Step 2](#) while creating this service.

Note the following when creating Service views for the OID connector:

- Do not add the IsEnabled attribute to any Service view; it is for internal use by the connector.
- Do not add the password attribute as part of the Service view; it is used for user-modification.

Uninstalling the Connector

If you need to uninstall a connector from Select Identity, make sure that the following are performed:

- All resource dependencies are removed.
- The connector is deleted using the Select Identity client Connectors pages.

On WebLogic

Perform the following to delete a connector:

- 1 Log on to the WebLogic Server Console.
- 2 Navigate to ***My_Domain*** → **Deployments** → **Connector Module**.
- 3 Click the delete icon next to the connector that you want to uninstall.
- 4 Click **Yes** to confirm the deletion.
- 5 Click **Continue**.

On WebSphere

Complete the following steps to uninstall the connector on WebSphere:

- 1 Log on to the WebSphere Application Server Console.
- 2 Navigate to **Resources** → **Resource Adapters**.
- 3 Select the connector to uninstall.
- 4 Click **Delete**.
- 5 Click the **Save** link (at the top of the page).
- 6 On the Save to Master Configuraton dialog, click the **Save** button.
