## Support

Please visit the HP OpenView web site at:

**<http://www.managementsoftware.hp.com/>**

This web site provides contact information and details about the products, services, and support that HP OpenView offers.

You can also go directly to the support web site at:

**<http://support.openview.hp.com/>**

HP OpenView online software support provides customer self-solve capabilities. It provides a fast and efficient way to access interactive technical support tools needed to manage your business. As a valuable support customer, you can benefit by using the support site to:

- Search for knowledge documents of interest
- Submit and track progress on support cases
- Manage a support contract
- Look up HP support contacts
- Review information about available services
- Enter discussions with other software customers
- Research and register for software training

Most of the support areas require that you register as an HP Passport user and log in. Many also require a support contract.

To find more information about access levels, go to:

**[http://support.openview.hp.com/access\\_level.jsp](http://support.openview.hp.com/access_level.jsp)**

To register for an HP Passport ID, go to:

**<https://passport.hp.com/hpp2/newuser.do>**

# Installing the Connector

The Oracle Administration connector — hereafter referred to as the Oracle Admin connector — enables HP OpenView Select Identity to administer the database server by provisioning database user information in system schemas. The connector is a two-way connector. Changes made to system user attributes in the database can also be propagated back to Select Identity.

Three configurations are supported for the Oracle Admin connector:

- **Agent-based**  
In this configuration, the connector communicates with an agent that resides on the database server; the agent uses a JDBC 2.0 compliant driver to communicate with the database. The agent can also push changes made in Oracle to the Select Identity database (this is called **reverse synchronization** and explained later).
- **Agentless using a JDBC data source**  
In this configuration, the connector communicates the database directly through JDBC calls. Be sure to create or identify a JDBC data source (and underlying connection pool) on the Select Identity server that can connect to the target Oracle database.
- **Agentless using a JDBC driver**  
The connector communicates the database using a JDBC 2.0 compliant driver; no agent is installed on the database server.

The Oracle Admin connector is packaged in the following files and folders, which are located on the Select Identity Connector CD:

- Oracle RDBMS - Admin/Admin-Oracle-Connector.rar — The binaries for the connector
- Oracle RDBMS - Admin/Admin Oracle Schema.zip — The mapping files (Admin\_Oracle.xml and Admin\_Oracle.xsl) for the connector
- Oracle RDBMS - Admin/Agent Installers/Oracle-Admin-AgentInstaller-Win.zip — A ZIP file that contains the installation executable for the connector agent
- Oracle RDBMS - Admin/Agent Installers/Oracle-Admin-AgentInstaller-Unix.tar — A TAR file that contains the installation executable for the connector agent
- Oracle RDBMS - Admin/Manual Agent/Oracle-Admin-Agent-Win.zip — A ZIP file that contains agent binaries and files (for manual installation)
- Oracle RDBMS - Admin/Manual Agent/Oracle-Admin-Agent-Unix.tar — A TAR file that contains agent binaries and files (for manual installation)

## Operations Supported by the Connector

The connector is intended for use in a wide variety of usage scenarios. Specifically, it can perform the following operations on the Oracle system:

- Add, update, and remove users
- Retrieve user attributes
- Enable and disable users
- Verify a user's existence
- Change user passwords
- Reset user passwords
- Retrieve all entitlements

- Retrieve a list of supported user attributes
- Assign and unassign entitlements to and from users

When you provision a user using this connector, be sure to grant administrative privileges to the user for the target database.

In addition, the connector's agent can send user changes made in Oracle to Select Identity. When changes are pushed from the agent to the Select Identity server, this is referred to as **reverse synchronization**. Specifically, the agent can add, modify, and delete users in Select Identity based on user additions, modifications, and deletions in Oracle.

When a user is added, modified, or deleted in the database, reverse notification tables capture the changes. The agent's reverse synchronization component then sends the changes to Select Identity's Web Service in SPML. If an error occurs during reverse synchronization, the agent stops the operation (without affecting the connector's operations).

Additional steps are required to configure the agent for reverse synchronization. (Note that installing and configuring the agent is mandatory in order for the connector to support reverse synchronization.)

## System Requirements

The Oracle Admin connector is supported in the following environment:

Select Identity Version	Application Server	Database
3.0.2	WebLogic 8.1.2 on Windows 2003	SQL Server 2000
	WebLogic 8.1.2 on Solaris 9	Oracle 9i
	WebLogic 8.1.2 on HP-UX 11i	Oracle 9i
	WebSphere 5.1.1 on Solaris 9	DB2 8.2 (or DB2 8.1 Service Pack 7)
3.3	WebLogic 8.1.4 on Windows 2003	SQL Server 2000

For Select Identity 3.0.2, the Oracle Admin connector is supported with Oracle 9i and 10g running on Windows 2000, Windows 2003, Windows XP, Solaris 9, and HP-UX 11i. For 3.3, the connector is supported with Oracle 9i and 10g running on Windows 2003, Solaris 9, and HP-UX 11i. Also, for secure communication, this connector supports secure JDBC for database communication. See [Configuring Oracle to Support Secure JDBC on page 34](#) for configuration information.

## Deploying on the Web Application Server

To install the Oracle Admin connector on the Select Identity server, complete these steps:

- 1 Create a subdirectory in the Select Identity home directory where the connector's RAR file will reside. For example, you could create the `C:\Select_Identity\connectors` folder on Windows. (A connector subdirectory may already exist.)
- 2 Copy the `Admin-Oracle-Connector.rar` file from the Select Identity Connector CD to the connector subdirectory.
- 3 Create a schema subdirectory in the Select Identity home directory where the connector's mapping files will reside. For example, you could create the `C:\Select_Identity\schema` folder. (This subdirectory may already exist.)
- 4 Extract the contents of the `Admin Oracle Schema.zip` file (on the Select Identity Connector CD) to the schema subdirectory. The XSL file is extracted into the `Admin Oracle Schema` subdirectory, and the XML file is extracted into the `Admin Oracle Schema/com/truologica/truaccess/connector/schema/spml` subdirectory.
- 5 Copy the JDBC 2.0 compliant driver to the application server. For Oracle, you must copy the JDBC driver file (`classes111.zip`). Obtain these files from your database administrator.
- 6 Add the JDBC driver and schema subdirectory to the application server's class path, such as by editing the `myStartWL.cmd` (on Windows) or `myStartWL.sh` (on UNIX) file.
- 7 If deploying the connector on WebLogic, complete the following steps.
  - a Start the application server if it is not currently running.

- b** Log on to the WebLogic Server Console.
  - c** Navigate to *My\_domain* → **Deployments** → **Connector Modules**.
  - d** Click **Deploy a New Connector Module**.
  - e** Locate and select the `Admin-Oracle-Connector.rar` file from the list. It is stored in the connector subdirectory.
  - f** Click **Target Module**.
  - g** Select the **My Server** (your server instance) check box.
  - h** Click **Continue**. Review your settings.
  - i** Keep all default settings and click **Deploy**. The Status of Last Action column should display Success.
- 8** If deploying the connector on WebSphere, complete the following steps:
- a** Start the application server, if necessary.
  - b** Log on to the WebSphere Application Server Console.
  - c** Navigate to **Resources** → **Resource Adapters**.
  - d** Click **Install RAR**.
  - e** In the Server path field, enter the path to the `Admin-Oracle-Connector.rar` file. It is stored in the subdirectory created in [Step 1](#).
  - f** Click **Next**.
  - g** In the Name field, enter a name for the connector.
  - h** Click **OK**.
  - i** Click the **Save** link (at the top of the page).
  - j** On the Save to Master Configuraton dialog, click the **Save** button.
  - k** Click **Resources** → **Resource Adapters**.
  - l** Click the new connector.
  - m** Click **J2C Connection Factories** in the Additional Properties table.
  - n** Click **New**.
  - o** In the Name field, enter the name of the factory for the connector. For the Oracle Admin connector, enter `eis/Admin-OracleConnector`.
  - p** Click **OK**.
-

- q** Click the **Save** link.
  - r** On the Save to Master Configuraton dialog, click the **Save** button.
  - s** Restart WebSphere.
- 9** Modify the mapping file, if necessary. This file is described in detail in [Understanding the Mapping File on page 15](#).
  - 10** To configure reverse synchronization on the server, you must create an XSL file based on the XML mapping file. The XSL file maps user attributes on Oracle to attributes in Select Identity. See [Understanding the Mapping Files on page 42](#) for more information.
    -  Note that the agent must be installed and configured for the Oracle Admin connector to support reverse synchronization.

