Support

Please visit the HP OpenView web site at:

http://www.managementsoftware.hp.com/

This web site provides contact information and details about the products, services, and support that HP OpenView offers.

You can also go directly to the support web site at:

http://support.openview.hp.com/

HP OpenView online software support provides customer self-solve capabilities. It provides a fast and efficient way to access interactive technical support tools needed to manage your business. As a valuable support customer, you can benefit by using the support site to:

- Search for knowledge documents of interest
- Submit and track progress on support cases
- Manage a support contract
- Look up HP support contacts
- Review information about available services
- Enter discussions with other software customers
- Research and register for software training

Most of the support areas require that you register as an HP Passport user and log in. Many also require a support contract.

To find more information about access levels, go to:

http://support.openview.hp.com/access_level.jsp

To register for an HP Passport ID, go to:

https://passport2.hp.com/hpp/newuser.do

1 Overview

This chapter covers the following topics:

- OVPI and interface performance
- New features in version 5.0
- Data collection
- Package contents: folders and reports
- Rules and actions for thresholds
- Ways to customize reports
- Sources for additional information

OVPI and Interface Performance

HP OpenView Performance Insight (OVPI) is a performance management and reporting application. Long-term data collection, in-depth analysis, and automated web-based reporting are this application's primary strengths. If desired, OVPI can be integrated with network and system management applications, including NNM and OVO. Integration will improve your ability to isolate faults, diagnose problems, and anticipate capacity issues.

The Interface Reporting Report Pack installs on OVPI. The reports in this package will help you maintain service levels, assess capacity constraints, and spot problem areas before they become serious. The following chores are now done for you, automatically:

- Monitor exceptions (discard exceptions, error exceptions, utilization exceptions)
- Spot the extremes trunks, locations, protocols that rank in the top ten
- Find hot spots interfaces and devices with high exception counts
- Sort interfaces by rate of growth over the rolling baseline period
- Identify devices that are expected to exceed utilization thresholds in the near future
- Estimate future utilization based on past behavior during the rolling baseline period
- Correlate future performance by day-of-week
- See how a device, trunk, or EtherChannel is performing in near real time
- Compare today's activity to yesterday
- Compare today's activity to last week and last month

New Features in Version 5.0

Interface Reporting 5.0 is one of three enhanced report packs in the June 2005 release of report packs. The other two are Device Resource 3.1 and System Resource 4.1. Enhanced report packs incorporate the following improvements:

- Report linking
- Launch Point
- Ad hoc selector reports
- Color-coded graphics in selection tables
- One-step upgrade packages

The links in reports allow you to move quickly from one report to another without having to close the report you are viewing, return to a report directory, and then open another report in the directory. Navigating reports is now more like navigating a website—numerous links are available and investigating a specific area of interest is easier and more efficient. In addition to moving from one report to another report within the same report pack, you can also link to reports in a different report pack. For example, from a report in Interface Reporting you can link to a report in the Device Resource Report Pack.

The Launch Point page provides an overview of package contents by grouping reports into logical categories, for example, Near Real Time reports, forecasting reports, and ad hoc selector reports. The ad hoc selector option opens an abbreviated report that lets you select specific elements from a set of drop-down menus. The drop-down menus make it easy to pin-point an item of interest. In addition, response time is especially good, since this report launches just a few queries against the database.

Interface Reporting 5.0 has new upgrade packages. The new upgrade packages eliminate the need for a version-by-version upgrade that would entail starting and stopping Package Manager multiple times. Now you can upgrade an existing package to the latest version by installing a single upgrade package. Note also that the main package and the sub-packages have matching version numbers. The main package is 5.0 and all four sub-packages (Device, Location, Protocol, VLAN) are 5.0.

The following table outlines recent enhancements to Interface Reporting.

| Version | Release Date | Features/Enhancements |
|---------|--------------|---|
| 2.0 | January 2002 | Sybase support |
| 2.1 | January 2003 | Minor fixes and changes |
| 3.0 | May 2003 | OVPI Object Manager support new change forms: Change Protocol Defaults Update Interface Change Interface Customer/Description Administer Interface Poll Flag Administration |

| Version | Release Date | Features/Enhancements |
|---------|---------------|--|
| 3.0 | October 2003 | new sub-packages: • Etherchannel • VLAN Cisco VLAN Datapipe 2.0 |
| 4.0 | April 2004 | Oracle support |
| 4.5 | August 2004 | new form: Assign Priority new folder: Vendor new reports: Top Level Inventory [Admin folder] Priority Customer [multiple] new upgrade packages: UPGRADE_Interface_Reporting_4_to_45.ap UPGRADE_Interface_Reporting_Device_4_to_45.ap UPGRADE_Interface_Reporting_Location_4_to_45.ap UPGRADE_Interface_Reporting_Protocol_4_to_45.ap UPGRADE_Interface_Reporting_Vlan_3_to_45.ap |
| 4.6 | November 3004 | Constraints on exception reports removed Default for Ethernet changed to full duplex Cisco 806 added to vendor table VLAN report statistics refreshed Cisco VLAN Datapipe 2.1 new upgrade packages: UPGRADE_Interface_Reporting_45_to_46.ap UPGRADE_Interface_Reporting_Device_45_to_46.ap UPGRADE_Interface_Reporting_Location_45_to_46.ap UPGRADE_Interface_Reporting_Protocol_45_to_46.ap UPGRADE_Interface_Reporting_Vlan_45_to_46.ap |

Overview 9

Data Collection

The following datapipes can be used with Interface Reporting:

1. Interface Reporting if Entry Datapipe 2.2 (required)

Collects data from the MIB-II ifTable in accordance with the polling rule you implement. If desired, you can configure this datapipe to perform directed-instance polling. Also known as *flagged interface polling*, directed-instance polling allows you to specify which interfaces you want to poll. If your network includes hundreds or possibly thousands of ports feeding desktop users, and your initial goal is to collect data from a few LAN switch interfaces (the server ports or the uplink ports), you can use directed-instance polling to restrict data collection to a smaller subset of interfaces, thereby enhancing performance and scalability.

2. Interface Discovery Datapipe 2.2 (required)

Discovers and tracks MIB-II if Table interface identifiers and configuration data. This datapipe does not poll. It is a prerequisite for several other datapipes, including the IR if Entry Datapipe.

3. Interface Reporting Duplex Datapipe 1.0 (optional)

Polls the RFC2665 MIB for OID 1.3.6.1.2.1.10.7.2.1.19, which indicates the status, full or half duplex, of an interface. The value pulled from the MIB overrides the default for that protocol type.

4. Interface Reporting Cisco VLAN Datapipe 2.1 (optional)

Collects VLAN configuration information for the VLAN reports in the IR VLAN package.

5. Interface Reporting OPNET Export Datapipe 2.0 (optional)

Exports MIB-II if Table data in a format compatible with OPNET.

Package Contents

The Interface Reporting Report Pack includes the following report folders:

- Admin
- Device
- EtherChannel
- Interface
- Location
- Protocol
- VLAN

Reports in the Device, Location, Protocol, and Vendor folders have a customer orientation. Your first step is to select a customer. Selecting a customer displays a list of devices, locations, protocols, or vendors that belong to the customer.

The only data in a customer-oriented report is aggregated data. The Device folder aggregates data by device, which means that data for all enabled interfaces (*administratively up interfaces*) has been rolled up to the device level. Similarly, the reports in the Location folder roll up data for enabled interfaces by location, while reports in the Protocol folder roll up data for enabled interfaces by protocol.

Reports in the Interface folder have an interface orientation. Each report begins with a table containing a list of devices in column 1 and a list of interfaces in column 2.

Folder Contents

Types of Reports

See below for a brief description of each type of report in the package.

Availability Detail. Displays a list of interfaces that were unavailable for at least part of the previous day.

Capacity Planning. Forecasts busy-hour utilization and sorts interfaces, devices, locations, protocols, or vendors by rate of growth.

Configuration and Logging. Displays configuration settings that determine how collections are performed; displays an entry for each transfer from the datapipe to the report pack, indicating when the transfer took place and the number of rows that were mapped to the report pack.

Exceptions. Identifies the interfaces with the highest number of discard exceptions, error exceptions, or utilization exceptions.

Exception Hot Spots. Identifies the trunks, interfaces, VLAN interfaces, and devices with the highest number of exceptions.

Executive Summary. Aggregates volume, exception counts, and utilization by protocol, location, or vendor.

Grade of Service. Identifies the ten worst performing interfaces and assigns a grade to each interface based on utilization, error, and discard exceptions.

Inventory. Shows which devices are provisioned and property data associated with devices and interfaces. Top Level Inventory shows the total number of devices for each customer, the total number of interfaces for each customer, and a breakdown by make and model.

Near Real Time. Provides utilization, error, and discard data for active interfaces, trunks, and EtherChannels; the time period begins with the most recent poll and goes back six hours; drill-down to daily and monthly data.

NRT Snapshot. Provides utilization, error, and discard data for one device, multiple devices, or specific interfaces on one device; same time period as Near Real Time.

Priority Customer. These reports provide availability, exception and volume metrics for selected high priority customers and their managed elements. They are suitable for wall board displays with an hourly refresh, allowing management and staff to see the current state of their network from a customer perspective at a high level. No data will appear in these reports unless you assign *Priority* to the customer/device, customer/location, customer/protocol or customer/vendor combinations using the Assign Priority forms under **General Tasks** in the Property/Object Manager window.

Service Level Management. Identifies interfaces, devices, locations, protocols, and vendors with lowest availability and highest response time.

Simple Near Real Time. A subset of Near Real Time; provides statistics for the previous six hours and an hourly view of utilization, discards, and errors. Intended for easy integration with the NMS.

System Performance. Measures duration, in seconds, for groups of related tasks performed by the report pack.

Top Ten. Identifies interfaces, VLAN interfaces, trunks, devices, locations, protocols, and vendors with the highest volume and the lowest volume.

Unreachable. Provides a list interfaces for which no data has been received for 35 minutes; excludes interfaces for which no data has been received for more than six hours.

Rules and Actions for Thresholds

You can enhance fault isolation and problem diagnosis by integrating NNM and OVPI. If NNM and OVPI are integrated, the NNM operator will have access to the Report Launchpad window. From the Report Launchpad window, the NNM operator can launch any report in Interface Reporting.

If NNM and OVPI are integrated, you should install the optional thresholds sub-package that comes with Interface Reporting. The optional thresholds sub-package contains a thresholds policy for the Thresholds Module. The thresholds policy defines:

- Threshold conditions specific to Interface Reporting
- An action for OVPI to take when a threshold is breached
- An action for OVPI to take when a breach condition returns to normal

Configuring the Thresholds Module is not necessary. You do not need to configure thresholds, define actions, or specify a destination for threshold traps. However, you may modify category, severity, and destination parameters at any time. For details about these options, refer to the *Thresholds Module 5.0 User Guide*.

The following table provides information about the thresholds policy contained in the optional thresholds sub-package.

| Threshold | Data Type | Description | Severity |
|-------------|-----------|---|----------|
| InDiscards | NRT | In Discard percentage exceeds discard exception level. | Warning |
| OutDiscards | NRT | Out Discard percentage exceeds discard exception level. | Warning |
| InErrors | NRT | In Error percentage exceeds error exception level. | Minor |

Overview 13

| Threshold | Data Type | Description | Severity |
|-------------------|-----------|--|----------|
| OutErrors | NRT | Out Error percentage exceeds error exception level. | Minor |
| InUtilization | NRT | In Utilization percentage exceeds utilization exception level. | Warning |
| OutUtilization | NRT | Out Utilization percentage exceeds utilization exception level. | Warning |
| Availability | NRT | Availability less than exception level. | Warning |
| UtilException | Hourly | Utilization exceeds threshold in more than 45% of samples. | Warning |
| DiscardsException | Hourly | Discards exceed threshold in more than 45% of samples. | Warning |
| ErrorsException | Hourly | Errors exceed threshold in more than 45% of samples. | Minor |
| InUtilForecast | Daily | 30 day forecast In Utilization exceeds utilization exception level. | Warning |
| OutUtilForecast | Daily | 30 day forecast Out Utilization exceeds utilization exception level. | Warning |

The thresholds in the preceding table are defaults. You can easily modify any default on a per-interface basis by using the Change Interface Properties form. For details about this form, see Chapter 6, Change Forms.

Ways to Customize Reports

Reports can be customized by importing properties (customers and locations), by applying group filters, by applying constraints, by editing tables and graphs, and by adding details about interface attributes. While creating group filters is a task for an administrator, any user looking at a report can apply constraints or edit tables and graphs. For details about view options for tables and graphs, see Appendix A, Editing Tables and Graphs.

Group Filters

If you want to share reports with customers, you must produce customer-specific reports. To produce customer-specific, perform these tasks:

- Use Common Property Tables to import properties (customer names and device locations)
- Create a group account for all of the users affiliated with each customer
- Create a group filter for the group account

For more information group filters, refer to the OVPI 5.1 Administration Guide.

Applying Constraints

Editing a parameter applies a constraint. The constraint eliminates the data you are not interested in seeing. If you edit the Customer Name parameter, data for every customer except the customer you typed in the Customer Name field drops from the report. You can apply multiple constraints at the same time. Interface Reporting supports the following parameters:

- Customer Name
- Customer ID
- Location Name
- Location ID
- Device Name
- Make
- Model

If you are using the Web Access Server to view reports, edit parameters by clicking the Edit Parameters icon at the bottom right-hand corner of the report. When the Edit Parameters window opens, enter the constraint in the field and click **Submit**.

If you are using Report Viewer, select **Edit > Parameter Values** from the menu bar. When the Modify Parameter Values window opens, click the **Current Value** field. Type a new value and click **OK**.

Importing Properties

You have the option of populating reports with node-level properties and interface-level properties. Node-level properties are sourced from Common Property Tables. Interface-level properties can be sourced from the network, or read from a property import file that you create yourself from scratch. If you prefer, you can also export existing property data from OVPI, modify what you get from OVPI, and then re-import this file with your changes. The following forms are available for updating properties:

- Change Protocol Defaults
- Change Interface Properties
- Change Interface Customer
- Change Interface Location
- Change Interface Description
- Administer Interface Poll Flag

The Administer Interface Reporting form does not pertain to object properties. Use it to modify the behavior of the package itself.

Sources for Additional Information

This guide includes samples of some reports. The demo package that comes with Interface Reporting contains a sample of every report in the package. If you have access to the demo package, and you want to know what fully-populated reports look like, install the demo

Overview 15

package. Like real reports, demo reports are interactive. Unlike real reports, demo reports are static.

