# Getting Started with Mercury Deployment Management Configuration

---

## In This Chapter:

- *Introduction to Mercury Deployment Management*
  - *Mercury Deployment Management Concepts*
    - *Overview of a Simplified Deployment Process*
  - *Overview of Configuring Deployment Management*
  - *Related Information*
-

## Introduction to Mercury Deployment Management

Mercury Deployment Management™ is a Mercury IT Governance Center™ application that automates and manages the migration and deployment of changes for packaged applications, custom applications, legacy systems, web content, and more. Leveraging and enforcing best practice deployment processes, Mercury Deployment Management performs all tasks required to install software changes correctly across your system landscape. With Mercury Deployment Management, packages are deployed automatically, eliminating errors inherent with manual processes. Mercury Deployment Management's detailed audit trail helps you pinpoint problems quickly, roll back changes if necessary, and supports regulatory compliance requirements, such as segregation of duties (SOD), at both the role level and the process step level.

Mercury Deployment Management allows developers to attach changes as package line items within a package. Each package line uses an object type to tell the system the type of a change. Packages then follow a digitized process to ensure they are appropriately handled with reviews and approvals. Based on the process, each package line (change) can then be deployed to the environments defined, such as development, test, and production.

This document provides the details on how to configure a Mercury Deployment Management system using the Mercury IT Governance Workbench, and making sure your packages follow your digitized process. [Chapter 1, \*Getting Started with Mercury Deployment Management Configuration\*, on page 15](#) (this chapter) provides an overview of how to configure Mercury Deployment Management to support your business processes.

## Mercury Deployment Management Concepts

The following are the major concepts of Mercury Deployment Management.

- **Deployment.** Deployment is moving a file, script, code, or full application (object) between two or more instances. For example, a file can be deployed from a development instance to a testing instance and finally into one or more production instances. Deployment typically involves connecting systems together, moving files between the systems, and running support scripts.

- **Environments.** Environments can consist of a server, a single database instance, or an associated remote client machine. Not all of these components need be present in an environment. For example, it is possible to have an environment which does not contain a database.
- **Environment Groups.** Environment groups define a set of environments which can be referenced as the source and destinations for object migrations and deployments.
- **Environment Refresh.** An environment refresh replaces one environment with another environment. After the physical refresh, data in Deployment Management is updated to be consistent with the refreshed environment.
- **Object Types.** Object types are used to define the technical steps required to migrate or deploy application files or changes for packaged applications, custom applications, legacy systems, web content. For example, a File Migration object type might contain the information and commands required to transfer a file from one machine to another, while a SQL script object type might address the migration and execution of database scripts.
- **Notification Templates.** Notification templates are pre-configured notification forms that can be selected and used with the various Mercury Deployment Management entities, such as workflows and packages.
- **Package.** A package is a set of objects (package lines) being migrated or deployed together. The package follows an assigned workflow through the various review, approval, and migration steps. Each object in a package is defined by a separate package line. While each package line is acted upon separately, the group of package lines (the package) represent a logical unit that should be moved and tracked together.
- **Package Lines.** A package line is one object being migrated or deployed within the package. Each package line follows the assigned workflow through the various review, approval, and migration steps.
- **Physical Refresh.** A physical refresh replaces one environment with a physical copy of another environment.
- **Refresh Group.** A refresh group reflects the environment being refreshed and the environment providing the new environment.
- **Release and Release Distribution.** Release Management introduces repeatable, reliable processes surrounding software and application releases. Mercury Deployment Management provides an interface for grouping and processing the packages and requests associated with a specific release. Groups of related packages can then be activated from a single window.

- **User Data.** Mercury Deployment Management entities such as packages and workflows include a set of standard fields that provide information concerning those entities. While these standard fields are normally sufficient for day-to-day processing, you can add “user data” fields to capture additional information specific to your business process.
- **Workflow.** A workflow is a digitized process where a logical series of steps define business process. Workflow steps can range in usage from review and approvals to performing migrations and deployments.

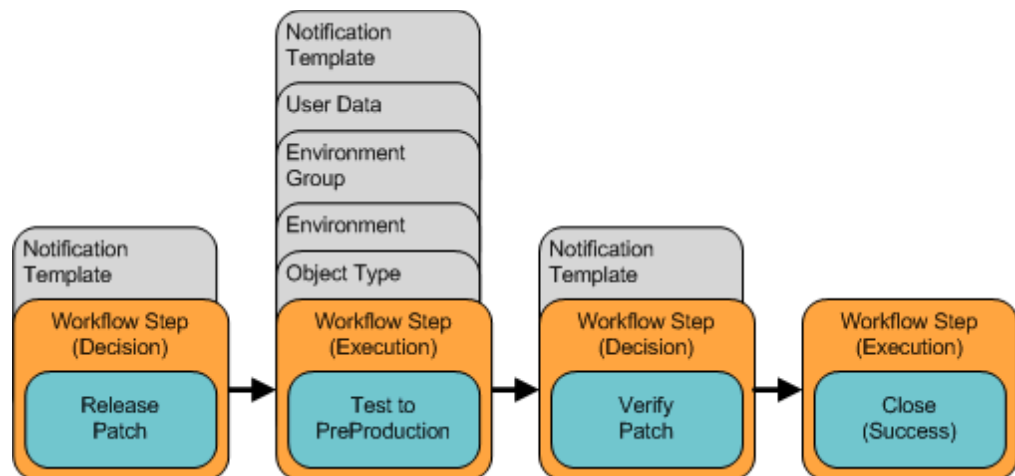

## Overview of a Simplified Deployment Process

*Figure 1-1* illustrates a simple four-step deployment process for a patch release.

The first step, **Release Patch**, is a decision step where a user is notified that a decision needs to be made, in this case, should the patch be released. Once manually approved the process moves to the second step.

The second step, **Test to PreProduction**, is an execution step where the patch (object) is automatically deployed from one environment to another environment. As part of this second step, the patch is deployed and a user is notified that the deployment has been completed. Once the execution step is complete, the process moves to the third step.

*Figure 1-1. Mercury IT Governance Center components*

The third step, **Verify Patch**, is a decision step where a user is notified to check and verify that the patch successfully deployed from one environment to another environment. Once verified and manually approved, the process moves to the fourth and final step.

The fourth step, **Close (Success)**, is an execution step that automatically closes the deployment process and automatically notifies users of the successful closure of the patch release.

## Overview of Configuring Deployment Management

A Mercury Deployment Management system can be configured using the following steps:

### *Step 1: Gather process requirements*

Before configuring a Mercury Deployment Management system, you should collect specific information concerning your process, the types of objects to be deployed, source and destination environments, and so on.

For detailed information, see [Chapter 2, \*Gathering Process Requirements\*, on page 23](#). [Appendix A, \*Worksheets\*, on page 269](#) also provides a series of worksheets to help gather the information required to build a deployment system.

### *Step 2: Configure workflows*

Configuring workflows involves setting up the required workflow steps (decision and execution), adding transitions between the steps, and configuring each workflow step for notifications, security groups, segregation of duties, and so on. For information on how to configure workflows, see [Chapter 3, \*Configuring Workflows\*, on page 45](#) and [Chapter 4, \*Configuring Workflow Components\*, on page 107](#). [Chapter 6, \*Configuring Releases and Distributions\*, on page 169](#) also details specific configuration requirements for Mercury Deployment Management's release process. [Appendix A, \*Worksheets\*, on page 269](#) also provides a series of worksheets to help gather the information required to configure a workflow.

### *Step 3: Configure object types*

Object types define the technical step or steps required to “copy” a change from one environment to another environment. For information on how to configure object types, see [Chapter 5, \*Configuring Object Types\*, on page 141](#). [Appendix A, \*Worksheets\*, on page 269](#) also provides a series of worksheets to help gather the information required to configure an object type.

### ***Step 4: Configure environments***

Configuring environments means defining the server and database instances identified by your business or deployment process. For information about how to configure environments, environment groups, and environment refreshes, see [Chapter 7, \*Configuring Environments\*](#), on page 195.

### ***Step 5: Configure notification templates***

Notification templates are preconfigured notification “formats” used by other Mercury Deployment Management entities, such as workflows, object types, and environments. [Chapter 8, \*Configuring Notification Templates\*](#), on page 237 discusses how to configure notification templates.

### ***Step 6: Configure user data fields***

User data fields add customized data fields used by other Mercury Deployment Management entities, such as workflows, object types, and environments. [Chapter 9, \*Configuring User Data\*](#), on page 249 discusses how to configure these user data fields.

### ***Step 7: Configure your security and access requirements***

Part of any migration or deployment process are the permissions required to perform various decisions or executions. Two of the ways in which Mercury IT Governance Center controls access to perform these decisions or executions are by licenses and access grants.

- **Licenses.** Licenses provide users with access to a Mercury IT Governance Center product such as Mercury Deployment Management, but they do not dictate what actions the users can perform.
- **Access Grants.** Access grants, when used with licenses, define the actions a user can perform within a Mercury IT Governance Center product.

For more information concerning security and access grants, see *Security Model Guide and Reference*.

### ***Once configured and tested: Educate your deployment system users***

Once your Deployment Management system is configured and tested, you should train your users on the new business process. The following offers some guidance on how to education your Deployment Management system users:

- **Basic Mercury Deployment Management training.** Ensure that each user understands how to create, process, and report on packages.

- **Process-specific training.** Ensure that each user understands the new process. Consider holding a formal meeting or publishing documents on the workflow steps and packages.
- **User Responsibilities.** Ensure that each user understands their individual role in the process. For example, the QA team may be restricted to approving the testing phase of a package. You can use email notifications that are part of Deployment Management to communicate information about user roles. Notifications can be very detailed, informing the recipients of their responsibility.

## Related Information

The following documents also include information related to configuring Mercury Deployment Management:

- *Mercury Deployment Management User's Guide*
- *Commands, Tokens, and Validations Guide and Reference*
- *Open Interface Guide and Reference*
- *Reports Guide and Reference*
- *Security Model Guide and Reference*
- *Configuring the Standard Interface*
- *Mercury-Supplied Entities Guide* (includes descriptions of all Mercury Deployment Management portlets, object types, and workflows)

## Overview of Gathering Process Requirements

Before configuring a Mercury Deployment Management process, you should gather information concerning your process, such as the steps in the workflow, the objects to be deployed, and the source and destination environments. Once this information is collected, you can then begin configuring your Mercury Deployment Management process.

This chapter offers you guidance on how to gather information for your deployment process. The subjects covered in this chapter are:

- **Defining workflows.** What are the steps your deployment process (workflow). Which steps require manual decisions (reviews and approvals)? Which steps require automatic executions? See *Defining Workflows* on page 25 for detailed information.
- **Defining object types.** What are you deploying? Are you deploying files? Are you deploying data? What scripts might be required to support the deployment? See *Defining Object Types* on page 33 for detailed information.
- **Defining environments.** What is the source environment for your deployment? What are the destination environments for your deployment? See *Defining Environments* on page 37 for detailed information.
- **Defining notification templates.** Is the correct notification template in place? Does your deployment require a new notification template? See *Defining Notification Templates* on page 39 for detailed information.
- **Defining user data fields.** Does your deployment require additional user information to process correctly? See *Defining User Data Fields* on page 40 for detailed information.
- **Defining security and access.** Who will be allowed to build the deployment packages? Who should receive notifications? Who will be allowed to approve the deployment at each step? See *Defining Security and Access* on page 41 for detailed information.

## Defining Workflows

A workflow is a digitized process where a logical series of steps define the path followed by a package. Workflow steps can range from reviews and approvals to performing the actual migration.

When defining a deployment workflow, you must first determine the intent of the business process the deployment workflow will follow. For example:

- Are you designing a simple migration of a file from one environment to another environment with little oversight or supervision?
- Are you designing a business-wide deployment process with a great deal of oversight and supervision?

Once you understand the intent of the business process, you can then begin to define the deployment workflow itself. The following lists the basic components of a workflow:

- **Workflow steps.** Workflow steps are the events (steps) of the process (workflow)? What starts your business process? Where are decisions made? Where are actions taken? The following lists the different types of workflow steps:
  - **Decision steps.** Decision steps are workflow steps that require an external process to decide their outcome.
  - **Execution steps.** Execution steps are workflow steps that perform actual work or actions.
  - **Condition steps.** Condition steps are logic steps used for complex workflow processing.
  - **Subworkflows steps.** Subworkflow steps represent multiple workflows steps that follow a consistent pattern.
- **Transitions between workflow steps.** Transitions between workflow steps represent the outcome of one workflow step that leads to next workflow step. Workflow steps can have more than one transition.
- **Security determines who can access a workflow step.** Each workflow step includes a list of who can access workflow step. Who can approve a workflow step? Can only one user approve the workflow step? Can one of several users approve the workflow step? Must multiple users approve the workflow step?

- **Notification determines who hears about the workflow step.** Each workflow step includes a list of who will be notified about the workflow step. Who is notified? When does the notification occur?

## Gathering Information for Workflow Steps

Workflow steps are the events of the process. Mercury Deployment Management employs the following types of workflow steps:

- **Decision steps.** Decision steps are workflow steps that require an external process to decide their outcome, such as reviews, approvals, or coding.
- **Execution steps.** Execution steps are workflow steps that perform actual work or actions, such as file migration, automatic time-stamping, or automatic package status changes.
- **Condition steps.** Condition steps are logic steps used for complex workflow processing, such as AND and OR.
- **Subworkflows steps.** Subworkflow steps represent multiple workflows steps that follow a consistent pattern, such as code rework or unit testing.

## Gathering Information for Decision Steps

Decision steps are workflow steps that require an external process to decide their outcome, such as reviews, approvals, or coding. *Table 2-1* provides a configuration consideration checklist to help define decision steps. See *Appendix A, Worksheets, on page 269* for a complete list of decision step considerations.

*Table 2-1. Decision Workflow Checklist*

	Decision Step Check Item	Example
	What is the name of this workflow step?	<ul style="list-style-type: none"> <li>■ Review Request</li> <li>■ On Hold</li> <li>■ In Rework</li> </ul>
	What is the status of the package at this workflow step?	<ul style="list-style-type: none"> <li>■ On Hold</li> <li>■ New</li> <li>■ In Review</li> </ul>
	What are the transitions from this workflow step?	<ul style="list-style-type: none"> <li>■ Assign</li> <li>■ Review</li> <li>■ On Hold</li> </ul>

Table 2-1. Decision Workflow Checklist

	Decision Step Check Item	Example
	Who or what groups can act on this step (approve, cancel, reassign)?	<ul style="list-style-type: none"> <li>■ Security Groups</li> <li>■ Users</li> <li>■ Tokens</li> </ul>
	How many decisions are required to exit this workflow step?	<ul style="list-style-type: none"> <li>■ Only one</li> <li>■ At Least One</li> <li>■ All</li> </ul>
	What event triggers the notification?	<ul style="list-style-type: none"> <li>■ When the process reaches the workflow step</li> <li>■ When a specific result is reached</li> </ul>
	Who or how many receive the notification?	<ul style="list-style-type: none"> <li>■ Email Address (group alias)</li> <li>■ Security Group</li> </ul>
	What is the notification message.	<ul style="list-style-type: none"> <li>■ Test complete.</li> <li>■ Approval required.</li> </ul>
	Use this workflow step as a timeout? How long?	<ul style="list-style-type: none"> <li>■ 1 day</li> <li>■ 2 days</li> </ul>
	Are you using segregation of duties?	<ul style="list-style-type: none"> <li>■ Based on owner of the workflow?</li> <li>■ Based on workflow step?</li> </ul>

## Gathering Information for Execution Steps

Execution steps are workflow steps that perform actual work or actions, such as file migration, automatic times-stamping, or automatic package status changes. *Table 2-2* provides a configuration consideration checklist to help define execution steps. See [Appendix A, Worksheets, on page 269](#) for a complete list of execution step considerations.

*Table 2-2. Execution Workflow Checklist*

	Execution Step Check Item	Example
	What is the name of this workflow step?	<ul style="list-style-type: none"> <li>■ Create Package</li> <li>■ Close</li> <li>■ Set Temp Date</li> </ul>
	Will this workflow step execute this command?	<ul style="list-style-type: none"> <li>■ Cancel project</li> <li>■ Update project</li> </ul>
	Will the object type (package line) execute this command?	<ul style="list-style-type: none"> <li>■ Open database</li> <li>■ Copy file to environment</li> </ul>
	What is the source environment?	(If required.) <ul style="list-style-type: none"> <li>■ KINTANA_SERVER</li> </ul>
	What is the destination environment?	(If required.) <ul style="list-style-type: none"> <li>■ KINTANA_SERVER</li> </ul>
	What are the transitions from this workflow step?	<ul style="list-style-type: none"> <li>■ Succeeded</li> <li>■ Failed</li> </ul>
	Who owns this execution step?	<ul style="list-style-type: none"> <li>■ Security Group</li> <li>■ User</li> </ul>
	What event triggers the notification?	<ul style="list-style-type: none"> <li>■ When the process reaches the workflow step.</li> <li>■ When a specific result is reached.</li> </ul>
	Who or how many receive the notification?	<ul style="list-style-type: none"> <li>■ Email Address (group alias)</li> <li>■ Security Group</li> </ul>
	What is the notification message.	<ul style="list-style-type: none"> <li>■ Test complete.</li> <li>■ Approval required</li> </ul>
	Use this workflow step as a timeout? How long?	<ul style="list-style-type: none"> <li>■ 1 day</li> <li>■ 2 days</li> </ul>
	Are you using segregation of duties?	<ul style="list-style-type: none"> <li>■ Based on owner of the workflow?</li> <li>■ Based on workflow step?</li> </ul>

## Gathering Information for Condition Steps

Condition steps are logic steps used for complex workflow processing, such as AND and OR. *Table 2-3* provides a configuration consideration checklist to help define your condition steps.

*Table 2-3. Condition Workflow Checklist*

	Condition Step Check Item	Example
	What is the name of this workflow step?	<ul style="list-style-type: none"> <li>■ AND</li> <li>■ OR</li> </ul>
	What is the status of the request at this workflow step?	<ul style="list-style-type: none"> <li>■ On Hold</li> <li>■ New</li> <li>■ In Review</li> </ul>
	What are the transitions from this workflow step?	<ul style="list-style-type: none"> <li>■ Succeeded</li> <li>■ Failed</li> </ul>
	Who owns this workflow step?	<ul style="list-style-type: none"> <li>■ Security Group</li> <li>■ User</li> <li>■ Standard Token</li> </ul>
	What event triggers the notification?	<ul style="list-style-type: none"> <li>■ When the process reaches the workflow step.</li> <li>■ When a specific result is reached.</li> </ul>
	Who or how many receive the notification?	<ul style="list-style-type: none"> <li>■ Email Address (group alias)</li> <li>■ Security Group</li> </ul>
	What is the notification message.	<ul style="list-style-type: none"> <li>■ Test complete</li> <li>■ Approval required</li> </ul>
	Use this workflow step as a timeout? How long?	<ul style="list-style-type: none"> <li>■ 1 day</li> <li>■ 2 days</li> </ul>
	Are you using segregation of duties?	<ul style="list-style-type: none"> <li>■ Based on owner of the workflow?</li> <li>■ Based on workflow step?</li> </ul>

## Gathering Information for Subworkflow Steps

Subworkflow steps represent multiple workflow steps that follow a consistent pattern, such as code rework or unit testing. *Table 2-4* provides a configuration consideration checklist to help define your subworkflow steps. See *Appendix A, Worksheets, on page 269* for a complete list of subworkflow step considerations.

*Table 2-4. Subworkflow Workflow Checklist*

	Subworkflow Step Check Item	Example
	Is an existing workflow available as a subworkflow?	<ul style="list-style-type: none"> <li>■ Yes</li> <li>■ No</li> </ul>
	What is the name of this subworkflow?	<ul style="list-style-type: none"> <li>■ QA Test Cycle</li> <li>■ QA Review Cycle</li> </ul>
	What are the transitions from this workflow step?	<ul style="list-style-type: none"> <li>■ Succeeded</li> <li>■ Failed</li> </ul>
	Who owns this workflow step?	<ul style="list-style-type: none"> <li>■ Security Group</li> <li>■ User</li> </ul>
	What event triggers the notification?	<ul style="list-style-type: none"> <li>■ When the process reaches the workflow step</li> <li>■ When a specific result is reached</li> </ul>
	Who or how many receive the notification?	<ul style="list-style-type: none"> <li>■ Email Address (group alias)</li> <li>■ Security Group</li> </ul>
	What is the notification message.	<ul style="list-style-type: none"> <li>■ QA Test Cycle Succeeded.</li> <li>■ QA Test Cycle Failed.</li> </ul>
	Use this workflow step as a timeout? How long?	<ul style="list-style-type: none"> <li>■ 1 day</li> <li>■ 2 days</li> </ul>
	Are you using segregation of duties?	<ul style="list-style-type: none"> <li>■ Based on owner of the workflow?</li> <li>■ Based on workflow step?</li> </ul>

## General Workflow Design Guidelines

*Table 2-5* provides a workflow logical guideline checklist that you can use to configure your deployment workflow.

*Table 2-5. Workflow logical guidelines (page 1 of 3)*

	Guideline	Reason
	<b>Workflows</b>	
	Make one or more workflows available to process the packages.	Each workflow is assigned one workflow scope. The possible workflow scopes are: <ul style="list-style-type: none"> <li>■ Request (Demand Management)</li> <li>■ Packages (Deployment Management)</li> <li>■ Release Distributions (Deployment Management)</li> </ul>
	<b>Beginning and Closing Steps</b>	
	Workflow must have a beginning step.	No processing can be done if the workflow has no beginning step.
	Workflow must have at least one step.	No processing can be done if the workflow has no steps.
	Workflow must have at least one Close step.	The package line cannot be closed without a Close step in the workflow.
	First workflow step cannot be a condition.	Workflow processing may not be correct if the first step is a condition.
	Close steps must not have a transition on 'Success' or 'Failure.' Return steps must have no outgoing transitions.	The package or request will not close if a transition exists on 'Success.'
	Close step in subworkflow closes entire package line or request.	No no include a Close step in a subworkflow unless you want to close the workflow in the subworkflow.
	<b>All Steps</b>	
	All steps must be enabled.	Disabled steps cannot be used by the workflow and the process stops.
	Each enabled workflow step must have at least one incoming transition (except the beginning step).	It is not possible to flow to a workflow step without an incoming transition.
	Transition value is not a valid validation value (error).	The validation value has changed since the transition has been made.

Table 2-5. Workflow logical guidelines (page 2 of 3)

	Guideline	Reason
	'Other Values' and 'All Values' transitions must not exist at the same step.	'Other Values' transition is always ignored if an 'All Values' transition exists.
	Each workflow step must have at least one outbound transition.	The branch of the workflow stops indefinitely without closing the package line or request.
	Each value from a list-validated validation must have an outbound transition.	Some validation values do not have transitions defined.
	Step with text or numeric validation must have an 'Other Values' or 'All Values' transition.	Because text and numeric Validations are not limited, an 'Other Values' or 'All Values' transition should be defined.
	Notifications with reminders must not be set on results that have transitions.	Transition into the Return Step does not match the validation.
<b>Decision Steps</b>		
	Each decision step must have at least one security group, user or token defined on the <b>Security</b> tab.	No one is authorized to act on the step without a security group.
<b>Execution Steps</b>		
	Each manual execution step must have at least one security group, user or token defined on the <b>Security</b> tab.	No one is authorized to act on the step without a security group.
	An immediate execution step must not have a transition to itself on 'Success' or 'Failure.'	The workflow could loop indefinitely.
<b>Condition Steps</b>		
	A condition step must not have a transition to itself.	A condition with a transition to itself could cause the workflow to run indefinitely.
	AND or OR condition step must have at least two incoming transitions.	An AND or OR condition with only one incoming transition will always immediately be true and have no effect.