After installing the connector, refer to [Configuring the Connector on page 36](#) for information about registering and configuring this connector in Select Identity.

## Installing the Agent on the Database Server

After you install the Oracle Admin connector on the Select Identity server, you can install the agent on the database server. This is optional; the connector can provision users in Oracle without the agent. However, the agent enables you to send data back to Select Identity (reverse synchronization).

You can install the agent using the installation wizard or by manually copying files to the server.

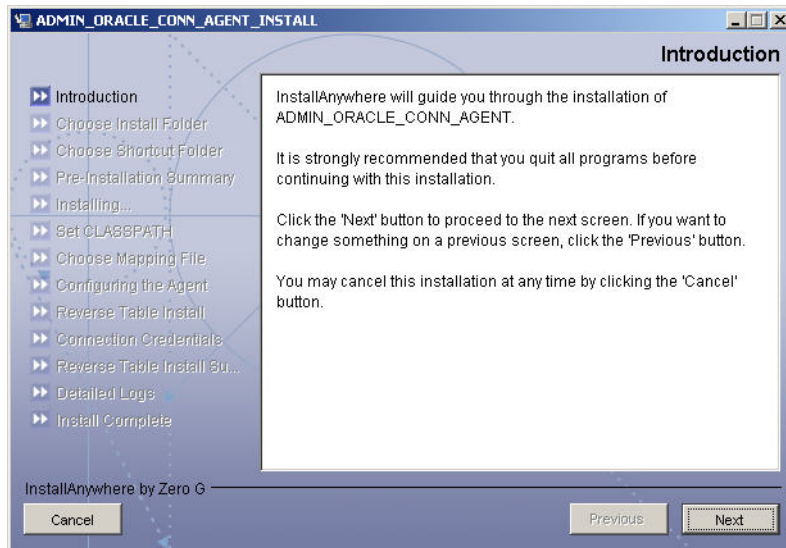

You must copy the mapping files from the Select Identity server to the system where you will install the agent (on the database server). The agent installation requires that the mapping files are available on the local system.

## Installation Using the Wizard on Windows

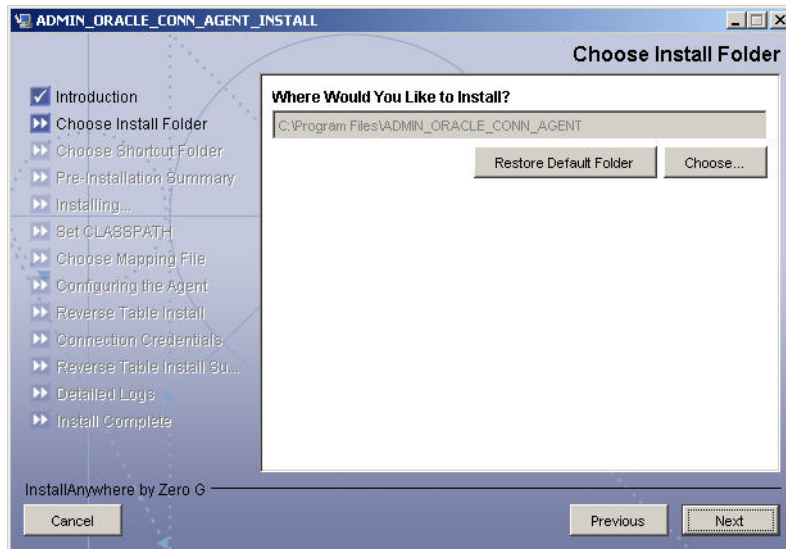

Complete the following steps to run the installation wizard, which installs the agent on Windows:

- 1 Extract the contents of the `Oracle-Admin-AgentInstaller-Win.zip` file, which is located in the `Agent Installers` directory on the CD.
- 2 Run `install.exe`, which is located in the `target_dir\CDROM_Installers\Windows\Disk1\InstData\NoVM`. The following dialog displays:

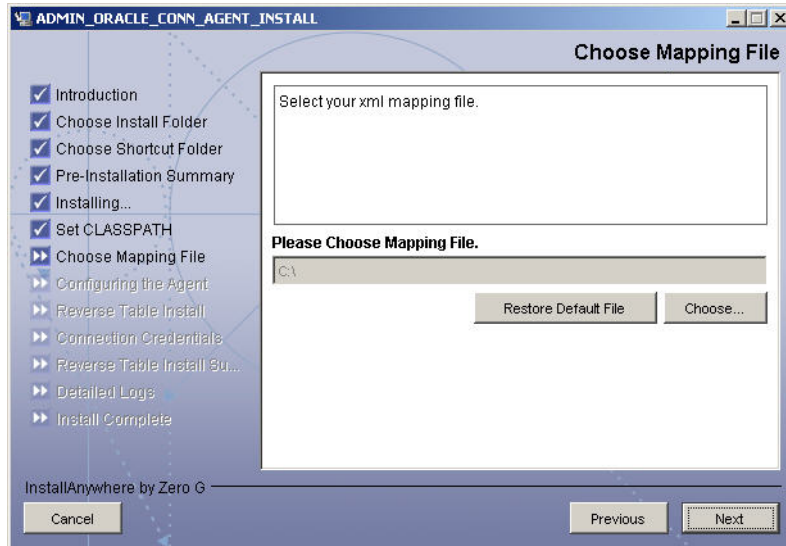

- 3 Click **Next** to proceed.

- Specify an installation directory on the Choose Install Folder dialog then click **Next**. By default, the agent is installed in `C:\Program Files\ADMIN_ORACLE_CONN_AGENT`.

- Select the location(s) where the product icons will be installed, then click **Next**.
- Verify the pre-installation summary. If you wish to make changes, click **Previous** and edit the chosen options. To install the agent, click **Install**.
- On the Set CLASSPATH dialog, click **Next** after you verify that the database driver file (`classes111.zip`) are in the database server's system CLASSPATH.

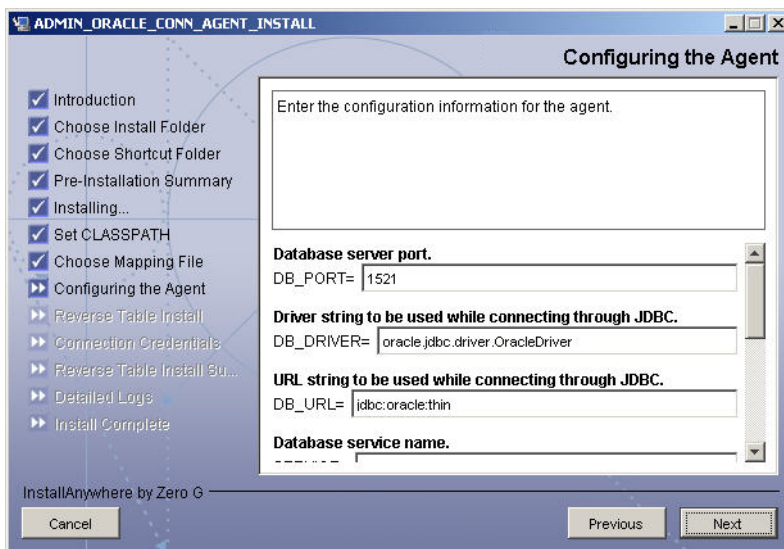

- Click the **Choose** button and select the `Admin_Oracle.xml` mapping file that was copied from the Select Identity server. This will copy the mapping file to the `install_dir/conf/com/truologica/truaccess/connector/schema/spml` directory, where `install_dir` is the installation folder selected in [Step 4](#) above.

Then, click **Next**.