For information regarding the latest enhancements to Interface Reporting and any known issues, refer to the *Interface Reporting Report Pack 5.0 Release Statement*. You may also be interested in the following documents:

- Cisco VLAN Datapipe 2.1 Release Statement
- Common Property Tables 3.5 User Guide
- Executive Summaries Report Pack 1.0 User Guide
- Interface Discovery Datapipe 2.2 User Guide
- Interface Reporting if Entry Datapipe 2.2 User Guide
- NNM/OVPI Integration Module 2.0 User Guide
- OVPI Report Packs, Version 8.0: Release Notes, June 2005
- Thresholds Module 5.0 User Guide

The user guides for the core product, OVPI, and the user guides for the reporting solutions that run on OVPI can be downloaded from this site:

http://www.managementsoftware.hp.com

Select Support > Product Manuals to reach the Product Manuals Search page. The user guides for OVPI are listed under Performance Insight. The user guides for report packs and datapipes are listed under Performance Insight Reporting Solutions.

The manuals listed under **Performance Insight Reporting Solutions** indicate the month and year of publication. If a manual is revised and reposted, the date of publication will change even if the software version number does not change. Since we post revised manuals on a regular basis, we recommend searching this site for updates before using an older manual that might not be the latest version available.

2 The Upgrade Install

This chapter covers the following topics:

- Guidelines for a smooth upgrade
- Upgrading to Interface Reporting 5.0 from an earlier release
- Package removal

Guidelines for a Smooth Upgrade

The June 2005 report pack CD includes the latest report packs and datapipes. It also contains the latest upgrade packages. If you insert the report pack CD in the CD-ROM drive and launch the package extraction program, the install script will extract every package on the CD to the Packages directory on your system. When the extract finishes, the install script prompts you to launch OVPI and start Package Manager.

If the package extraction step has already taken place, all of the packages associated with Interface Reporting, including the upgrade packages, are in the Packages directory on your system awaiting installation. To upgrade Interface Reporting, start Package Manager and follow the on-screen instructions. Before beginning the upgrade, you may want to review the following topics:

- Prerequisites for Interface Reporting 5.0
- Sequence issues
- Common Property Tables
- Datapipes and remote pollers
- Custom table views
- Upgrading Interface Reporting in a distributed environment

Prerequisites for Interface Reporting 5.0

Make sure the following software is already installed before upgrading Interface Reporting:

- OVPI 5.1
- Any Service Pack available for OVPI 5.1

If you need help installing a Service Pack, refer to release notes for the Service Pack.

Sequence Issues

Upgrading from your current version of Interface Reporting to version 5.0 involves installing and removing multiple packages. Some of the packages you install are required and some are optional. Due to the dependent relationship that exists between some packages, you have to install packages in the correct sequence. For example, upgrading Common Property Tables must take place before upgrading Interface Reporting. Also, you have to install the upgrade package for the main package before installing the upgrade packages for the device, location, protocol, or VLAN modules.

Common Property Tables

Upgrade Common Property Tables before upgrading Interface Reporting. You can upgrade to version 3.5 from version 2.2 or version 3.0 by installing the "to_3.5" upgrade package. When you install this package, do not install other packages at the same time. Install the upgrade package for Common Property Tables and *only* the upgrade package for Common Property Tables.

Datapipes and Remote Pollers

When you uninstall an existing datapipe, the following information is lost:

- Single polling policy for a remote poller
- Cloned polling policies for multiple remote pollers
- Customized polling groups

To prevent this information from being lost, export existing polling policy configurations and customized polling groups by using the following commands:

- collection_manager
- group_manager

Exporting Polling Policy Configurations

If your environment contains polling policies for remote pollers, use the collection_manager command to export existing policy configurations to a file.

UNIX: As user trendadm, run the following command:

```
cd $DPIPE_HOME
```

```
./bin/collection_manager -export -file /tmp/savePollingPolicy.lst
```

Windows: As Administrator, launch a command window. Navigate to the OVPI install directory and execute the following command:

bin\collection_manager -export -file \temp\savePollingPolicy.lst

Exporting Polling Group Configurations

If your environment contains customized polling groups, use the group_manager command to export groups to individual .xml files.

UNIX: As user trendadm, execute the following command:

cd \$DPIPE_HOME

./bin/group_manager -export_all -outfile /tmp/savePollingGroups

Windows: As Administrator, launch a command window, then navigate to the OVPI install directory and execute the following command:

bin\group_manager -export_all -outfile \temp\savePollingGroups

Custom Table Views

If you created custom table views, the views you created may interfere with the report pack upgrade process, causing the upgrade to fail. Whether or not your views interfere with the upgrade process depends on how you created them. If you created them using SQL, the upgrade will succeed, however, your views will not be available once the upgrade is complete. If you created them using Datapipe Manager, the upgrade is likely to fail. To prevent the upgrade from failing, delete the views you created before you upgrade the report pack, then, after the report pack is upgraded, recreate your custom views.

Distributed Environments

If you are running OVPI as a distributed system, every server must be running OVPI 5.0 and all the Service Packs available for OVPI 5.0. Here is an overview of the installation procedure for distributed environments:

- 1 Disable trendcopy on the central server.
- **2** For the central server:
 - Upgrade to Interface Reporting 5.0; deploy reports.
 - Upgrade the device, location, protocol and VLAN sub-packages; deploy reports.
 - Re-edit the process files containing trendcopy directives for Device, Location and Protocol; these files were overwritten during the upgrade process.
- **3** For each satellite server:
 - Upgrade to Interface Reporting 5.0; deploy reports.
 - Upgrade the device and thresholds sub-packages.

If reports are currently deployed from satellite servers, you would also want to upgrade the location, protocol and VLAN sub-packages.

- Remove these datapipes:
 - Interface Discovery Datapipe 1.1/2.0
 - Interface Reporting if Entry Datapipe 1.1/2.0
 - Interface Reporting Duplex Datapipe 1.0
 - Cisco VLAN Datapipe 1.0
 - Cisco VLAN Datapipe 2.0
- Install these datapipes:
 - Interface Discovery Datapipe 2.2
 - Interface Reporting if Entry Datapipe 2.2

The Upgrade Install

- Interface Reporting Duplex Datapipe 2.0
- Cisco VLAN Datapipe 2.1 (optional)
- OPNET Export Datapipe 2.0 (optional)
- **4** Re-enable trendcopy on the central server.

If you installed Interface Reporting 4.0 on servers running OVPI 4.6, you had to configure the servers in your system. You did this by running DS EDIT to set up connections with satellite server databases, configuring trendcopy pull commands from the central server, and switching off aggregations at each satellite server. If you recently upgraded from OVPI 4.6 to OVPI 5.1, you must repeat the following tasks:

- Setting up connections with satellite server databases (using the Add Database Wizard)
- Configuring trendcopy pull commands

These tasks must be repeated because the way that connections are set has changed since OVPI 4.6 was released. For details, see Chapter 4, Setting Up a Distributed System.

Upgrading to Version 5.0

Perform the following tasks to upgrade to Interface Reporting 5.0:

- Task 1: Stop OVPI Timer and extract packages from the report pack CD
- Task 2: If necessary, upgrade to Common Property Tables 3.5
- Task 3: Install the Interface Reporting "to_50" upgrade package
- Task 4: Install "to_50" sub-packages
- Task 5: If you want to upgrade a datapipe, uninstall the old version
- Task 6: Install the new version of the datapipe you uninstalled in the previous step
- Task 7: Restart OVPI Timer

If you are using the "Poll Flagged Interfaces Only" polling rule, you have to re-provision the poll flag after this upgrade. Refer to the *Interface Reporting ifEntry Datapipe 2.2 User Guide* for details.

Task 1: Stop OVPI Timer and extract packages from the report pack CD

- 1 Log in to the system. On UNIX systems, log in as root.
- 2 Stop OVPI Timer and wait for processes to terminate.

Windows: Select Settings > Control Panel > Administrative Tools > Services

UNIX: As root, type one of the following:

HP-UX: sh /sbin/ovpi_timer stop

Sun: sh /etc/init.d/ovpi_timer stop

3 Insert the report pack CD. On Windows, a Main Menu displays automatically; on UNIX, mount the CD if the CD does not mount automatically, navigate to the top level directory on the CD, and run the **Jsetup** command.

4 Type 1 in the choice field and press Enter. The install script displays a percentage complete bar. When the copy is complete, the install script starts Package Manager. The Package Manager welcome window opens.

Once the extract is finished, you have the option of navigating to the Packages directory on your system to see the results. Following is a list of folders under the Interface Reporting folder:

- Docs
- Interface_Reporting.ap
- Interface_Reporting_Demo.ap
- Interface_Reporting_Device.ap
- Interface_Reporting_Location.ap
- Interface_Reporting_Protocol.ap
- Interface_Reporting_Thresholds.ap
- Interface_Reporting_Vlan.ap
- UPGRADE_Interface_Reporting_Device_to_50.ap
- UPGRADE_Interface_Reporting_Location_to_50.ap
- UPGRADE_Interface_Reporting_to_50.ap
- UPGRADE_Interface_Reporting_Vlan_3_to_45.ap
- UPGRADE_Interface_Reporting_Vlan_45_to_46.ap
- UPGRADE_Interface_Reporting_Vlan_to_50.ap

Task 2: Upgrade to Common Property Tables 3.5

If you have not upgraded to Common Property Tables 3.5, do this now. Observe these rules:

- Do not install other packages at the same time; install the upgrade package for Common Property Tables and *only* the upgrade package for Common Property Tables.
- When the Report Deployment window opens, accept the default to Deploy Reports. In this context, deploying reports means deploying the forms that come with Common Property Tables.
- When the install completes, click **Done** to return to the Management Console.

If you need help with the upgrade, refer to the Common Property Tables 3.5 User Guide.

Task 3:Install UPGRADE_Interface_Reporting_to_50

- 1 Start Package Manager. The Package Manager welcome window opens.
- 2 Click **Next**. The Package Location window opens.
- 3 Click **Install**. Approve the default installation directory or select a different directory if necessary.
- 4 Click Next. The Report Deployment window opens. Accept the default for Deploy Reports; accept the defaults for application server name and port; type your user name and password for the OVPI Application Server.
- 5 Click **Next**. The Package Selection window opens.
- 6 Click the check box next to the following package:

The Upgrade Install 21

UPGRADE_Interface_Reporting_to_50

- 7 Click **Next.** The Type Discovery window opens. Disable the default and click **Next**. The Selection Summary window opens
- 8 Click **Install**. The Installation Progress window opens and the install begins. When the install finishes, a package install complete message appears.
- **9** Click **Done** to return to the Management Console.

Task 4:Install Location, Device, Protocol, VLAN and Thresholds

Installing the Interface Reporting Thresholds sub-package is optional. If you install Interface Reporting Thresholds, Package Manager will install the Thresholds Module, a prerequisite package, for you.

- 1 Start Package Manager. The Package Manager welcome window opens.
- 2 Click **Next.** The Package Location window opens.
- 3 Click Install.
- 4 Click **Next**. The Report Deployment window opens. Accept the default for Deploy Reports; accept the defaults for application server name and port; type your user name and password for the application server.
- 5 Click **Next**. The Package Selection window opens.
- 6 Click the check box next to the following packages:
 - **u** UPGRADE_Interface_Reporting_Device_to_50
 - **b** UPGRADE_Interface_Reporting_Location_to_50
 - **c** UPGRADE_Interface_Reporting_Protocol_to_50
 - d UPGRADE Interface Reporting Vlan to 50
 - Interface Reporting Thresholds
- 7 Click **Next.** The Type Discovery window opens. Disable the default and click **Next.** The Selection Summary window opens.
- 8 Click **Install**. The Installation Progress window opens and the install begins. When the install finishes, a package install complete message appears.
- 9 Click Done.

Do not be surprised if the UPGRADE packages you just installed seem to have disappeared from view. Package Manager will display what you just installed as $Interface\ Reporting\ 5.0$. This is not an error.

Task 5:Remove old datapipes

If you are using the "Poll Flagged Interfaces Only" polling rule, you must re-provision the poll flag after this upgrade. Refer to the *Interface Reporting ifEntry Datapipe 2.2 User Guide* for details.

- 1 Start Package Manager. The Package Manager welcome window opens.
- 2 Click **Next.** The Package Location window opens.
- 3 Click Uninstall.

- 4 Click **Next**. The Report Undeployment window opens. Accept the default for Undeploy Reports; accept the defaults for application server name and port; type your user name and password for the OVPI Application Server.
- 5 Click **Next**. The Package Selection window opens.
- **6** Click the check box next to the following packages:
 - a IFEntry_Disc_Datapipe (1.1, 2.0, or 2.1)
 - **b** *IRifEntry_Datapipe* (1.1, 2.0, or 2.1)
 - c CiscoVLAN_Datapipe (1.0 or 2.0)
 - d Interface_Reporting_Duplex Datapipe 1.0
- 7 Click **Next.** The Type Discovery window opens. Disable the default and click **Next**. The Selection Summary window opens.
- 8 Click **Uninstall.** The Progress window opens and the removal process begins. When removal finishes, a package removal complete message appears.
- 9 Click Done.

Task 6:Install new datapipes

- 1 Start Package Manager. The Package Manager welcome window opens.
- 2 Click Next. The Package Location window opens.
- Click Install.
- 4 Click Next. The Report Deployment window opens. Disable the default for Deploy Reports.
- 5 Click **Next.** The Package Selection window opens.
- **6** Click the check box next to the following packages:
 - a IFEntry_Disc_Datapipe 2.2
 - **b** Interface_Reporting_ifEntry_Datapipe 2.2
 - c Cisco_VLAN_Datapipe 2.1
 - d Interface Reporting Duplex Datapipe 2.0
 - e OPNET Export Datapipe 2.0
- 7 Click **Next**. The Type Discovery window opens. Disable the default and click **Next**. The Selection Summary window opens.
- 8 Click **Install.** The Installation Progress window opens and the install begins. When the install finishes, the package installation complete message appears.
- 9 Click Done.

Task 7: Restart OVPI Timer.

Windows: Select Settings > Control Panel > Administrative Tools > Services

UNIX: As root, type one of the following:

HP-UX: sh /sbin/ovpi timer start

Sun: sh /etc/init.d/ovpi timer start

The Upgrade Install 23

Package Removal

If you uninstall the Interface Reporting package, the IR ifEntry Datapipe will be removed automatically. Uninstalling the Interface Reporting package does not affect the Interface Discovery Datapipe. Follow these steps to uninstall Interface Reporting 5.0:

- 1 Log in to the system. On UNIX systems, log in as root.
- 2 Stop OVPI Timer and wait for processes to terminate.