Table 2-5. Workflow logical guidelines (page 3 of 3)

	Guideline	Reason
	Subworkflows	
	Subworkflows must have at least one Return step.	Must include a Return step.
	Top-level workflow must not have a Return step.	Only subworkflows have a Return step.

## Defining Object Types

Object types define the technical steps required to deploy application changes for packaged applications, custom applications, legacy systems, and web content. Many types of objects are deployed through a workflow such as files, SQL scripts, and data. Each object requires different information for proper processing. The information required to properly process an object are defined by the object type. For example, the object type for a file migration requires the following:

- The name of the file
- The type of file
- The location of the file

Additional information such as file compilation after file migration can also be specified on by the object type. A single workflow can process many different object types, as the workflow specifies the process and the environments. The package specifies each object and the associated object type as a package line in the package. Information contained on a package line (defined in the object type) works in conjunction with the workflow process to ensure that the object is correctly deployed.

For each object deployed through the process, you should collect the following information:

- The name of the object
- Object category (optional, used for reporting purposes)

- Parameters describing the object: what it is, where it is, its name, what needs to be done to it, and so on. This information will translate into object type fields. For each object type field, define the following:
  - Field name
  - Validation and component type (dictated by the validation)
  - Field behavior: whether it is displayed, required, any defaulting behavior, and so on.
- Commands required for the object being deployed. Object type commands often reference information stored in the parameters. These commands are executed at specific points (executions steps) in the workflow. For additional, you might shutdown a database before inserting new data into the database. For more information, see *Determining Commands Needed for Objects* on page 35.

For an example of conceptual workflow steps using different object types, see *Table 2-6*. See *Chapter 5, Configuring Object Types*, on page 141 for information on how to configure object types.

*Table 2-6. Example workflow steps (page 1 of 2)*

Step Name	Workflow Step	Transition Values	Object Type Description
Migrate DEV to TEST	Decision	Approved Not Approved	Not applicable. Decision workflow step.
Stop the Server	Execution	Succeeded Failed	Connect to the server and stop the processes running on it.
Evaluate Object Type	Execution	Database File SQL Script	Evaluate the object type for each package line. Resolve the object type token.
Migrate to Database Environment	Execution	Succeeded Failed	Migrate the database changes to the TEST database environment. To do this, execute commands located in the object type.
Migrate to Server Environment	Execution	Succeeded Failed	Migrate the changes to the TEST server environment. To do this, execute commands located in the object type.
Sync	Condition	Success	Have all package lines enter this step before any continue to the next process step.

Table 2-6. Example workflow steps (page 2 of 2)

Step Name	Workflow Step	Transition Values	Object Type Description
Compile Code	Execution	Succeeded Failed	Connect to the server and compile the code located on it.
Start the Server	Execution	Succeeded Failed	Connect to the server and start the processes on it.
Close FAILED	Execution	Succeeded	When a package line (object) enters this step, close the package.

## Determining Commands Needed for Objects

When defining a deployment process, consider what commands need to be executed to achieve the desired results. Commands control which steps must be executed for each workflow step for the deployment process to execute properly. This can involve such things as migrating a file, executing a script, or compiling code.

At early stages of process development, it often helps to list the functional steps and desired results of the commands. It also helps to specify when in the deployment process these commands should be executed. It is then possible to use this information to build your commands adhering to Mercury Deployment Management's command standards, or to deliver these as design specifications for engineers in your group.

Collect the following information for each object type:

- The goal/purpose of the commands
- Functional steps within the commands
- When the commands should be run

For additional information on building commands, see *Commands, Tokens, and Validations Guide and Reference*.

## Object Type Checklist

*Table 2-7* provides a configuration consideration checklist to help define your deployment system. See [Appendix A, Worksheets](#), on page 269 for a complete list of object type considerations.

*Table 2-7. Object type configuration checklist (page 1 of 2)*

	Object Type Check Item	Configuration Consideration
	Define an object type for each type of object to be deployed.	Include creating fields that describe the object and commands required to process it during deployment.
	Fields defined for the object type.	<ul style="list-style-type: none"> <li>■ Fields are required to define the object. Make sure that the correct parameters describe the object to be deployed.</li> <li>■ See <a href="#">Chapter 5, Configuring Object Types</a>, on page 141.</li> </ul> <p>See <i>Commands, Tokens, and Validations Guide and Reference</i>.</p>
	Commands defined for the object type.	<ul style="list-style-type: none"> <li>■ All commands needed to process and deploy the object have been constructed.</li> <li>■ See <a href="#">Chapter 5, Configuring Object Types</a>, on page 141.</li> </ul> <p>See <i>Commands, Tokens, and Validations Guide and Reference</i>.</p>
	Conditions set in commands for the object type.	<ul style="list-style-type: none"> <li>■ Conditions to steps within the command that dictate when the specific command steps run have been added.</li> </ul> <p>See <i>Commands, Tokens, and Validations Guide and Reference</i>.</p>

Table 2-7. Object type configuration checklist (page 2 of 2)

	Object Type Check Item	Configuration Consideration
	Is the object type enabled?	Disabled object types cannot be used.
	Object type and workflow	<p>The following items should be coordinated between the workflow and object type:</p> <ul style="list-style-type: none"> <li>■ Decide which workflow steps will execute the object type commands.</li> <li>■ Decide which object type commands to run at specific workflow steps (using command conditions)</li> <li>■ Workflow step source validations and object type field validations are in agreement. This is required when transitioning based on a field value (using token, SQL or PL/SQL execution types)</li> <li>■ Allow the object type use for the workflow (set in the workflow window - <b>Deployment Management Settings</b> tab).</li> </ul>
	Object types and environments	Specify any environment overrides must correspond to the object type commands.

## Defining Environments

An environment can be a server, a single database instance, or an associated remote client machine. Deployment workflows require the source and destination environments as part of the execution workflow steps. Each environment must be carefully configured to ensure that passwords, communication protocols, and transfer protocols are configured properly. These configured environments can then be used in the deployment process.

If there are multiple applications on a single environment, you can use the application codes feature in the environment definition.

*Example environments settings* illustrates the environments for several steps in a workflow. For information concerning the configuration of environments, see [Chapter 7, Configuring Environments](#), on page 195.

*Table 2-8. Example environments settings*

Workflow Execution Step	Source Environment	Destination Environment
Stop the Server	DEV Server	TEST Server
Migrate to Server Environment	DEV Server	TEST Server
Compile Code	DEV Server	TEST Server
Start the Server	DEV Server	TEST Server
Migrate to Database Environment	DEV Database	TEST Database

## Environments Checklist

*Table 2-9* provides a configuration consideration checklist to help define your environments.

*Table 2-9. Environments checklist (page 1 of 2)*

	Environments Check Item	Configuration Consideration
	Is the source environment defined	<ul style="list-style-type: none"> <li>■ Is the source environment a server or a client?</li> <li>■ Does the source environment include a database?</li> </ul>
	Is the destination environment defined	<ul style="list-style-type: none"> <li>■ Is the destination environment a server or a client?</li> <li>■ Does the destination environment include a database?</li> </ul>
	What is the connection protocol?	Is the connection protocol telnet, SSH, SSH2?
	What is the transfer protocol?	Is the transfer protocol FTP, FTP (active), FTP (passive), Secure Copy, Secure Copy 2?
	Is the environment enabled?	Disabled environments cannot be used.

Table 2-9. Environments checklist (page 2 of 2)

	Environments Check Item	Configuration Consideration
	Is there an environment group?	<ul style="list-style-type: none"> <li>■ What is the environment group name.</li> <li>■ What is the source environment?</li> <li>■ Is the execution order serial or parallel?</li> </ul>
	Is the environment group enabled?	Disabled environment groups cannot be used.
	Is there an environment refresh?	<ul style="list-style-type: none"> <li>■ What is the environment refresh name?</li> <li>■ What is the source environment?</li> <li>■ What is the destination environment?</li> </ul>
	Is the environment refresh enabled?	Disabled environment refreshes cannot be used.
	Environments and workflow considerations.	Specify the source and destination environments (or environment groups) on the workflow execution steps.
	Environments and object type considerations.	Specify any environment overrides in the object type commands.

## Defining Notification Templates

Notification templates are preconfigured email forms that can be used to quickly construct the body of a message. Notification templates are used by entities of Mercury Deployment Management, such as workflows and packages. When configuring a workflow, select the notification template you want to use for each workflow step. Mercury Deployment Management comes with a set of standard notification templates. You can use these existing templates or modify these templates or create new notification templates for your business process. [Chapter 8, Configuring Notification Templates, on page 237](#) provides detailed information concerning the configuration of notification templates.

## Notification Templates Checklist

*Table 2-10* provides a configuration consideration checklist to help define your notification templates.

*Table 2-10. Notification template checklist*

	Notification Template Check Item	Configuration Consideration
	Is the notification template enabled?	Disabled notification template cannot be used.
	Notification template and security group considerations.	Set ownership groups for these entities. Members of the ownership group (determined by associating security groups) are the only users who can edit the entities.

## Defining User Data Fields

Mercury Deployment Management entities such as packages and workflows include a set of standard fields that provide information about those entities. While these fields are normally sufficient for day-to-day processing, you can add “user data” fields to capture additional information specific to your business process. [Chapter 9, Configuring User Data, on page 249](#) provides detailed information concerning the configuration of user data fields.

## User Data Checklist

*Table 2-11* provides a configuration consideration checklist to help define your user data fields.

*Table 2-11. User data checklist*

	User Data Check Item	Configuration Consideration
	Are the user data fields enabled?	Disabled user data fields cannot be used.
	User data and security group considerations	Set ownership groups for these entities. Members of the ownership group (determined by associating security groups) are the only users who can edit the user data fields.

## Defining Security and Access

Included as part of a deployment process are the permissions required to perform various decisions or executions. Two of the ways in which Mercury IT Governance Center controls access to perform decisions and executions are by the following:

- **Licenses.** Licenses provide users with access to a Mercury IT Governance Center products such as Mercury Deployment Management, but licenses do not dictate what actions a user is authorized to perform.
- **Access Grants.** Access grants, when used with licenses, define the actions a user is authorized to perform within a Mercury IT Governance Center product.

For example, you can restrict a user's actions as follows:

- License, Deployment Management
  - Access Grant, View Packages - Those who can view packages
  - Access Grant, Edit Packages - Those who can edit packages

For more information concerning licenses and access grants, see *Security Model Guide and Reference*.

When designing deployment processes, use security groups or dynamic access (tokens). Avoid specifying a list of users to control an action. If the list of users changes (due to a departmental reorganization), you must update your workflow in a variety of places to keep the deployment process running correctly. By using a security group instead of a list of users, you can update the security group once, and the changes are propagated throughout the workflow.

*Table 2-12* provides an example of which security groups can access a deployment workflow and at which workflow step.

Table 2-12. Example of workflow security groups

Workflow Step	Security Groups
Create a package	Financial Apps - Engineer Financial Apps - Database Financial Apps - Manage Deployment
Use the deployment workflow	Financial Apps - Engineer Financial Apps - Manage Deployment
Use a file object type	Financial Apps - Engineer Financial Apps - Database Financial Apps - Manage Deployment
Use a database object type	Financial Apps - Database Financial Apps - Manage Deployment

## Security and User Access Checklist

Table 2-13 provides a configuration consideration checklist to help define your security and user access requirements.

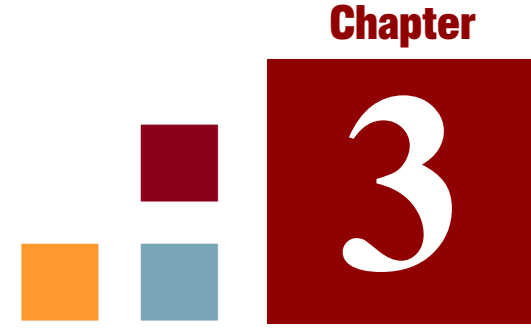

Table 2-13. Security and user access checklist (page 1 of 2)

	Security and User Access Check Item	Configuration Consideration
	Created security groups for access to screens and functions	Security groups to be used to grant access to certain screens and functions have been created.
	Created security groups for association with workflow steps	Security groups to allow users to act on a specific workflow step have been created.
	Set security on package creation	All available options for restricting who can create and submit packages have been set.
	Set security on package processing	All available options for restricting who can process packages have been set.
	Set security on deployment system configuration	You have specified who can modify the deployment process. This includes editing the workflow, object type, environment, security groups, and so on.

Table 2-13. Security and user access checklist (page 2 of 2)

	Security and User Access Check Item	Configuration Consideration
	Security group and workflow considerations	<ul style="list-style-type: none"> <li>■ Associate security groups with workflow steps. Users in the included groups can act on the step.</li> <li>■ Set workflow and workflow step ownership.</li> </ul>
	Security group and object type considerations	Set ownership groups for object types. Members of the ownership group (determined by associating security groups) are the only users who can edit the object type.
	Security group and environments considerations	Set ownership groups for environments. Members of the ownership group (determined by associating security groups) are the only users who can edit the environments.
	Security group and notification template considerations	Set ownership groups for notification templates. Members of the ownership group (determined by associating security groups) are the only users who can edit the notification templates.
	Security group and user data considerations	Set ownership groups for user data. Members of the ownership group (determined by associating security groups) are the only users who can edit user data.

# Configuring Workflows

---

## In This Chapter:

- *Overview of Workflows*
- *Mapping Workflows*
- *Opening the Workflow Workbench*
- *Creating Workflows*
  - *Configuring General Information for a Workflow*
  - *Dragging and Dropping Workflow Steps*
  - *Choosing Workflow Steps*
  - *Adding Close Workflow Steps*
  - *Adjusting Workflow Step Sequences*
  - *Specifying the First Step*
  - *Verifying and Enabling Workflows*
- *Configuring Workflow Steps*
  - *Configuring General Information for Workflow Steps*
  - *Configuring Security for Workflow Steps*
  - *Configuring Notifications for Workflow Steps*
  - *Configuring Timeouts for Workflow Steps*
  - *Configuring Transitions for Workflow Steps*
  - *Configuring Validations for Workflow Steps*

## Overview of Workflows

A workflow represents a business process and is used to map business rules and processes to your organization. This chapter covers information about Deployment Management workflows.

The following is a list of the basic components of a workflow:

- **Begin.** For each workflow, you must explicitly define the first eligible workflow step.
- **Workflow step.** Workflow steps are events that are linked together to form a complete workflow. The following lists the basic workflow steps:
  - **Decision step.** Decision steps represent manual activities performed outside of Mercury IT Governance Center. For example, a decision step is where a user or group of users approves a request.
  - **Execution step.** Execution steps represent actions that are automated through Mercury IT Governance Center. Example: updating a Web page with the results of a test.
  - **Condition step.** Condition steps are logic steps used for complex workflow processing, such as allowing the workflow to proceed only when each of the workflow steps are completed.
  - **Subworkflows step.** A subworkflow step represents multiple workflows steps (the subworkflow) in a workflow. For example, a test workflow step in the main workflow represents a series of tests and approvals.
- **Transition.** The results of workflow step that must be communicated to another workflow step. For example, the result of a decision step is either Approved or Not Approved.

- **Workflow step security.** Workflow step security determines who has permission to execute or choose a result for a workflow step. For example, for an Approve Request decision step, only the IT project manager can approve or deny the request.
- **Notification.** Notifications are emails alerts sent out at specific workflow steps. For example, for an Approve Request decision step, an email alert is sent to the product manager.
- **Close step.** Close steps indicate the end of the workflow. The close step is an execution step that marks the request as completed.

*Figure 3-1* illustrates the basic workflow components in a workflow.

*Figure 3-1. Workflow components*

## Mapping Workflows

Mapping all of the individual workflow steps into a single workflow involves the following two stages:

**Stage 1.** Create a block diagram. Map each Workflow Step Worksheet as one block in the diagram. On the block diagram include transitions, workflow step security, and notifications (see *Figure 3-2*).

**Stage 2.** Map the block diagram to the workflow. Open the Workflow Workbench and start a new workflow. Map each component from the block diagram to the new workflow (see *Figure 3-3*).

Figure 3-2. Stage 1. Create a block diagram

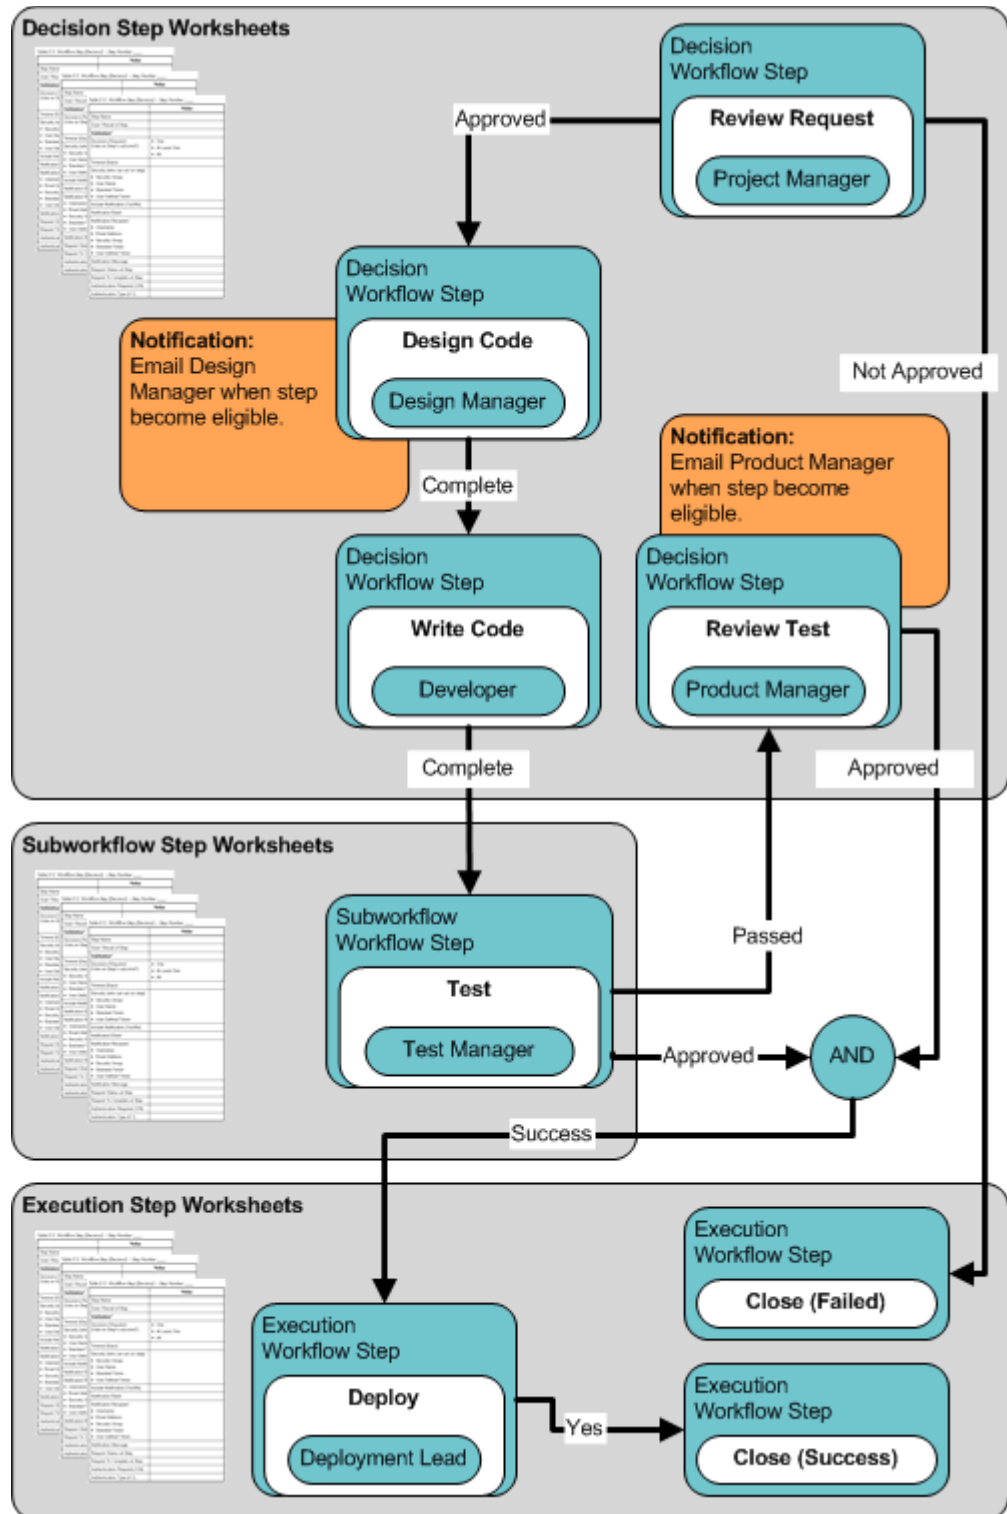

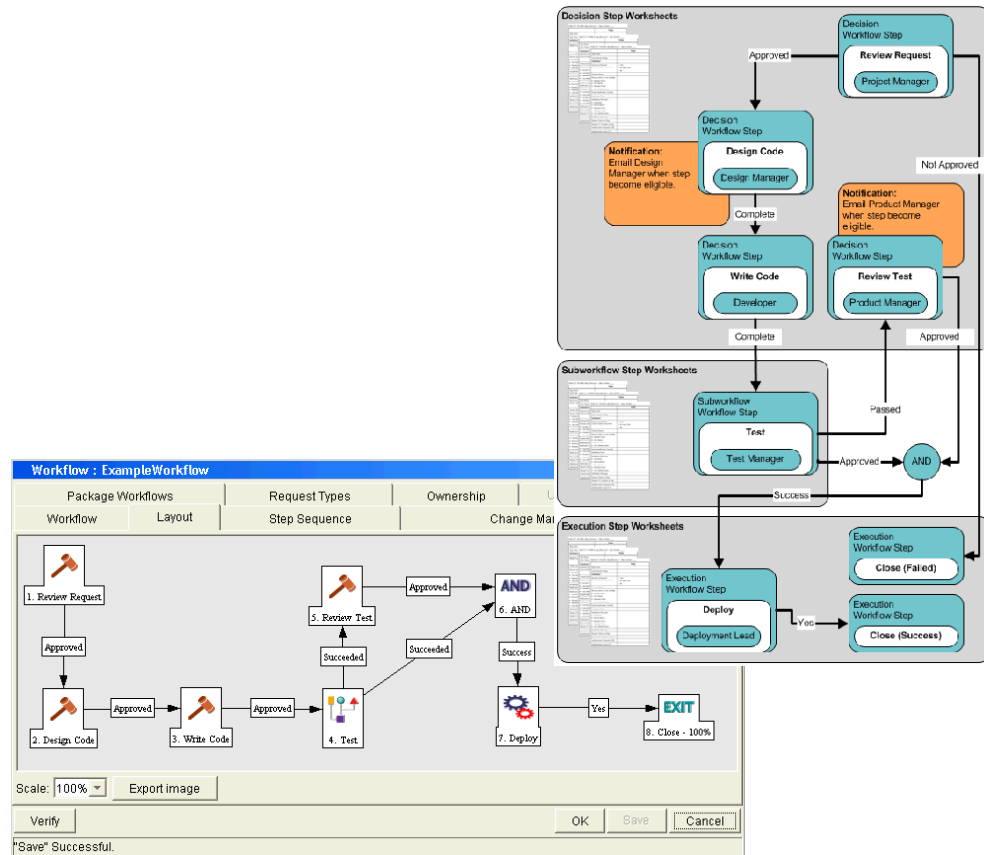

Figure 3-3. Stage 2. Create the workflow

## Opening the Workflow Workbench

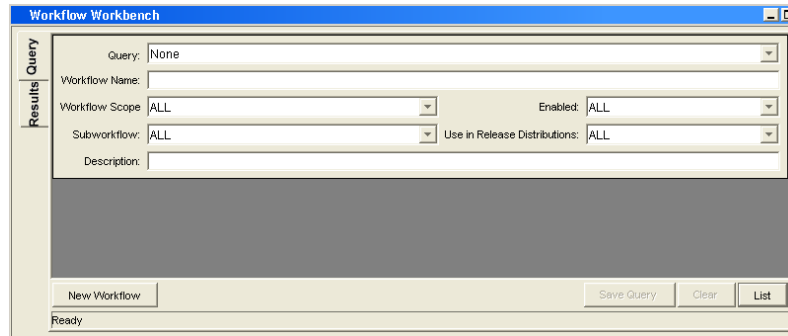

To open the Workflow Workbench:

1. Log on to Mercury IT Governance Center.
2. From the menu bar, select **Administration > Open Workbench**.

The Workbench opens.