- 9 On the Configuring the Agent dialog, specify the requested configuration information:

The following provides an explanation of the configuration options:

Option	Description	Example Value
DB_PORT	The port on which the database server is listening.	1521
DB_DRIVER	The JDBC driver for the database connection.	oracle.jdbc.driver.OracleDriver
DB_URL	The JDBC URL string used for the database communication.	jdbc:oracle:thin
SERVICE	The database name.	SI_DB
CONCERO_SERVER_URL	The URL of the Select Identity Web Service.	http://host:port/lmz/webservice
PollDelay	The polling delay for reverse polling (in seconds).	10

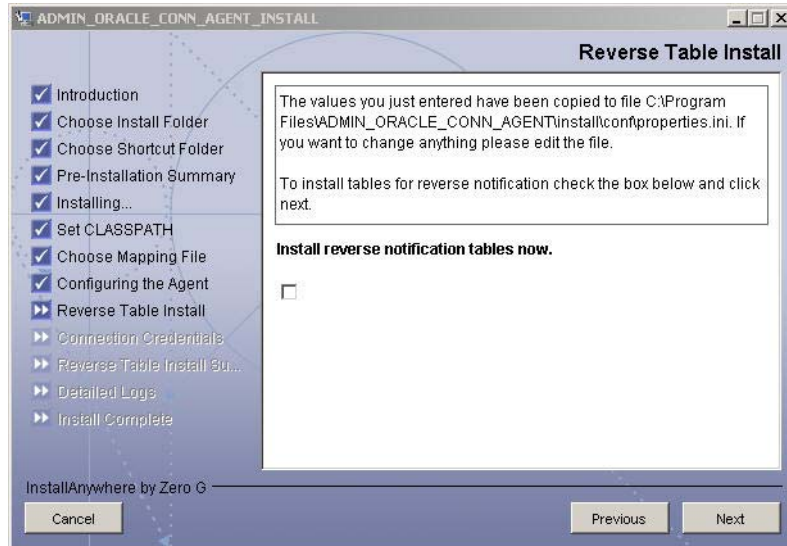

Option	Description	Example Value
AGENT_PORT	The port on which the agent listens for user provisioning requests from Select Identity.	5601
MAPPING_FILE	The XML mapping file.	Mapping.xml
SPML_DELAY	The delay (in milliseconds) between successive SPML requests sent from the agent. Increase this delay if the network or Select Identity server is performing slowly.	10000

To edit any of these values after installation, you can edit the `properties.ini` file, which resides in `install_dir\conf`.

After specifying these values, click **Next**.

- 10 To enable reverse synchronization, you must install the reverse notification tables. (See [Operations Supported by the Connector](#) on page 9 for an explanation of reverse synchronization.) Select the **Install reverse notification tables Now** option to install the tables. Then, click **Next** and proceed to the next step.

If you choose not to install the reverse notification tables, skip to [Step 14 on page 20](#). (You can manually install the tables later, if necessary. This is described in [Installing the Reverse Notification Tables on page 30](#).)

- 11 If you selected the **Install reverse notification tables now** option on the Reverse Table Install dialog, specify authentication information for the database user. Then, click **Next**. The tables are installed for the schema specified by the mapping file.

- 12 Review the installation summary for the tables. If you wish to make changes, or if the table installation failed, click **Previous** and edit the chosen options, such as the credentials. You can also select the **Show Logs** option to review the table installation log files. Then, click **Next**.
- 13 If you selected the **Show Logs** option, the Detailed Logs dialog is displayed. Review the log entries and click **Next**.
- 14 When the installation wizard completes, click **Done** on the Install Complete dialog to close the installation program.

If you configured the agent for reverse synchronization (by installing the reverse notification tables), you must edit the `install_dir/conf/opattributes.properties` file to configure the reverse notification tables. See [Step 4 on page 30](#) for details.

## Installation Using the Wizard on UNIX

Complete the following steps to run the installation wizard, which installs the agent on UNIX:

- 1 Extract the contents of the `Oracle-Admin-AgentInstaller-Unix.tar` file, which is located in the `Agent Installers` directory on the CD, to a directory that will server as the agent's home directory. (Use `tar xvf` to extract the contents of the TAR file.) This will create the required directory structure in the `Oracle-Admin-AgentInstaller-Unix` subdirectory of the home directory.
- 2 Set the `JAVA_HOME_14` environment variable to the directory where the JDK 1.4 is installed. Also, add the JVM to the system `PATH` variable.
- 3 Add the JDBC 2.0 compliant driver file (`classes111.zip`) for the database to the `CLASSPATH`.
- 4 Start the wizard by running the following command:

```
agent_home/Oracle-Admin-AgentInstaller-Unix/install.bin
```

The following displays:

```
=====
Extracting the installation resources from the installer
archive...
Configuring the installer for this system's environment...
Launching installer...
Preparing CONSOLE Mode Installation...
=====
(created with InstallAnywhere by Zero G)
-----

Choose Install Folder
-----

Where would you like to install?
Default Install Folder: /ADMIN_ORACLE_CONN_AGENT
ENTER AN ABSOLUTE PATH, OR PRESS <ENTER> TO ACCEPT THE DEFAULT:
```

- 5 Specify the installation location of the agent. Enter a path and press ENTER, or simply press ENTER to accept default path. The following displays:

```
=====
Choose Link Location
-----

Where would you like to create links?

->1- Default: /
2- In your home folder
3- Choose another location...
4- Don't create links

ENTER THE NUMBER OF AN OPTION ABOVE, OR PRESS <ENTER> TO ACCEPT
THE DEFAULT:
```

- 6 Select where you would like the agent shortcut location to be created. Select the number of the desired option as shown and press ENTER, or simply press ENTER to accept the default. The following displays:

```
=====
Pre-Installation Summary
-----

Please Review the Following Before Continuing:

Product Name:
ADMIN_ORACLE_CONN_AGENT

Install Folder:
/install_dir

Link Folder:
/

Disk Space Information (for Installation Target):
Required: xxx bytes
Available: yyy bytes

PRESS <ENTER> TO CONTINUE:
```

- 7** Verify the pre-installation summary and press ENTER. The following displays:

```

=====
Installing...
-----

[=====|=====|=====|=====]
[-----|-----|-----|-----]
=====

Configuring the Agent
-----

Enter the port number where database server listens. Hit <ENTER>
to accept default.

Enter DB_PORT : (DEFAULT: 1521 ):
```

- 8** Specify the database port number and press ENTER to continue. Or, simply press ENTER to accept the default. The following displays:

```

=====
Configuring the Agent
-----

Enter the driver string (Driver string to be used by Java
program to connect to the database).

Enter the database driver : (DEFAULT:
oracle.jdbc.driver.OracleDriver):
```

- 9** Enter the database driver and press ENTER to continue. Or, simply press ENTER to accept the default. The following displays:

```

=====
Configuring the Agent
-----

Enter the driver URL (URL to be used by Java program to connect
to the database).

Enter the database URL : (DEFAULT: jdbc:oracle:thin):
```

- 10** Enter the JDBC URL and press ENTER to continue. Or, simply press ENTER to accept the default. The following displays:

```
=====
Configuring the Agent
-----

Enter the database service name.
Enter the service name : (DEFAULT: ): OPENVIEW
```

- 11** Enter the database name and press ENTER to continue. Or, press ENTER to accept the default. The following displays:

```
=====
Configuring the Agent
-----

Enter the URL where spml is to be sent by reverse sync.
Enter the concero server URL : (DEFAULT: ): http://
localhost:7001/lmz/webservice
```

- 12** Enter the URL of the Select Identity Web Service, which is where SPML requests are sent and press ENTER to continue. Or, press ENTER to accept the default. The following displays:

```
=====
Configuring the Agent
-----

Enter the interval (in seconds) at which polling is desired for
reverse sync.
Enter poll delay : (DEFAULT: 10):
```

- 13** Enter the polling interval (in seconds) that is used by the agent to check for changes on the resource that must be sent to the Select Identity server (during reverse synchronization), then press ENTER. Or, simply press ENTER to accept the default. The following displays:

```
=====
Configuring the Agent
-----

Enter the port where the agent should listen.
Enter the agent port : (DEFAULT: ):6000
```