Windows: Select Settings > Control Panel > Administrative Tools > Services

UNIX: As root, type one of the following:

HP-UX: sh /sbin/ovpi_timer stop

Sun: sh /etc/init.d/ovpi timer stop

- 3 Launch Performance Insight and start Package Manager. The Package Manager welcome window opens.
- 4 Click Next. The Package Location window opens.
- 5 Click Uninstall.
- 6 Click Next. The Report Undeployment window opens.
- 7 If you deployed the reports in Interface Reporting from this server, accept the defaults for Undeploy Reports, Application Server Name, and Port. Otherwise, clear the check box and skip to step 9.
- 8 Type the username and password for the OVPI Application Server.
- 9 Click Next. The Package Selection window opens. Click the check box next to the following packages:
 - a Interface Reporting
 - **b** Interface Reporting Device
 - c Interface Reporting Location
 - d Interface Reporting Protocol
 - e Interface Reporting Thresholds
 - f Interface Reporting Vlan
 - g Interface Reporting Demo
- 10 Click OK.
- 11 Click Next. The Selection Summary window opens.
- 12 Click **Uninstall**. The Progress window opens and the removal process begins. When the uninstall process is complete, a package removal complete message appears.
- 13 Click Done.
- 14 Restart OVPI Timer.

Windows: Select Settings > Control Panel > Administrative Tools > Services

UNIX: As root, type one of the following:

HP-UX: sh /sbin/ovpi_timer start

Sun: sh /etc/init.d/ovpi_timer start

3 The New Install

This chapter covers the following topics:

- Guidelines for a smooth installation
- Installing and tuning Interface Reporting 5.0
- Accessing deployed reports
- New object categories in the object model
- Seeing performance data in reports
- Package removal

Guidelines for a Smooth Installation

The reporting solutions that runs on OVPI consist of at least two packages, a report pack and a datapipe, or sometimes multiple datapipes. When you install a datapipe, you configure OVPI to collect a specific type of performance data at a specific polling interval. When you install a report pack, you configure OVPI to summarize and aggregate the data collected by the datapipe.

If the packages on the June 2005 report pack CD have been extracted to the Packages directory on your system, Interface Reporting 5.0 and all of the latest sub-packages are available for installation. If you have not extracted packages from the report pack CD, follow the procedure in this chapter. As soon as the extract is finishes, you can install Interface Reporting 5.0 by starting Package Manager and following the on-screen instructions. Before using Package Manager, review the following guidelines related to prerequisites, Common Property Tables, and (if it applies to you) distributed environments.

Prerequisites Related to OVPI

Follow these steps to ensure that the prerequisites are in order before proceeding further:

- 1 Make sure the following software is already installed:
 - OVPI 5.1
 - All available Service Packs for OVPI 5.1

This chapter does not discuss database configuration, sizing, or tuning. For help with those tasks, see the *OVPI 5.1 Installation Guide*. If you need help installing a Service Pack, refer to the release notes that were issued with the Service Pack.

- 2 Turn off OVPI Timer. If OVPI Timer is not turned off, the system will begin doing things before you finish tuning the report pack.
- 3 Using one of the following techniques, populate your node list:

- Do it manually
- Run OVPI SNMP discovery
- Import a list of nodes exported from another application (for example, NNM)
- Add the nodes to a file and use node_manager.exe to import the file

Prerequisites Related to SNMP Polling

- Open the SNMP Edit Profile window (Polling Policy Management > Edit > SNMP Profiles) and edit the following fields:
 - a Increase the default for OIDs-per-PDU.

The default for the number of OIDs-per-PDU is 20. IR's raw collection polls 28 OIDs. Unless the OIDs per PDU is adjusted, OVPI will send two PDUs to the polled device. Changing the default to 30 OIDs per PDU can cut in half the number of packets sent to each device.

- Not all SNMP agents permit large request packets. If the agent does not allow 28 OIDs, you may see a message indicating that your request packet is too large. Your options are to send more packets that are smaller, or create a separate SNMP profile that reduces the OID count, and assign that policy to the nodes that cannot sustain the 30-OID policy.
- The default for OIDs-per-PDU is set by OVPI. Upcoming releases of OVPI may use a different default. If the default is correct, no changes are necessary.
- **b** Reduce the default for the SNMP timeout.
 - If you have a reliable, high-speed network, reduce the timeout default. Reducing the default will shorten the polling window.
- **c** Lower the default for SNMP retries.
 - If you have a reliable, high-speed network, do not keep retrying a non-responsive device. The default, 5 retries, is usually overkill. Drop this down to 1 or even 0. Better to lose a poll for a device than to keep retrying unavailable device.
- 2 Increase the default for the number of child pollers.
 - The SNMP poller is mw_collect. Mw_collect spawns one child poller for each polled device. The default is 5 child pollers, which is analogous to a process window that sustains 5 active child pollers at any one time, initiating a new child poller as soon as the preceding child poller completes.

The number of child pollers is controlled by the "-c" argument. To make polling more efficient, increase the number of child pollers (to 25, 35, or even 50) by editing the following file:

\$DPIPE HOME/lib/trendtimer.sched

Edit the file by adding "-c n" to the mw_collect entries for 5, 10, 15, 20, 60, 1440-minute invocations.

3 Activate SNMPv2 GETBULK retrieval.

OVPI provides GETBULK retrieval for SNMPv2 (snmpv2c) collections. Using GETBULK can significantly reduce the number of SNMP PDUs that OVPI sends to target nodes. Reducing the number of SNMP PDUs makes polling more efficient and may, depending on how the vendor's SNMP agent was implemented, reduce the load on polled devices.

To activate SNMPv2 GETBULK, add the "-e" argument to mw_collect. For example:

```
5 - {DPIPE_HOME}/bin/mw_collect -m -i 5 -K 1 -c 250 -e

10 - {DPIPE_HOME}/bin/mw_collect -m -i 10 -K 1 -c 250 -e

15 - {DPIPE_HOME}/bin/mw_collect -m -i 15 -K 1 -c 250 -e

20 - {DPIPE_HOME}/bin/mw_collect -m -i 20 -K 1 -c 250 -e

60 - {DPIPE_HOME}/bin/mw_collect -m -i 60 -K 1 -c 250 -e
```

Common Property Tables

If you are running an older version of Common Property Tables, version 2.2 or version 3.0, upgrade your current version to version 3.5. If you are not running any version of Common Property Tables, let Package Manager install the latest version of Common Property Tables for you. Do not install the upgrade for Common Property Tables and other packages at the same time. Install the upgrade for Common Property Tables and only the upgrade for Common Property Tables. For more information about installing and using Common Property Tables, refer to the Common Property Tables 3.5 User Guide.

Distributed Environments

If you intend to run Interface Reporting as a distributed system, every server must be running the same version of OVPI as well as all available Service Packs for that version. An outline of the installation procedure follows.

Central Server

Install the following packages on the central server:

- Interface Reporting 5.0
- Device sub-package
- Location sub-package
- Protocol sub-package
- VLAN sub-package

When installing these packages on the central server, deploy reports.

Satellite Servers

Install the following packages on each satellite server:

- Interface Reporting 5.0
- Device sub-package
- Location sub-package (optional)
- Protocol sub-package (optional)
- VLAN sub-package (optional)
- Interface Reporting Thresholds (optional)
- Interface Discovery Datapipe 2.2

The New Install 27

- Interface Reporting if Entry Datapipe 2.2
- Cisco VLAN Datapipe 2.1 (optional)
- OPNET Export Datapipe 2.0 (optional)

When installation is complete, your next step is to set up connections with satellite server databases, configure trendcopy pull commands, and switch off daily and monthly aggregations at each satellite server. For details, see Chapter 4, Setting Up a Distributed System.

Installing and Tuning Interface Reporting 5.0

This section covers the following tasks:

- Task 1: Extract packages from the report pack CD
- Task 2: If necessary, upgrade to Common Property Tables 3.5
- Task 3: Install Interface Reporting and both datapipes
- Task 4: Turn off polling policies for the IR ifEntry Datapipe
- Task 5: Use the IR_Config.pl utility to check and adjust polling rules

One of the polling rule options you can implement using the IR_Config.pl utility is **Poll Flagged Interfaces Only**. If your network includes hundreds or possibly thousands of ports feeding desktop users, you can use the flagged interfaces only option to restrict data collection to a smaller subset of interfaces, thereby enhancing performance and scalability. For details, refer to the *IR ifEntry Datapipe User Guide*.

- Task 6: Use the Administration form to set the provisioning mode
- Task 7: Restart OVPI Timer
- Task 8: De-activate unwanted ifTypes (protocols) and adjust default thresholds.
- Task 9: Turn back on the polling policies you turned off in Task 4.
- Task 10: Provision customers and locations
- Task 11: Export provisioning data from OVPI for safekeeping

Task 1: Stop OVPI Timer and extract packages from the report pack CD

- 1 Log in to the system. On UNIX systems, log in as root.
- 2 If OVPI Timer process is running, stop it and wait for processes to terminate.

Windows:

- a From the Control Panel, select Administrative Tools > Services
- **b** Select OVPI Timer from the list of services.
- **c** From the Action menu, select **Stop**.

Select Settings > Control Panel > Administrative Tools > Services

UNIX: As root, type one of the following:

HP-UX: sh /sbin/ovpi timer stop

Sun: sh /etc/init.d/ovpi timer stop

- 3 Insert the June 2005 report pack CD in the CD-ROM drive. On Windows, a Main Menu displays automatically; on UNIX, mount the CD manually if the CD does not mount automatically, then run the setup command.
- Select OVPI report packs by typing 1 in the choice field and pressing Enter. The install script displays a percentage complete bar. When extraction is complete, the install script starts Package Manager. The Package Manager welcome window opens.

Once the extract is finished, you have the option of navigating to the Packages directory on your system to see the results. Following is a list of folders under the Interface Reporting folder:

- Docs
- Interface_Reporting.ap
- Interface_Reporting_Demo.ap
- Interface_Reporting_Device.ap
- Interface_Reporting_Location.ap
- Interface_Reporting_Protocol.ap
- Interface_Reporting_Thresholds.ap
- Interface_Reporting_Vlan.ap
- UPGRADE_Interface_Reporting_Device_to_50.ap
- UPGRADE_Interface_Reporting_Location_to_50.ap
- UPGRADE_Interface_Reporting_to_50.ap
- UPGRADE_Interface_Reporting_Vlan_3_to_45.ap
- UPGRADE_Interface_Reporting_Vlan_45_to_46.ap
- UPGRADE_Interface_Reporting_Vlan_to_50.ap

You can ignore the upgrade packages. Installing the demo package is optional.

Task 2: Upgrade Common Property Tables

This task is necessary only if you are currently running an older version of Common Property Tables. Upgrade to version 3.5 by installing the "to_3.5" upgrade package. Observe these rules:

- Install the upgrade by itself; install no other packages.
- When the Report Deployment window opens, accept the default to Deploy Reports. By deploying reports, you will also deploy the forms that come with Common Property Tables.
- When the install finishes, click **Done** to return to the Management Console.

If you need help with the upgrade, refer to the Common Property Tables 3.5 User Guide.

Task 3: Install Interface Reporting 5.0 and both datapipes

- 1 Start Package Manager. The Package Manager welcome window opens.
- 2 Click **Next**. The Package Location window opens.
- 3 Click **Install**. Approve the default installation directory or use the browse feature to select a different directory if necessary.

The New Install 29

- 4 Click Next. The Report Deployment window opens. Accept the default for Deploy Reports; accept the default for application server name and port; type the username and password for the OVPI Application Server.
- 5 Click Next. The Package Selection window opens.
- **6** Click the check box next to the following packages:
 - **a** Common Property Tables 3.5
 - **b** Interface Discovery Datapipe 2.2
 - c Interface Reporting if Entry Datapipe 2.2
 - d Interface Reporting Duplex Datapipe 2.0
 - e Cisco VLAN Datapipe 2.1 (optional)
 - f OPNET Export Datapipe 2.0 (optional)
 - g Interface Reporting
 - h Interface Reporting Device
 - i Interface Reporting Location (optional)
 - *i* Interface Reporting Protocol (optional)
 - k Interface Reporting Thresholds (optional)
 - Interface Reporting Vlan (optional)
 - m Interface Reporting Demo
 - If you do not want protocol and location statistics, do not install the protocol and location sub-packages. Installing these sub-packages forces the database server to allot resources to additional summarizations.
- 7 Click **Next**. The Type Discovery window opens. To run Type Discovery immediately after package installation, accept the default.
- 8 Click Next. The Selection Summary window opens.
- 9 Click **Install**. The Installation Progress window opens and the install process begins. When the install finishes, a package install complete message appears.
- 10 Click Done.

Task 4: Turn off polling policies for the IR if Entry Datapipe

You do not want raw collections to begin until you have configured the report pack for ifType monitoring. From the Management Console, open Polling Policy Management and turn off the following polling policies for IR collections:

- ifName Collection
- ifIndex_Collection
- ifDescr_Collection
- ifAlias Collection

Task 5: Use the IR Config.pl utility to check and adjust polling rules

The IR ifEntry Datapipe includes a configuration tool. Use the configuration tool to adjust the polling rule. These are your polling rule options:

- Poll all active interfaces
- Poll all interfaces
- Poll all active interfaces with monitored protocols (default)
- Poll all interfaces with monitored protocols
- Poll flagged interfaces only

If you want to adjust the default, launch the configuration tool (IR_Config.pl) and change it. For details about polling flagged interfaces only (also known as directed-instance polling), refer to the *Interface Reporting ifEntry Datapipe User Guide*.

Task 6: If necessary, use the Administration form to change the default provisioning mode

The provisioning mode determines whether values sourced from the network override the user, or whether the user overrides values sourced from the network. The default is that values set by the user for ifIndex, ifName, and ifDescr will not be over-written by values sourced from the network.

However, if your network is dynamic and if you want to be able to adapt to changes, then the default may not be appropriate. To change the default, open the Object Management view and select the **Administer Interface Reporting** form. When the form opens, set the provisioning mode to 1.

Task 7: Restart OVPI Timer

Windows:

- a From the Control Panel, select Administrative Tools > Services
- **b** Select OVPI Timer from the list of services.
- **c** From the Action menu, select **Start**.

UNIX: As root, type one of the following:

HP-UX: sh /sbin/ovpi_timer start

Sun: sh /etc/init.d/ovpi_timer start

Task 8: Deactivate ifTypes (protocols) you do not want and adjust default thresholds

- 1 Open the Change Protocol Defaults form.
- 2 Deactivate any ifTypes you do not want included in reports by toggling the status from monitored to not monitored. If desired, operate in lock-down mode by deactivating *all* ifTypes. If you deactivate all ifTypes, you must enable certain ifTypes later.
 - If you are polling flagged interfaces only, the ifTypes you do not want included in reports have already been deactivated.
- 3 Adjust default thresholds on a per-ifType basis. When Interface Reporting discovers new interfaces on a device, it will add a new row to the KIRDevPorts property table. This new row will include the threshold values established by this form.