3. From the shortcut bar, select **Configuration > Workflows**.

The Workflow Workbench opens.

## Creating Workflows

To start a new workflow, you must know how to use the Workflow Workbench. This section covers the basics on how to create a workflow.

### Configuring General Information for a Workflow

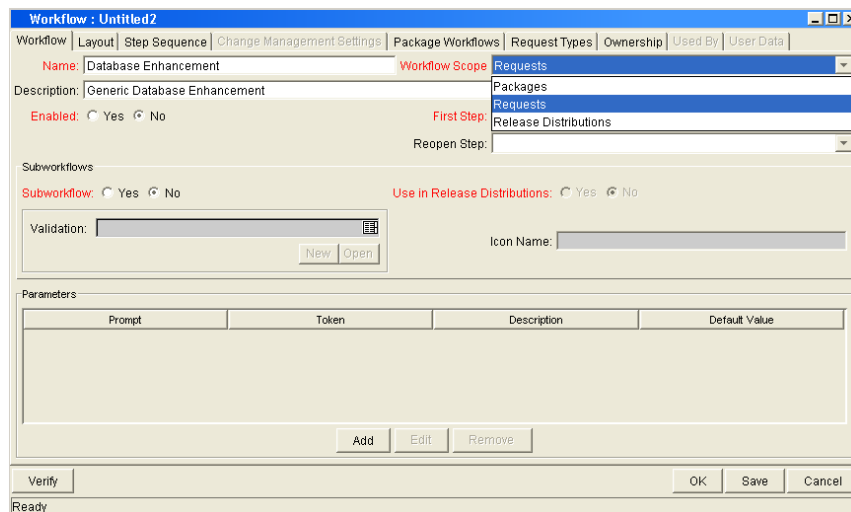

To enter basic workflow information:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.

The Workflow Workbench opens.

2. Click **New Workflow**.

The Workflow window opens.

3. In the **Name** field, type a name for the workflow.
4. In the **Workflow Scope** field, select:
  - For Mercury Deployment Management packages, select **Packages**.
  - For Mercury Deployment Management releases and distributions, select **Release Distributions**.
5. Click **Save**.
6. Click **OK**.

## Dragging and Dropping Workflow Steps

A library of existing workflow steps resides in the Workflow Step Source window. The Workflow Step Source window includes a **Filter by** field, lets you see only the workflow steps that you can use.

Workflow steps are assembled into workflows on the **Layout** tab of the Workflow window. Drag a workflow step from the Workflow Step Sources window and drop it onto the **Layout** tab.

The Workflow Step window opens.

Use the Workflow Step window to configure the following:

- General information about the workflow step
- Workflow step security
- Notifications for the workflow step
- Timeouts for the workflow step

## Choosing Workflow Steps

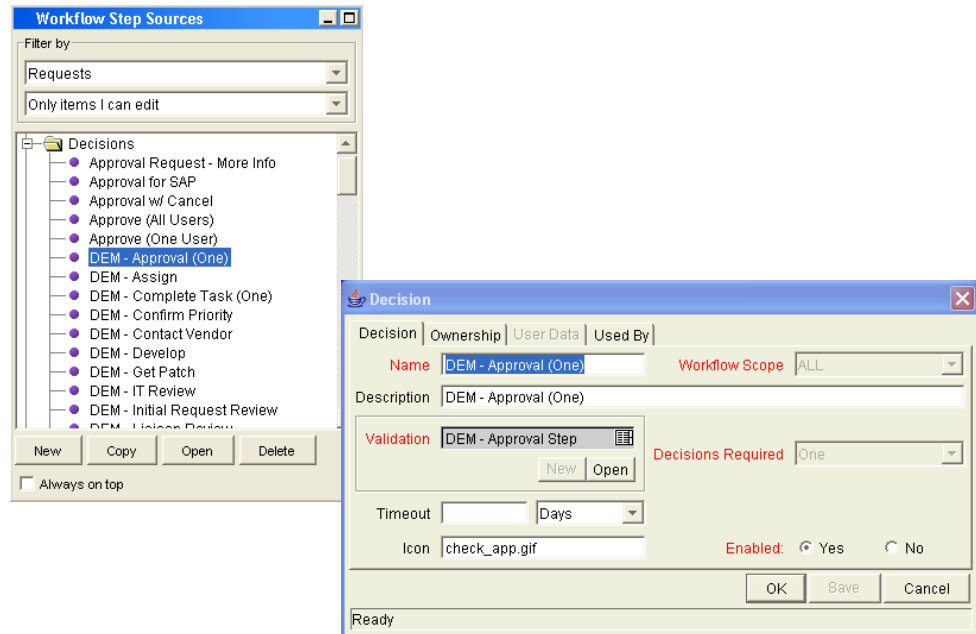

Mercury IT Governance Center comes with many predefined workflow steps. These workflow steps are located in the Workflow Step Source window. Workflow steps in the Workflow Step Source window are filtered using the **Filter by** field. The Workflow Step Source window contains the following folders:

- Decision
- Conditions

- Executions
- Subworkflows

To evaluate a workflow step, determine which of these workflow folders it corresponds to. Open the Workflow Step Source folder, and then open the workflow steps that most closely suit your needs (*Figure 3-4*).

Figure 3-4. Workflow step source

The validation values are the acceptable values a workflow step can have (see *Configuring Validations for Workflow Steps* on page 91). Check these to see if they meet your transition requirements.

Figure 3-5. Workflow step source validation

**Validation : DEM - Approval Step**

Name: DEM - Approval Step  
 Description: DEM - Approval Step  
 Enabled:  Use in Workflow?:   
 Component Type: Drop Down List  
 Validated By: List

Validation Values:

Seq	Code	Meaning	Description	Enabled	Default
1	APPROVED	Approved	Approved	Y	Y
2	NOT_APPROVED	Not Approved	Not Approved	Y	N

**Decision**

Decision | Ownership | User Data | Used By  
 Name: DEM - Approval (One) Workflow Scope: ALL  
 Description: DEM - Approval (One)  
 Validation: DEM - Approval Step  
 Decisions Required: One  
 Timeout: Days  
 Icon: check\_app.gif  
 Enabled:  Yes  No

### Overview of Decisions Workflow Steps

Decision workflow steps represent manual activities performed outside of Mercury IT Governance Center. Decision workflow steps include such activities as:

- Decisions made by committees
- Code designs and reviews

### Overview of Condition Workflow Steps

Condition workflow steps are logic steps used for complex workflow processing, such as allowing the workflow to proceed only after each workflow step is completed. The condition workflow steps are as follows:

- **AND.** This condition is met only after all workflow steps leading to it reach the specified required status. *Figure 3-6* illustrates an example of the AND condition workflow step.

Figure 3-6. AND example

- **OR.** This condition is met if at least one of the workflow steps leading to it reaches the required status specified for it *Figure 3-7* illustrates an example of the OR condition workflow step.

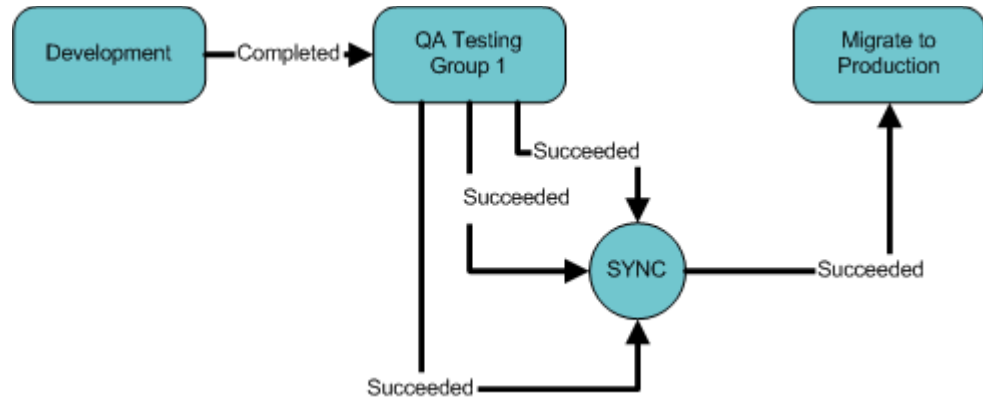

Figure 3-7. OR example

- **SYNC.** A SYNC workflow condition step is successful only if all the package lines of that package reach the status required for the workflow step immediately preceding that SYNC step.

Consider the business process illustrated in *Figure 3-8*. According to the flow chart, after QA Testing Group 1 succeeds for all package lines, SYNC succeeds, and then the next step, Migrate to Prod, becomes eligible.

Figure 3-8. SYNC example

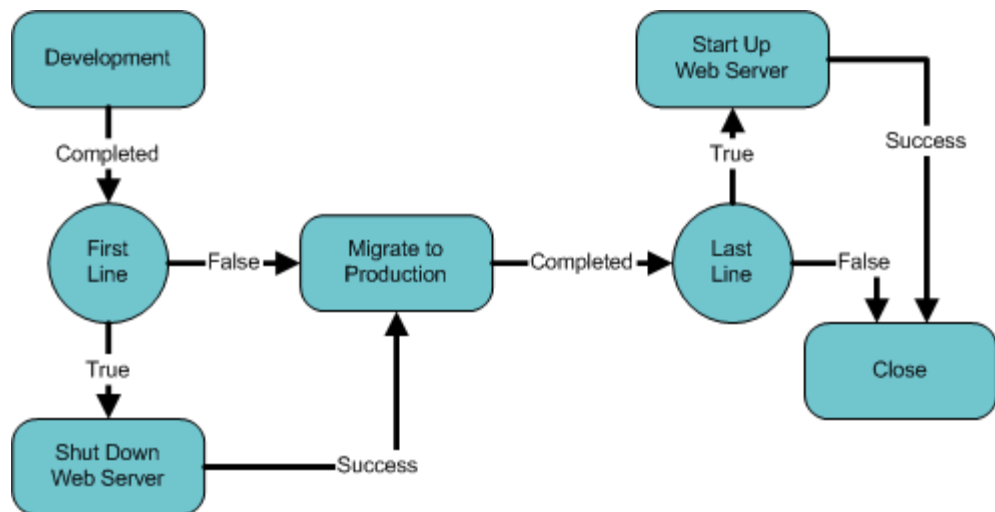

- FIRST LINE and LAST LINE.** For FIRST LINE, only the first line to reach the condition workflow step takes the True transition. All subsequent lines take the False transition.

For LAST LINE, only the last active line to reach the condition workflow step takes the True transition. All previous lines take the False transition.

The business process illustrated in *Figure 3-9* could be part of a Web site maintenance life cycle. As part of this life cycle, three HTML files are processed on three respective package lines in a single package. The Web site updates are large enough to warrant shutting down the Web server during change migration.

By including a FIRST LINE step, only the first line causes the server to shut down. The server remains down while the rest of the changes are migrated to production. By including a LAST LINE workflow step, the server remains down until the last active line reaches the condition step. The last active line takes the True transition, the Web server starts up, and the maintenance is complete.

Figure 3-9. FIRST LINE and LAST LINE example

### Overview of Execution Workflow Steps

Execution workflow steps represent actions that are automated through the Mercury IT Governance Center. Execution workflow steps include such activities as:

- Run object type commands
- Run workflow step commands
- Close the workflow (Close workflow step)

### Overview of Subworkflow Workflow Steps

A subworkflow step represents multiple workflow steps (the subworkflow) within a workflow. After the workflow process reaches the subworkflow step, it follows the path defined in that subworkflow. Subworkflows can either end the workflow or return to the parent workflow.

### Adding Close Workflow Steps

Regardless of how long or short it is, every workflow must include a close workflow step (see [Figure 3-10](#)). A close workflow step is a type of execution workflow step. You can find it in the Executions folder in the Workflow Step Sources window.

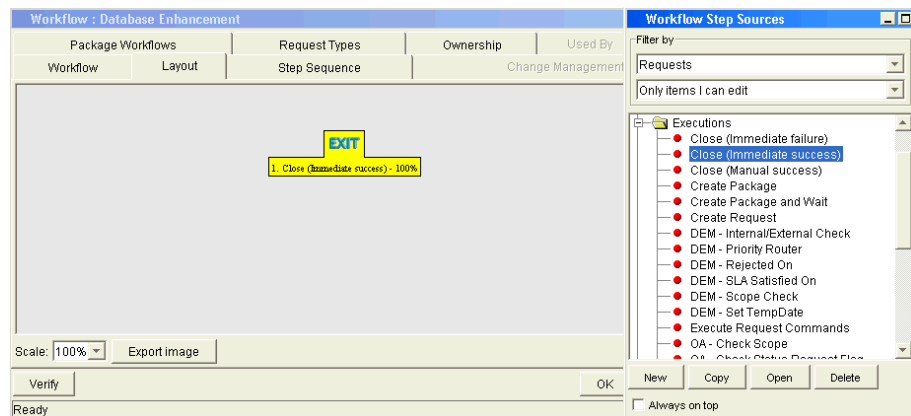

The three close workflow steps are as follows:

- **Close (Immediate Success).** This close workflow step immediately completes a request or package with a status of Success.
- **Close (Manual Success).** This close workflow step requires manual intervention to complete a request or package and set the request or package status to Success.
- **Close (Immediate Failure).** This close workflow step immediately completes a request or package with a status of Failure.

You add a close workflow step to a workflow as you would any other type of workflow step (*Figure 3-10*).

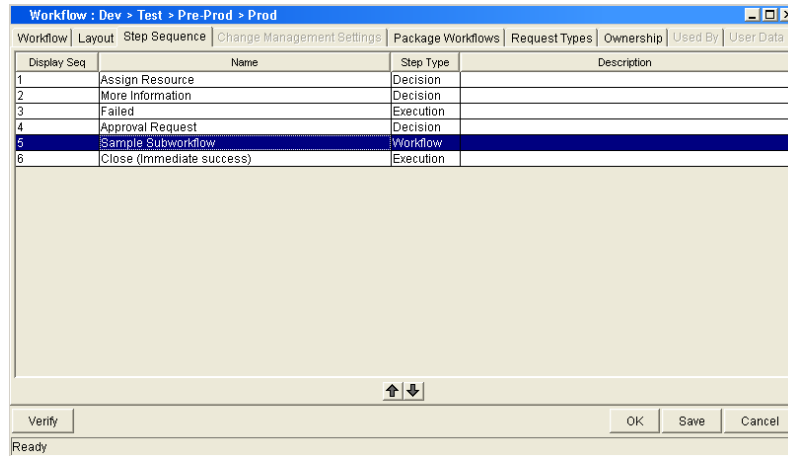

Figure 3-10. Close workflow step

## Adjusting Workflow Step Sequences

After you have assembled all of the workflow steps on **Layout** tab, you can adjust their sequence. In the Workflow window, click the **Step Sequence** tab. The **Step Sequence** tab lists all of the workflow steps. Select a workflow step, and click the arrow pointers at the bottom of the tab to move the selected workflow step up or down.

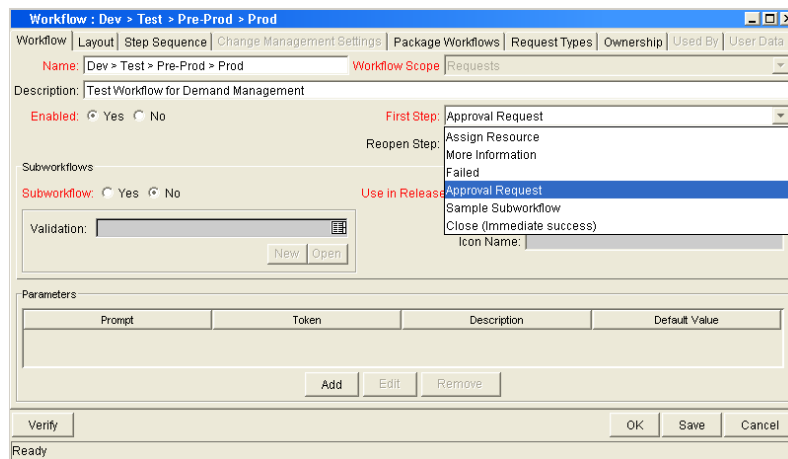

Figure 3-11. Step sequence tab

## Specifying the First Step

After you assemble all of the workflow steps in the correct sequence, specify the first step in the workflow process. To specify the first step, in the Workflow Workbench, click the **Workflow** tab (see [Figure 3-12](#)). In the **First Step** field, select the first step.

Figure 3-12. Workflow tab

## Verifying and Enabling Workflows

Verifying and enabling a workflow are the last steps required to make a workflow available. Verify a workflow checks to make sure the logic of the workflow is correct. Enabling a workflow makes the workflow available for use.

To verify a workflow:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.

The Workflow Workbench opens.

2. Open a workflow.

The Workflow window opens to the **Workflow** tab.

3. Click **Verify**.

The logic of the workflow is checked and a status window is returned.

To enable a workflow:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.

The Workflow Workbench opens.

2. Open a workflow.

The Workflow window opens to the **Workflow** tab.

3. For Enabled, click **Yes**.

The screenshot shows the 'Workflow : Untitled2' window with the following details:

- Name:** Database Enhancement
- Description:** Generic Database Enhancement
- Enabled:**  Yes  No
- Workflow Scope:** Requests (dropdown menu)
- First Step:** Release Distributions (dropdown menu)
- Reopen Step:** (dropdown menu)
- Subworkflows:**
  - Subworkflow:**  Yes  No
  - Use in Release Distributions:**  Yes  No
- Validation:** (text field with 'New' and 'Open' buttons)
- Icon Name:** (text field)
- Parameters:**

Prompt	Token	Description	Default Value

Buttons at the bottom include 'Verify', 'Add', 'Edit', 'Remove', 'OK', 'Save', and 'Cancel'. The status bar shows 'Ready'.

4. Click **Save**.

## Configuring Workflow Steps

Every time you drag a workflow step from the Workflow Step Source window to the **Layout** tab in the Workflow window, a Workflow Step window opens. You can enter none, some, or all of the known information at the initial window opening, or you can open the Workflow Step window later in the workflow design process.

Information that you enter in the Workflow Step window can be gathered from the corresponding Workflow Step Worksheets. The Workflow Step window contains the following tabs:

- **Properties.** This tab displays general information about the workflow step.
- **Security.** This tab displays permission settings for specific individuals or groups authorized to act on a workflow step.
- **Notifications.** Use this to define email notifications to send when a workflow step becomes eligible or after a workflow step is completed. Notifications can inform a user of a task (workflow step) to perform (such as review and approve a new request). Notifications can also inform a group of users of the results of a task.
- **Timeout.** Use this tab to specify how long a workflow step can remain inactive before an error is generated.
- **User Data.** Product entities such as packages, workflows, requests, and projects include a set of standard fields that provide information about those entities. While these fields are normally sufficient for day-to-day processing, user data fields provide the ability to capture additional information specific to each organization. User data is defined under the **User Data** tab. If there are no user data fields, the **User Data** tab is disabled.
- **Results.** This tab lists the validation included in each workflow step, the component type, and the results.
- **Segregation of Duties.** This tab configures workflow steps to take into account segregation of duties, excluding the participants for a workflow step from participating in a different workflow step.

## Configuring General Information for Workflow Steps

You can use the **Properties** tab in the Workflow Step window to enter general information about a workflow step.

To add general information to a workflow step:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.

The Workflow Workbench opens.

2. Open a workflow.

The Workflow window opens.

3. Click the **Layout** tab.

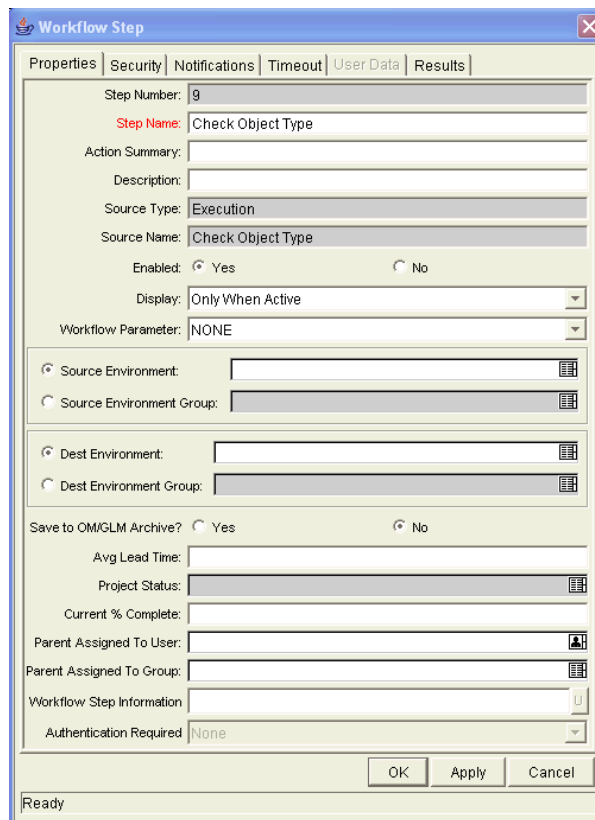

4. Right-click a workflow step.

A menu window opens.

5. Click **Edit**.

The Workflow Step window opens.

6. Complete the fields on the **Properties** tab.

7. Click **Save**.

## Configuring Security for Workflow Steps

To determine which users or groups are authorized to act on a workflow step, you must set the permissions for the step.

To add security to a workflow step:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.

The Workflow Workbench opens.

2. Open a workflow.

The Workflow window opens.

3. Click the **Layout** tab.

4. Right-click a workflow step.

A menu window opens.

5. Click **Edit**.

The Workflow Step window opens.