- 14** Enter the listening port number for the agent and press ENTER. Or, simply press ENTER to accept the default and continue. The following displays:

```
=====
Configuring the Agent
-----

Enter the time (in milli seconds) for which the agent should
wait before sending SPML.

Enter the spml delay : (DEFAULT: 100):
```

- 15** Specify the delay (in milliseconds) that the agent will wait before sending SPML requests to the Select Identity server and press ENTER. Or, simply press ENTER to accept the default and continue. The following displays:

```
=====
Configuring the Agent
-----

Enter Directory Path of the XML mapping file. (e.g. If the
mapping file is "/osd5/truologica/xxx.xml", enter "/osd5/
truologica/" including slashes)

Directory Path of the XML mapping file. (DEFAULT: ): /opt/
```

- 16** Enter the path to the mapping file (include trailing slashes but do not include the file name) and press ENTER. Or, simply press ENTER to accept the default. The following displays:

```
=====
Configuring the Agent
-----

Enter name of the XML mapping file. (Enter extension also.)

Name of the XML mapping file. (Enter extension also.) (DEFAULT:
) : xxx.xml
```

- 17** Enter the name of the mapping file and press ENTER. Or, simply press ENTER to accept the default. The following displays:

```
=====
XML Mapping Path
-----

This is your directory path of Mapping File
"/opt/"

This is the Mapping File
"xxx.xml"

Is it Correct Path?(Y/N) (DEFAULT: Y): y
```

- 18** Press ENTER to accept the default (y) or enter **n** and press ENTER to change the values. If you enter **y**, the following displays:

```
=====
Reverse Notification Tables Install
-----

The values you just entered have been copied to file /
ADMIN_ORACLE_CONN_AGENT\conf\properties.ini. If you want to
change anything please edit the file.

Do you want to install reverse notification triggers now? (Y/N)
(DEFAULT: Y)   : y
```

- 19** To enable reverse synchronization, you must install the reverse triggers. (See [Operations Supported by the Connector on page 9](#) for an explanation of reverse synchronization.) Enter **y** and press ENTER to install the triggers (or simply press ENTER to accept the default), or enter **n** and press ENTER to bypass this installation.

If you enter **y**, the following displays:

```
=====
Connection Credentials
-----

Enter user name.

Enter user name : (DEFAULT: ): TEST
```

- 20** To specify credentials to install the triggers in the database, specify a user name and press ENTER. Or, leave this prompt blank and press ENTER. The following displays:

```
=====
Connection Credentials
-----

This installation requires a password to continue.
Enter password : : password
```

- 21** If you specified a user name, enter a password and press ENTER. The following displays:

```
=====
command
-----

calling the command "//ADMIN_ORACLE_CONN_AGENT/AdminSetup.sh"
-userName "TEST" -password password

PRESS <ENTER> TO CONTINUE: y
```

- 22** Press ENTER to continue. The trigger pre-installation summary displays, indicating whether the installation of the triggers succeeded or failed:

```
=====
Reverse Trigger Install Summary
-----

Reverse Trigger Install SUCCESS. Please see the logs for
details.

PRESS <ENTER> TO CONTINUE: y
```

- 23** Press ENTER to continue. The following displays:

```
=====
View Logs
-----

Do you want to see detailed logs? (Y/N) (DEFAULT: Y): y
```

- 24** If you wish to view the installation log file, enter **y** and press ENTER. Otherwise, enter **n** and press ENTER.
- 25** To exit the installation wizard, press ENTER.

## Manual Installation

Instead of using the installation wizard, you can install the agent files and reverse notification tables manually. The following sections describe how to do this.

### Installing the Agent

Complete the following steps to manually copy the agent files to the target server:

**1** *On Windows:*

Extract the contents of the `Oracle-Admin-Agent-Win.zip` file, which resides in the `Manual Agent` subdirectory on the CD, to a target location for the agent on the Oracle system. The extracted files will reside in the `Oracle-Admin-Agent-Win` directory.

*On UNIX:*

Extract the contents of the `Oracle-Admin-Agent-Unix.tar` file, which resides in the `Manual Agent` subdirectory on the CD, to a target location for the agent on the Oracle system. (Use `tar xvf` for extracting the contents of the TAR file.) The extracted files will reside in the `Oracle-Admin-Agent-Unix` directory.

- 2** Copy the mapping file created in [Step 9 on page 13](#) to the `agent_home/conf/com/truologica/truaccess/connector/schema/spml` directory.
- 3** Modify the `properties.ini` file, which resides in the `agent_home/conf` subdirectory, to specify parameters for the agent. The parameters are listed in the following table.

Parameter	Sample Values	Description
PORT	1521	The port on which the database server is listening.
DB_DRIVER	oracle.jdbc. driver. OracleDriver	JDBC driver for the database connection.
DB_URL	jdbc:oracle: thin	JDBC URL string used for the database communication.

<b>Parameter</b>	<b>Sample Values</b>	<b>Description</b>
SERVICE	SI_DB	Database name.
CHECK_LOGIN	true	The Login Check flag.
MAX_LOGIN_RETRIES	3	The number of times the agent will attempt to log in to the database.
CONCERO_SERVER_URL	http:// <i>host:port/lmz/</i> webservice	URL of the Select Identity Web Service.
PollDelay	10	The polling delay for reverse polling (in seconds).
AGENT_PORT	5601	The port on which the agent listens for user provisioning requests from Select Identity.
MAPPING_FILE	Mapping.xml	The XML mapping file.
SPML_Delay	10000	The delay (in milliseconds) between successive SPML requests sent from the agent. Increase this delay if the network or Select Identity server is performing slowly.

- 4 Copy the Oracle JDBC driver file (`classes111.zip`) to the system CLASSPATH. Obtain these files from the Oracle system, the Select Identity server, or your system or database administrator.

See [Installing the Reverse Notification Tables on page 30](#) for steps to configure reverse synchronization. See [Starting the Agent on page 33](#) for information about starting the agent.

## Installing the Reverse Notification Tables

Perform these steps if you want to synchronize changes made to users in Oracle with Select Identify. Reverse synchronization relies on reverse notification tables configured on the database. When you start the agent, reverse synchronization is enabled.

- 1 Copy the XSL mapping file created in [Step 10 on page 13](#) to the `agent_home/conf/com/trulogica/truaccess/connector/schema/spml` directory.
- 2 Edit the `properties.ini` file, which resides in the `agent_home/conf` subdirectory, to specify parameters for reverse synchronization. See [Step 3 on page 28](#) for details on this file.
- 3 Run the `agent_home/Adminsetup.cmd` file (on Windows) or `Adminsetup.sh` file (on UNIX) from the command line. This installs reverse notification tables as specified by the mapping file and creates snapshot tables. If the tables exist, table creation fails, indicating the error.
- 4 Modify the `opattributes.properties` file, which resides in the `agent_home/conf/` subdirectory and provides operational attributes that are sent to the Select Identity server during reverse synchronization requests. The file must contain the following:

Parameter	Sample Values	Description
<code>urn:oasis:names:tc:SPML:1:0#UserIDAndOrDomainName</code>	Sisa	User ID of the administrative user on Select Identity
<code>urn:trulogica:conceroc:2.0#password</code>	Abc123	Password of the administrative user
<code>urn:trulogica:conceroc:2.0#reverseSync</code>	true	Set to <b>true</b> if you want to enable reverse synchronization

<b>Parameter</b>	<b>Sample Values</b>	<b>Description</b>
urn:trulogica:concero:2.0#resourceType	GenSQL_Schema1	The name of the XSL file (without the .xsl extension) that is used during reverse synchronization
urn:trulogica:concero:2.0#resourceId	SQL	The name of the Select Identity resource that is created for the Oracle Admin connector.

If you wish to delete the reverse notification tables, complete the steps in [Uninstalling the Agent on page 51](#). These steps assume that *agent\_home/conf/properties.ini* is configured as mentioned in [Installing the Agent on the Database Server on page 13](#).