Task 9: Turn on the polling policies you turned off in Task 4.

Your implementation is properly configured. You are retrieving ifEntry data from the desired interfaces, timeouts are not wasting time, SNMP retry requests are not wasting time, and you are transmitting the least number of SNMP datagrams required to retrieve the OIDs. It is now safe to turn on the polling policies you turned off in Task 4.

The New Install 31

Task 10: Provision customers and locations

There is no need to assign a customer and a location to an interface. The interface will inherit customer and location from the parent node. If you want to override the inherited values, then you must assign a customer and location to the interface.

To assign a parent node to a customer and location, navigate the Object/Property Management view, select a node, and open the Update Node Information form under **Object Specific Tasks**.

Task 11: Export provisioning data from OVPI for safekeeping

Export property information from OVPI. If for any reason you need to uninstall and reinstall the report pack, you can use the export file to immediately re-import property information.

Accessing Deployed Reports

When you installed Interface Reporting, you enabled the Deploy Reports option. As a result, the reports in this package (as well as any forms that come with reports) were deployed to the OVPI Application Server. Once reports reside on the OVPI Application Server, you can view the reports using the OVPI client applications or you can view reports on the Web.

If the client applications are installed on your system, you have access to Report Viewer, Report Builder, and the Management Console. If you don't have the client applications, then using a web browser to view reports is the only way you can view reports.

For more information about the clients, refer to the *OVPI 5.1 Installation Guide*. For details about the Management Console, including how to use the Object/Property Management view to launch reports specific to a selected object, refer to the *OVPI 5.1 Administration Guide*.

New Object Categories in the OVPI Object Model

The OVPI object model allows you to navigate to an object, perform tasks that pertain to the object, or open reports that pertain to the object. Installing a new report pack modifies the object model, adding one or more object categories. Installing Interface Reporting adds one object category to the object model: *interface*.

Selecting any object in the object model, including an interface, causes the right side of the Object/Property Management window to refresh. Look for the forms that pertain to the object under General Tasks and Object Specific Tasks. Look for the reports that pertain to the object under Object Specific Reports.

Seeing Performance Data in Reports

Some reports populate with data sooner than others. The first report to populate with data is the Near Real Time report. Data begins to appear in this report after three polling cycles. Other reports, including any report that begins with an analysis of yesterday's performance, will need at least one full day's worth of data before results are viewable.

Until data has been collected for several days, the daily charts will be sparsely populated; likewise, monthly charts will not have much to offer until data has been collected for several months. Because the Capacity Planning report cannot function without maximum busy-hour averages derived from data in the baseline period (42 days long), you will have to wait about six weeks for reliable forecasting data.

Package Removal

If you uninstall the Interface Reporting package, the Interface Reporting ifEntry Datapipe will be removed automatically. Uninstalling the Interface Reporting package will not affect the Interface Discovery Datapipe.

Follow these steps to uninstall Interface Reporting 5.0:

- 1 Log in to the system. On UNIX systems, log in as root.
- 2 Stop OVPI Timer and wait for processes to terminate.

Windows:

- a From the Control Panel, select Administrative Tools > Services
- **b** Select OVPI Timer from the list of services.
- **c** From the Action menu, select **Stop**.

Select Settings > Control Panel > Administrative Tools > Services

UNIX: As root, type one of the following:

HP-UX: sh /sbin/ovpi_timer stop

Sun: sh /etc/init.d/ovpi_timer stop

- 3 Start Package Manager. The Package Manager welcome window opens.
- 4 Click Next. The Package Location window opens.
- 5 Click Uninstall.
- 6 Click **Next.** The Report Undeployment window opens. If the reports in Interface Reporting were deployed from this server, accept the defaults for Undeploy Reports, Application Server Name, and Port. Otherwise, clear the check box and skip to step 8.
- 7 Type your username and password for the OVPI Application Server.
- 8 Click **Next.** The Package Selection window opens. Click the check box next to the following packages:
 - a Interface Reporting
 - **b** Interface Reporting Device
 - c Interface Reporting Location
 - d Interface Reporting Protocol
 - Interface Reporting Thresholds
 - f Interface Reporting Vlan
 - g Interface Reporting Demo
- 9 Click OK.
- 10 Click Next. The Selection Summary window opens.
- 11 Click **Uninstall**. The Progress window opens and the removal process begins. When the uninstall process is complete, a package removal complete message appears.
- 12 Click **Done** to return to the Management Console.

The New Install 33

13 Restart OVPI Timer.

Windows: Select Settings > Control Panel > Administrative Tools > Services

UNIX: As root, type one of the following:

HP-UX: sh /sbin/ovpi_timer start

Sun: sh /etc/init.d/ovpi_timer start

4 Setting Up a Distributed System

This chapter covers the following topics:

- Checking for proper package installation
- Splitting polling and avoiding duplicate polling
- Central server configuration
- Satellite server configuration
- Synchronizing system clocks

Check for Proper Package Installation

Verify that package installation is correct. The central server requirements are:

- Interface Reporting 5.0
- Interface_Reporting_Device
- Interface_Reporting_Location
- Interface_Reporting_Protocol
- Interface_Reporting_Vlan (optional)

The satellite server requirements are:

- Interface Reporting 5.0
- Interface Reporting Device
- Interface_Reporting_Location
- Interface_Reporting_Protocol
- Interface_Reporting_Vlan (optional)
- Thresholds sub-package (optional)
- Interface Discovery Datapipe 2.2
- Interface Reporting if Entry Datapipe 2.2
- Cisco VLAN Datapipe 2.1 (optional)
- OPNET Export Datapipe 2.0 (optional)

Split Polling and Avoid Duplicate Polling

You must decide how polling will take place, and then split the device groups accordingly. These are your options:

- Split polling between the central server, satellite servers, and remote pollers
- Split polling between satellite servers and remote pollers
- Split polling between multiple remote pollers

The situation you must avoid is *duplicate polling*, which arises when the device groups assigned to one server happen to be the same device groups assigned to a different server, or to a remote poller. To avoid this problem, make sure that you split the polling function properly. The polling function is split properly when:

- No two servers have the same polling policies and device group lists
- No two remote pollers have the same polling policies and device group lists
- · Servers and remote pollers do not share polling policies and device group lists

For more information about polling policies and how to create them, refer to the *Interface Reporting ifEntry Datapipe 2.2 User Guide*.

Configuring the Central Server

To configure the central server, perform the following tasks:

- Task 1: Set up connections with satellite server databases
- Task 2: Configure trendcopy pull commands and modify the entry in OVPI Timer

Task 1: Set up connections with satellite server databases

- 1 Select HP OpenView > Performance Insight > Management Console.
- 2 Click the Systems icon on the lower left. The System/Network Administration pane opens.
- 3 Right-click the **Databases** folder. When prompted, select **Add OVPI Database**. The Add Database Wizard opens.
- 4 Click Next.
- 5 Type the hostname and port number for the database you want to add; click **Next**.
- **6** Review the Summary. Repeat steps 4 and 5 for each additional database.
- 7 When you are done adding databases, click **Finish**.

Task 2:Configure trendcopy pull commands and modify the entry in OVPI Timer

1 Open this file:

```
$DPIPE_HOME/scripts/IR_DevPort_Hourly_Process.pro
```

- 2 Modify the trendcopy commands so that each command includes the correct name of each satellite server.
- 3 If necessary, add more commands.

4 Optional. If you want to look at Near Real Time reports on the central server, you must have rate data available to the central server. To copy rate data to the central server, change SHIRDevPorts in copy commands to SRIRDevPorts.

If you copy polled rate data from each satellite server every hour, you will increase the amount of traffic between the satellites and the central server and you will increase the processing load on the central server.

If you do not want to open NRT reports from the central, you can undeploy the Unreachable report and the three NRT reports. The NRT reports require rate data and will not display correctly if the SRIRDevPorts table is not populated.

5 Modify the hourly IR trendtimer entry. The default is 20 minutes after the hour. If you make the start time 10 minutes later, the central server will not attempt to copy data from satellite servers when satellite servers are running their summarizations.

Configuring a Satellite Server

A satellite server can perform local reporting from the satellite database without the Location and Protocol modules. However, if you want a satellite server to perform full reporting, make sure that these modules are installed. If the Location and Protocol modules are installed, begin this procedure at step 5.

Follow these steps to configure each satellite server.

1 Switch off interface aggregations above the hourly level. Navigate to this file:

```
$DPIPE HOME/lib/trendtimer.sched
```

Comment out the line referencing:

```
IR_DevPort_DMF_Process.pro
```

2 Switch off **all** IR_Device aggregations. Comment out lines referencing:

```
IR_Device_DMF_Process.pro
```

3 Navigate to this directory:

```
Interface_Reporting.ap
```

Remove unnecessary daily, monthly, and forecasting tables. Run the following command:

```
trend_proc -f IR_remove_DMF_tables.pro
```

- 4 Using Table Manager, reduce the retention period of the SHIRDevPorts table from 4 days to 2 days.
- 5 Configure any protocols that should not be monitored to *unmonitored*.
- 6 Configure polling policies for the IR ifEntry Datapipe, taking care that each node is polled from one system only. Follow these guidelines:
 - If remote pollers are being used, avoid duplicate polling by remote pollers, and duplicate polling by the satellite server and remote pollers.
 - If a satellite server has two or more remote pollers, create separate polling policies for each poller and use view groups to separate the devices.
 - Each poller must have 13 polling policies associated with it:

- 1 for the RIRRouterSystem table
- 8 for the Interface Discovery Datapipe
- 4 for the Interface Reporting if Entry Datapipe

If you need help configuring polling policies, refer to the *Interface Reporting ifEntry Datapipe 2.2 User Guide*. See especially Chapter 3, Datapipe Configuration.

Synchronizing System Clocks

Make sure that the system clock on each satellite server is synchronized with the system clock on the central server.

5 Importing Properties

This chapter covers the following topics:

- Static property information
- Protocol-specific monitoring
- The batch-mode property import
- Adding details about vendors and models

Static Property Information

Interface Reporting has the ability to store and process static property information as well as rapidly changing performance data. Following is an alphabetical list of the properties that may appear in reports:

- 1 Country
- 2 Customer
- 3 Description
- 4 Device Name
- 5 Device Type
- 6 Discard Threshold
- 7 Error Threshold
- 8 Full or Half Duplex
- 9 Group ID
- 10 Group Name
- 11 Interface Description
- 12 Interface Speed
- 13 Interface Speed In
- 14 Interface Speed Out
- 15 Interface Type
- 16 Location ID
- 17 Location Name
- 18 Model Details
- 19 Model Number
- 20 Protocol

- 21 Utilization Threshold
- 22 Vendor Details
- 23 Vendor Name

Property information comes from the following sources:

- Protocol Configuration Table (update this using a form)
- Automatic feed from the network
- Common Property Tables batch-mode property import
- · Common Property Tables "add new" and "update" forms
- Interface Reporting batch-mode property import
- Interface Reporting change forms:
 - Change Protocol Defaults
 - Update Interface
 - Change Interface Customer
 - Change Interface Description
 - Administer Interface Poll Flag
 - Administration (Logging, Data Filtering, Provisioning)

Node-level properties and interface-level properties have different sources. Common Property Tables is the source for node-level properties. The change forms that come with Interface Reporting, and the batch-mode import that comes with Interface Reporting, are sources for interface-level properties.

If there is a customer and a location associated with a device, use Common Property Tables to assign the device to that customer and location. Once that step is done, interface-level properties will be inherited from the node level. For example, if you use Common Property Tables to assign a device to a customer, and then you import additional properties using the batch-mode property import that comes with Interface Reporting, any "unassigned interfaces" (interfaces not explicitly assigned to a customer) in your import file will automatically inherit the node-level customer.

When an interface is discovered, various attributes associated with that interface (speed, type and description) are sourced from the network. However, attributes sourced from the network are not always correct. The following properties may be incorrect:

- ifType
- ifSpeed
- ifDescr

To correct a property that is incorrect, you can either update a property import file, then import the file, or you can open a form, modify the contents of the form, and save your changes.

If you set the Provisioning Mode to option 1, the property import file will not overwrite values for ifType, ifSpeed, and ifDescr that were sourced from the network. For details, see the section about Provisioning Mode options in Chapter 6, Change Forms.

Protocol-Specific Monitoring

The monitoring status parameter allows you to enable or disable interface monitoring based on the protocol. By default, all active (administratively up) interfaces with monitored protocols are polled, and all the polled data is stored, summarized, and reported. You can configure OVPI to disable collection for certain protocols. For example, if a device has ATM ports and frame relay ports and you are not interested in the frame relay ports, you can disable collection for the frame relay ports.

Switching off monitoring of a previously monitored protocol does not remove data from the database, but switching off monitoring will prevent new data for that protocol from being collected or inserted. If you switch off monitoring of a previously monitored protocol, previously collected data will eventually age out. To find out whether any interface data is being deliberately ignored as the result of marking a protocol *unmonitored*, look at the Configuration and Logging report in the Admin folder.

For information about polling rules and how to stop the system from collecting data for ports with unmonitored protocols, refer to the *Interface Reporting ifEntry Datapipe User Guide*.

Batch-Mode Property Import

The purpose of the property data interface is to import property data into OVPI as a batch process and export property data from OVPI as a batch process. Batch mode would typically be used instead of forms when large numbers of interfaces need to be updated.