6. Click the **Security** tab.

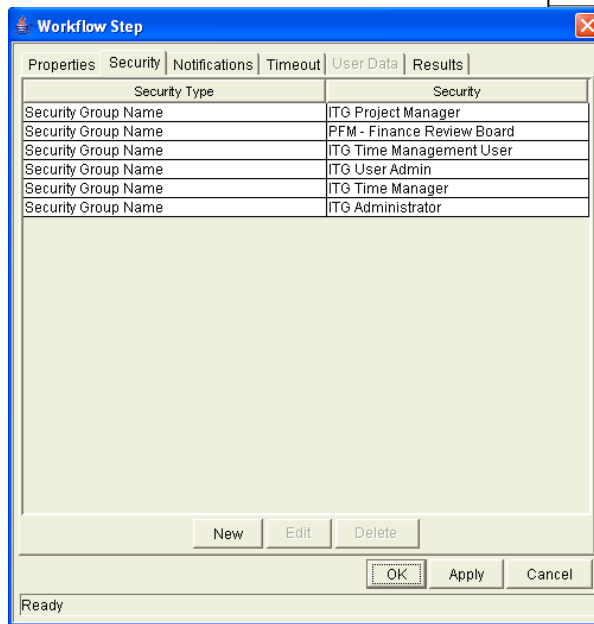

7. Click **New**.

The Workflow Step Security window opens.

**Decision Workflow Step Worksheets**

Table A-5. Workflow step [decision], step number \_\_\_\_:

	Value
Step Name	
Goal / Result of Step	
<b>Validation*</b>	
Decisions Required (Vote on Step's outcome?)	<input type="radio"/> One <input type="radio"/> At Least One <input type="radio"/> All
Timeout (Days)	
Security (who can act on step):	
<input type="checkbox"/> Security Group <input type="checkbox"/> User Name <input type="checkbox"/> Standard Token <input type="checkbox"/> User Defined Token	
Include Notification (Yes/No)	
<b>Event</b>	
Recipient:	
Address:	
Group:	
Standard Token:	
Defined Token:	
Message:	
Status at Step:	
Complete at Step:	
Notification Required (Y/N)	
Notification Type (if Y)	

8. Select one of the following security types:

- Enter a Security Group Name.** Select a security group to act on the workflow step. Selecting a security group changes the name of the auto-complete to Security Group. The security type changes to Security Group.

- **Enter a Username.** Select a user to act on the workflow step. The auto-complete name changes to Username. The security type changes to Username.
  - **Enter a Standard Token.** Select a standard token to act on the workflow step. The auto-complete name changes to Standard Token. The security type is left undefined. Select a standard token from the auto-complete. The **Security Type** field is defined based on the standard token chosen.
  - **Enter a User Defined Token.** Select a user-defined token to act on the workflow step. This changes the auto-complete name to **User Defined Token**. The security type changes to a list, and the **Tokens** button is enabled. To open the Token Builder window and select a token, click **Tokens**. In the list, select one of the following:
    - **Username.** The selected token resolves to a username.
    - **User ID.** The selected token resolves to a user ID.
    - **Security Group Name.** The selected token resolves to a security group.
    - **Security Group ID.** The selected token resolves to a security group ID.
9. Click **OK**.
10. In the Workflow Step window, click **OK**.
- The Workflow Step window closes.
11. From the **Security** tab, click **OK**.
- The changes are added to the workflow.

## ***Configuring Dynamic Security for Workflow Steps***

Workflow steps can also be configured so that its security is determined at runtime based on information entered in the request or package.

To configure a workflow step with dynamic security:

1. Open the Workflow Workbench.

The Workflow Workbench opens.

2. Open a workflow.

The Workflow window opens.

3. Click the **Layout** tab.

4. Right-click a workflow step.

A menu window opens.

5. Click **Edit**.

The Workflow Step window opens.

6. Click the **Security** tab.

7. Click **New**.

The Workflow Step Security window opens.

8. Select one of the following security types:

- **Enter a Security Group name.** Select a security group to act upon the workflow step. The auto-complete name changes to Security Group. The security type changes to Security Group.
- **Enter a Username.** Select a user to act upon the workflow step. The auto-complete name changes to Username. The security type changes to Username.
- **Enter a Standard Token.** Select a standard token to act upon the workflow step. The auto-complete name changes to Standard Token. The security type is left undefined. Select a standard token from the auto-complete. The **Security Type** field is defined based on the standard token chosen.

- **Enter a User Defined Token.** Select a user defined token to act upon the workflow step. Selecting a user defined token changes the name of the auto-complete to **User Defined Token**. The security type dynamically changes to a list. The **Tokens** button is enabled. Click **Tokens** to open the Token Builder window and select a token. Select one of the following from the drop-down list:
    - **Username.** The selected token resolves to a username.
    - **User ID.** The selected token resolves to a user ID.
    - **Security Group Name.** The selected token resolves to a security group.
    - **Security Group ID.** The selected token resolves to a security group ID.
9. In the Workflow Step Security window, click **OK**.
  10. In the Workflow Step window, click **OK**.
  11. From the **Security** tab of the Workflow Step window, click **OK**.

## Configuring Notifications for Workflow Steps

Notifications can be sent when a workflow step becomes eligible or after a workflow step is complete. Notifications can inform a user of a task (workflow step) to perform, such as review and approve a new request. Notifications can also inform a group of users of the results of a task (workflow step). Notifications are defined on the **Notifications** tab of the Workflow Step window.

Review the Workflow Step Worksheet for notification information.

To add a notification to a workflow step:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.
2. Open a workflow.

The Workflow window opens.
3. Click the **Layout** tab.
4. Right-click a workflow step.

The workflow step is highlighted. A menu window opens.
5. Click **Edit**.

The Workflow Step window opens.

6. Click the **Notifications** tab.
7. Click **New**.

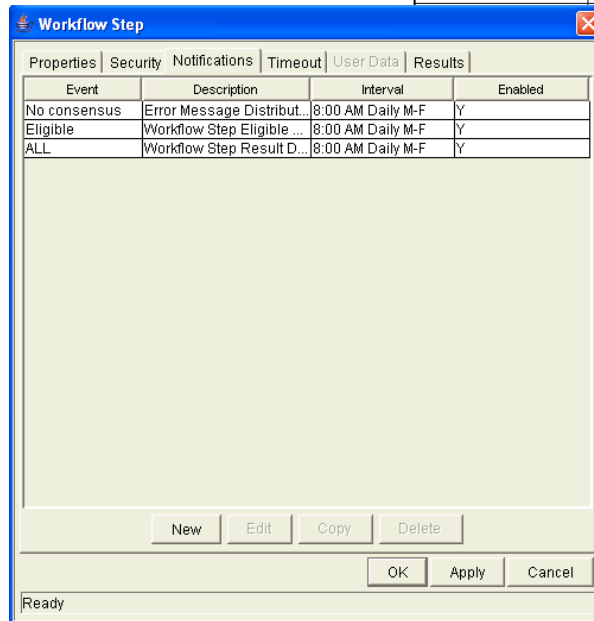

The Add Notification for Step window opens.

8. From the **Setup** tab, configure the following:
  - When to send the notification (Event and Interval).
  - Who receives the notification (Recipients)
9. Click the **Message** tab.
10. Configure the body of the notification.

**Decision Workflow Step Worksheets**

Table A-5. Workflow step [decision], step number \_\_\_\_.

	Value
Step Name	
Goal / Result of Step	
<b>Validation*</b>	
Decisions Required (Vote on Step's outcome?)	<input type="checkbox"/> One <input type="checkbox"/> At Least One <input type="checkbox"/> All

11. Click **OK**.

The **Notifications** tab lists the new notification. You can send different notifications to different recipients for different events by clicking **New** and repeating this process. The following lists some of the reasons you might want to send different notifications for a single workflow step:

- Send different notifications depending on the result of the step
- Send different notifications depending on the type error
- Send the notifications to a different set of users depending on the step's result or error
- Specifying different intervals or reminders based on the type of step error

12. Click **OK**.

The changes are added to the workflow.

### ***Configuring Setup Tabs***

You can configure a workflow step to send notifications at different times, different intervals, different events, and to different recipients.

#### ***Sending Notifications when Workflow Steps become Eligible***

To send a notification when a workflow step becomes eligible:

1. In the Workflow Step window, click the **Notifications** tab.

See *Configuring Notifications for Workflow Steps* on page 66.

2. Click **New**.

The Add Notification for Step window opens.

3. Click the **Setup** tab.
4. Configure the **Setup** tab as specified in the following table.

Field Name	Description	Notes
Event	Eligible	
Interval	Immediate	A notification can be sent at different intervals. For example, you might choose to send a notification of a final approval step at midnight so that it is ready for approval in the morning. Note also that multiple notifications to a single recipient can be brought together in a batch and sent together. Selecting an interval other than Immediate will allow this batching to occur.
Send Reminder	Yes/No	This field is optional. A reminder notification can be sent if the notification event is still true after a period of time. For example, a reminder can be sent if a step is still Eligible after a number of days. A reminder cannot be sent if the notification event is All.
Enabled	Yes	

5. Click **OK**.
6. In the Workflow Step window, click **OK**.

### *Sending Notifications when Workflow Steps have Specific Results*

You can configure a notification to send when a workflow step has a specific decision or execution result. The value for these results is determined by the workflow step source's validation.

To send notification when a workflow step has a specific result:

1. In the Workflow Step window, click the **Notifications** tab.  
See *Configuring Notifications for Workflow Steps* on page 66.
2. Click **New**.  
The Add Notification for Step window opens.
3. Click the **Setup** tab.

4. Configure the **Setup** tab as listed in the following table.

Field Name	Description	Notes
Event	Specific Result	
Value	Select the value to trigger the Notification.	The list of values is determined by the workflow step source's validation. Therefore, this selection will always be limited to the possible results of the step.
Interval	Immediate	A notification can be sent at different intervals. For example, you might choose to send a notification of a final approval step at midnight so that it's ready for approval in the morning. Note also that multiple notifications to a single recipient can be brought together in a batch and sent together. Selecting an interval other than Immediate will allow this batching to occur.
Send Reminder	Yes/No	This field is optional. A reminder notification can be sent if the notification event is still true after a period of time. For example, a reminder can be sent if a step is still eligible after a number of days. A reminder cannot be sent if the notification event is All.
Enabled	Yes	

5. Click **OK**.

6. In the Workflow Step window, click **OK**.

### *Sending Notifications When Workflow Steps Have Specific Errors*

You can configure the notification to be sent when a workflow step has a specific error. *Table 3-1* lists the workflow step errors.

*Table 3-1. Specific errors for workflow steps*

Specific Error	Meaning
No consensus	When all users of all security groups, or users linked to the workflow step need to vote, and there is no consensus.
No recipients	When none of the security groups linked to the workflow step has users linked to it, no user can act on the workflow step.
Timeout	When the workflow step times out. Used for executions and decisions.
Invalid token	Invalid token used in the execution.
ORACLE error	Failed PL/SQL execution.
NULL result	No result is returned from the execution.
Invalid integer	Validation includes an invalid value in the <b>Integer</b> field.
Invalid date	Validation includes an invalid value in the <b>Date</b> field.
Command execution error	Execution engine has failed or has a problem.
Invalid Result	Execution or subworkflow has returned a result not included in the validation.
Parent closed	For wf_receive or wf_jump steps, a request is expecting a message from a package line that is cancelled or closed.
Child closed	For wf_receive or wf_jump steps, a package line is expecting a message from a request that is cancelled or closed.
No parent	For wf_receive or wf_jump steps, a request is expecting a message from a package line that has been deleted.
No child	For wf_receive or wf_jump steps, a package line is expecting a message from a request that has been deleted.
Multiple jump results	For wf_jump steps in a package Line, different result values were used to transition to the step.
Multiple Return Results	When the package level subworkflow receives multiple results from package lines that traversed through it.

To send a notification when a workflow step has a specific error:

1. In the Workflow Step window, open the **Notifications** tab.

See *Configuring Notifications for Workflow Steps* on page 66.

2. Click **New**.

The Add Notification for Step window opens.

3. Click the **Setup** tab.

4. Configure the **Setup** tab as follows:

Field Name	Description	Notes
Event	Specific Error	
Error	Select the value to trigger the Notification.	This is a standard set of errors. See <i>Sending Notifications When Workflow Steps Have Specific Errors</i> on page 71.
Interval	Immediate	A notification can be sent at different intervals. For example, you might choose to send a notification of a final approval step at midnight so that it's ready for approval in the morning. Note also that multiple notifications to a single recipient can be brought together in a batch and sent together. Selecting an interval other than Immediate allows this batching to occur.
Send Reminder	Yes/No	This field is optional. A reminder notification can be sent if the notification event is still true after a period of time. For example, a reminder can be sent if a step is still eligible after a number of days. A reminder cannot be sent if the notification event is All.
Enabled	Yes	

5. Click **OK**.

6. In the Workflow Step window, click **OK**.

### *Specifying the Time Notifications are Sent*

Use the **Interval** field in the workflow step to specify when to send the notification. The interval determines how frequently the notification is sent.

To send the time notification are sent:

1. In the Workflow Step window, click the **Notifications** tab.

See *Configuring Notifications for Workflow Steps* on page 66.

2. Click **New**.

The Add Notification for Step window opens.

3. Click the **Setup** tab.

4. Configure the **Interval** field as follows:

- **8:00 AM Daily M-F.** This notification is sent every 8:00 a.m. on the next available work day after the notification event occurs.
- **Hourly M-F.** This notification is sent every hour, starting on the next available work day after the notification event occurs.
- **Immediate.** This notification is sent immediately.

5. Click **OK**.

6. In the Workflow Step window, click **OK**.

### *Sending Follow Up Notifications (Reminders)*

A reminder notification can be sent if the notification event is still true after a period of time. For example, a reminder can be sent if a step is still Eligible after a number of days. A reminder cannot be sent if the notification event is All.

To send follow-up notifications:

1. In the Workflow Step window, click the **Notifications** tab.

See *Configuring Notifications for Workflow Steps* on page 66. The **Notifications** tab opens.

2. Click **New**.

The Add Notification for Step window opens.

3. Click the **Setup** tab.

4. Configure the **Interval** field, as listed in the following table.

Field Name	Description	Notes
Event		Selects any value except for All.
Send Reminder	Yes	To enable the <b>Reminder Days</b> field, select <b>Yes</b> .
Reminder Days	Enter the number of days.	The number of days to wait before sending a reminder notification.

5. Click **OK**.

6. In the Workflow Step window, click **OK**.

### *Configuring Notification Recipients*

You must specify at least one recipient for a notification. The recipient can be a specific user, all members of a security group, or any email address.

To add a recipient to a notification:

1. In the Workflow Step window, click the **Notifications** tab.

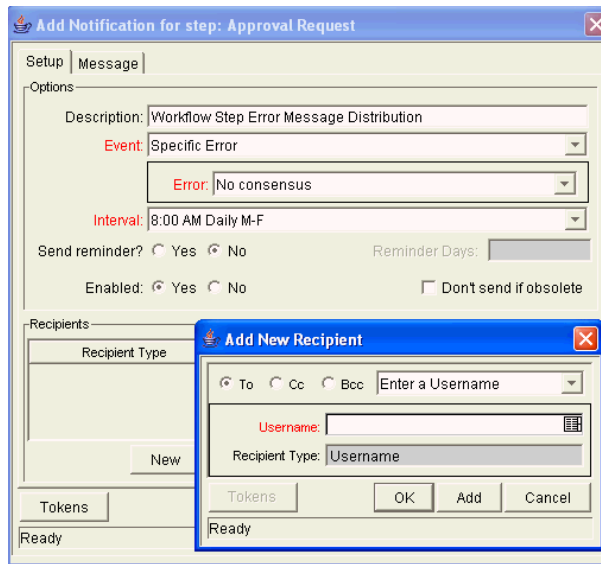

2. Click **New**.

The Add Notification for Step window opens.

3. Click the **Setup** tab.

4. Click **New**.

The Add New Recipient window opens.

5. In the list, select one of the following methods to use to specify the recipient(s):
  - **Enter a Security Group.** Select a specific security group, and all enabled users in the group with email addresses will receive the notification.
  - **Enter a Username.** Select a specific user to receive the notification. The user must have an email address.
  - **Enter an Email Address.** Enter any email address of the notification.
  - **Enter a Standard Token.** Select from a list of system tokens that corresponds to a user, security group, or email address.
  - **Enter a User Defined Token.** Enter any field token that corresponds to a user, security group, or email address.

Selecting a value updates the value displayed in the **Recipient Type** field. For example, selecting Enter a Security Group changes the value to Security Group.

6. Enter the specific value that corresponds to the recipient type selected above.

This can be a username, email address, security group, or a token.

Use security groups or dynamic access (distributions) to define the notification recipients whenever possible. Avoid specifying a list of users or an individual user's email address. If the list of users changes (due to a departmental or company reorganization), that list would have to be

updated manually. By using a security group instead of a list of users, the security group can be updated once, and the changes will be propagated throughout the workflow steps.

Use distributions when sending a notification to an undetermined party. For example, the notification can be configured to be sent to the Assigned to User by specifying [REQ.ASSIGNED\_TO\_USERID] in the Add New Recipient window.

7. Click **OK**.
8. From the **Setup** tab, click **OK**.

The Workflow Step window opens.

9. Click **OK**.

The changes are added to the workflow.

### ***Configuring Message Tabs***

It is possible to construct the notification's message to ensure that it contains the correct information or instructions for the recipient. For example, if a notification is sent to instruct you that a request requires your approval, the message should instruct you to log onto Mercury IT Governance Center and update the request's status. Additionally, the notification should include a link (URL) to the referenced request.

Notifications include the following features to make them easier to configure and use:

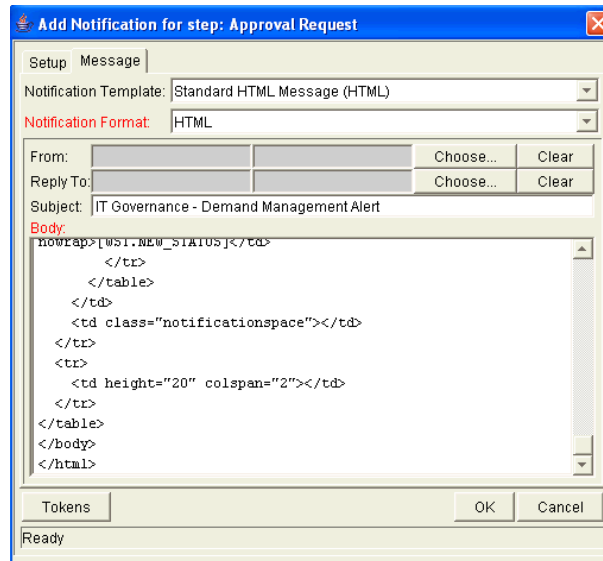

- Select from a number of pre-configured notification templates to more quickly construct the body of your message.
- The body of the notification can be plain text or HTML.
- Multiple tokens can be included in the notification. These tokens will resolve to information relevant to the recipient. For example, you can include tokens for the URL to the request approval page, information on request status and priority, and emergency contacts.

To configure the message in a notification:

1. In the Workflow Step window, click the **Notifications** tab.
2. Click **New**.

The Add Notification for Step window opens.

3. Click the **Message** tab.

4. In the **Notification Template** field, you can select a template to use for the notification.

The **Body** field content is updated based on the selected template.

5. In the **Notification Format** field, select **HTML** or **Plain Text**.

The HTML format allows more flexibility in the look and feel of the notification. You can use any HTML editor to write and test the HTML code, and then copy and paste this content to the **Body** field.

6. Select values for the **From** and **Reply to** fields.
7. Construct the body of the message.

When constructing the body, consider using the following:

- Token for the URL to the Request Detail page. See [Table 3-2 on page 79](#) for a list of these tokens.
- Token for the URL to the package (Workbench or standard interface). See [Table 3-2 on page 79](#) for a list of these distributions.

- Tokens in the body of the message. Click **Tokens** to access the Token Builder window where you can add tokens to the message body.
  - Tokens related to specific package lines or request detail fields. Add tokens that resolve information related to the individual package line or request detail field to the **Linked Token** field.
8. Click **OK**.
  9. From the **Notifications** tab, click **OK**.

### *Using Tokens in the Message Body*

It is possible to select any of the available tokens accessed through the Token Builder window to include in the body of your message. However, not all tokens will resolve in all situations. As a general rule, tokens associated with the request or workflow will resolve.

### *Including URLs (Smart URLs)*

When you receive a notification, it is often helpful to have a link to the item needing attention. Notifications can be configured in the body of a notification to include the Web address (URL) for the following entities:

- Packages
- Requests
- Request Types
- Projects
- Tasks
- Workflows
- Validations
- Object Types
- Environments

If you are viewing your email with a Web-based mail reader (such as Microsoft Outlook), you can click the URL in the notification and be taken directly to the referenced entity.

For workflows, request types, validations, object types and environments the notification can use the entity ID or the entity name as the parameter in the

URL. This will bring you to the correct window in the Workbench and open the detail window for the specified entity.

The most commonly used smart URL tokens for packages and requests are described in *Table 3-2*.

*Table 3-2. Smart URL tokens*

Smart URL Token	Description
PACKAGE_URL	Provides a URL that loads the package Details page in the standard interface.
WORKBENCH_PACKAGE_URL	Provides a URL that loads the package window in the Workbench.
REQUEST_URL	Provides a URL that loads the request Details page in the standard interface.

When using an HTML formatted message, an alternate token must be used to provide a link to requests. This token can also be used in plain-text formatted notifications. The smart URL token for requests is described in *Table 3-3*.

*Table 3-3. Smart URL tokens in HTML format*

Smart URL Token	Description
REQUEST_ID_LINK	Provides a link that loads the request detail page in the standard interface.

The token will resolve to the following format:

```
<a href="http://URL">Request Name</a>
```

In the notification, the link would appear as a linked entry.

## Configuring Timeouts for Workflow Steps

Timeouts determine how long a workflow step can remain eligible before generating an error. The **Timeout** tab in the Workflow Step window is used to set a timeout for the workflow step. See the **Timeout** field in the Workflow Step Worksheet for information on how to set the timeout.

To set timeouts for a workflow step:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.
2. Open a workflow.

The Workflow window opens.

3. Click the **Layout** tab.
4. Right-click a workflow step.

The workflow step is highlighted. A menu window opens.

5. Click **Edit**.

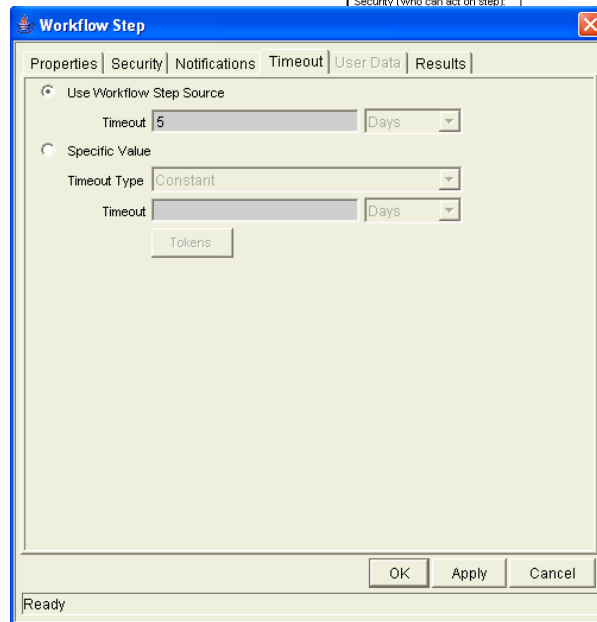

The Workflow Step window opens.