## Installed Files

The following provides a listing of the directories and files installed for the agent:

Directories and Files	Description
<i>agent_home/</i>	Contains the following files: <ul style="list-style-type: none"> <li>• <code>AddToStartupGroup.cmd/sh</code> — Adds icons to startup group; this file is present only if the agent was installed using the wizard</li> <li>• <code>CopyFile.cmd/sh</code> — Used by agent to copy files; this file is present only if the agent was installed using the wizard</li> <li>• <code>DelFile.cmd/sh</code> — Used by agent to delete files; this file is present only if the agent was installed using the wizard</li> <li>• <code>setup.cmd/sh</code> — Installs the reverse notification tables</li> <li>• <code>sqlapp.cmd/sh</code> — Used by agent to communicate with the database</li> <li>• <code>SQLConnectorConsole.cmd/sh</code> — Starts the agent</li> <li>• <code>AdminUninstall.cmd/sh</code> — Uninstalls the reverse notification tables</li> </ul>
<i>agent_home/conf/</i>	Contains the following files: <ul style="list-style-type: none"> <li>• <code>properties.ini</code> — Provides configuration settings for the agent</li> <li>• <code>opAttributes.properties</code> — Provides configuration settings for reverse synchronization</li> <li>• <code>log4j.properties</code> — Provides settings for logging.</li> </ul>
<i>agent_home/conf/com/</i>	Contains the <code>truologica/truaccess/connector/schema/spml</code> directory structure where the XML mapping file is stored

Directories and Files	Description
<i>agent_home/lib/</i>	Contains JAR files used by the agent.
<i>agent_home/logs</i>	Contains log files produced by the agent.
<i>agent_home/</i> Uninstall_ADMIN_ORACLE _CONN_AGENT/	Contains files for uninstalling the agent. This subdirectory is created only if the agent is installed using the installation wizard.

## Starting the Agent

To start the agent, run `SQLConnectorConsole.cmd` (on Windows) or `SQLConnectorConsole.sh` (on UNIX), which resides in the agent's home directory. This program logs in to the database server using the user name and password of a user who has administrative privileges on the database.

If you wish, you can provide the following parameters to the command:

**username** — The user name of the user who has administrative privileges on the database.

**password** — The specified user's password.

Here is an example you can use on Windows:

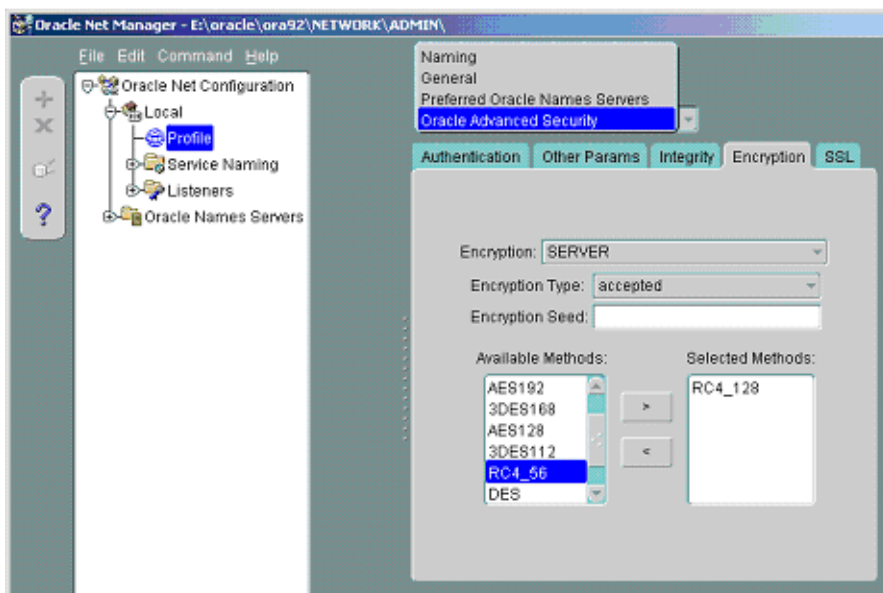

```
agent_home/SQLConnectorConsole.cmd -userName si -password abc123
```

If you start the agent before or without configuring reverse synchronization (the reverse notification tables), a message is displayed stating that reverse notification is disabled.

# Configuring Oracle to Support Secure JDBC

Complete the following steps to configure the Oracle server to support secure JDBC:

- 1 Start the Oracle Net Manager by entering the following command from `$ORACLE_HOME/bin`:  
**run netmgr**
- 2 In the Navigator window, expand **Local** → **Profile**
- 3 Select **Oracle Advanced Security** from the drop-down menu in the upper right-side of the frame. The Oracle Advanced Security tabbed window displays:

- 4 Click the **Encryption** tab.
- 5 Select **SERVER** from the drop-down menu.
- 6 Select **accepted** from the Encryption Type drop-down menu.
- 7 Move the desired method(s) from the Available Methods list to the Selected Methods list.

- 8 For each method selected, ensure that you specify the same encryption method in the Encryption Algorithm field when creating the connector resource ([Step 2 on page 37](#)). The following table illustrates the resulting security settings when the server-side settings for the accepted methods overlap with the client-side encryption settings. Ensure that the client and server settings are set such that an ON condition results.

	<b>Client - Rejected</b>	<b>Client - Accepted (Default)</b>	<b>Client - Requested</b>	<b>Client - Required</b>
<b>Server - Rejected</b>	OFF	OFF	OFF	Connection fails
<b>Server - Accepted (Default)</b>	OFF	OFF	ON	ON
<b>Server - Requested</b>	OFF	ON	ON	ON
<b>Server - Required</b>	Connection fails	ON	ON	ON

ON — Secure JDBC connection

OFF — Unsecure JDBC connection

Connection Fails — The connection between client and the server fails.

- 9 Select **File** → **Save Network Configuration**. The `sqlnet.ora` file is updated.

## Configuring the Connector

After you deploy the connector on the application server, you must configure Select Identity to use the connector by deploying it in the Select Identity client. The following provides an overview of the procedures you must complete in order to deploy your connector. It also provides connector-specific information you must provide when configuring Select Identity to use the connector.

- 1 Register the Oracle Admin connector with Select Identity by clicking the **Deploy New Connector** button on the Connectors home page. Complete this procedure as described in the “Connectors” chapter of the *HP OpenView Select Identity Administrator Guide*.

After you deploy the connector, the connector properties will look similar to this:

Connector Information	
* Connector Name:	<input type="text" value="AdminOracleConnector"/>
* Pool Name:	<input type="text" value="eis/Admin-OracleConnector"/>
Mapper Available:	<input type="checkbox"/>

- 2 Deploy a resource that uses the newly created connector. On the Resources home page, click the **Deploy New Resource** button. The resource configuration depends on how the connector and agent were installed and configured:
  - Using a JDBC data source, an agent is not installed:  
In this configuration, the connector performs operations on the database directly through JDBC calls. You must specify the JDBC data source and mapping file when configuring the resource.
  - Using a JDBC driver, an agent is not installed:  
The connector uses the JDBC driver to communicate with the database. You must specify all parameters except the agent port and JDBC data source.
  - Using a JDBC driver, an agent installed:  
If the agent is installed and a JDBC driver is used to communicate with the database, you must specify all parameters except the JDBC data source.

Complete the steps in this procedure as described in the “Resources” chapter of the *HP OpenView Select Identity Administrator Guide*. When configuring the resource, refer to the following table for parameters specific to this connector:

- ▶ Copy or move the XML and XSL files to the proper locations. For example, if `C:\si3.3\weblogic\sysarchive` is a folder in the WebLogic CLASSPATH, the XSL should reside in `C:\si3.3\weblogic\sysarchive` and the XML should reside in `C:\si3.3\weblogic\sysarchive\com\trulogica\truaccess\connector\schema\spml`.

Field Name	Sample Values	Description
Resource Name	Gen-Oracle	The name of the resource.
Resource Type	SQL	The connector that was deployed in <a href="#">Step 1 on page 36</a> .