When OVPI imports property data, the file that gets imported needs to adhere to a particular format; when OVPI exports property data, the file it produces is already in the proper format for you to modify and re-import. You can create an import file by:

- Building it from scratch using a spreadsheet application
- Exporting the required data, in the required format, from your provisioning database
- Letting OVPI collect property data, then exporting this data from OVPI

Since building a property import file from scratch is not easy, we recommend that you follow these steps:

- 1 Add devices to the system.
- 2 Allow the system to discover the interfaces on those devices.
- **3** Export existing property data from OVPI by typing this command:

```
trend proc -f IR exportdata.pro
```

- 4 Use the results as a starting point for your own modified property import file.
- 5 Store your modified file in the correct directory (where OVPI expects to find it) and import the file by typing this command:

```
trend proc -f IR importdata.pro
```

The import command will import data from—and the export command will export data to—the following directory:

```
{$DPIPE_HOME}/data/PropertyData
```

Importing Properties 41

Property Import File

The following table describes the format of the property file. If you are creating this file yourself, make sure that your file adhere to this format. Your sequence of fields left to right must follow this sequence of attributes top to bottom and your attributes must be delimited by tabs, not spaces. If you are exporting this file from OVPI, the format will be correct.

| Attribute | Туре | Default | Description |
|---------------|-----------------|-----------------------|--|
| Device | char_string,64 | N/A | Name of the device. A value for this attribute is required. |
| Interface | char_string,128 | N/A | A unique identifier for the interface. A value for this attribute is required. |
| full_half | integer | 2 | Denotes half duplex or full duplex: 1 = half duplex 2 = full duplex Automatically populated from the Protocol Configuration Table if the value is NULL. Not automatically overwritten unless set to NULL. |
| ifType | integer | N/A | The ifType as given by the ifTable on the managed device. Used as a cross-reference into the Protocol Configuration Table to determine the protocol and its properties. |
| ifSpeed | gauge | N/A | The ifSpeed as given by the ifTable on the managed device. |
| ifSpeedIn | gauge | N/A | The ifSpeed as given by the ifTable on the managed device. Can be changed to reflect the inbound speed on a dual speed interface. Used only for full-duplex interfaces. |
| ifSpeedOut | gauge | N/A | The ifSpeed as given by the ifTable on the managed device. Can be changed to reflect the outbound speed on a dual speed interface. Used only for full-duplex interfaces. |
| ifDescr | char_string,255 | N/A | The ifDescr as reported in the ifTable. |
| cust_id | seq_key | -2 | The customer identifier used to group interfaces by associated customer. |
| customer_name | char_string,128 | "Unknown Customer" | The customer name used to group interfaces by associated customer. |
| group_id | seq_key | -2 | The group identifier for this interface. Not used explicitly. |
| group_name | char_string,128 | "Unknown Group" | The group name for this interface. Not used explicitly. |
| location_id | seq_key | -2 | The location identifier used to group interfaces by physical location. |

| Attribute | Туре | Default | Description |
|-----------------------|-----------------|-----------------------|---|
| location_name | char_string,128 | "Unknown Location" | The location name used to group interfaces by physical location. |
| country_code | seq_key | -2 | The country code for this interface. Not used explicitly. |
| country_name | char_string,128 | "Unknown Country" | The country name for this interface. Not used explicitly. |
| UtilThreshold | integer | 10000 | Utilization threshold. A percentage of available bandwidth, calculated as an average over the polling interval. Will auto-update from the Protocol Configuration Table only when this value is defaulted to 10000 and the KIR_protocol_config value is > 0. |
| ErrorThreshold | integer | 10000 | Error threshold. Percentage of traffic with errors, calculated as an average over the polling interval. Will auto-update from the Protocol Configuration Table when the value is defaulted to 10000 and the KIR_protocol_config value is > 0. |
| DiscardThreshold | integer | 10000 | Discard threshold. Percentage of traffic with discards, calculated as an average over the polling interval, at which an exception is counted. Will auto-update from the Protocol Configuration Table only when this value is at the default of 10000 and the KIR_protocol_config value is > 0. |
| AvailabilityThreshold | integer | 98 | Availability threshold. A percentage of availability, calculated as an average over the polling interval, at which an exception is counted. Will auto-update from the Protocol Configuration Table only when this value is at the default of 10000 and the KIR_protocol_config value is > 0. |

Changing the Default Directory for PropertyData

The default directory for data property files, the location where the import utility will look for your edited files, is specified by the SourceDirectory path. This path appears in the following TEEL file:

$IR_Property.teel$

If you change the default directory before you install the Interface Reporting package, your task is easier, since you only have to change the path once, by finding the TEEL files in the Interface_Reporting.ap directory. If you want to change the default directory after installing Interface Reporting, you must make the path change in two places, namely:

Importing Properties 43

- Interface_Reporting.ap
- {DPIPE_HOME}/lib

Changing the location of the PropertyData directory is **not** recommended. However, if you needed to change the directory location, follow these steps:

- Create the new source directory.
- 2 Navigate to the appropriate directory (see the discussion above regarding which directories are involved) and open the directory.
- **3** Edit this file: IR_Property.teel
 - Locate the SourceDirectory default path; look for the line beginning with
 SourceDirectory =
 - Change the path, replacing the existing path with the complete path name to the new directory; begin the new path name just after the equal sign (=).

Leave the file filter as specified in the original SourceDirectory.

Adding Details about Vendors and Models

The Devices sub-package can recognize vendors and models based on the sysObjectId. You can add or modify the list using an import procedure that is similar to interface provisioning. Vendor details are stored in the following files inside the Interface_Reporting_Device.ap directory:

- vendor.txt
- vendor_model.txt

Add rows, or modify existing rows, and then call this process:

trend_proc -f IR_Import_Vendor.pro

Vendor Properties

The following table provides a list of the available fields.

| Column | Туре | Default | Comments |
|--------------------|-----------------|----------------|---|
| Vendor Name | char_string,128 | Required Field | The name of the vendor. Example: "Cisco" |
| Vendor Details | char_string,128 | Required Field | Additional details about all equipment from this vendor. Example: "Cisco Inventory" |
| Vendor sysObjectId | char_string,128 | Required Field | The SNMP sysObjectId from the system group on the device. |

Model Properties

The following table provides a list of the available fields.

| Column | Туре | Default | Comments |
|-------------------|-----------------|----------------|---|
| Vendor Name | char_string,128 | Required Field | The vendor name. |
| Model Details | char_string,128 | Required Field | Additional details about this model. |
| Model sysObjectId | char_string,128 | Required Field | The SNMP sysObjectId from the system group on the device. |

Importing Properties 45

6 Change Forms

Interface Reporting includes multiple change forms. Use these forms to modify:

- Protocol defaults
- · Interface speed and associated thresholds
- Customer, location, and interface description
- Directed-instance polling
- Logging level
- Data filtering
- Provisioning mode

Keep in mind that you cannot assign interfaces to customers or locations that are not already recognized by Common Property Tables. To add customers and locations to Common Property Tables, use the **Create New Customer** or **Create New Location** forms, or use the batch-mode property import that comes with Common Property Tables. For details, refer to the *Common Property Tables 3.5 User Guide*.

Changing Protocol Defaults

If you have not pre-provisioned new interfaces to configure specific thresholds and indicate whether they are full or half duplex, values for those variables will be pulled from the protocol configuration file as new interfaces are discovered and added to the system. You can add a new protocol to this file or you can modify the characteristics of an existing protocol.

Follow these steps to change the monitoring status or the default protocol thresholds:

- 1 Select HP OpenView > Performance Insight > Management Console.
- 2 Click **Objects** and select any managed object. Forms appear under General Tasks.
- 3 Double-click Change Protocol Defaults. The form opens.
- 4 Select the protocol you want to change, then update Protocol Name, Monitor status, or Threshold percentage values as required.
- 5 Click **Apply** to save changes, **OK** to save changes and close the form, or **Cancel** to close the form without saving changes.

The system will use defaults from the protocol table when:

- A just-discovered interface is inserted into the interface property table
- An existing interface has NULL values for protocol-related properties
- An existing interface has NULL values for protocol-related properties

/admin/Interface Reporting Forms/change protocol defaults.frep

_ | _

Interface Reporting Change Protocol Defaults

Use this form to change the default settings for Protocols (interface types) for the Interface Reporting report pack. You can change the names for Unknown protocols, and modify the default duplex and threshold settings for each protocol. The system can be configured to not poll interface types that have the Monitor flag set to Off (0). Select the Protocol you want to change the settings for, and then enter the new settings below. Click the Apply button to save any changes. Click the Cancel button to cancel any changes. Click the OK button to save changes and close the form.

| ifТуре | Protocol Name | Duplex | Monitor | Default Utilization Threshold | Default Discard Threshold | Dei Er Thre |
|----------|--------------------------------|--------|------------|-------------------------------------|---------------------------------|-------------------|
| 1 | other | 2 | 1 | 90.00 | 1.00 | |
| 2 | regular1822 | 2 | 1 | 90.00 | 2.00 | 2 |
| 3 | hdh1822 | 2 | 1 | 90.00 | 2.00 | 2 |
| 4 | ddn-x25 | 2 | 1 | 90.00 | 2.00 | 2 |
| 5 | rfc877-x25 | 2 | 1 | 90.00 | 2.00 | 2 |
| 6 | ethernet-csmacd | 1 | 1 | 30.00 | 1.00 | * |
| 7 | iso88023-csmacd | 1 | 1 | 90.00 | 2.00 | 2 |
| 8 | iso-88024-tokenBus | 1 | 1 | 50.00 | 2.00 | 2 |
| 9 | iso-88025-tokenRing | 1 | 1 | 50.00 | 2.00 | 2 |
| 10 | iso88026-man | 2 | 1 | 90.00 | 2.00 | 3-1 |
| 4 | etad an | ? | 1 | 00.00 | 2.00 | Þ |
| Protocol | Name ethernet-csmacd | | | Monitor | Monitor | |
| Threshol | Utilization Threshold ds 30.00 | | rror Thres | hold | Discard Thr | eshold |
| | | | | ОК | Apply | Cancel |

Changing Interface Properties

You can use the Change Interface Properties form to modify the following properties:

- Customer assignment
- Location assignment
- Utilization threshold
- Error thresholds
- Discard threshold
- · Availability threshold
- Speed [In/Out]

This form is especially helpful when you want to change multiple properties for a single interface, or when you want to update multiple interfaces on a single device. If desired, you may use the Change Interface Properties form to update *all* the interfaces on one device in one operation; however, don't forget that *every* interface will be updated to the same set of values, including speed and threshold settings. To access the form:

- 1 Select HP OpenView > Performance Insight > Management Console.
- 2 Click Objects, then navigate to and select the interface you want to update. Or, to update all the interfaces on a device, select the device. You will see Change Interface Properties listed under Object Specific Tasks.
- 3 Double-click Change Interface Properties. The form opens.
- 4 Select an interface, then update assignments, thresholds, speeds, or duplex values as required.
- 5 Click Apply to save changes, OK to save changes and close the form, or Cancel to close the form without saving changes.

Change Forms 49

Interface Reporting

This form allows interface information to be updated. Select the interface(s) you want to change, and update the property values. Click the Apply button to save any changes. Click the Cancel button to cancel any changes. Click the OK button to save any changes and close the form.

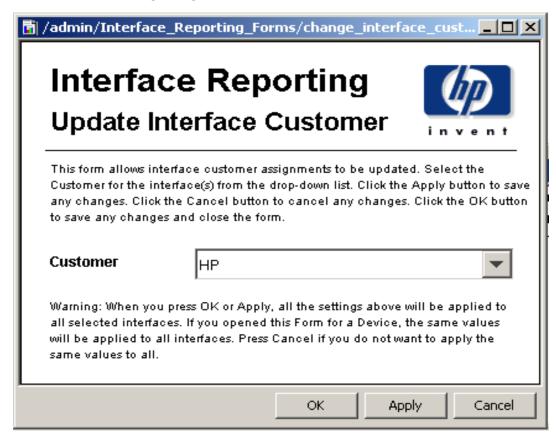

| Device | Interface | ifIndex | Description | Speed | Protocol | Cus |

Changing Customer and Location

The Change Interface Customer and Change Interface Location forms allow you to assign interfaces to a customer or a location. These forms can be used to update a single interface, or to assign all the interfaces on a device to single customer or location.

To change the customer or location assignments, follow these steps:

- 1 Select HP OpenView > Performance Insight > Management Console.
- 2 Click Objects, then navigate to the interface you want to update, and select it. You may also select a device, if you want to update all the interfaces on that device. The forms appear under Object Specific Tasks.
- 3 Double-click Change Interface Customer or Change Interface Location. The form opens.
- **4** Use the selection list to update the assignment.
- 5 Click **Apply** to save changes, **OK** to save changes and close the form, or **Cancel** to close the form without saving changes.

Change Forms 51

Changing the Interface Description

If you want to change the description of an interface, follow these steps:

- 1. Select HP OpenView > Performance Insight > Management Console.
- 2. Click Objects.
- 3. Navigate to the interface you want to update, or the device for which you want to update one or more interfaces. The Change Interface Description form is listed under **Object Specific Tasks**.
- 4. Double-click Update Interface Description. The form opens.
- 5. Select the interface you want to change, then update the description as required.
- 6. If you selected a device and opened this form, all the interfaces on the device will appear in the table. You can update the descriptions for multiple interfaces by selecting one, updating the description and clicking **Apply**, and then repeating.
- 7. Click **Apply** to save changes, **OK** to save changes and close the form, or **Cancel** to close the form without saving changes.

Interface Reporting Update Interface Description

This form allows the interface Description to be updated. Click the Apply button to save any changes. Click the Cancel button to cancel any changes. Click the OK button to save any changes and close the form.

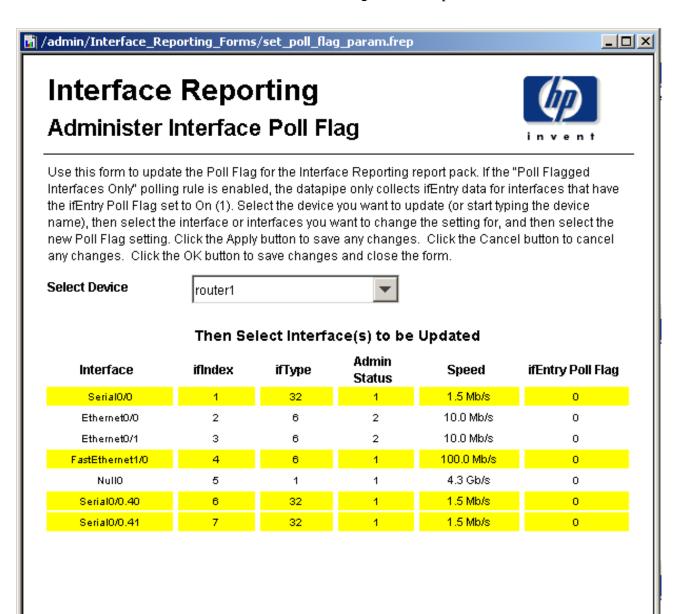

| Device | Interface | Description | Protocol | Speed |
|---------|-----------------|-----------------|-----------------|------------|
| router1 | FastEthernet1/0 | FastEthernet1/0 | ethernet-csmacd | 100.0 Mb/s |
| router1 | NullO | NullO | other | 4.3 Gb/s |
| router1 | Serial0/0 | Serial0/0 | frameRelay | 1.5 Mb/s |
| router1 | Serial0/0.40 | Atlanta | frameRelay | 1.5 Mb/s |
| router1 | Serial0/0.41 | Serial0/0.41 | frameRelay | 1.5 Mb/s |

Configuring Directed-Instance Polling

The Interface Reporting ifEntry Datapipe supports five polling rules. One of the supported rules, *Poll Flagged Interfaces Only*, permits collection from selected interfaces only, namely, interfaces that have a poll flag set. There are several methods to set the interface poll flag. One method is to use the Administer Interface Poll Flag form.