6. Click the **Timeout** tab.

### Decision Workflow Step Worksheets

Table A-5. Workflow step [decision], step number \_\_\_\_.

	Value
Step Name	
Goal / Result of Step	
<b>Validation*</b>	
Decisions Required (Vote on Step's outcome?)	<input type="radio"/> One <input type="radio"/> At Least One <input type="radio"/> All
Timeout (Days)	
Security (who can act on step)	

7. Configure the timeout as follows:

- **Use Workflow Step Source.** This setting determines the timeout for workflow step. The **Timeout** and **Interval** fields are disabled.
- **Specific Value.** You can enter a timeout value for the workflow step based on the Timeout Type value.

8. Click **Apply**.

## Configuring Transitions for Workflow Steps

Transitions are the rules that logically connect workflow steps. You add transitions to a workflow to establish the direction a process should take, based on the results of a workflow step. For example, a request is entered into a request resolution system. The first step in the workflow is Review Request. From this workflow step, the request might be Approved or Not Approved. Both Approved and Not Approved are transitions from the Review Request workflow step.

Transitions are added to a workflow after a workflow step had been dragged and dropped from the Workflow Step Source window to the **Layout** tab in the Workflow window. You can choose a transition between workflow steps based on the following workflow step results:

- **Specific result.** The specific result follows this transition. The specific results is the default workflow step results. Specific results are based on the workflow step's validation.
- **Other results.** All other results that do not have transitions set follow this transition.
- **All results.** All results follow this transition.
- **Specific Error.** The specific error follows this transition.
- **Other Errors.** All other errors that do not have transitions set follow this transition.
- **All Errors.** All errors follow this transition.

## ***Adding Transitions Based on Specific Results***

To add a Specific Result transition:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.

The Workflow Workbench opens.

2. Open a workflow.

The Workflow window opens.

3. Click the **Layout** tab.

4. Right-click a workflow step.

The workflow step is highlighted. A menu window opens.

5. Select **Add Transition**.

The menu window closes. The workflow step remains highlighted.

6. Select the destination workflow step for the transition.

A line with an arrowhead appears between the workflow steps. The Define Transition and Step Transitions windows opens. The Define Transition window is enabled and has many options on how to define the transition. The most common transition is Specific Results. For information on other transitions definitions, see [Adding Transitions not Based on Specific Results on page 83](#).

7. In the **Specific Results** field, select the transition.

8. Click **OK**.

9. In the Step Transitions window, click **Apply** or **OK**.

To add another validation to the transition, click **New**, and then add another transition value. Click **OK** to add the transition value and close the Step Transitions window. The defined transition name is added to the transition line.

10. Click **Save**.

### ***Adding Transitions not Based on Specific Results***

Transitions are added to a workflow after a workflow step had been dragged and dropped from the Workflow Step Source window to the **Layout** tab of the Workflow window. Specific results is the default transition value for the transition. The following lists other transition values:

- Other results
- All results
- Specific Events
- Specific Error
- Other Errors
- All Errors

### *Adding Transitions Based on Data in Tables*

You can transition based on information stored in a table. To transition using this method, use a workflow execution step with an execution type of SQL.

When transitioning from a properly configured execution step (Execution Type = SQL Statement), transition based on a specific result. The possible results are defined in the workflow step source's validation. The values in this field are determined by a SQL query of a database table.

As with any execution step, configure this transition as an immediate or a manual step.

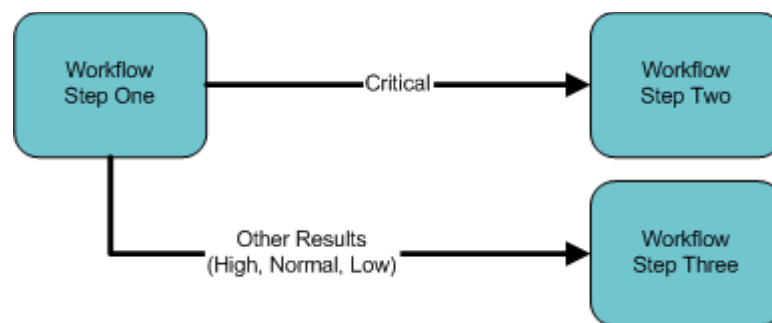

### *Adding Transitions Based on All But One Specific Value*

You can transition based on all but one specified value. You can use Other Results when multiple transitions exit a single step. Other Results acts as the transition if none of the other explicit transition conditions are satisfied.

For example, you might want to transition all Critical requests one way and all other results (High, Normal, Low) in a different way.

To add a transition based on all but one specific value, create a transition from a workflow step based on a value in Specific Results. Create a second transition from the same workflow step. For the second transition, specify Other Results in the Define Transition window.

*Figure 3-13. Transitions using other results*

### Adding Transitions Based on All Results

It is possible to define a request to transition regardless of the step's actual results. For example, you may want to run a subworkflow to perform server maintenance after the on-call server contact is identified. To do this, add a transition from the Specify Contact step to the subworkflow. Since the next step in the process does not depend on the result of the step, it is appropriate to use the All Results transition. To do this, define a transition from the step, and then select **All Results**.

Consider using an All Results transition to start a sub-process. Note that you can still define transitions based on Specific Results or errors when you select **All Results**. Later, you can use an AND condition workflow step to bring the process together.

### Adding Transitions Based on Errors

You can transition based on a specific error that occurs during an execution step. You can then branch the business process based on likely execution errors such as Timeout, Command Execution, or Invalid Token (see [Table 3-4](#)). As you add a transition, select Specific Error option in the Define Transition window, and then select the error.

Table 3-4. Workflow transition errors (page 1 of 2)

Transition Option	Meaning
Multiple Return Results	When the package level subworkflow receives multiple results from package lines that traversed through it.
No consensus	When all users of all security groups, or users linked to the workflow step need to vote, and there is no consensus.
No recipients	When none of the security groups linked to the workflow step has users linked to it, no user can act on the workflow step.
Timeout	When the workflow step times out. Used for executions and decisions.
Invalid token	Invalid token used in the execution.
ORACLE error	Failed PL/SQL execution.
NULL result	No result is returned from the execution.
Invalid integer	Validation includes an invalid value in the <b>Integer</b> field.
Invalid date	Validation includes an invalid value in the <b>Date</b> field.

Table 3-4. Workflow transition errors (page 2 of 2)

Transition Option	Meaning
Command execution error	Execution engine has failed or has a problem.
Invalid Result	Execution or subworkflow has returned a result not included in the validation.
Parent closed	For wf_receive or wf_jump steps, a package line is expecting a message from a request that is cancelled or closed.
Child closed	For wf_receive or wf_jump steps, a request is expecting a message from a package line that is cancelled or closed.
No parent	For wf_receive or wf_jump steps, a package line is expecting a message from a request that has been deleted.
No child	For wf_receive or wf_jump steps, a request is expecting a message from a package line that has been deleted.
Multiple jump results	For wf_jump steps in a package line, different result values were used to transition to the step.

### Adding Transitions Back to the Same Step

You can keep the option of resetting failed execution workflow steps, rather than immediately transition along a failed path. This is often helpful when troubleshooting the execution ([Figure 3-14](#)).

Figure 3-14. Transitioning back to the same step

When the commands execute successfully, they will follow the Success transition path. However, when the commands fail, they will not transition out of the step because no transition has been defined for the FAILED result. The user has to manually select the workflow step and select FAILED - RETRY. The execution is re-run.

Do not use an immediate execution workflow step when a FAILED result is feeding directly back into the execution workflow step. This would result in a continual execution-failure loop.

To transition a request or package line based on a value in a field, you must:

- Configure an execution workflow step
- Configure the transition for the execution workflow step

To transition back to the same execution step:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.

The Workflow Workbench opens.

2. Open a workflow.

The Workflow window opens.

3. Click the **Layout** tab.

4. Configure an immediate execution workflow step, as follows:

- a. From the Workflow Step Source window, copy an existing immediate execution workflow step.

The Execution window opens.

- b. Complete the fields as specified in the following table:

Field Name	Description
Workflow Scope	<b>Requests</b> for request tracking and resolution processes, <b>Packages</b> for deployment processes, or <b>Release Distributions</b> for release processes.
Execution Type	Token
Processing Type	Immediate
Validation	Create a validation with the following validation values. <ul style="list-style-type: none"> <li>● <b>Succeeded</b></li> <li>● <b>Failed</b></li> <li>● <b>Failed - Reset</b></li> <li>● <b>Failed - Rejected</b></li> </ul> For details on how to create a validation, see <i>Commands, Tokens, and Validations Guide and Reference</i> .
Enabled	Yes

- c. Click **OK**.

5. Add the new execution workflow step to the workflow.

6. Right-click the immediate execution workflow step.

The workflow step is highlighted. A menu window opens.

7. Add the transition, as follows:

a. Select **Add Transition**.

The menu window closes and the workflow step remains highlighted.

b. Select several points near the execution workflow step, and then select the source workflow step.

The Define Transition and Step Transitions windows opens. The Define Transition window is enabled and has many options on how to define the transition.

c. In the **Specific Results** field in the Define Transitions window, select the transition.

The validations in the **Specific Results** field are the validations created for the execution workflow step. For example, select **Failed - Reset**.

d. Click **OK**.

e. In the Step Transitions window, click **OK**.

The defined transition name is added to the transition line.

8. Click **Save**.

### ***Adding Transitions Based on Previous Workflow Step Results***

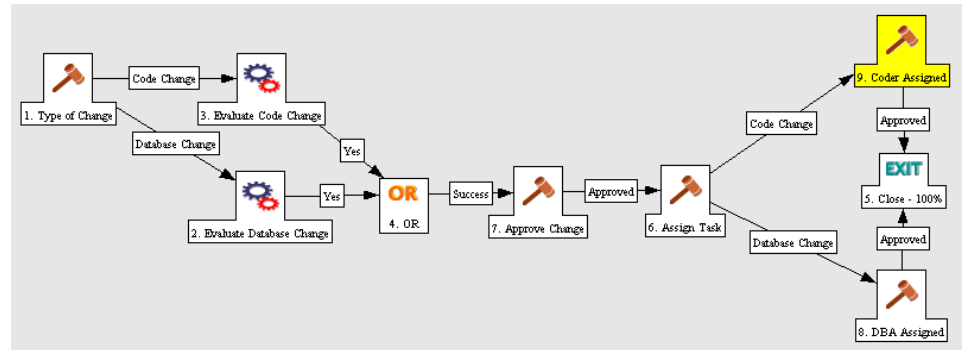

You can use workflow parameters to store the result of a workflow step. This value can then be used later to define a transition. The basic steps of adding a transition based on a previous workflow step result are:

1. In the Workflow window, on the **Workflow** tab, create a workflow parameter.
2. Create a token execution step to resolve the value in the workflow parameter.
3. For a workflow step, on the **Properties** tab of the Workflow Step window, in the **Workflow Parameter** field, enter the workflow parameter name.

*Figure 3-15* shows an example process. One step requires the user to route the request based on the type of change (code or database). The decision made at this step is considered later in the process to correctly route rework of the specific type.

Figure 3-15. Add a transition based on a previous workflow step

To add a transition based on a previous workflow step:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.  
The Workflow Workbench opens.
2. Open a workflow.  
The Workflow window opens to the **Workflow** tab.
3. Create a workflow parameter, as follows:
  - a. In the parameters section, click **Add**.  
The Workflow Parameters window opens.
  - b. Complete the fields.
  - c. Click **OK**.
4. Click the **Layout** tab.
5. Configure an execution workflow step with a token that resolves the value in the workflow parameter.

Note

The validation used in this step must contain the same values as the validation specified in the Type of Change decision step.

- a. From the Workflow Step Source window, copy an existing execution workflow step.  
The Execution window opens.
  - b. Configure the workflow step.
  - c. Click **OK**.
6. Add the new execution workflow step to the workflow, as follows:
- a. Add a workflow step to the workflow.  
The Workflow Step window opens.
  - b. In the Workflow Step window, on the **Properties** tab, select the workflow parameter from the **Workflow Parameter** field.
  - c. Click **OK**.
7. Add the steps and transitions as shown in *Figure 3-15* on page 89.
8. Click **OK**.

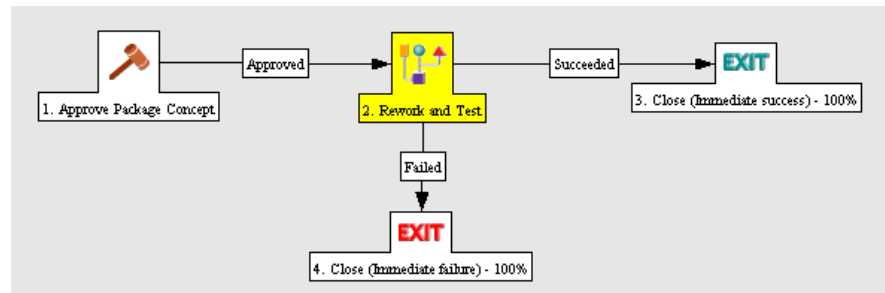

### ***Adding Transitions To and From Subworkflows***

A transition to a subworkflow step is made in the same way as a transition to any other workflow step (execution, decision, or condition). The transition is graphically represented by an arrow between the two steps. The package line or request proceeds to the first step designated in the subworkflow definition.

When the package or request reaches the subworkflow step, it follows the path defined in that subworkflow. It either closes within that workflow (at a Close step) or returns to the parent workflow.

For a package line or request to transition back to the parent workflow, the subworkflow must contain a return step. The transitions leading into the return step must match the validation established for the subworkflow step. In the following example, the transitions exiting the Rework and Test step (Successful Test and Failed Test) match the possible transitions entering the subworkflow's return step.

Figure 3-16. Transitioning to and from subworkflows

Users must verify that the validation defined for the subworkflow step is synchronized with the transitions entering the return step. The subworkflow validation is defined in the Workflow window.

Users typically define the possible transitions from the subworkflow step during the subworkflow definition.

The subworkflow step validation cannot be edited if the subworkflow is used in another workflow definition. You cannot edit the subworkflow field if the subworkflow is used in another workflow definition.

## Configuring Validations for Workflow Steps

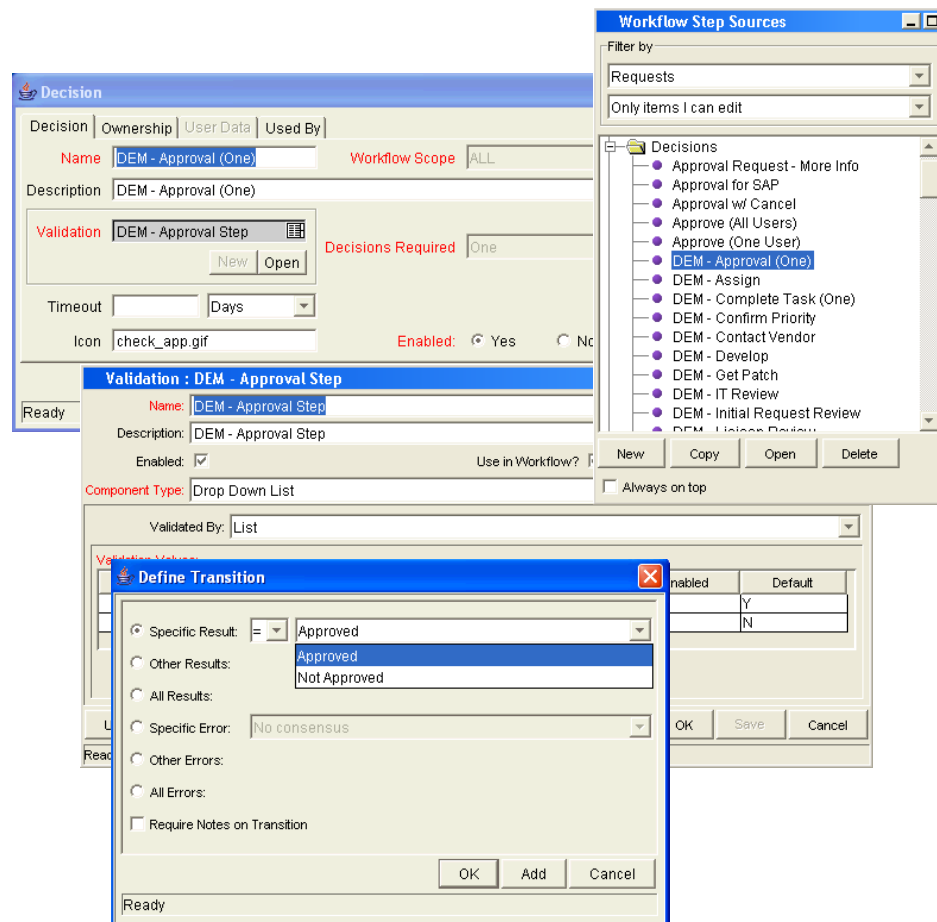

Validations determine the acceptable values for fields. Validations maintain data integrity by ensuring that the correct information is entered in a field before it is saved to the database. For workflow steps, validations ensure the correct transitions are associated with the correct workflow step.

Validations are defined for each workflow step found in the Workflow Step Source window. Opening a workflow step in the Workflow Step Source window opens the Decision window. The Decision window contains the workflow step's default information. One piece of the default information is the validation. *Figure 3-17* illustrates the Decisions window of the Approve (One User) decision workflow step and the validation listed in the Decision window. In this example, the validation is WF - Approval Step. By checking the validation, WF - Approval Step has two validation values:

- Approved
- Not Approved

Once a workflow step is added to a workflow, the transition can be added. Opening the Define Transition window for the workflow step, the validation values are displayed as the **Specific Results** field.

Figure 3-17. Workflow step sources and validations

## Validations and Execution Type Relationships

There is a correlation between the validation and the execution type. For data-dependent transitions (token, SQL, PL/SQL), the validation must contain all possible values of the query or token resolution. Otherwise, the execution step could result in a value that is not defined for the process, and the request or package line could become stuck in a workflow step.

For most built-in workflow events and executions that run commands, the validation often includes the standard workflow results (Success or Failure). If the commands or event execute without error, the result of Success is returned, otherwise, Failure is returned.

*Table 3-5* summarizes this relationship between validations and execution types.

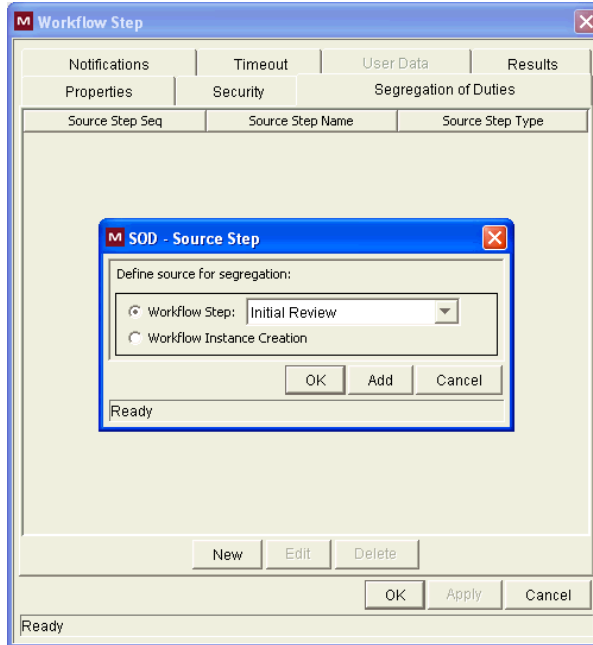

Table 3-5. Relationship between validation and execution types

Execution Types	Validation Notes
Built-in workflow event and workflow step commands	Typically use a variation of the WF - Standard Execution Results validation (Succeeded or Failed). A few of the workflow events have specific validation requirements: <ul style="list-style-type: none"> <li>• wf_return</li> <li>• wf_jump</li> <li>• wf_receive</li> </ul>
PL/SQL function	Validation must contain all possible values returned by the function.
Token	Validation must contain all possible values for the token.
SQL statement	Validation must contain all possible values for the SQL query. You can use the same SQL in the validation (drop-down or auto-complete) minus the WHERE clause.

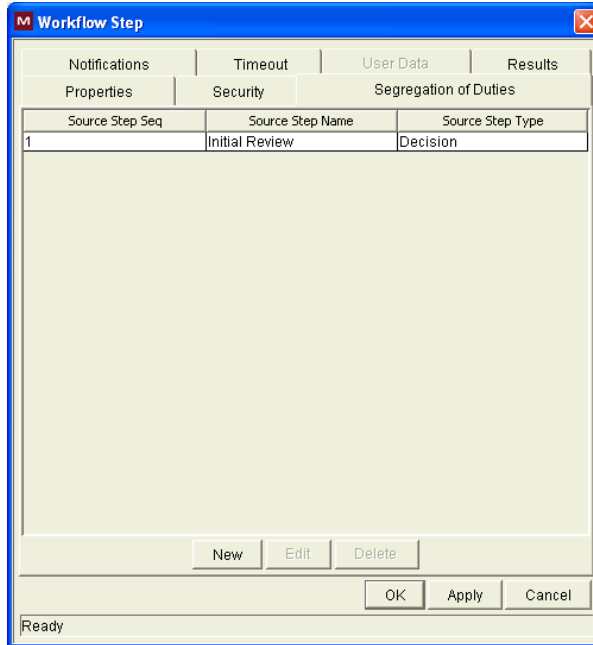

## Configuring Segregation of Duties for Workflow Steps

To set segregation of duties for a workflow step:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.
2. Open a workflow.  
The Workflow window opens.
3. Right-click a workflow step.  
The workflow step is highlighted. A menu window opens.
4. In the menu window, click **Edit**.  
The Workflow Step window opens.
5. In the Workflow Step window, select the **Segregation of Duties** tab.  
The **Segregation of Duties** tab opens.
6. Click **New**.  
The SOD - Source Step window opens.

7. Define a segregation source for the current workflow step.
  - To segregate the current step from another workflow step, select the Workflow Step option and choose that step from the drop-down list.
  - To segregate the current step from being acted on by the creator of the package, request, or release, select the Workflow Instance Creation option.
8. In the SOD - Source Step window, click **OK** to add the segregation source to the **Segregation of Duties** tab.

9. In the Workflow Step window, click **OK**.

The Workflow Step window closes.

10. In the Workflow window, click **Save**.

Changes are saved to the workflow.

■ ■ Note

All users who are able to act on a segregated step will be excluded from acting on the current workflow step.

## Integrating Object Types and Workflows

This section details the ways in which workflows and object types can integrate to work together.

### Integrating Object Type Commands and Workflows

Object type commands are tightly integrated with Mercury IT Governance workflow engine. The commands contained in an object type are executed at execution workflow steps.

It is important to note the following concepts regarding command and workflow interaction:

- To execute object type commands at a particular workflow step, the workflow step must be configured with the following parameters:
  - Workflow step must be an execution type step.
  - Workflow Scope = Packages
  - Execution Type = Built-in Workflow Event
  - Workflow Command = `execute_object_commands`
- When the object reaches the workflow step (with Workflow Command = `execute_object_commands`), all object type commands whose conditions are satisfied will be run in the order they are entered in the object type's command field (**Commands** tab).
- The object type can be configured to run only certain commands at a particular step.
- Each object type command can be configured so that only certain steps (within a command) are executed within a particular workflow step. This is set using conditional statements within the command.