<b>Field Name</b>	<b>Sample Values</b>	<b>Description</b>
Authoritative Source*	No	Whether this resource is a system that is considered to be the authoritative source for user data in your environment. Specify <b>Yes</b> if the connector is enabled for reverse synchronization. If the resource is not authoritative, the resource can only modify user entitlements during reverse synchronization.
Associate to Group	Selected	Whether the system uses the concept of groups. For this connector, select this option.
Server Name	Ps0111	Host name or IP address of the database server. You must specify this parameter if the agent was installed.
Server Port	1521	Port on which the database server is listening. You must specify this parameter if the agent was installed.
Username	sa	The login name of the database administrative user. You must specify this parameter if the agent was installed.
Password	p4ssword	Password of the database administrative user. You must specify this parameter if the agent was installed.
Agent Port	5601	The port where the agent listens for incoming connections. You must specify this parameter if the agent was installed.

Field Name	Sample Values	Description
SQL URL	jdbc:oracle:thin	URL to use to communicate with the database over a JDBC connection. You must specify this parameter if the agent was installed.
Database / Service Name	testDB	The database name in which to provision users. You must specify this parameter if the agent was installed.
Database Driver String	oracle.jdbc.driver.OracleDriver	Name of the JDBC driver to connect to the database. You must specify this parameter if the agent was installed.
Mapping File	Mapping.xml	The XML mapping file, which must reside in <code>install/conf/com/truologica/truaccess/connector/schema/spml</code> directory in order for the Select Identity server to find it.
JDBC Datasource String	Jdbc/SQLDataSource	JNDI data source name that was created or identified on the Select Identity server that can connect to the target Oracle database. Specify a value for this property if the agent was not installed.
Encryption Specification Algo	oracle.net.encryption_types_client	Encryption algorithm specification string. Specify this parameter if you wish to use secure communication with Oracle.
Encryption Algorithm	RC4_128	Name of the encryption algorithm. Specify this parameter if you wish to use secure communication with Oracle.

Field Name	Sample Values	Description
Encryption Specification Level	oracle.net.encryption_client	Encryption level specification string. Specify this parameter if you wish to use secure communication with Oracle.
Encryption Level	ACCEPTED	Encryption level. Specify this parameter if you wish to use secure communication with Oracle.

\* Instead of creating an authoritative resource, you can create authoritative attributes (in the next step) for the attributes that will be synchronized. Entitlements are authoritative by default in a non-authoritative resource but other attributes are not.

After you deploy the resource for the Oracle Admin connector, the Access Info page of the resource properties will look similar to this:

Resource Access Information	
* Resource Name:	OraAdminRes
Server Name:	ovprtt11
Server Port:	1521
Username:	sys as sysdba
Password:	**
Agent Port:	5056
SQL URL:	jdbc:oracle:thin
DataBase/Service Name:	OVS1
Database Driver String:	oracle.jdbc.OracleDriver
* Mapping File:	Admin_Oracle.xml
JDBC Datasource String:	
Encryption Specification Algo:	
Encryption Algorithm:	
Encryption Specification Level:	
Encryption Level:	

- 3 Create attributes that link Select Identity to the connector. For each mapping in the connector's mapping file, create an attribute using the Attributes capability on the Select Identity client.

Refer to the "Attributes" chapter in the *HP OpenView Select Identity Administrator Guide* for more information. After you create the attributes

for the Oracle Admin connector, the View Attributes page for the resource will look similar to this:

- The attributes in the snapshot are sample values based on the sample XML file given above.

(Resource Name=OraAdminRes)				
<< < Page 1 of 1 >>				Total Records:7
Name	Min Length	Max Length	Attribute Mapped To	Authoritative
DEFAULT_TABLESPACE	0	255	Addr1	N
OraAdminRes_ENTITLEMENTS	1	255	OraAdminRes_ENTITLEMENTS	Y
OraAdminRes_KEY	1	255	OraAdminRes_KEY	Y
PASSWORD	0	255	Password	N
PROFILE	0	255	Company	N
TEMPORARY_TABLESPACE	0	255	Addr2	N
USERNAME	0	255	UserName	N

- 4 Create a Service that will use the newly created resource. To do so, click the **Deploy New Service** button on the Services home page. Complete this procedure as described in “Services” of the *HP OpenView Select Identity Administrator Guide*. You will reference your new resource created in [Step 2](#) while creating this service.

If you are enabling reverse synchronization, configure the Service as follows:

- When selecting the Business Relationship, choose the ReconciliationDefaultProcess workflow for the RECONCILIATION:Add Service and RECONCILIATION:Delete Service Membership request events. For RECONCILIATION:Add Service, use the user addition view.
- In the user addition view, specify mandatory attributes that are guaranteed to be passed by the reverse synchronization request when adding a user. If you specify a mandatory attribute that is not passed by the resource, the user will be created in Select Identity but reverse synchronization will not succeed.
- When specifying the context, obtain the value from the add request issued by the resource. For example, if the context is Country and the value is US, the <addRequest> element in the reverse synchronization request should have an attribute called country and a value of US. If the context attribute is not present in the add user request, the user will be created in Select Identity but will not be assigned to a Service.

# Understanding the Mapping Files

To enable the connector to provision users and entitlements in the schema on the Oracle resource, you must create an XML mapping file. If you configured the agent to support reverse synchronization, you must also provide an XSL file that provides a reverse mapping of the Select Identity and resource fields mapped in the XML file.

This chapter provides an explanation of the XML and XSL mapping files. The following sections are provided:

- [Elements in the XML Mapping File on page 43](#)
- [Elements in the XSL Reverse Mapping File on page 47](#)

Refer to `Admin_Oracle.xml` and `Admin_Oracle.xsl`, which were extracted from the `Admin Oracle Schema.zip` file, for a sample XML and XSL files for this connector.

## Elements in the XML Mapping File

Here is an explanation of the format of the XML mapping file. For a sample mapping file, see the `Admin_Oracle.xml` that was extracted from the `Admin Oracle Schema.zip` file.

- **<Schema>**, **<providerID>**, and **<schemaID>**

Provides standard elements for header information.

- **<objectClassDefinition>**

Defines the actions that can be performed on the specified object as defined by that name attribute (in the `<properties>` element block) and the Select Identity-to-resource field mappings for the object (in the `<memberAttributes>` block). For example, the object class definition for users defines that users can be created, read, updated, deleted, reset, and expired in Oracle.

- **<properties>**

Defines the operations that are supported on the object. This can be used to control the operations that are performed through Select Identity. The following operations can be controlled:

- Create (CREATE)
- Read (READ)
- Update (UPDATE)
- Delete (DELETE)
- Enable (ENABLE)
- Disable (DISABLE)
- Reset password (RESET\_PASSWORD)
- Expire password (EXPIRE\_PASSWORD)
- Change password (CHANGE\_PASSWORD)
- Assign entitlements (LINK)
- Unassign entitlements (UNLINK)
- Retrieve entitlements (GETALL)

The operation is assigned as the name of the <attr> element and access to the operation is assigned to a corresponding <value> element. You can set the values as follows:

- true — the operation is supported by the connector
- false — the operation is not supported by the connector
- bypass — the operation is not supported by the connector

Here is an example:

```
<objectClassDefinition description="" name="User">
  <properties>
    <attr name="GETCHILDREN">
      <value>true</value>
    </attr>
    <attr name="DELETE">
      <value>true</value>
    </attr>
    <attr name="EXPIREPASSWORD">
      <value>true</value>
    </attr>
    <attr name="GETALL">
      <value>true</value>
    </attr>
  ...
```

- **<memberAttributes>**

Defines the attribute mappings. This element contains <attributeDefinitionReference> elements that describe the mapping for each attribute. Each <attributeDefinitionReference> can be followed by an <attributeDefinition> element that specifies details such as minimum length, maximum length, and so on.

Each <attributeDefinitionReference> element contains the following attributes:

- Name — the name of the reference.
- Required— if this attribute is required in the provisioning (set to true or false).
- Conzero:tafield — the name of the Select Identity resource attribute.

- `Concero:resfield` — the name of the physical resource attribute from the resource schema. If the resource does not support an explicit schema (such as UNIX), this can be a tag field that indicates a resource attribute mapping.
- `Concero:isKey` — An optional attribute that, when set to true, specifies that this is the key field to identify the object on the resource. Only one `<attributeDefinitionReference>` can be specified where `isKey="true"`. This key field does not need to be the same as the key field of the identity object in Select Identity.
- `Concero:init` — An optional attribute that identifies that the attribute is initialized with the value of the attribute passed in from Select Identity.