Follow these steps to set the interface poll flag using the Administer Interface Poll Flag form:

- 1. Select HP OpenView > Performance Insight > Management Console.
- 2. Click Objects.
- 3. Navigate to the device you want to update and select it. The Administer Interface Poll Flag form appears under **Object Specific Tasks**.
- 4. Double-click Administer Interface Poll Flag. The form opens.

Change Forms 53

- 5. Select the interfaces you want to change, then update the description as required. You can select multiple interfaces by using the CTRL or SHIFT keys.
- 6. Select the required poll flag setting, On or Off.
- 7. Click **Apply** to save changes, **OK** to save changes and close the form, or **Cancel** to close the form without saving changes.

Data Filtering, Provisioning, and Logging Level

Data Filtering

| Option | Impact |
|--------|--|
| 0 | The default. Data for all collected interfaces is transferred from the datapipe to the report pack. If new devices or interfaces are discovered and polled, property rows for those devices and interfaces will be added in the report pack. |
| 1 | Only data for provisioned interfaces will be transferred to the report pack. Data collected for interfaces that are not already provisioned in the report pack will be discarded. |

Provisioning Mode

| Option | Impact |
|--------|---|
| 0 | The default. Values for Interface Speed, Type, and Description collected from the network do not overwrite provisioned settings. If a new interface is discovered, and this interface is not provisioned in the report pack, these attributes are set once from collected data. |
| 1 | Values for Interface Speed, Type, and Description collected from the network overwrite provisioned settings. If you use property import to import values, if Speed, if Type, and if Descr will not be updated. |

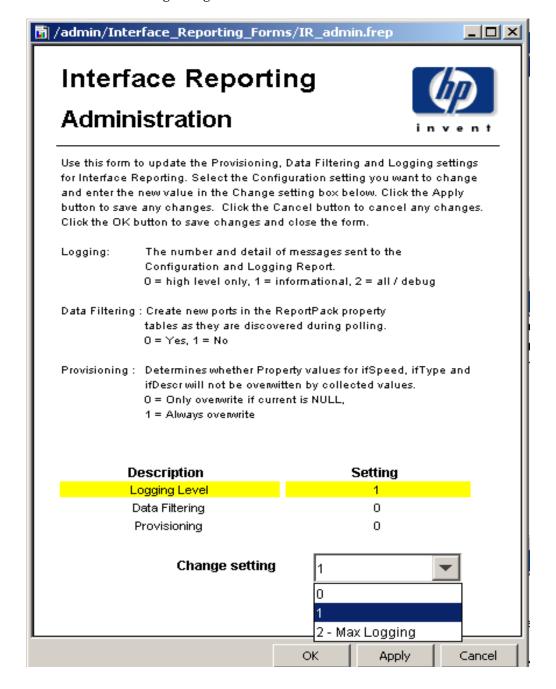

Logging Level

| Option | Impact |
|--------|---|
| 0 | Errors only |
| 1 | The default. Standard level of logging. |
| 2 | Maximum level of logging. |

Changing Settings

To change settings for data filtering, provisioning, or logging level follow these steps:

- 1. Select HP OpenView > Performance Insight > Management Console.
- 2. Click **Objects** and select any managed object. Forms will appear in the General Tasks window.
- 3. Double-click Administer Interface Reporting. The form opens.
- 4. Select the administration setting you want to change, then select the new setting.
- 5. Click **Apply** to save changes, **OK** to save changes and close the form, or **Cancel** to close the form without saving changes.

Change Forms 55

7 Spotting High Exceptions

Interface Reporting provides five reports that help you focus on high exception counts:

- Exception Hot Spots (Exceptions sub-folder)
- Device Exception Hots Spots (Device folder)
- Trunk Exception Hot Spots (VLAN folder)
- VLAN Exception Hots Spots (VLAN folder)
- EtherChannel Exception Hot Spots (EtherChannel folder)

The Exceptions Hot Spots sorts interfaces by exception count, highest to lowest. The selection table is followed by three graphs:

- Exception counts (hourly / daily / monthly)
- For each exception type, the average, maximum, and threshold for the previous 30 days
- Daily averages for each exception type, for each traffic direction

The first graph will tell you whether the exception activity is relatively static, caused by one type of exception, or variable, caused by multiple types of exceptions. The second graph makes it easy to compare exception activity to the threshold. The third graph looks at utilization, discard, and error exceptions as a percentage of available bandwidth. When the interface is full duplex, you can view data for inbound traffic and data for outbound traffic.

The device version of the report is similar. It sorts initially by customer, then by device, and aggregates data at the device level. Use this report to identify the devices that are generating the most exceptions. The selection table is followed by three graphs:

- Exception counts (hourly / daily / monthly)
- For each exception type, the average, maximum, and threshold for the previous 30 days
- Daily averages by exception type

Samples of the following reports follow:

- Exception Hot Spots
- Device Hots Spots
- Trunk Exception Hot Spots

Interface Reporting

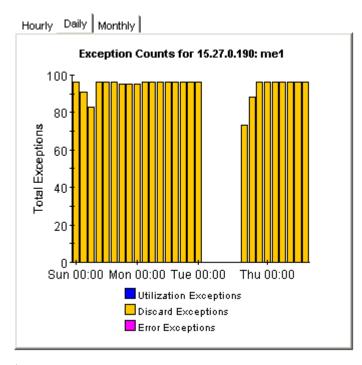

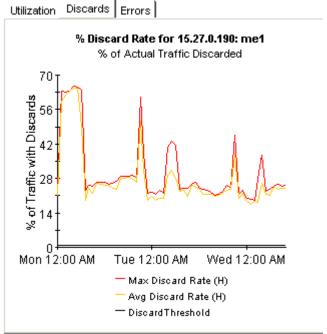

This report has one entry for each monitored interface that experienced threshold exceptions yesterday. An exception occurs when inbound or outbound utilization, % discard rate or % error rate exceeds the threshold set for that interface. U = Utilization, D = Discards, E = Errors. F/H indicates full or half Duplex.

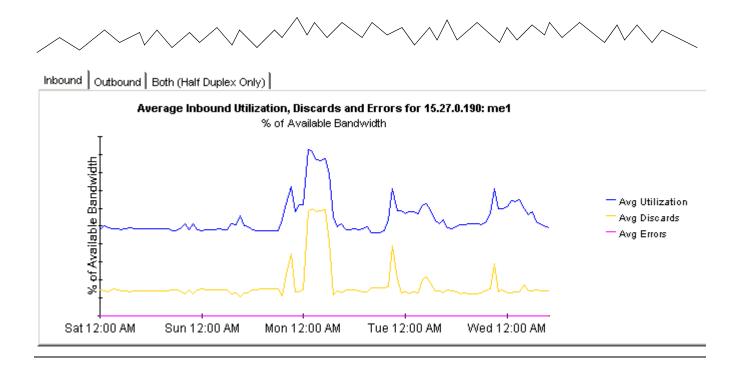

Interfaces with Exceptions Yesterday Sorted by Exception Count

Spotting High Exceptions 63

8 Exceptions by Type

Interface Reporting looks at exceptions in two ways, by count and by type. You can look for interfaces and devices with the highest exception counts for yesterday, or you can look for interfaces that produced a particular type of exception. If the exception count is what interests you, use the Hot Spots reports. If the type of exception is what interests you, you have three choices:

- Discard Exceptions
- Error Exceptions
- Utilization Exceptions

The format for all three reports is similar:

- Selection table that ranks interfaces by exception count
- Bar chart showing total exceptions (hourly/daily/monthly)
- · Line graph comparing maximum, average, and threshold
- List of recent maximum rates, with date and time stamp

The selection table looks at yesterday's activity and shows the exception count, the speed of the interface, and threshold setting for each type of exception. (Threshold values are set to defaults; these values can be changed by modifying a form or by importing a property file that contains updated threshold values.)

The first graph tracks exception counts; the hourly graph covers the previous two days, while the daily graph covers the previous 30 days. If yesterday's exception count seems abnormal, compare it to the daily graph to get a sense of what has been normal in the past. The second graph allows you to compare average and maximum values to the threshold.

Below the graphs is a list of recent maximum rates, date stamped so that you know exactly when the maximum was recorded. Use this list to compare yesterday's total to previous totals and to see whether the maximum rate has been occurring at the same time of day.

Samples of all three exception reports follow.

Interface Reporting

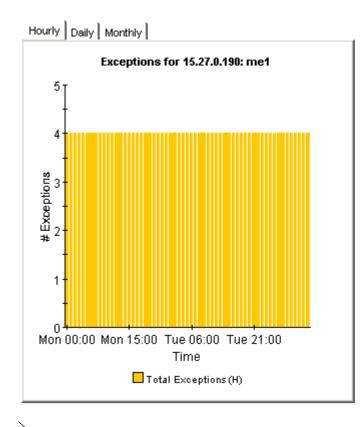

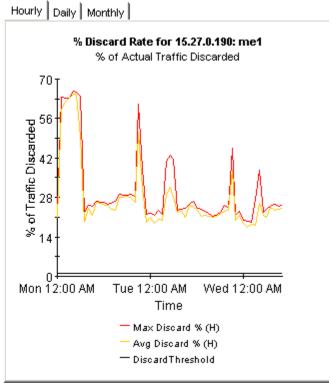

This report has one entry for each monitored interface that experienced discard exceptions yesterday. An exception occurs when inbound or outbound discard traffic (with respect to total traffic) exceeds the threshold set for that individual interface. F/H indicates full or half Duplex.

Exceptions by Type 71

9 Locations and Protocols

Interface Reporting includes two summary reports. One offers a location perspective on performance, rolling up performance data by location, and the other offers a protocol perspective on performance, rolling up performance data by protocol. The key metrics in both reports are volume, exceptions, and utilization.

Summary reports provide aggregated data across multiple systems. The location summary report provides the following information:

- Number of active, monitored interfaces by location
- Volume for one customer by location
- Volume for all customers by location
- Hourly, daily, and monthly analysis of exception counts by location
- Hourly, daily, and monthly utilization by location

The protocol summary report provides the following information:

- Number of active, monitored interfaces by protocol
- Volume for one customer by protocol
- Volume for all customers by protocol
- Hourly, daily, and monthly analysis of exception counts by protocol
- Hourly, daily, and monthly utilization by protocol

You may investigate a location customer-by-customer, or you may investigate a location by looking at performance data for every customer at that location simultaneously. Similarly, you may look at the performance of a protocol for one customer, or for all customers.

Use summary reports to find out how the number of actively monitored interfaces compares location to location, or protocol to protocol, and to compare exception counts location to location or protocol to protocol. If a customer needs an upgrade, or if a location needs an upgrade, the summary reports should make that clear. In addition, if a recent upgrade at one location was expected to lower the exception count for that location, the location summary report should provide the evidence you need to verify that the situation has improved.

Both summary reports are reproduced below.

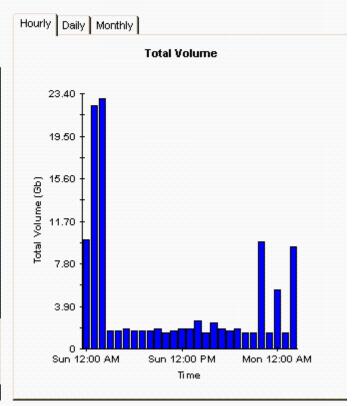

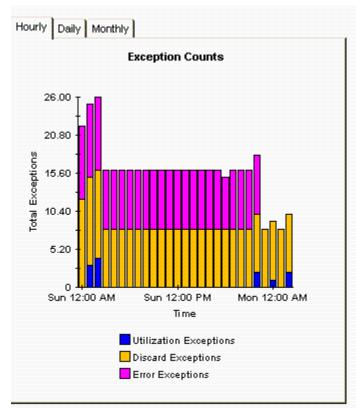

This report has one entry for each Customer and Location combination on the network. This report only contains metrics for ports that are administratively up.

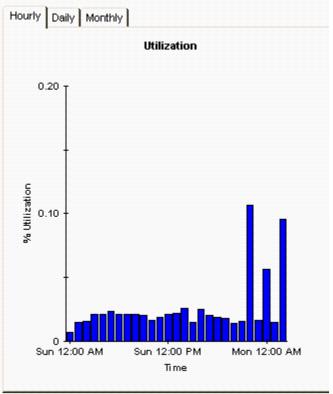

Locations with Traffic Yesterday

| Location | Customer | #Int | |
|---------------------|---------------|------|--|

Locations and Protocols 77

10 Capacity Planning

In addition to monitoring the exceptions created by occasional spikes in traffic, Interface Reporting is concerned with gradual increases in utilization and the resulting capacity problems that may arise a few months from now. Interface Reporting includes the following capacity planning reports:

- Capacity Planning by Interface (Busy Hour)
- Capacity Planning by Device
- Capacity Planning by Location
- Capacity Planning by Protocol

The interface version of the report focuses on the baseline busy hour average (a rolling average of 42 busy hours) and projected increases or decreases in the baseline busy hour average. The selection table sorts interfaces by the F30 forecast for the baseline busy hour and allows you to compare the following statistics for each interface:

- Baseline busy hour
- F30 forecast for baseline busy hour
- Utilization threshold

The baseline busy hour will change slightly every day, since, each day, the oldest busy hour value will be dropped from the average, while a new busy hour (for yesterday) will be added to the average. Note that the value for each busy hour is itself an average (based on four samples) and should not be confused with peak usage. For a portion of that busy hour, actual usage may have been much higher (or much lower) than the average.

The other three capacity planning reports are customer-oriented, so your first step is to select a customer. The selection table will then rank the elements (devices, locations, or protocols) belonging to that customer. The ranking is done according to rate of growth and the rate of growth is calculated by dividing the F30 forecast by the baseline busy hour. In all four capacity planning reports, the graphs beneath the selection table provide additional forecast data (baseline details, the F60 value, the F90 value, and day-of-week values) and a Grade of Service score that assesses the impact of discard, error, and utilization exceptions.

Samples of two capacity planning reports follow; the first report is from the Interface folder, the second report is from the Device folder.