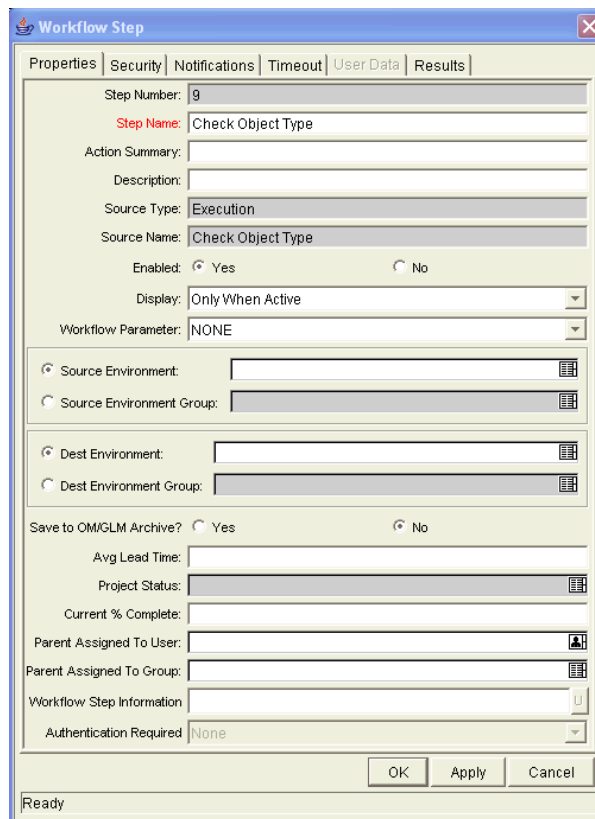

## Integrating Environments and Workflows

Environments must be linked to execution workflow steps that require connection, communication, or transfer between the clients, servers and databases used in the deployment system.

Environments are specified in the Workflow Step window, accessible from the **Layout** tab in the Workflow window. Select the source and destination environment or environment groups from the fields shown in *Figure 3-18*.

*Figure 3-18. Workflow step window for environments*

The screenshot shows the 'Workflow Step' dialog box with the following fields and options:

- Step Number: 9
- Step Name: Check Object Type
- Action Summary: (empty)
- Description: (empty)
- Source Type: Execution
- Source Name: Check Object Type
- Enabled:  Yes  No
- Display: Only When Active
- Workflow Parameter: NONE
- Source Environment: (empty)
- Source Environment Group: (empty)
- Dest Environment: (empty)
- Dest Environment Group: (empty)
- Save to OM/GLM Archive?  Yes  No
- Avg Lead Time: (empty)
- Project Status: (empty)
- Current % Complete: (empty)
- Parent Assigned To User: (empty)
- Parent Assigned To Group: (empty)
- Workflow Step Information: (empty)
- Authentication Required: None

Buttons: OK, Apply, Cancel

Status: Ready

## Choosing Source Environments Based on Application Code

Environment groups can be used to dynamically determine the source environment based on the application code for a package line. The application codes are selected based on the environments associated with the environment groups. All application codes associated with an environment are inherited by the environment group.

To enable the dynamic selection of a source environment:

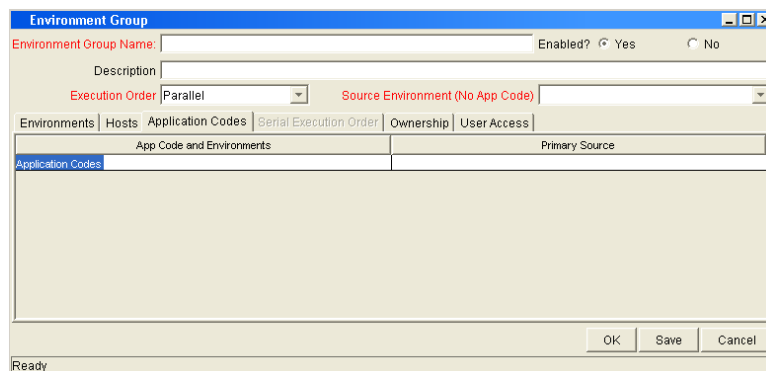

1. From the Workbench shortcut bar, select **Environments > Environment Groups**.

The Environments Workbench opens.

2. Select an environment group or create a new environment group.

The Environment Group window opens.

3. Click the **Application Codes** tab.

4. For each application code, select **Primary Source Environment**.

The primary source environment is selected automatically as the source environment in the workflow step when the associated application code is used in a specified package line.

5. Click **OK**.

## Integrating Request and Package Workflows

Request (Demand Management) and package workflows (Deployment Management) can be configured to work together, communicating at key points in the request and package processes. A request workflow step can actually jump to a preselected package workflow step. The package workflow step receives the request workflow step and acts on it to go to the next step in the process.

Packages and requests can also be integrated at a level that does not rely on the workflow configuration. Attach packages and requests to each entity as references. Dependencies can then be set on these reference to control the behavior of the request or package. For example, you can specify a request as a predecessor to the package. This means the package cannot continue until the request closes.

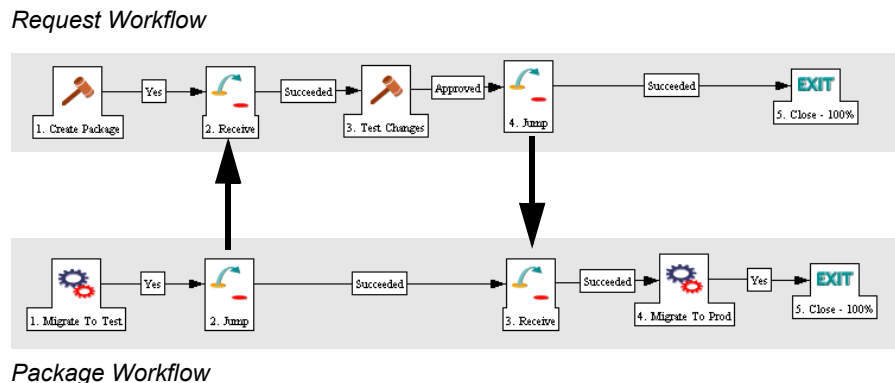

Two built-in workflow events facilitate this cross-product workflow integration. These workflow steps are **wf\_jump** and **wf\_receive**. Jump workflow step (**wf\_jump**) and receive workflow step (**wf\_receive**) are used at the points of interaction between workflows. Each jump workflow step must be coupled with a receive workflow step. Workflows can communicate through these jump and receive workflow step pairs.

As an example of when this kind of communication is useful:

1. A request spawns a package for migrating new code to the production environment.
2. The newly spawned package must go through an Approval step.
3. After the Approval step succeeds, the process jumps back to, and is received by, the request. The request then undergoes more testing and changes in the QA Environment.
4. After successfully completing the QA Test, the process jumps from the request and is received by the package.
5. Since the step has succeeded, the process can now migrate the code changes to the Production Environment.

This process is illustrated in *Figure 3-19*.

Figure 3-19. Jump/Receive workflow steps

The jump and receive workflow step pair must be carefully coordinated. Each jump workflow step must have an associated receive workflow step, linked together by a common jump and receive workflow step label defined in the Workflow Step window. The transition values for entering into and exiting the jump and receive workflow steps must also be coordinated.

To establish communication between request and package workflows:

1. Set up the **WF - Jump/Receive Step Labels** validation for use in the Workflow Step window.

This validation is used to group a jump and receive workflow step pair. The selected **WF - Jump/Receive Step Labels** must match in the paired jump and receive Workflow Step windows. See [Step 1. Setting Up WF - Jump/Receive Step Label Validations](#) on page 101.

2. Create a jump workflow step using the **wf\_jump Built-in Workflow Event**.

See [Step 2. Generating Jump Step Sources](#) on page 102.

3. Create a receive workflow step using the **wf\_receive Built in Workflow Event**.

See [Step 3. Generating Receive Step Sources](#) on page 103.

4. Verify that both the jump and receive workflow steps specify the same entry in the **WF - Jump/Receive Step Labels** field and that the entry matches the transition value between the two steps.

See [Step 4. Including Jump and Receive Workflow Steps in Workflows](#) on page 105.

## Step 1. Setting Up WF - Jump/Receive Step Label Validations

To set up the **WF - Jump/Receive Step Labels** validation:

1. From the Workbench shortcut bar, select **Configuration > Validations**.

The Validation Workbench opens.

2. In the Validation Workbench, open **WF - Jump/Receive Step Labels**.

The Validation window opens.

Seq	Code	Meaning	Description	Enabled	Default
1	QA_DEV	QA Fix in Development		Y	N
2	QA_PROD	QA Fix in Production		Y	N
3	DEV2QAENV	Migrate to QA		Y	N
4	DEV2TESTRET2REQ	Finish Migration to QA		Y	N
5	DEV2PROD	Migrate to Production		Y	N
6	DEV2PRODRET2R...	Finish Migration to production		Y	N

3. To define a new validation value to use to link two workflows, click **New**.

The Add Validation Value window opens.

4. Enter the code, meaning and a description.

5. Click **OK**.

The Validation window is enabled.

6. To select which ownership groups can edit this validation, click **Ownership**.

7. Click **OK**.

The new validation value is now included in the **Jump/Receive Step Label** field in the Workflow Step window.

### For More Information

For more information concerning configuring validations, see *Commands, Tokens, and Validations Guide and Reference*.

## Step 2. Generating Jump Step Sources

To create a jump step using the wf\_jump built-in workflow event:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.

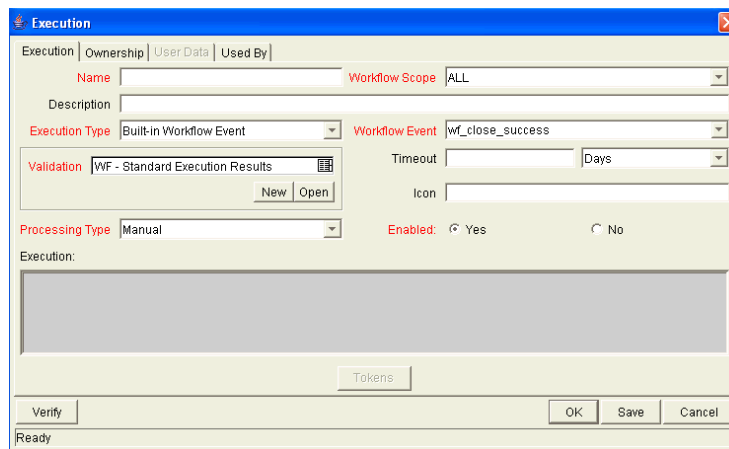

The Workflow Workbench opens.

2. Open a workflow.

The Workflow window opens.

3. In the Workflow Step Sources window, in the Executions folder, click **New**.

The Execution window opens.

4. Select either **Packages** or **Requests** from the **Workflow Scope** field, depending on the desired application of the workflow.

Package level subworkflows and Release Distribution workflows cannot include jump and receive steps.

5. In the **Execution Type** field, select **Built-in Workflow Event**.

6. In the **Workflow Event** field, select **wf\_jump**.
7. In the **Validation** field, select or create a validation to use to transition out of this workflow step.  
  
The validation values exiting the Jump workflow step must match the possible validation values entering the Jump workflow step.
8. Enter any other required or optional information, such as name, description, or processing type.
9. Click the **Ownership** tab.
10. Specify the Ownership Groups that can edit this execution workflow step.
11. Click **OK**.

The workflow step is added to the Workflow Step Sources window.

This workflow step can now be used in any new or existing workflow within the step's defined workflow scope. Remember that every jump step must have a paired receive step in another workflow.

### Step 3. Generating Receive Step Sources

To create a receive step using the wf\_receive built-in workflow event:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.

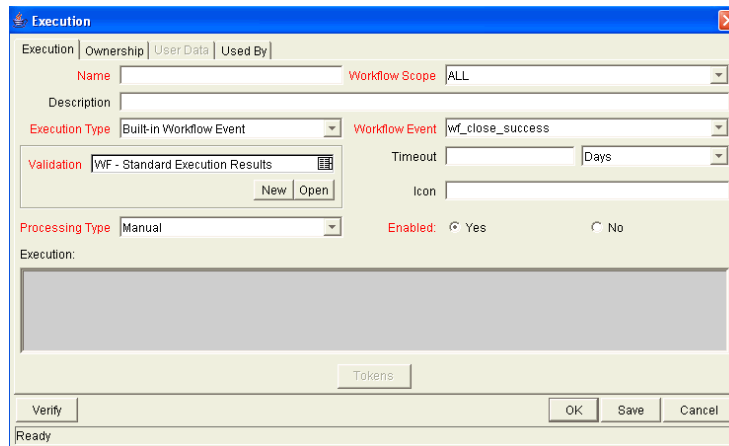

The Workflow Workbench opens.

2. Open a workflow.

The Workflow window opens.

3. In the Workflow Step Sources window, in the Executions folder, click **New**.

The Execution window opens.

4. In the **Workflow Scope** field, select either **Packages** or **Requests**, depending on the workflow application.
5. In the **Execution Type** field, select **Built-in Workflow Event**.
6. In the **Workflow Event** field, select **wf\_receive**.
7. Select or create a validation to use to transition out of this workflow step.  

The validation values exiting the Receive workflow step must match the possible validation values entering and exiting the Jump workflow step.
8. Enter any other required or optional information, such as name, description, or processing type.
9. Click the **Ownership** tab.
10. Select the Ownership Groups that are to be allowed to edit this execution workflow step.
11. Click **OK**.

The Workflow Step Sources window now lists the workflow step.

This workflow step can now be used in any new or existing workflow within the defined workflow scope. Keep in mind that every receive step must correspond to a jump step in another workflow.

## Step 4. Including Jump and Receive Workflow Steps in Workflows

With the jump workflow and receive workflow steps generated (see *Step 2. Generating Jump Step Sources* and *Step 3. Generating Receive Step Sources*), the two workflow steps must now be included in the workflow. The Jump/Receive Step Label field is the key communication link between separate workflows. The communicating jump and receive workflow steps must have a matching Jump/Receive Step Label field entry. The Jump/Receive Step Label field entry must be unique for any jump and receive pair.

To include a jump and a receive workflow step in a workflow:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.

The Workflow Workbench opens.

2. Open a workflow.

The Workflow window opens.

3. From the Executions folder, add the jump workflow step.

- a. Drag the jump workflow step from the Workflow Step Sources window to the **Layout** tab for the workflow.

The Workflow Step window opens.

- b. In the **Jump/Receive Step Label** field, select an item.

For example, **Migrate to Production**. This item must be the same for a paired jump and receive workflow step. The Jump/Receive Step Label field is the key communication link between separate workflows. The communicating jump and receive workflow steps must have a matching Jump/Receive Step Label field. The Jump/Receive Step Label field must be unique for any jump and receive pair.

- c. In the Workflow Step window, enter any additional workflow step information, and then click **OK**.

4. In the Executions folder, add the receive workflow step.

- a. Drag the **Receive** step from the Workflow Step Sources window to the **Layout** tab for the workflow.

The Workflow Step window opens.

- b. In the **Jump/Receive Step Label** field, select an item.

For example, **Migrate to Production**. This item must be the same for a paired jump and receive workflow step. The Jump/Receive Step Label field is the key communication link between separate workflows. The communicating jump and receive workflow steps must have a matching Jump/Receive Step Label field. The Jump/Receive Step Label field must be unique for any jump and receive pair.

- c. In the Workflow Step window, enter any additional workflow step information, and then click **OK**.
5. Add a transition between the jump workflow step and the receive workflow step. The transition must be set to the value selected in the **Jump/Receive Step Label** field, for example **Migrate to Production**.
6. Click **Save** to save and close the workflow.

## Chapter

## Configuring Workflow Components

---

### In This Chapter:

- *Overview of Workflow Step Sources*
    - *Configuring and Using Workflow Step Source Restrictions*
    - *Opening the Workflow Workbench*
  - *Overview of Creating Workflow Step Sources*
    - *Configuring Ownership of Workflow Step Sources*
  - *Creating Decision Workflow Step Sources*
  - *Creating Execution Workflow Step Sources*
    - *Setting Up Execution Steps*
    - *Defining Execution Types*
  - *Creating Subworkflow Workflow Step Sources*
    - *Subworkflows Returning to Deployment Management Workflows*
  - *Using Workflow Parameters*
    - *Creating Workflow Parameters*
  - *Modifying Workflows Already In Use*
    - *Performance Considerations*
    - *Copying and Testing Trial Versions of Workflows*
    - *Modifying Production Workflows*
-

## Overview of Workflow Step Sources

This chapter covers information about Deployment Management workflows.

Mercury IT Governance Center includes a number of standard workflow step sources that you can add to a workflow. These sources are pre-configured with standard validations (transition values), workflow events, and workflow scope. These available steps specify the following common attributes, which are expected to remain consistent across all workflows which use that step source:

- Validation associated with the step (and, thus, the list of valid transition values out of the step).
- Voting requirements of the step.
- Default timeout value for the step. (You can configure a unique timeout value for each step.)
- Icon used for the step within the graphical layout.

Browse through all of the workflow step sources using the Available Workflow Steps window in the Workflow Workbench. If a step source that meets the process requirements is not available, one needs to be created.

If Mercury IT Governance Center has a workflow step source that meets the process requirements, you can copy and rename it. This can save configuration effort and avoid user processing errors. For example, if you need a step to route a request based on whether it needs more analysis, you could copy and use the preconfigured Request Analysis workflow step source.

Copy the step source so that it can be used uniquely for the processes. This allows you to control who can edit the step source, ensuring that the process will not be inadvertently altered by another user.

Create a new step source when the step requires any of the following:

- A unique validation (transition values) leaving the step
- A unique execution in the step: PL/SQL function, token, SQL function, or workflow step commands
- A different processing type: immediate versus manual
- A specific workflow scope
- A unique combination of the above settings

## Configuring and Using Workflow Step Source Restrictions

The following restrictions apply to workflow step sources:

- You cannot delete a step source that is in use in a workflow.
- You cannot change a validation for a step source that is in use. If you must change the validation, copy the associated step source, and then configure a new validation.
- You must enable the workflow step source before you can add it to a workflow.
- Only add step sources to a workflow if the workflow has a matching workflow scope, or the step source scope is set to All.
- You cannot delete a workflow step in a workflow that has processed a request, package line, or release. Deleting the step would compromise data integrity. Instead, remove all transitions to and from the workflow step, and then disable the step.

## Opening the Workflow Workbench

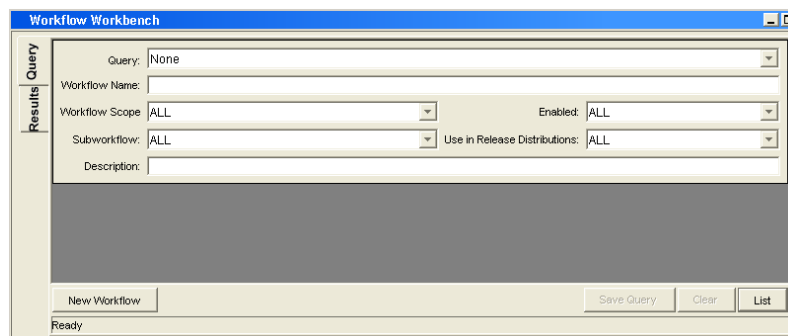

To open the Workflow Workbench:

1. Log on to Mercury IT Governance Center.
2. From the menu bar, select **Administration > Open Workbench**.

The Workbench opens.

3. From the shortcut bar, select **Configuration > Workflows**.

The Workflow Workbench opens.

## Overview of Creating Workflow Step Sources

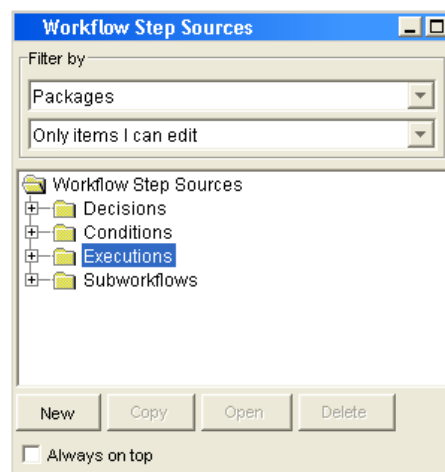

It is possible to create new decision and execution workflow step sources from the Workflow Step Sources window. Subworkflow workflow steps are created by configuring a standard workflow to be a subworkflow (see [Creating Subworkflow Workflow Step Sources on page 129](#)). Condition steps cannot be added to, deleted or modified.

To create a new workflow step source:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.
2. Open a workflow.

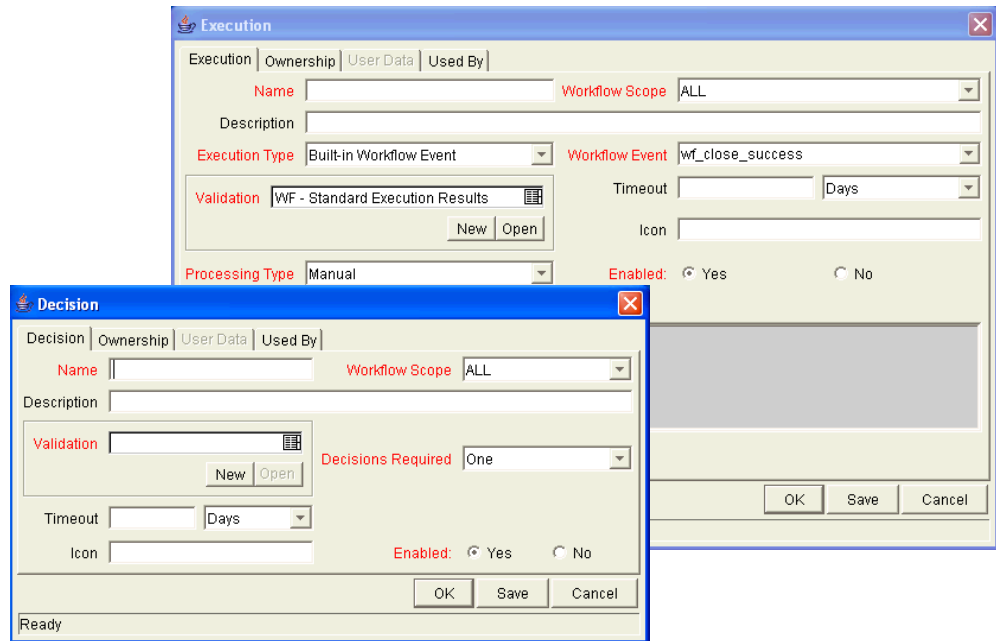

The Workflow window opens.

3. Select the Workflow Step Sources window.

4. In the first **Filter by** field, select **Requests, Packages, or Release Distributions**, depending on the type of workflow.
5. In the second **Filter by** field, select **Only items I can edit**.
6. Under Workflow Step Sources, select **Decisions** or **Executions**.
7. Click **New**.

A window that corresponds to the selected workflow step source type opens.

8. Enter the required information and any optional information to define the workflow step.

For information about how to configure a specific workflow step source, see [Creating Decision Workflow Step Sources](#) on page 113 or [Creating Execution Workflow Step Sources](#) on page 117.

9. Configure the ownership of the workflow step source.

For information on configuring the ownership of a workflow step source, see: [Configuring Ownership of Workflow Step Sources](#) on page 112.

10. For **Enabled**, click **Yes**.
11. Click **OK**.

The new workflow step source is now included in the Workflow Step Sources window. You can use it in any new or existing workflow with the corresponding workflow scope.

## Configuring Ownership of Workflow Step Sources

As you Configure a workflow step source, you can specify who can edit the workflow step source.