Here is an example:

```
<memberAttributes>
  <attributeDefinitionReference concero:isKey="true"
    concero:resfield="adminproperty=USER,attribute=NAME"
    concero:tafield="UserId" encrypt="false"
    encryptionAlgorithm="" fk="" iTK="true" isPassword="false"
    name="adminpropertyUSERattributeNAME" required="true"
    supportedOperations="UNLINK, LINK, GETATTRIBUTES,
      GETPARENT, GETCHILDREN, GETALL, RESETPASSWORD,
      CHANGEPASSWORD, EXPIREPASSWORD, DISABLE, ENABLE, CREATE,
      DELETE, UPDATE" type="java.lang.String"/>
  ...
```

The interpretation of the mapping between the connector field (as specified by the `Concero:tafield` attribute) and the resource field (as specified by the `Concero:resfield` attribute) is determined by the connector. The Oracle Admin connector has code to interpret the mappings in one way, as follows:

- The connector attribute names are specified in `tafield`. The value of attribute `xyz` is taken from the `UserModel` during provisioning.
- Composite attributes can be specified in the Oracle Admin connector mapping file. To do this, specify `[attr1] xxxx [attr2]` as the connector attribute. This specifies that the value of the `attr1` and `attr2` attributes should be combined with the string `xxxx` to form a mapping for the specified resource field. The Oracle Admin connector has code to handle these composite mappings.

You must specify static text (strings) in composite attributes with brackets ( { } ). Also, if no string separates two connector attributes, you must add a space that is within brackets, like this: attr1{ }attr2.

- **<attributeDefinition>**

Defines the properties of each object's attribute. For example, the attribute definition for the Directory attribute defines that it must be between one and 50 characters in length and can contain the following letters, numbers, and characters: a-z, A-Z, 0-9, @, +, and a space.

Here is an example:

```
<attributeDefinition
  description="adminpropertyENTITLEMENTattributeNAME"
  name="adminpropertyENTITLEMENTattributeNAME"
  type="java.lang.String">
  <properties>
    <attr name="minLength">
      <value>0</value>
    </attr>
    <attr name="maxLength">
      <value>255</value>
    </attr>
    <attr name="defaultValue">
      <value/>
    </attr>
    <attr name="pattern">
      <value><![CDATA[[a-zA-Z0-9@+]]></value>
    </attr>
  </properties>
</attributeDefinition>
```

- **<concerto:entitlementMappingDefinition>**

Defines how entitlements are mapped to users.

- **<concerto:objectStatus>**

Defines how to assign status to a user.

- **<concerto:relationshipDefinition>**

Defines how to create relationships between users.

Refer to `Admin_Oracle.xml`, which was extracted from the `Admin Oracle Schema.zip` file, for a sample XML file for this connector.

## Elements in the XSL Reverse Mapping File

If the agent is installed on the resource and you wish to enable reverse synchronization, you must create an XSL file to map all attributes that are specified in the XML mapping file. See the `Admin_Oracle.xsl` file that was extracted from the `Admin Oracle Schema.zip` file for a full sample.

Note that the elements in the XSL file are case sensitive.

You must define the user's ID field on the resource and in Select Identity. In the following example, `RES_USERID` is the user ID resource attribute for the user on the resource. The `RES_PASSWORD` is the corresponding password attribute on the resource. The following provides an example for setting these attributes:

```
<xsl:variable name="RES_USERID"
select="'adminproperty=USER,attribute=USERNAME'"/>
<xsl:variable name="RES_PASSWORD"
select="'adminproperty=USER,attribute=PASSWORD'"/>
```

`SI_USERID` is the Select Identity attribute for the user ID, and `SI_PASSWORD` is the Select Identity attribute for the password. The following shows how to set these attributes:

```
<xsl:variable name="SI_USERID" select="'USERNAME'"/>
<xsl:variable name="SI_PASSWORD" select="'PASSWORD'"/>
```

For each resource attribute, you must define a corresponding Select Identity attribute, which defines the attribute in Select Identity to which the resource attribute is mapped. The following example defines the `RES_ATTR0` resource attribute and the `SI_ATTR0` attribute in Select Identity:

```
<xsl:variable name="RES_ATTR0" select="'xxxxxxxxxxxx'"/>
<xsl:variable name="SI_ATTR0" select="'xxxxxxxxxxxx'"/>
```

Then, define the resource attribute, such as in this example for `RES_ATTR0`:

```
<xsl:when test="$ATTRNAME = $RES_ATTR0">
  <xsl:call-template name="AttributeBuilder">
    <xsl:with-param name="DSMLELEMENT" select="$DSMLELEMENT"/>
    <xsl:with-param name="ATTRNAME" select="$SI_ATTR0"/>
    <xsl:with-param name="ATTRVALUE" select="$ATTRVALUE"/>
```

```
<xsl:with-param name="MODIFYFLAG" select="$MODIFYFLAG" />
</xsl:call-template>
</xsl:when>
```

**Refer to the `Admin_Oracle.xsl` file, which was extracted from the `Admin Oracle Schema.zip` file, for a sample XSL file for this connector.**

## Uninstalling the Connector

If you need to uninstall a connector from Select Identity, make sure that the following are performed:

- All resource dependencies are removed.
- The connector is deleted through the Connectors home page on the Select Identity client.

## Uninstalling the Connector from WebLogic

Perform the following to delete a connector:

- 1 Log on to the WebLogic Server Console.
- 2 Navigate to ***My\_Domain*** → **Deployments** → **Connector Modules**.
- 3 Click the delete icon next to the connector that you want to uninstall.
- 4 Click **Yes** to confirm the deletion.
- 5 Click **Continue**.

## Uninstalling the Connector from WebSphere

Complete the following steps to uninstall the connector on WebSphere:

- 1 Log on to the WebSphere Application Server Console.
- 2 Navigate to **Resources** → **Resource Adapters**.
- 3 Select the connector to uninstall.
- 4 Click **Delete**.
- 5 Click the **Save** link (at the top of the page).
- 6 On the Save to Master Configuraton dialog, click the **Save** button.

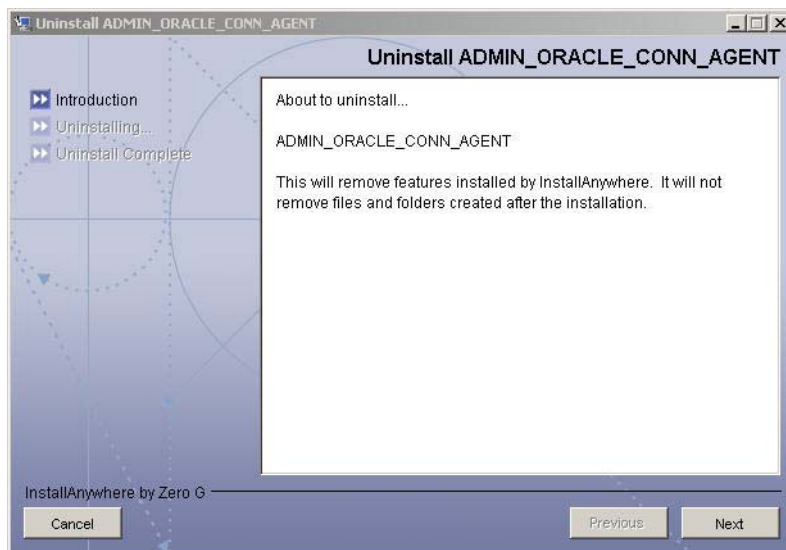

# Uninstalling the Agent

The following sections describe how to remove the agent, which you can do using a wizard or manually.