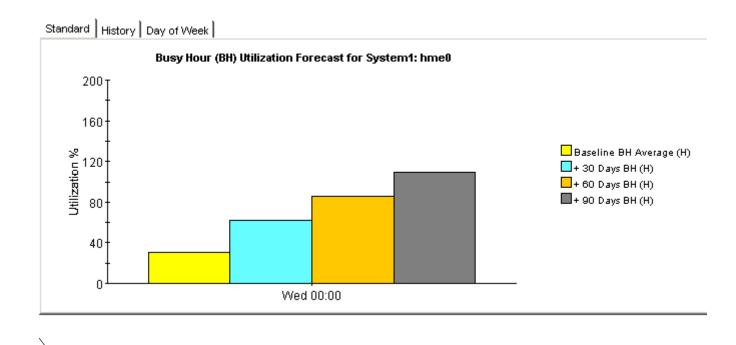

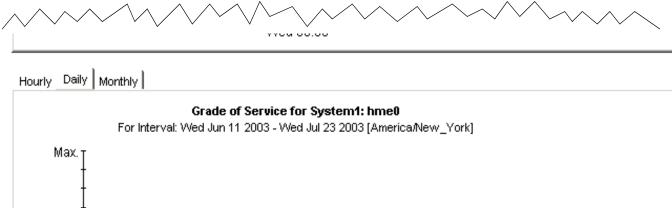

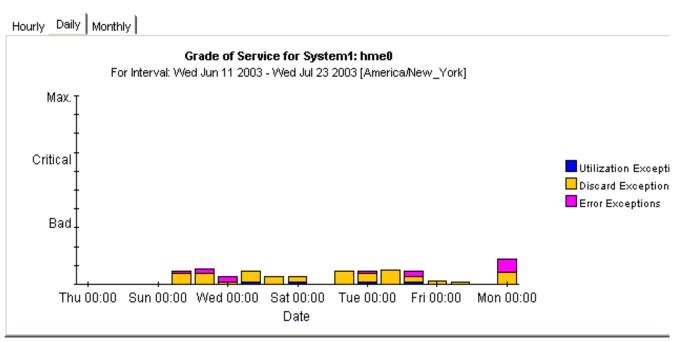

This report provides details about the interfaces whose 30 day forecasted busy hour utilization is greater than their utilization threshold. The busy hour (BH) utilization is the maximum average utilization across a complete hour during the day. F/H = Full or Half Duplex.

Interfaces Where Forecasted Utilization Exceeds Threshold Sorted by Forecasted Utilization

| Device | Interface | FЛ | Customer | BH Avg. Util. | F30 BH Util. | Util. Threshold | Descr. |

Capacity Planning 83

11 Service Level Management

Service level agreements between service providers and customers commonly stipulate a minimum response time and minimum availability. The purpose of the Service Level Management (SLM) reports is to improve service level monitoring for both parties, enhancing precision and making violations easier to spot.

SLM reports focus on SNMP response time and availability. Response time measures delay within the management infrastructure, that is, delay between the datapipe and the device being polled, not delay between clients and servers. While you would not want to infer from a high SNMP response time that users are seeing the same delay, the response time that users are seeing could be similar if the device is the source of the delay.

Availability measures the percentage of time a device has been operational. This metric provides insight into device outages as reported through the SNMP *sysUpTime* attribute. To calculate the availability of individual interfaces, OVPI combines the *sysUpTime* value for the device with two interface attributes, *ifOperStatus* and *ifLastChange*.

Use the SLM reports to identify specific interfaces, devices, protocols, and locations that are experiencing availability or response time problems. The report in the Interface folder is interface-oriented, beginning with a list of device/interface combinations; the other SLM reports are customer-oriented, allowing you to select a customer/element combination.

The initial selection table looks at yesterday's availability, and ranks items by availability, lowest to highest. Use the graph to the right to view availability on an hour by hour basis, then compare the hourly graph to the daily graph to find out whether yesterday's activity was an isolated incident, not likely to occur again, or part of an ongoing trend. The second table, response time, looks at yesterday's response time and ranks items by response time, highest to lowest.

Interface Reporting includes four Service Level Management reports. Two samples follow, one from the Interface folder and one from the Device folder.

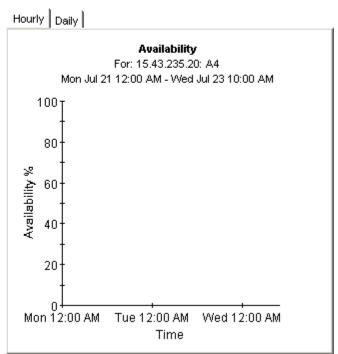

The Service Level Management report indicates whether interfaces are meeting contracted service levels for availability and response time. Select an interface from the table to see performance over time. Only interfaces with less than 100% availability will be listed. Use the AvailabilityPct parameter to constrain which interfaces are displayed.

12 Administration Reports

The following table outlines the scope of each admin report.

| Admin Report | Information Provided | |
|---------------------------|---|--|
| Configuration and Logging | Configuration settings for: — Logging level — Data filtering — Provisioning. List of recent log entries Entries are listed by component Each entry is time-stamped Each entry indicates duration in seconds IR_map_p is the most common component | |
| | • The number of entries per poll (two entries per poll in the sample report) is related to number of index types | |
| Inventory | List of customers List of devices for each customer IP address, make, model, description List of interfaces on each device Attributes for each interface: — AdminStatus — Protocol — Full/Half — Speed — Threshold — Description | |
| Top Level Inventory | Total number of devices for each customer Total number of interfaces for each customer List of devices by make and model | |

| Admin Report | Information Provided |
|--------------------|---|
| System Performance | Processes that took place during the last 2 hours: |
| | Name |
| | Start time |
| | Duration |
| | Rating |
| | Bar chart showing duration of each process in seconds |
| | Processes that took place since yesterday: |
| | Name |
| | Start time |
| | Duration |
| | Rating |
| | Bar chart showing duration of each process in seconds |

See below for samples of these reports:

- Inventory
- System Performance

Report Pack Administration

Configuration and Logging

This report displays configuration information relating to Interface Reporting collections, and lists the most recent log table entries for report rack internal procedures. Logging to this report is open to all installed report packs. Use the 'Component' parameter to filter the displayed data.

IR Mapping Procedure Configuration

| Configuration Parameteर | Current Value | Meaning |
|-------------------------|---------------|----------------------------|
| Logging Level 🥀 | 1 | High Level and Errors Only |
| Data Filtering | 0 | Report on all interfaces |
| Provisioning | 0 | Use provisioned data only |

ReportPack Log Entries

| Time | Component | Message |
|----------------------|-----------|--|
| Ved Jul 23 11:09 AM | IR_map_p | Info: 411 polled rows were mapped to SRIRDevPorts in 2 seconds. |
| Ved Jul 23 11:08 AM | IR_map_p | Info: 1725 polled rows were mapped to SRIRDevPorts in 5 seconds. |
| Ved Jul 23 10:52 AM | IR_map_p | Info: 411 polled rows were mapped to SRIRDevPorts in 0 seconds. |
| Ved Jul 23 10:52 AM | IR_map_p | Info: 1734 polled rows were mapped to SRIRDevPorts in 5 seconds. |
| Ved Jul 23 10:37 AM | IR_map_p | Info: 411 polled rows were mapped to SRIRDevPorts in 0 seconds. |
| Ved Jul 23 10:37 AM | IR_map_p | Info: 1734 polled rows were mapped to SRIRDevPorts in 4 seconds. |
| Ved Jul 23 10:22 AM | IR_map_p | Info: 411 polled rows were mapped to SRIRDevPorts in 0 seconds. |
| Ved Jul 23 10:22 AM | IR_map_p | Info: 1734 polled rows were mapped to SRIRDevPorts in 4 seconds. |
| Ved Jul 23 10:09 AM | IR_map_p | Info: 411 polled rows were mapped to SRIRDevPorts in 0 seconds. |
| Ved Jul 23 10:08 AM | IR_map_p | Info: 1727 polled rows were mapped to SRIRDevPorts in 10 seconds. |
| Ved Jul 23 09:52 AM | IR_map_p | Info: 411 polled rows were mapped to SRIRDevPorts in 0 seconds. |
| Ved Jul 23 09:51 AM | IR_map_p | Info: 1734 polled rows were mapped to SRIRDevPorts in 11 seconds. |
| Ved Jul 23 09:37 AM | IR_map_p | Info: 411 polled rows were mapped to SRIRDevPorts in 0 seconds. |
| Ved Jul 23 09:37 AM | IR_map_p | Info: 1735 polled rows were mapped to SRIRDevPorts in 6 seconds. |
| Ved Jul 23 09:22 AM | IR_map_p | Info: 411 polled rows were mapped to SRIRDevPorts in 1 seconds. |
| Ved Jul 23 09:22 AM | IR_map_p | Info: 1733 polled rows were mapped to SRIRDevPorts in 5 seconds. |
| Ved Jul 23 09:09 AM | IR_map_p | Info: 411 polled rows were mapped to SRIRDevPorts in 2 seconds. |
| Ved Jul 23 10:09 AM | IR_map_p | Info: 411 polled rows were mapped to SRIRDevPorts in 0 seconds. |
| Ved Jul 23 10:08 AM | IR_map_p | Info: 1727 polled rows were mapped to SRIRDevPorts in 10 seconds. |
| Ved Jul 23 09:52 AM | IR_map_p | Info: 411 polled rows were mapped to SRIRDevPorts in 0 seconds. |
| Ved Jul 23 09:51 AM | IR_map_p | Info: 1734 polled rows were map \ed to SRIRDevPorts in 11 seconds. |
| Ved Jul 23 09:37 AM | IR_map_p | Info: 411 polled rows were mapped to SRIRDevPorts in 0 seconds. |
| Ved Jul 23 09:37 AM | IR_map_p | Info: 1735 polled rows were mapped to SRIRDevPorts in 6 seconds. |
| Ved Jul 23 09:22 AM | IR_map_p | Info: 411 polled rows were mapped to SRIRDevPorts in 1 seconds. |
| Ved Jul 23 09:22 AM | IR_map_p | Info: 1733 polled rows were mapped to SRIRDevPorts in 5 seconds. |
| Ved Jul 23 09:09 AM | IR_map_p | Info: 411 polled rows were mapped to SRIRDevPorts in 2 seconds. |
| Ved Jul 23 09:09 AM | IR_map_p | Info: 1727 polled rows were mapped to SRIRDevPorts in 7 seconds. |
| Ved Jul 23 08:52 AM | IR_map_p | Info: 411 polled rows were mapped to SRIRDevPorts in 0 seconds. |
| Ved Jul 23 08:52 AM | IR_map_p | Info: 1734 polled rows were mapped to SRIRDevPorts in 5 seconds. |
| Ved Jul 23 08:37 AM | IR_map_p | Info: 411 polled rows were mapped to SRIRDevPorts in 0 seconds. |
| MA 4 Tol 22 09:27 AM | IR man n | Info: 1732 notted rome man and to SRIRNavPorts in 5 seconds |

Administration Reports 91

This report has one entry for each customer and provides inventory information for the devices assigned to that customer and the interfaces on those devices. Modify the report constraints to limit the number of interfaces displayed. Only interfaces that were polled yesterday will be displayed.

| Customer | ld | Devices Associated with the Chosen Customer | | | |
|---------------------|----|---|-------|-------|-------------|
| Acme | 1 | Device | Make | Model | Description |
| Customer Unassigned | -2 | 15.6.96.4 | Cisco | 2522 | 15.6.96.4 |
| HP | 2 | | | | |

Interfaces on 15.6.96.4 Change Constraints to Modify the List

| Interface | AdminStatus | Protocol | Full/Half | Speed | Threshold % | Description |
|-----------|-------------|-----------------|-----------|--------------------------------|--------------|-------------|
| Ethernet0 | Up | ethernet-csmacd | Н | 10.0 Mb/s | U:30 D:1 E:1 | Ethernet0 |
| Serial0 | Up | frameRelay | F | In: 1.5 Mb/s Out: 1.5 Mb/s | U:70 D:1 E:1 | Serial0 |
| Serial1 | Up | frameRelay | F | In: 1.5 Mb/s Out: 1.5 Mb/s | U:70 D:1 E:1 | Serial1 |
| Serial2 | Up | frameRelay | F | In: 115.0 Kb/s Out: 115.0 Kb/s | U:70 D:1 E:1 | Serial2 |

Reporting System Performance

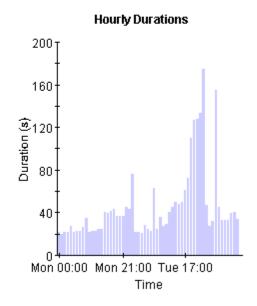

This report provides total duration details in seconds for groups of related tasks in the report pack. The information can be used to assess if the system is approaching its processing limits.

Hourly Process Durations

For the Last 2 Hours

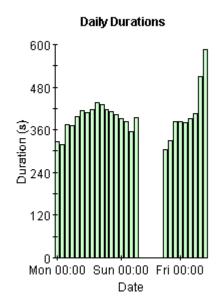

| Process Name | StartTime | Duration (s) | Rating |
|-----------------|---------------------|-----------------|-----------|
| DevPort_Summary | Wed Jul 23 11:20 AM | | |
| DevPort_Summary | Wed Jul 23 10:20 AM | 34 | Excellent |
| DevPort_Summary | Wed Jul 23 09:20 AM | 40 | Excellent |

Daily Process Durations

Since Yesterday

| Process Name | StartTime | Duration (s) | Rating |
|---------------------|---------------------|-----------------|-----------|
| DevPort_DMF_Summary | Wed Jul 23 04:00 AM | 585 | Good |
| DevPort_DMF_Summary | Tue Jul 22 04:00 AM | 510 | Good |
| Device_DMF_Summary | Wed Jul 23 04:06 AM | 94 | Excellent |
| Device_DMF_Summary | Tue Jul 22 04:06 AM | 97 | Excellent |
| Property_Import | Wed Jul 23 04:00 AM | 18 | Excellent |
| Property_Import | Tue Jul 22 04:00 AM | 17 | Excellent |

Administration Reports 93

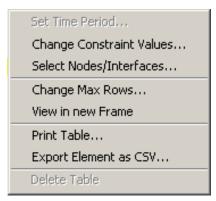

A Editing Tables and Graphs

Any table or graph can be viewed in several ways. While the default view is usually adequate, you can easily change to a different view. If you are using Report Viewer, right-click the object to open a list of view options. If you are using the Web Access Server, follow these steps to change the default view of a table or graph:

- 1 Click **Preferences** on the links bar.
- 2 Expand Reports in the navigation frame.
- 3 Click Viewing.
- 4 Select the Allow element editing box.
- 5 Click Apply.
- 6 Click the Edit icon next to the table or graph.