To configure ownership of a new workflow step source:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.
2. Open a workflow.

The Workflow window opens.

3. Open a decision or execution workflow step source window.

A window that corresponds to the selected workflow step source type opens.

4. Click the **Ownership** tab.

Note

You use the **Ownership** tab to select the security groups that can edit this workflow step. The default is to allow all security groups who can edit workflows to edit a workflow step source.

5. Select **Only groups listed below that have the Edit Workflows Access Grant**.
6. Click **Add**.

The Add Security Group window opens.

7. Select a security group.
8. Click **OK**.

Only users who belong to a listed security group that can edit workflows can now edit this workflow step source.

9. From the **Ownership** tab, click **OK**.

The new workflow step source is now listed in the Workflow Step Sources window. You can use it in any new or existing workflow with the corresponding workflow scope.

## Creating Decision Workflow Step Sources

Before creating a decision workflow step source, check the Decision Step Worksheet. The Decision Step Worksheet contains the information required to properly configure the workflow step source. *Figure 4-1* illustrates the Decision Step Worksheet.

*Figure 4-1. Information used to create the decision step source*

### Decision Workflow Step Worksheets

Table A-5. Workflow step [decision], step number \_\_\_\_.

	Value
Step Name	
Goal / Result of Step	
<b>Validation*</b>	
Decisions Required (Vote on Step's outcome?)	<input type="checkbox"/> One <input type="checkbox"/> At Least One <input type="checkbox"/> All
Timeout (Days)	
Security (who can act on step):	
<input type="checkbox"/> Security Group <input type="checkbox"/> User Name <input type="checkbox"/> Standard Token <input type="checkbox"/> User Defined Token	
Include Notification (Yes/No)	
Notification Event	
Notification Recipient:	
<input type="checkbox"/> Username <input type="checkbox"/> Email Address <input type="checkbox"/> Security Group <input type="checkbox"/> Standard Token <input type="checkbox"/> User Defined Token	
Notification Message	
Request Status at Step	
Request % Complete at Step	
Authentication Required (Y/N)	
Authentication Type (if Y)	

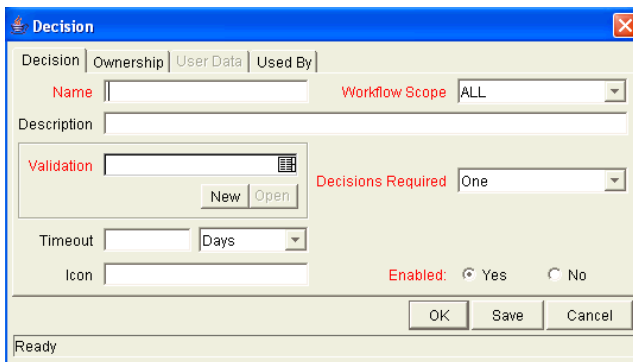

To create a new decision workflow step source:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.
2. Open a workflow.

The Workflow window opens.

3. In the first **Filter by** field, select **Requests, Packages, or Release Distributions**, depending on the type of workflow.
4. Select the **Workflow Step Sources**.
5. Under Workflow Step Sources, select **Decisions**.
6. Click **New**.

The Decision window opens.

7. From the **Decision** tab, enter the information as listed in the following table.

Field Name	Description
Name	The name that describes the workflow step source. The step can be renamed when added to the workflow.
Workflow Scope	Describes the type of workflow that will be using this step source. Use the list to select a workflow scope. The following lists the possible values: <ul style="list-style-type: none"> <li>• <b>ALL</b>. For all workflow types.</li> <li>• <b>Requests</b>. For Mercury Demand Management™ request workflows.</li> <li>• <b>Packages</b>. For Mercury Deployment Management package workflows.</li> <li>• <b>Release Distributions</b>. For Mercury Deployment Management release workflows.</li> </ul>
Description	Description of the workflow step source.
Validation	Validations determine the transition values for the workflow step. Use the list to select a validation.

Field Name	Description
Decisions Required	<p>Defines the number of decisions required for the workflow step. Use the list to select a value. The following lists the possible values:</p> <ul style="list-style-type: none"> <li>• <b>One.</b> If <b>One</b> is selected, the workflow step can progress if any one user who is eligible to act on this step makes a decision.</li> <li>• <b>At Least One.</b> If <b>At Least One</b> is selected, the workflow step waits for the voters to vote on this step for a predefined amount of time, designated as the timeout. If all voters mark their decisions before the timeout period, it takes the cumulative decision as the decision for the step and proceeds forward. If any of the voting results differ before the timeout period, the step will immediately result in a No consensus outcome. A timeout period must be defined to use this choice. You can define Specific Errors in workflow steps such as Timeout and No consensus as either Success or Failure in the Define Transition window. If all voters decide on Approve, the final decision is Approve. If all voters decide on Not Approved, the final decision is Not Approved. If some voters decide on Approved and one voter decides on Not Approved, the result is No consensus. If at the end of the timeout, only a few voters (or only one voter) have cast their vote, the cumulative decision of the voters that voted will be used. If at the end of the Timeout no one has voted, the step will result in a Timeout.</li> <li>• <b>All.</b> If <b>All</b> is selected, the workflow step waits for all of the voters to vote. This workflow step is used along with a specified timeout period. Selecting All makes it mandatory for all voters to vote on the workflow step. The workflow step waits until the timeout period for the voters to vote. If all voters vote, the cumulative decision is considered. If some or none of the voters voted, the step remains open or closes due to a timeout, depending on the configuration.</li> </ul> <p>When using All or At Least One, all users must unanimously approve or not approve one of the validation's selections. Otherwise, the result is No Consensus.</p>

Field Name	Description
Timeout	<p>A timeout specifies the amount of time that a step can stay eligible for completion before completing with an error (if <b>Decisions Required</b> is <b>All</b>, <b>One</b>, or <b>At Least One</b>). Timeouts can be by minute, hour, weekday or week. Timeout parameters for executions and decisions are a combination of a numerical timeout value and a timeout unit (such as weekdays).</p> <p>If this workflow step remains eligible for the value entered in the timeout value, the request, package, or release can be configured to send an appropriate notification. This field is often used in conjunction with the <b>At Least One</b> and <b>All</b> settings for <b>Decisions Required</b>.</p> <p>Timeouts can be uniquely configured for each workflow step in the <b>Layout</b> tab. The timeout value specified in the workflow step source acts as the default timeout value for the step. When adding a workflow step to the workflow using this workflow step source, you can specify a different timeout value for the workflow step.</p>
Icon	<p>A different graphic can be specified to represent steps of this source for use on the workflow <b>Layout</b> tab.</p> <p>The graphic needs to exist in the icons subdirectory. All icons are in .gif format.</p>
Enabled	<p>The workflow step source must be enabled in order to add the workflow step to the workflow layout.</p>

8. Click the **Ownership** tab.
9. From the **Ownership** tab, specify the security groups that can edit this workflow step.

For detailed information about how to configure the **Ownership** tab, see [Configuring Ownership of Workflow Step Sources on page 112](#).

10. Click the **User Data** tab.

Product entities such as packages, workflows, requests and projects include a set of standard fields that provide information about those entities. While these fields are normally sufficient for day to day processing, user data fields provide the ability to capture additional information specific to each organization. User data is defined under the **User Data** tab. If there are no user data fields, the **User Data** tab is disabled.

11. Click the **Used By** tab.

The **Used By** tab displays reference information concerning the workflow step.

12. Click **OK**.

The new workflow step source is now included in the Workflow Step Sources window. It can be used in any new or existing workflow with the corresponding workflow scope.

## Creating Execution Workflow Step Sources

Before creating an execution workflow step source, check the Execution Step Worksheet. The Execution Step Worksheet contains the information required to properly configure the workflow step source. *Figure 4-2* illustrates the Execution Step Worksheet.

Figure 4-2. Information used to create the execution step source

### Execution Workflow Step Worksheets

Table A-2. Workflow step [execution], step number \_\_\_\_.

	Value
Step Name	
Goal / Result of Step	
Validation*	
Execution Type**	
Processing Type	
Timeout (Days)	
Source Environment (Group)	
Dest Environment (Group)	
Security (who can act on step):	
# User Name	
# Standard Token	
# User Defined Token	
Include Notification (Yes/No)	
Notification Event	
Notification Recipient:	
# Username	
# Email Address	
# Security Group	
# Standard Token	
# User Defined Token	
Notification Message	
Request Status at Step	
Request % Complete at Step	
Authentication Required (Y/N)	
Authentication Type (if Y)	

Table A-3. Workflow step [execution], step number \_\_\_\_ validation.

Validation Information*	Value
Existing Validation?	
New Validation?	
Validation Type: (text field, autocomplete, dropdown list, etc.)	
Validation Definition (list of values or SQL)	

Table A-4. Workflow step [execution], step number \_\_\_\_ execution Type.

Execution Type**	Value
Built-in Workflow Event:	
# Execute Commands	
# Close	
# Jump / Receive	
# Ready for Release	
# Return from Subworkflow	
PL/SQL Function	
Token	
SQL Statement	
Workflow step commands	

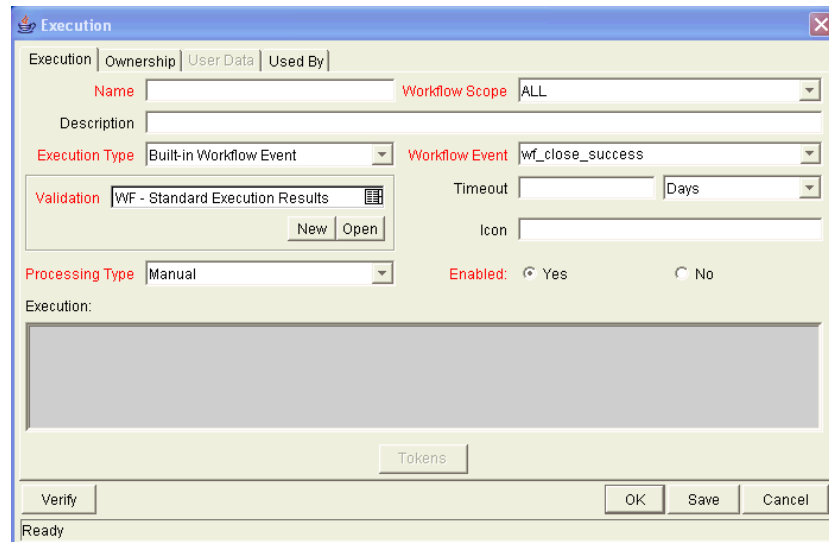

To create a new execution workflow step source:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.
2. Open a workflow.

The Workflow window opens.

3. Select the Workflow Step Sources window.
4. In **Filter by** field, select **Requests, Packages, or Release Distributions**, depending on the type of workflow.
5. Select the Executions folder.
6. Click **New**.

The Execution window opens.

The screenshot shows the 'Execution' dialog box with the following fields and options:

- Execution | Ownership | User Data | Used By
- Name: [Text Field]
- Workflow Scope: ALL
- Description: [Text Field]
- Execution Type: Built-in Workflow Event
- Workflow Event: wf\_close\_success
- Validation: WF - Standard Execution Results (with New and Open buttons)
- Timeout: [Text Field] Days
- Icon: [Text Field]
- Processing Type: Manual
- Enabled:  Yes  No
- Execution: [Large Empty Text Area]
- Tokens: [Button]
- Verify: [Button]
- OK Save Cancel
- Ready

7. Enter the information as listed in the following table.

Field Name	Description
Name	The name of the workflow step source. The step can be renamed when added to the workflow.
Workflow Scope	<p>Describes the type of workflow that will be using this step source. Use the list to select a workflow scope. The following lists the possible values:</p> <ul style="list-style-type: none"> <li>● <b>ALL.</b> For all workflow types.</li> <li>● <b>Requests.</b> For Mercury Demand Management request workflows.</li> <li>● <b>Packages.</b> For Mercury Deployment Management package workflows.</li> <li>● <b>Release Distributions.</b> For Mercury Deployment Management release workflows.</li> </ul>
Description	Description of the step source.
Execution Type	<p>Used to select the type of execution to be performed. Use the list to select an execution type. The following lists the possible values:</p> <ul style="list-style-type: none"> <li>● <b>Built-in Workflow Event.</b> Executes a predefined command and returns its result as the result of the step.</li> <li>● <b>SQL Statement.</b> Executes a SQL statement and returns its result as the result for the workflow step.</li> <li>● <b>PL/SQL Function.</b> Runs a PL/SQL function and returns its result as the result for the workflow step.</li> <li>● <b>Token.</b> Calculates the value of a token and returns its value as the result for the workflow step.</li> <li>● <b>Workflow Step Commands.</b> Executes a set of commands, independent of an object, at a workflow step.</li> </ul>

Field Name	Description
Workflow Event	<p>For Execution Type Built-in Workflow Event, the specific event to perform must be selected. The available choices in the list depend on the workflow scope selected. The choices include:</p> <ul style="list-style-type: none"> <li>• <b>execute_object_commands.</b> Executes the object type commands for a package line.</li> <li>• <b>execute_request_commands.</b> Executes the request type commands for a request.</li> <li>• <b>create_package.</b> Generates a Mercury Deployment Management package.</li> <li>• <b>rm_ready_for_release.</b> Generates a Mercury Demand Management request.</li> <li>• <b>create_package_and_wait.</b> Generates a Mercury Deployment Management package. The create workflow step that generates the package holds it until the package is closed.</li> <li>• <b>create_request.</b> Generates another request.</li> <li>• <b>wf_close_success.</b> Sets the request or package line as closed with an end status of Success.</li> <li>• <b>wf_close_failure.</b> Sets the request or package line as closed with an end status of Failed.</li> <li>• <b>wf_jump.</b> (Mercury Deployment Management and Mercury Demand Management) Instructs the workflow to proceed to a corresponding Receive Workflow Step in another workflow.</li> <li>• <b>wf_receive.</b> (Mercury Deployment Management and Mercury Demand Management) Instructs the workflow to receive a Jump Workflow Step and continue processing a request or package line initiated in another workflow.</li> <li>• <b>wf_return.</b> (Mercury Deployment Management and Mercury Demand Management) Used to route a subworkflow process back to its parent workflow.</li> </ul>
PL/SQL Function	<p>For Execution Type PL/SQL Function, the actual function to run. The results of the function will determine the outcome of the step.</p> <p>The results of the function must be a subset of the validation values for that workflow step.</p>
Token	<p>For Execution Type Token, the token that will be resolved. The results of the token resolution will determine the outcome of the workflow step.</p>
SQL Statement	<p>For Execution Type SQL Statement, the actual query to run. The results of the query will determine the outcome of the workflow step.</p> <p>The results of the query must be a subset of the validation values for that step.</p>
Workflow step commands	<p>For Execution Type Workflow Step Commands, the actual commands to run. The commands will result with a Succeeded or Failed value. Use a validation with those values to enable transitioning out of the step based on the execution results.</p>

Field Name	Description
Processing Type	<p>Defines when the execution is performed. Use the list to select a processing type. The following lists the possible values:</p> <ul style="list-style-type: none"> <li>• <b>Immediate.</b> Executes the workflow step when the workflow step becomes eligible.</li> <li>• <b>Manual.</b> Executes the workflow step manually by a user.</li> </ul>
Validation	<p>Validations determine the transition values for the workflow step. Use the list to select a validation.</p>
Timeout	<p>The amount of time that a step is eligible before completing with an error. Timeouts can be by minute, hour, weekday or week. Timeout parameters for executions are a combination of a numerical timeout value and a timeout unit, such as weekdays.</p> <p>If this workflow step remains eligible for the value entered in the timeout value, the request, package line, or release can be configured to send an appropriate notification.</p> <p>Timeouts can be uniquely configured for each workflow step in the <b>Layout</b> tab. The timeout value specified in the workflow step source acts as the default timeout value for the step. When adding a workflow step to the workflow using this workflow step source, you can specify a different timeout value for the workflow step.</p> <p>For executions, timeouts can also be uniquely configured for the amount of time that an execution is allowed to run before completing with an error. This applies to the workflow step commands and object type commands only. Command level timeouts are set in the Command window of an object type.</p>
Icon	<p>You can select a different graphic to represent this steps of this workflow step source.</p> <p>This graphic needs to exist in the icons subdirectory. All icons are in .gif format.</p>
Enabled	<p>The workflow step source must be enabled in order to add it to the workflow layout.</p>

8. Click the **Ownership** tab.

The **Ownership** tab configures which security groups will have the ability to edit this workflow step. The default is to allow all security groups who can edit workflows to edit a workflow step source. For complete instructions on how to configure the **Ownership** tab, see [Configuring Ownership of Workflow Step Sources on page 112](#).

9. Click the **User Data** tab.

Product entities such as packages, workflows, requests and projects include a set of standard fields that provide information about those entities. While these fields are normally sufficient for day to day processing, user data fields provide the ability to capture additional information specific to each organization. User data is defined under the **User Data** tab. If there are no user data fields, the **User Data** tab is disabled.

10. Click the **Used By** tab.

The **Used By** tab displays reference information concerning the workflow step.

11. Click **OK**.

The new workflow step source is now included in the Workflow Step Sources window. It can be used in any new or existing workflow with the corresponding workflow scope.

## Setting Up Execution Steps

When setting up execution workflow steps, be sure to include workflow events (transitions) for both Success and Failure. If a workflow step has failed and users cannot select Failure as one of the workflow events, the workflow will not be able to proceed.

## Defining Execution Types

Execution workflow steps are used to perform specific actions. Mercury Deployment Management provides a number of built in workflow events for processing common execution events, such as running request type commands, object type commands, and closing a request. You can also create custom executions based on SQL, PL/SQL, token resolution, and custom commands.

### *Executing Object Type Commands*

Different objects stored in the package line require unique processing at different points in a process. For example, the commands needed to migrate a file are different than the commands needed to migrate data. Therefore, it is possible to program the commands on an object type basis. The workflow can then be configured to execute the object type commands at a specific step in the process. Each package line will run its own commands, ensuring the correct execution for that object type.

Mercury Deployment Management includes the execution workflow step source *DLV Execution w/ Reset* that executes object type commands. Use this step source unless it does not meet the required specifications, such as validation or processing type.

To create this execution step source, make a copy of execution workflow step source DLV Execution w/ Reset and changes the field values as defined in [Table 4-1 on page 123](#).

*Table 4-1. Execution window values to execute object type commands*

Field Name	Description
Name	Enter a descriptive name for the step source.
Workflow Scope	Packages
Execution Type	Built-in Workflow Event
Workflow Event	execute_object_commands
Processing Type	Manual or Immediate
Validation	WF - Standard Execution Results (This is the default selection. You can select another existing or create a new validation.)
Enabled	Yes

### ***Closing Packages as Success***

It is possible to create an execution workflow step that close a package line and marks the package line as **Success**. When all package lines are closed, the package will close. Each package workflow should resolve with a closed package. Later, the packages that were closed successfully can be reported on.

This type of step is also required when integrating request and package workflows. If a package has been created using the request workflow step Create Package and Wait, the request workflow will not proceed until the package workflow has closed.

Mercury Deployment Management includes the execution workflow step sources Close (Immediate success) and Close (Manual success) that performs this task. Use one of these step sources unless they do not meet the required specifications, such as validation or processing type.

To create the execution step source, make a copy of execution workflow step source Close (Immediate success) or Close (Manual success) and changes the field values as defined in [Table 4-2 on page 124](#).

Table 4-2. Execution window values for closing packages as success

Field Name	Description
Name	Enter a descriptive name for the workflow step source.
Workflow Scope	Packages
Execution Type	Built-in Workflow Event
Workflow Event	wf_close_success
Processing Type	Manual or Immediate
Validation	WF - Standard Execution Results (This is the default selection. You can select another existing or create a new validation.)
Enabled	Yes

### *Closing Packages as Failed*

It is possible to create an execution step that closes a package and marks the package as **Failed**. Each package workflow should resolve with a closed package.

This type of step is also required when integrating request and package workflows. If a package has been created using the request workflow step Create Package and Wait, the request workflow will not proceed until the package workflow has closed.

Mercury Deployment Management includes the execution workflow step source Close (Immediate failure) that performs this task. Use this step source unless it does not meet the required specifications, such as validation or processing type.

To create the execution step source, make a copy of execution workflow step source Close (Immediate failure) and changes the field values as defined in [Table 4-3 on page 124](#).

Table 4-3. Execution window values for closing packages as failed  
(page 1 of 2)

Field Name	Description
Name	Enter a descriptive name for the workflow step source.
Workflow Scope	Packages
Execution Type	Built-in Workflow Event

*Table 4-3. Execution window values for closing packages as failed  
(page 2 of 2)*

Field Name	Description
Workflow Event	wf_close_failure
Processing Type	Manual or Immediate
Validation	WF - Standard Execution Results (This is the default selection. You can select another existing or create a new validation.)
Enabled	Yes

## ***Marking Packages Ready for Release***

You can configure an execution workflow step source to feed a package into Deployment Management.

Mercury Deployment Management includes the execution workflow step source Ready for Release that performs this task. Use this step source unless it does not meet the required specifications, such as validation or processing type.

To create the execution step source, make a copy of execution workflow step source Ready for Release and change the field values listed and described in [Table 4-4](#).

*Table 4-4. Execution window values for marking packages as Ready for Release*

Field Name	Description
Name	Enter a descriptive name for the workflow step source.
Workflow Scope	Packages
Execution Type	Built-in Workflow Event
Workflow Event	rm_ready_for_release
Processing Type	Manual or Immediate
Validation	RM - Ready for Release
Enabled	Yes

## ***Executing PL/SQL Functions and Creating Transitions Based on the Results***

PL/SQL function execution workflow steps are used when a workflow needs to be routed based on the results of the PL/SQL function. A PL/SQL function execution workflow step runs a PL/SQL function and returns its results as the result of that workflow step.

Create a new execution step source with the field values as defined in [Table 4-5](#).

*Table 4-5. Execution window values for executing PL/SQL functions*

Field Name	Description
Name	Enter a descriptive name for the workflow step source.
Workflow Scope	Packages
Execution Type	PL/SQL Function
Processing Type	Manual or Immediate
Validation	Selects or creates a validation that includes all of the possible values of the SQL query. You can create a validation validated by SQL. Use the same SQL from the execution minus the WHERE clause.
Execution	Enter the SQL query.
Enabled	Yes

## ***Executing SQL Statements and Creating Transitions Based on the Results***

SQL statement execution workflow steps are used when a workflow needs to be routed based on the result of a query. An SQL statement execution workflow step runs a SQL query and returns its results as the result of that workflow step.

When creating the SQL statement, you must obey the following rules:

- Use only SELECT statements
- Tokens can be used within the WHERE clause
- A query must return only one value

Create a new execution step source with the field values described in [Table 4-6](#).

*Table 4-6. Execution window values for executing SQL statements*

Field Name	Description
Name	Enter a descriptive name for the workflow step source.
Workflow Scope	Packages
Execution Type	SQL Statement
Processing Type	Manual or Immediate
Validation	Selects or creates a validation that includes all of the possible values of the SQL query. You can create a validation validated by SQL. Use the same SQL defined for the execution minus the WHERE clause.
Execution	Enter the SQL query.
Enabled	Yes

### ***Evaluating Tokens and Creating Transitions Based on the Results***

Mercury Demand Management includes workflow execution steps that may be used to set up data-dependent rules for the routing of workflow processes. Token execution workflow steps enable a workflow to be routed based on the value of any field within a particular entity. A token execution workflow step references the value of a given token and uses that value as the result of the workflow step. A transition can be made based on the value stored in the product by using tokens in the execution workflow step.