## Using a Wizard to Remove the Agent on Windows

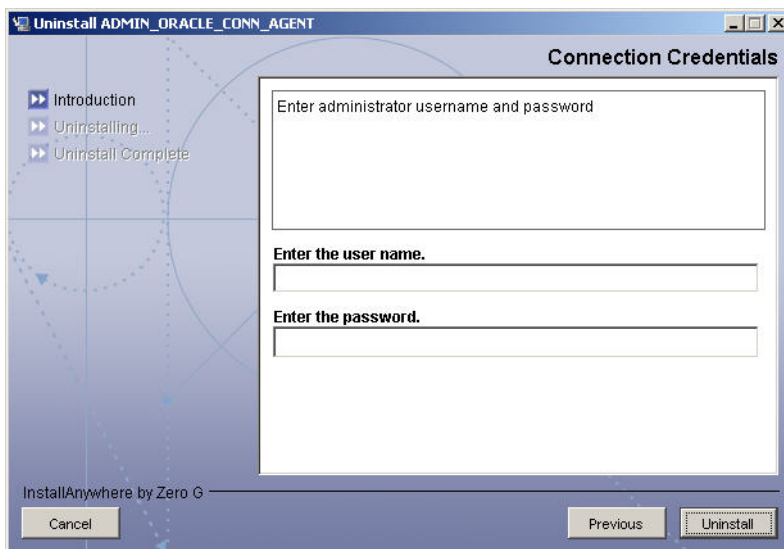

Perform the following steps to delete the agent on the Windows server:

- 1 Select **Programs** → **ADMIN\_ORACLE\_CONN\_AGENT** → **Uninstall Agent** from the Start menu. The wizard displays.

- 2 Click **Next** on the introductory dialog.

- 3 Provide the database credentials to uninstall the reverse notification tables, if they were installed. Then, click **Uninstall**.

- 4 Click **Continue** when the pop-up dialog indicates that the reverse notification tables were successfully uninstalled.
- 5 Click **Done** on the Uninstall Complete dialog to close the wizard.

## Using a Wizard to Remove the Agent on UNIX

Perform the following steps to delete the agent on the UNIX server:

- 1 Start the wizard by running the following command:

```
agent_home/Uninstall_ADMIN_ORACLE_CONN_AGENT/  
Uninstall_ADMIN_ORACLE_CONN_AGENT
```

The following displays:

```
=====
Preparing CONSOLE Mode Installation...
=====
(created with InstallAnywhere by Zero G)
=====
```

```
=====
Uninstall ADMIN_ORACLE_CONN_AGENT
-----
```

About to uninstall...

ADMIN\_ORACLE\_CONN\_AGENT

This will remove features installed by InstallAnywhere. It will not remove files and folders created after the installation.

PRESS <ENTER> TO CONTINUE:

- 2** Press ENTER to continue. The following displays:

```
=====
Get User Input
-----
```

Enter requested information

Enter user name : (DEFAULT: ): TEST

- 3** Enter the database user name and press ENTER. The following displays:

```
=====
Get User Input
-----
```

Enter requested information

Enter password : (DEFAULT: ): password

- 4** Enter the user's password and press ENTER. The installer removes the reverse notification tables (if installed) and displays a success or failure message, as follows:

```
=====
Executed the command
-----
```

```
"/ADMIN_ORACLE_CONN_AGENT/Adminuninstall.sh" -userName "TEST"
-password "password"
```

Reverse Notification Tables Uninstall Summary

Reverse Notification Tables Uninstall SUCCEEDED.

- 5** To view the log file, select the Show Logs and press ENTER.
- 6** Press ENTER to exit the wizard.

## Manually Removing the Agent

Perform the following steps to manually remove the agent:

- 1 Make sure that the `agent_home\conf\properties.ini` file retains the same values used during the installation of the reverse notification tables.
- 2 Make sure that the XML mapping file during the installation of the agent is available in the `agent_home\conf\com\trulogica\truaccess\connector\schema\spml` folder.
- 3 Run the `Adminuninstall.cmd` file (on Windows) or `Adminuninstall.sh` file (on UNIX).
- 4 Provide the database login credentials when prompted.
- 5 Delete the agent files and directory structure, if you wish.

# Troubleshooting

This appendix describes common problems encountered during the installation and use of the connector and its agent.

## Connector Installation

This section lists the common problems encountered during installation and use of the connector.

- After redeploying the connector, Select Identity does not display the current connector information.

*Possible Cause:* The application is using a cached connector file.

*Solution:* Restart the application server.

- Select Identity does not display the most current mapping file information.

*Possible Cause:* The application server is using a cached mapping file.

*Solution:* Restart the application server.

- The mapping file of a existing resource is changed and, when you attempt to modify the resource to add a new mapping file, the following error displays:

```
Application cannot be modified at this time
```

*Possible Cause:* Major differences may exist between the old and new mapping files.

*Solutions:*

- Create a new resource with the new mapping file.
- Unmap all attributes in the current resource and modify the resource to reference the new mapping file. You cannot use this second solution, however, if users were provisioned using this resource.
- Select Identity can successfully add a user but the new user is not shown in the resource's database table.

*Possible Causes:*

- The mapping file lacks the Create operation for the Key attribute.
- The Create operation for the User entity is not added in the XML file.
- The XML parser files may be missing from the `BEA_HOME/jdk_1.4.1/jre/lib/endorsed` folder (on WebLogic).
- A database exception occurred.

*Solutions:*

- Add the create operation to the mapping file or add the relevant JARs to the path.
- If a database exception occurred, refer to the logs for details of the exception. Common exceptions include size mismatches for columns and foreign key constraint violations. Refer to the database documentation for more information on the database exceptions.

## Agent and Reverse Notification Tables Installation

This section lists the common problems encountered while installing and configuring reverse synchronization.

- A `NullPointerException` occurs

*Possible Cause:* The specified mapping file is not available in the class path.

*Solution:* Make sure that the file is placed in the `Install/conf` directory. Ensure the name of the file specified in `properties.ini` is spelled correctly. Note that it is case sensitive. Also, check the format of the mapping file.

- The following error messages is displayed:

Can't create view dbo.DBA\_USERS Message received from the database: There is already an object named ... Cannot proceed.

*Possible Cause:* You are attempting to reinstall the agent without removing previously installed database tables.

*Solution:* Uninstall the agent as documented in [Uninstalling the Connector on page 49](#). This removes previously installed tables. Then, run the agent installation wizard again.

- The following error message is displayed:

Can't create view. Message received from the database:  
ORA-00942: table or view does not exist

*Possible Cause:* The database user has insufficient database permissions.

*Solution:* Grant the user permission to the necessary view. Here is an example for Oracle, granting the SYS.DBA\_SYS\_PRIVS and DBA\_RSRC\_CONSUMER\_GROUP\_PRIVS permissions to the Oracle User:

```
Grant on select SYS.DBA_ROLE_PRIVS to "Oracle User"
```

```
Grant on select SYS.DBA_RSRC_CONSUMER_GROUP_PRIVS to "Oracle User"
```

- The following error message is displayed:

```
Exception occurred while starting reverse. Error message  
receive: Io exception: Connection  
refused(DESCRIPTION=(TMP=) (VSNNUM=135295488) (ERR=12505) (ERROR_S  
TACK=(ERROR=(CODE=12505) (EMFI=4))))Error in logon. Can not  
proceed.
```

*Possible Cause:* The wrong database service name was entered.

*Solution:* Verify the database service name in the `properties.ini` (see [Step 3 on page 28](#)) for correctness and ensure that the case of the name is correct (the name is case-sensitive).

## Agent Execution

This section lists the common problems encountered while running the agent.

- An exception similar to the following is displayed:

```
java.net.BindException: Address in use: JVM_Bind
```

*Possible Cause:* The listening port on the agent's system is in use, possibly by another invocation of the agent.

*Solution:* Stop the older invocation and run the agent again.

- An error message similar to the following is displayed:

```
Invalid Object schema.tableName
```

*Possible Cause:* The schema specified in the mapping file is incorrect.

*Solution:* Check the mapping file.

- The agent console shows a Log4jFactory exception when started.

*Possible Cause:* The agent cannot find the log4j-1.2.8.jar in the classpath.

*Solution:* Add the JAR to BEA\_HOME/jdk1\_4\_05/jre/lib/ext (on WebLogic).

- The following error is displayed:

```
SQLException occurred while adding element into SNAPSHOT_TAB.
Message received from the database: ORA-00942: table or view
does not exist
```

*Possible Cause:* The agent is installed without the reverse notification tables.

*Solution:* Install the tables by re-running the installation, then run the agent.