View Options for Tables

Right-clicking a table, or selecting the Edit Table icon if you are using the Web Access Server, opens a list of table view options.

Select **Set Time Period** to alter the relative time period (relative to now) or set an absolute time period. The Set Time Period window opens.

You may shorten the period of time covered by the table from, for example, 42 days to 30 days or to 7 days. If you are interested in a specific period of time that starts in the past and stops *before* yesterday, click **Use Absolute Time** and select a Start Time and an End Time.

Select **Change Constraint Values** to loosen or tighten a constraint, thereby raising or lowering the number of elements that conform to the constraint. The Change Constraint Values window opens. To loosen a constraint, set the value lower; to tighten a constraint, set the value higher.

The **Select Nodes/Interfaces** allows you to change the scope of the table by limiting the table to specific nodes, specific interfaces, or a specific group of nodes or interfaces. The Select Node Selection Type window opens.

Change Max Rows increases or decreases the number of rows in a table. The default is 50. If you expand the default, the table may take more time to open. If you are trending a large network, using the default ensures that the table opens as quickly as possible.

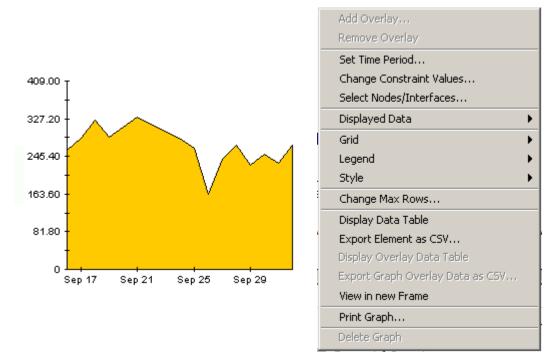

View in new Frame opens the table in a Table Viewer window, shown below. If necessary, make the data in the table more legible by resizing the window.

| III Table Viewer | | | | |
|--|--------------|----------------|---------------|---------------------|
| Polled IP QoS Statistics Data - Input Over Previous 6 Hours | | | | |
| Direction | lpPrecedence | Switched Bytes | Switched Pkts | Time Period |
| Input | . 0 | 105,688 | 675 | Tue Oct 29 07:00 AM |
| Input | 1 | 0 | 0 | Tue Oct 29 07:00 AM |
| Input | 2 | 0 | 0 | Tue Oct 29 07:00 AM |
| Input | 3 | 0 | 0 | Tue Oct 29 07:00 AM |
| Input | 4 | 0 | 0 | Tue Oct 29 07:00 AM |
| Input | 5 | o | 0 | Tue Oct 29 07:00 AM |
| Input | 6 | 600 | 5 | Tue Oct 29 07:00 AM |
| Input | 7 | 0 | 0 | Tue Oct 29 07:00 AM |
| Input | 0 | 98,334 | 638 | Tue Oct 29 06:45 AM |
| Input | 1 | 0 | 0 | Tue Oct 29 06:45 AM |
| Input | 2 | 0 | 0 | Tue Oct 29 06:45 AM |
| Input | 3 | 0 | 0 | Tue Oct 29 06:45 AM |
| Input | 4 | 0 | 0 | Tue Oct 29 06:45 AM |
| Input | 5 | 0 | 0 | Tue Oct 29 06:45 AM |
| Input | 6 | 0 | 0 | Tue Oct 29 06:45 AM |
| Input | 7 | 0 | 0 | Tue Oct 29 06:45 AM |
| Input | 0 | 97,539 | 648 | Tue Oct 29 06:30 AM |
| Input | 1 | 0 | 0 | Tue Oct 29 06:30 AM |
| Input | 2 | 0 | 0 | Tue Oct 29 06:30 AM |
| Input | 3 | 0 | 0 | Tue Oct 29 06:30 AM |
| Input | 4 | 0 | 0 | Tue Oct 29 06:30 AM |
| Input | 5 | 0 | 0 | Tue Oct 29 06:30 AM |
| Input | 6 | 120 | 1 | Tue Oct 29 06:30 AM |
| Input | 7 | 0 | 0 | Tue Oct 29 06:30 AM |
| Input | 0 | 90,744 | 564 | Tue Oct 29 06:15 AM |

| Input | 3 | 0 | 0 | Tue Oct 29 06:15 AM |
| Input | 4 | 0 | 0 | Tue Oct 29 06:15 AM |
| Input | 5 | 0 | 0 | Tue Oct 29 06:15 AM |
| Input | 6 | 0 | 0 | Tue Oct 29 06:15 AM |
| Input | 7 | 0 | 0 | Tue Oct 29 06:15 AM |
| Input | 0 | 103,775 | 656 | Tue Oct 29 06:00 AM |
| Input | 1 | 0 | 0 | Tue Oct 29 06:00 AM |
| Input | 2 | 0 | 0 | Tue Oct 29 06:00 AM |
| Input | 3 | 0 | 0 | Tue Oct 29 06:00 AM |
| Input | 4 | 0 | 0 | Tue Oct 29 06:00 AM |

96 Appendix A

View Options for Graphs

Right-clicking a graph, or clicking the Edit Graph icon if you are using the Web Access Server, opens the following list of view options.

The following table provides details about each option.

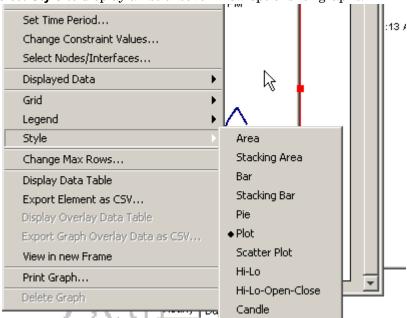

| Option | Function |
|--------------------------|--|
| Set Time Period | Same as the table option shown above. |
| Change Constraint Values | Same as the table option shown above. |
| Select Nodes/Interfaces | Same as the table option shown above. |
| Displayed Data | For every point on a graph, display data in a spreadsheet. |
| Grid | Add these to the graph: |
| | X axis grid lines |
| | Y axis grid lines |
| | X and Y axis grid lines |
| Legend | Delete or reposition the legend. |
| Style | See the illustrations below. |
| Change Max Rows | Same as the table option shown above. |
| Display Data Table | See below. |

Editing Tables and Graphs 97

| Option | Function |
|-----------------------|---------------------------------------|
| Export Element as CSV | Same as the table option shown above. |
| View in New Frame | Opens graph in a Graph Viewer window. |
| Print Graph | Same as the table option shown above. |

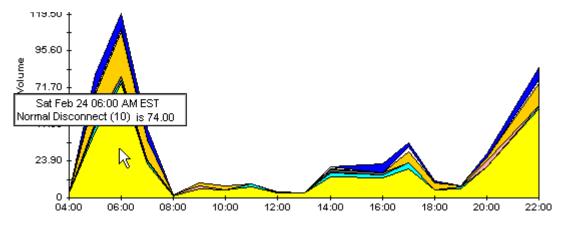

Style Options

Select **Style** to display a list of seven view options for graphs.

Style > Area

The plot or bar chart changes to an area graph. While relative values and total values are easy to view in this format, absolute values for smaller data types may be hard to see. Click anywhere within a band of color to display the exact value for that location

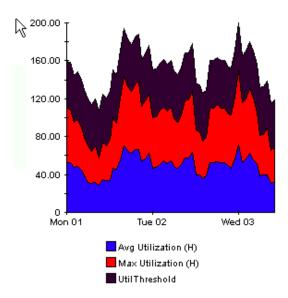

To shorten the time span of a graph, press SHIFT+ALT and use the left mouse button to highlight the time span you want to focus on. Release the mouse button to display the selected time span.

98 Appendix A

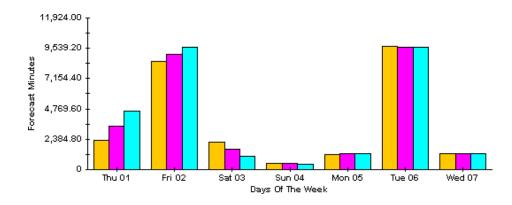

Style > Stacking Area

The area or plot graph changes to a stacking area graph. This view is suitable for displaying a small number of variables.

Style > Bar

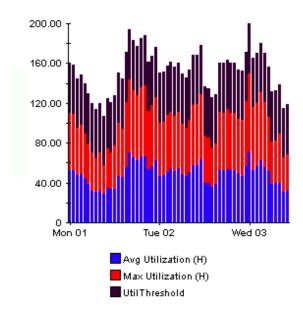

The graph changes to a bar chart. This view is suitable for displaying relatively equal values for a small number of variables. There are three variables in the graph below.

Editing Tables and Graphs 99

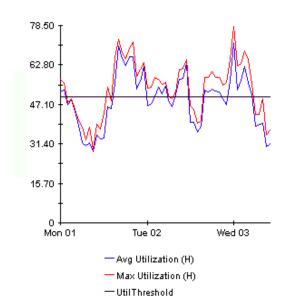

Style > Stacking Bar

The plot or area graph changes to a stacking bar chart. If you increase the width of the frame, the time scale becomes hourly. If you increase the height of the frame, the call volume shows in units of ten.

Style > Plot

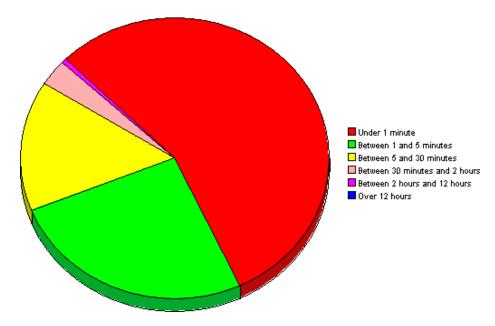

Bands of color in an area graph change to lines. If you adjust the frame width, you can make the data points align with hour; if you adjust the frame height, you can turn call volume into whole numbers.

100 Appendix A

Style > Pie

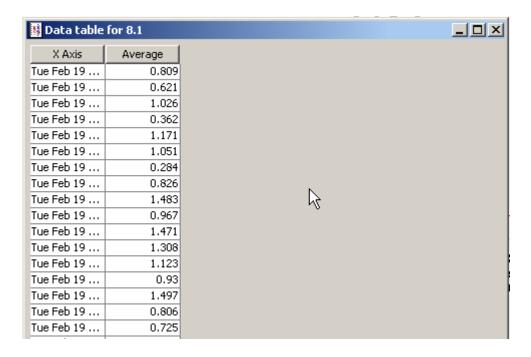

An area graph becomes a pie chart. Bands in an area graph convert to slices of a pie and the pie constitutes a 24-hour period. This view is helpful when a small number of data values are represented and you are looking at data for one day.

If you are looking at data for more than one day, you will see multiple pie graphs, one for each day.

Display Data Table

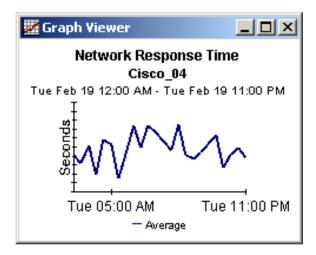

This option changes a graph into a spreadsheet.

Editing Tables and Graphs

View in New Frame

The graph opens in a Graph Viewer window. Improve legibility by resizing the window.

102 Appendix A

Glossary

availability

The percentage of time a device has been operational. Identifies device outages as reported through the sysUpTime variable. Calculated by combining device sysUpTime with interface ifOperStatus and interface ifLastChange.

avg volume

This metric is found in capacity planning reports. It refers to average daily volume during the baseline period.

baseline busy-hour

This value is the average of 42 busy-hour values recorded during the rolling baseline period. This value is static for one day only. It will be different tomorrow, when yesterday's busy hour is factored into the calculation that determines average Busy Hour. Baseline busy hour and forecasts for future baseline busy hour values appear in capacity planning reports.

busy-hour

This value reflects a relatively persistent phenomenon and, when combined with multiple busy-hour values over the baseline, is used to predict future performance. The busy hour value is an average of multiple samples taken during the hour. Do not confuse busy-hour with peak. During the busy hour, actual utilization can be significantly higher than the busy-hour average.

country

This value is imported by the provisioning interface. If not provisioned, the field reads unknown.

daily

A view showing daily performance for the previous 31 days. The most recent day in this view is yesterday.

day of week

A forecast, derived from baseline data, that assigns a growth rate to each day of the week.

discard rate

The percentage of packets discarded by the interface. Data about discards is sampled during each poll cycle (by default this is four times an hour); based on those samples, OVPI calculates an average and a maximum discard rate.

discard threshold

The point at which an acceptable percentage of discarded traffic becomes an abnormal percentage and possibly impacts response time. If the interface is full duplex, the same threshold value is applied to both in and out packets separately.

error rate

The percentage of packets with errors as reported by the interface. Data about errors is sampled during each poll cycle (by default this is four times an hour); based on those samples, OVPI calculates an average and a maximum error rate.

error threshold

The point at which an acceptable percentage of errored traffic becomes an abnormal percentage and possibly impacts response time. If the interface is full duplex, the same threshold value is applied to both in and out packets separately.

F30 / F60 / F90

The level where utilization (or volume) is expected to be 30, 60, and 90 days from now. Calculated by applying linear regression to busy-hour levels over the baseline period.

group

This value is imported by the provisioning interface. If not provisioned, the field displays *unknown*.

growth rate

F30 utilization divided by average busy-hour.

hourly

A view showing performance for the last two days and whatever portion of today has elapsed. The minimum time range is 48 hours; the maximum is 72 hours.

interface

An entry in the SNMP if Table for the device, representing a physical or a logical interface.

location

This value imported by the provisioning interface. If not provisioned, the field reads unknown.

monthly

A view showing performance for each month over the last two years. Blank until data collection has been functioning for at least one month.

protocol

The textual name associated with the enumerated if Type of the interface.

response time

Delay within the network management structure, specifically, delay between the datapipe and the device. If the device is causing the delay, this value may point to device resource issues.

threshold

The line between normal and abnormal performance. When this line is crossed, an exception is recorded. Thresholds are set to default values that are easily changed to reflect individual needs.

utilization

The total number of octets traversing the interface as a percentage of the total *possible* number of octets, using the ifSpeed property. If an interface is full duplex, the table displays utilization in each direction. Groups of interfaces have their utilization calculated by taking the total traffic on all administratively up interfaces in the group and dividing that by the total possible bandwidth. Utilization for a group of interfaces is more reliable when all the interfaces in the group use the same protocol.

utilization threshold

The point at which the number of octets traversing the interface is considered detrimental to the service level required by network users. In the case of full duplex interfaces, the same threshold value is applied to in and out packets separately.