Create a new execution step source with the field values as defined in [Table 4-7](#).

*Table 4-7. Execution window values for evaluating tokens (page 1 of 2)*

Field Name	Description
Name	Enter a descriptive name for the workflow step source.
Workflow Scope	Packages
Execution Type	Token
Processing Type	Manual or Immediate

Table 4-7. Execution window values for evaluating tokens (page 2 of 2)

Field Name	Description
Validation	Selects or creates a validation that includes all of the possible values of the resolved token. For example, if the token is for the <b>Priority</b> field, use the validation for the <b>Priority</b> field here as well.
Execution	Enter the token for the value that the transition will be based on.
Enabled	Yes

For example, IT needs to deploy changes to different servers depending on the type of object being deployed.

Figure 4-3. Transitioning based on a token

IT decides to use an execution workflow step to automatically evaluate the object type and route the package line accordingly. To accomplish this, an execution workflow step source, Evaluate Object Type, is configured with the parameters listed in [Table 4-8](#).

Table 4-8. Example of execution window values for evaluating tokens

Field Name	Description
Name	Evaluate Object Type
Workflow Scope	Packages
Execution Type	Token
Processing Type	Immediate
Validation	DLV - Object Type - Enabled
Execution	[PKGL.OBJECT_TYPE]
Enabled	Yes

## ***Executing Multiple System Level Commands***

System level commands can be run for execution steps of the following execution type:

- Built-in Workflow Event (execute\_object\_commands)
- Workflow Step Commands

When either the workflow or the object type commands execute at this step, the commands either succeed or fail. It may be preferable to retain the option of resetting failed execution steps, rather than immediately transitioning along a failed path. This is often helpful when troubleshooting the execution.

## **Creating Subworkflow Workflow Step Sources**

A subworkflow is any workflow that is referenced from within another workflow. Use subworkflows to model complex business processes into logical, more manageable, and reusable subprocesses.

You can drag a subworkflow from the Workflow Step Sources window and drop it onto the **Layout** tab. When the package, request, or release reaches the subworkflow step, it follows the path defined in that subworkflow. The subworkflow either closes within that workflow or returns to the parent workflow.

Subworkflows are defined in the Workbench using the same process as when configuring a workflow. When creating a subworkflow, be sure to set the following:

- Set the **Sub-workflow** option to **Yes**.
- Make sure that the validation for the step leaving the subworkflow layout matches the subworkflow step in the parent workflow.

## Subworkflows Returning to Deployment Management Workflows

Execution workflow steps can be configured to automatically return from a subworkflow to its parent Deployment Management workflow.

For a request to transition back to the parent workflow, the subworkflow must contain a return step. The transitions leading into the return step must match the validation established for the subworkflow step. You must verify that the validation defined for the subworkflow step is synchronized with the transitions entering the return step.

Mercury Deployment Management includes the Return from Subworkflow execution workflow step source, which performs this task. Use this step source unless it does not meet the required specifications, such as validation or processing type.

To create the execution step source, make a copy of execution workflow step source Return from Subworkflow and changes the field values as defined in [Table 4-9](#).

*Table 4-9. Execution window values for returning from subworkflows*

Field Name	Description
Name	Enter a descriptive name for the work step source.
Workflow Scope	Packages
Execution Type	Built-in Workflow Event
Workflow Event	wf_return
Processing Type	Manual or Immediate
Validation	WF - Standard Execution Results (This is the default selection. You can select a different validation or create a new one.)
Enabled	Yes

## Using Workflow Parameters

Use workflow parameters to store the results of a workflow step. This value can then be used later to define a transition. The following lists the rules concerning workflow parameters:

- You can use the WFIP token prefix to reference workflow parameters.

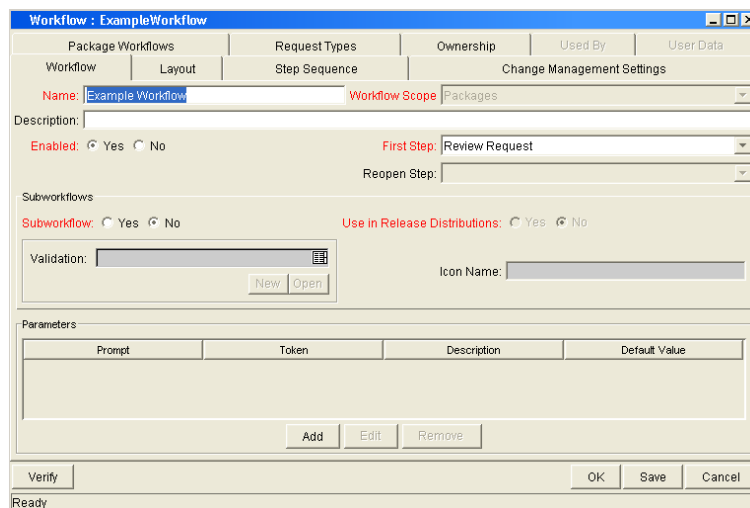

- You can use workflow parameters in PL/SQL and SQL workflow step executions.

## Creating Workflow Parameters

To create a workflow parameter:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.
2. Open a workflow.

The Workflow window opens.

3. From the **Workflow** tab, click **Add**.

The Workflow Parameter window opens.

4. Enter information in the Workflow Parameter window as specified in the following table:

Field Name	Description
Prompt	The name of the workflow parameter.
Token	The name of the token. For example, LOOP_COUNTER.
Description	A description of the workflow parameter.
Default Value	The initial value given to the workflow parameter.

5. In the **Parameters** section of the **Workflow** tab, click **Add**.
6. Click **OK**.
7. From the **Workflow** tab, click **OK**.

### ***Example: Building a Loop Counter Using Workflow Parameters***

A workflow parameter can be used to generate a counter for the number of times a workflow step enters a state.

To build a loop counter using workflow parameters:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.
2. Open a workflow.  
The Workflow window opens.
3. From the **Workflow** tab, click **Add**.

The Workflow Parameter window opens.

4. Enter the information as listed in the following table.

Field Name	Description
Prompt	Loop Counter
Token	LOOP_COUNTER
Description	Stores count.
Default Value	0

5. In the Parameters section of the **Workflow** tab, click **Add**.
6. Click **OK**.

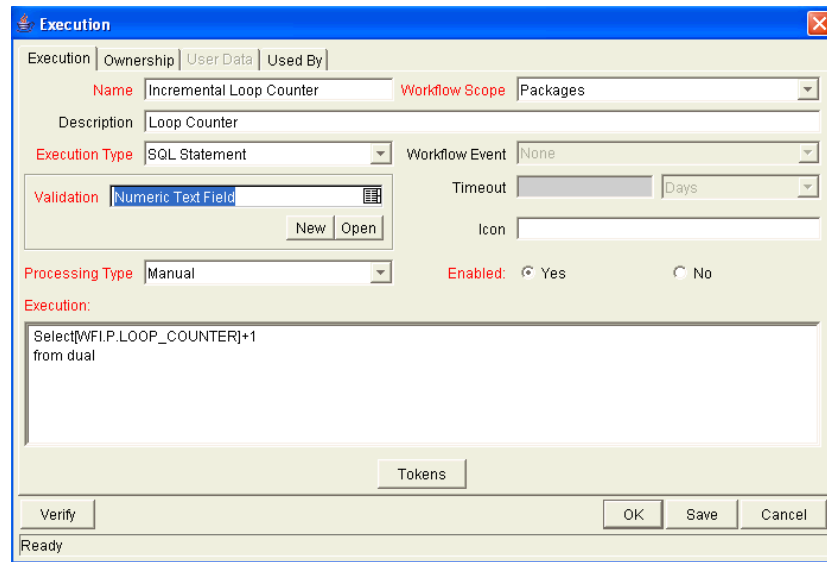

7. From the **Workflow** tab, click **OK**.
8. Create a new immediate SQL execution workflow step.

For details on how to create an SQL execution workflow step, see [Creating Execution Workflow Step Sources on page 117](#).

There are two key concepts to note about the new step definition.

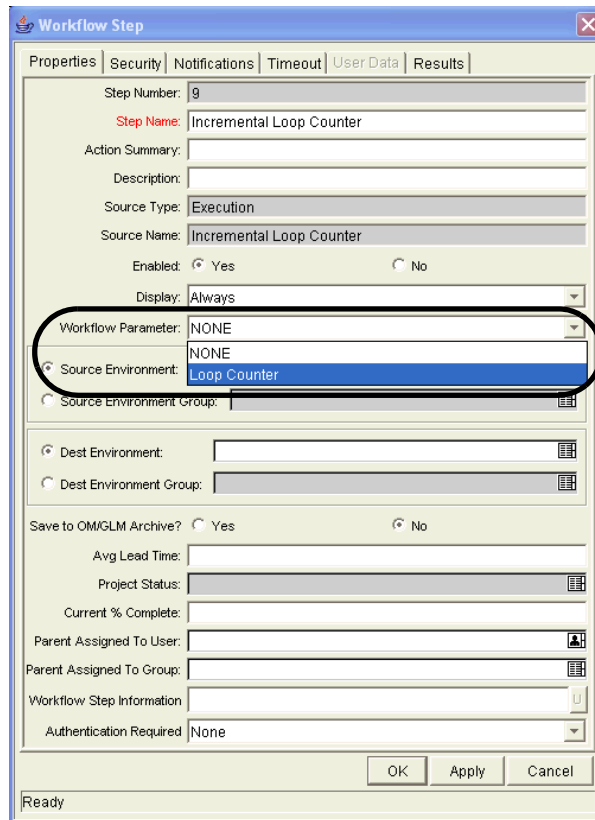

- The result of the SQL execution workflow step returns the result `LOOP_COUNTER + 1`. This return value is linked back into the parameter when the workflow step is generated on a workflow.
- A validation for a Numeric text field is used. This allows you to use `<=`, `<`, `>=`, and `>` comparisons in transitions off this step.

The following illustrates the Execution window for the SQL execution workflow step.

9. Add the workflow step to a workflow and choose the new workflow parameter Loop Counter.

By choosing Loop Count, the workflow engine is told to assign the result of “select loop counter val + 1” from dual back into the loop counter parameter.

You can now add transitions to and from the new loop counter step. For example, you add the loop counter each time an execution fails. If the execution fails three times, a notification is sent to the user. If the execution fails five times, management is notified.

## Modifying Workflows Already In Use

Workflows can be modified while they are going through their workflow steps after a package or request has been initiated. These modifications include adding new workflow steps, as well as changing the transitions, security assignments and notifications from within the workflow.

It is possible to make changes to workflows currently in use with the same procedures and windows that you used to define the workflows. All of these procedures are performed in the Workflow Workbench window.

When modifying workflows that are being used, rules exist for which entities can be added, changed, deleted or renamed. These rules are described in *Table 4-10*.

*Table 4-10. Rules for modifying production workflows*

Entity	Procedure
Transitions Security Notifications Workflow Steps Workflow Parameters	You can change any of these entities or add them to a workflow that is in use.
Transitions Security Notifications Workflow Parameters	You can delete any of these entities from a workflow in use.
Workflow Steps	You cannot delete this entity from a workflow in use, but you can rename it. You can delete transitions coming into or going out of a workflow step to effectively remove it from the workflow.

If a workflow that is in use is changed and saved, the changes take effect immediately. Any changes made to workflow steps are applied to all open package lines, requests, releases, and distributions.

Changes to a workflow can have undesirable effects on requests or packages currently in progress and are using that workflow.

When modifying a workflow that is in use, this can disrupt the normal flow in and out of the workflow and prevent it from reaching completion. For example, removing a transition from a workflow step may result in the requests or package lines being stuck in that workflow step.

## Performance Considerations

Updating an existing workflow step's security with a specific configuration can impact system performance. When adding dynamic security to a step, such as based on a standard or user defined token, in the Workflow Step window in the **Layout** tab, product database tables are updated to handle this new configuration. Due to the scope of these database changes, Database Statistics need to be re-run on your database.

For information about how to run database statistics on your database, see the document *System Administration Guide and Reference*. For help with this procedure, contact your application administrator.

This also applies when migrating a workflow with these types of changes into an instance of the Mercury IT Governance Center.

Migrating a workflow with these types of changes into an instance of the Mercury IT Governance Center can impact system performance. Product database tables must be updated to handle this new workflow. Due to the scope of these database changes, Database Statistics need to be re-run on your database.

For information about how to run database statistics on your database, see the document *System Administration Guide and Reference*. For help with this procedure, contact your application administrator.

## Copying and Testing Trial Versions of Workflows

Before modifying a workflow that is being used, do the following:

1. Make a copy of the original workflow.
2. Modify the copied version of the workflow with the changed workflow steps.
3. Test the modified version of the workflow to make sure it works correctly.
4. Determine if the workflow step is in use. To determine which steps are currently eligible, remove the incoming transition to the step that will be deleted and run the following reports. The reports will indicate if the step to be deleted is eligible for action by package lines or requests.
  - To determine when the requests have flowed out of a workflow step, run the Workflow Detail Report. This report indicates if the step to delete is eligible for user action or has been completed.

- To determine if any package lines are eligible for user action in a workflow, run the Packages Pending Report.

You are ready to make the same changes to the original workflow.

## Modifying Production Workflows

The final step in modifying workflows already in use is to modify the production workflow. The following sections offer guidance on how to modify the production workflow.

### *Disabling Workflow Steps*

As mentioned in *Table 4-10*, a step can not be deleted from a workflow when it is in use. It can only be disabled. However, you may want to change the process. Any changes to the process must be reflected in the workflow. This may require disabling existing steps and adding new steps.

To disable a and add a new step:

1. Remove transitions to the existing workflow step you no longer want to use.
2. Add a new workflow step to the workflow.
3. Redirect the transitions to the new workflow step.

### *Redirecting Workflows*

When disabling a workflow step that is currently **Eligible** for user action, the requests or package lines in that step will become stuck. Since the step is now disabled, the user cannot take action on it and will not be able to progress any further through the workflow.

The outgoing transition to be deleted is still intact, so the eligible package lines and requests will eventually be acted upon and flow out of the workflow step.

Add a new workflow step to the workflow and redirect the transitions to that new workflow step so that the movement of package lines and requests avoids the disabled step and is not interrupted.

For example, consider a workflow where you wanted to disable workflow step B in the sequence shown in *Figure 4-4*.

Figure 4-4. Redirecting the workflow, step 1

After removing the incoming and outgoing transitions to B, add a new workflow step D which would connect steps A and C and let the workflow continue to process requests or package lines (see [Figure 4-5](#)).

Figure 4-5. Redirecting the workflow, step 2

Run the appropriate report(s) again to be sure there are no entities Eligible for action by the user in the step that was disabled.

### ***Moving Requests or Packages Out of Steps***

If the requests or packages are stuck in a step after a transition has been removed from a workflow in use, add the deleted transition back to the workflow. After the requests or packages have flowed out of the step, delete the transition again.

Chapter

## Configuring Object Types

---

### In This Chapter:

- *Overview of Object Types*
- *Opening the Object Type Workbench*
- *Configuring General Information for Object Types*
- *Creating Object Type Fields*
  - *Overview of Object Type Field Validations*
  - *Creating Object Type Fields*
  - *Configuring Field Dependencies*
  - *Copying Object Type Fields*
  - *Editing Object Type Fields*
  - *Removing Fields*
- *Configuring Layouts for Object Types*
  - *Changing Field Widths*
  - *Moving Fields*
  - *Setting Object Names*
  - *Setting Object Revisions*
- *Configuring Commands for Object Types*
  - *Adding Commands to Object Types*
  - *Editing Commands of Object Types*
  - *Copying Commands in Object Types*
  - *Deleting Commands in Object Types*
  - *Command Conditions*

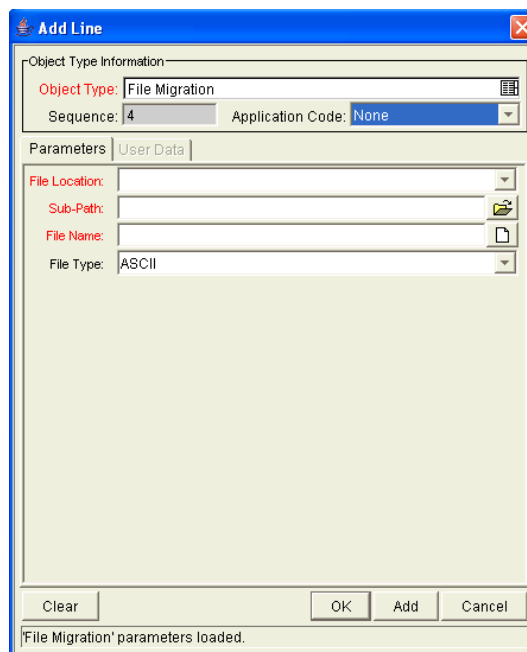

- *Configuring Ownership for Object Types*
    - *Adding Ownerships to Object Types*
    - *Deleting Ownerships from Object Types*
    - *Using Commands to Change Field Values*
- 

## Overview of Object Types

Mercury Deployment Management automates complex software deployment processes. While Mercury IT Governance workflows define the process, object types are used to define the technical steps required to deploy a particular object. For example, a File Migration object type may contain the information and commands required to transfer a file from one machine to another, while a SQL script object type might address the migration and execution of database scripts.

Object types are used to create and process packages. Each package line in a package consists of one object of a specific type. To define a package line, the user selects an object type in the Add Line window in the package screen (see [Figure 5-1](#)). The fields required to process that object type are dynamically displayed.

*Figure 5-1. Example of an object type*

You use the Object Type window to create and configure object types (see [Figure 5-2](#)).

Figure 5-2. Object Type window

The screenshot shows the 'Object Type : File Migration' window. It contains the following fields and options:

- Object Type Name:** File Migration
- Description:** File Copy from Environment to Environment
- Extension:** (empty dropdown)
- Object Name Column:** PARAMETER1
- Object Category:** Standard Objects
- Object Revision Column:** (empty dropdown)
- Meta Layer View:** MPKGL\_ FILE\_MIGRATION
- Enabled:**  Yes  No

Below these fields is a table with tabs for 'Fields', 'Layout', 'Commands', 'Ora Apps', and 'Ownership'. The 'Fields' tab is active, showing the following table:

Prompt	Token	Parameter Col.	Displayed	Component Type	Validation
File Location:	P_FILE_LOCATI...	PARAMETER4	Y	Drop Down List	DLV - File Location
File Name:	P_FILENAME	PARAMETER1	Y	File Chooser	File Chooser - Full File N:
File Type:	P_FILE_TYPE	PARAMETER3	Y	Drop Down List	DLV - File Type
Sub-Path:	P_SUB_PATH	PARAMETER2	Y	Directory Chooser	Directory Chooser

At the bottom of the window are buttons for 'New', 'Edit', 'Remove', 'OK', 'Save', and 'Cancel'. The status bar at the very bottom says 'Ready'.

The following is a list of the main components of an object type:

- **General information.** General information includes basic information concerning the object type, such as the object type name and the object type category. See [Configuring General Information for Object Types on page 144](#).
- **Fields.** Every object type includes fields. The **Fields** tab is used to create fields for the object type. See [Creating Object Type Fields on page 146](#).
- **Layout.** Once all of the fields are created for a object type, the layout of those fields can be configured using the **Layout** tab. See [Configuring Layouts for Object Types on page 156](#).
- **Commands.** Commands can also be used to control certain behavior of object type fields. At specific workflow execution steps in a deployment process, it is possible to select to run the commands stored in the object type. These commands can then manipulate the data inside a object type field. This provides an advantage over the defaulting features on the **Field** tab, which can only default based on a single parameter stored on the same object type. See [Configuring Commands for Object Types on page 160](#).
- **OraApps.** Mercury Deployment Management Extension for Oracle E-Business Suites™ requires specially configured object types. If Mercury

Deployment Management Extension for Oracle E-Business Suites is not installed, the **OraApps** tab is disabled.

- **Ownership.** Configure who can edit the object type. See *Configuring Ownership for Object Types* on page 166.

## Opening the Object Type Workbench

To open the Object Type Workbench:

1. Log on to Mercury IT Governance Center.
2. From the menu bar, select **Administration > Open Workbench**.

The Workbench opens.

3. From the shortcut bar, select **Deployment Mgmt > Object Types**.

The Object Type Workbench window opens.

## Configuring General Information for Object Types

To configure the general information of an object type:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Object Types**.

The Object Type Workbench opens.

2. Open an object type.

The Object Type window opens.

3. Enter the information listed in the following table:

Field Name	Description
Object Type Name	The name of the object type.
Description	A useful description of how the object type is used.
Extension	For object types created for a Mercury Deployment Management extension. Select the extension.
Object Category	Object categories provide a way of categorizing object types in Mercury Deployment Management. The default values are <b>Custom Object</b> and <b>Standard Objects</b> . You can configure the values by changing the validation. Validation: DLV - Object Category - Enabled
Object Name Column	When defining an object type, this field represents the name of the object in a package line. This field shout link to a field defined for the object type. Typically, selecting an entry for the <b>Object Name</b> column is done after all of the object type fields are created. For more information, see <a href="#">Setting Object Names on page 159</a> .
Object Revision Column	If integrating with a version control system using this object type, indicates which parameter field represents the revision number for the object. The object revisions column should be set after defining the object type fields. It is also possible to create a field in the object type to represent the revision number of the object. This field will often be a numeric text field. The deployment process can then be configured to consider the object revision number when processing the package. Typically, selecting an entry for the <b>Object Revision</b> column is done after all of the object type fields are created. For more information, see <a href="#">Setting Object Names on page 159</a> .
Meta Layer View	Meta layer views relate information specific to Mercury IT Governance Center.
Enabled	Indicates whether or not the object type is available to Mercury IT Governance Center. Selecting <b>Yes</b> makes the object type available to the system.

4. To save the changes and close the Object Type window, click **OK**. To save the changes and leave the Object Type window open, click **Save**.

## Creating Object Type Fields

You can configure each field to behave in a certain way using the Field configuration window in the Object Type window. The Field window contains three tabs:

- **Attributes.** The **Attributes** tab is used to set basic display, edit, and requirement field properties.
- **Default.** The **Default** tab is used to set the value in the field.
- **Dependencies.** The **Dependencies** tab is used set clearing, display and requirement field properties based on values in other object type fields.

From the Field window, configure whether the field:

- Is displayed (for example, you might need to store a value for later use in commands, but do not want to clutter the package line)
- Can be edited under different circumstances
- Is required under different circumstances
- Defaults to a certain value
- Is dependent on values in other fields in the object type
  - Clear the field's value when another field changes
  - Display only when another field has a specific value
  - Required only when another field has a specific value

## Overview of Object Type Field Validations

When configuring the object type, you can specify a different validation for each field. The validation dictates the possible values that can be entered in the field and the field type (such as text field, drop-down list, or date field).

For example, XYZ Corporation requires a **File Type** field to capture the objects to be deployed. On their object type, they set up the field as shown in *Figure 5-3*.

Figure 5-3. Field window

The validation is validated by a list. This is an appropriate choice because the selection is not expected to change.

## Selecting Validations

If no validation meets the necessary requirements (such as having the appropriate values), you must create one. You can also select a validation that has been configured for use at your site.

Be careful if you use a validation that is configured for use in another process. If the owner of the other process changes the validation, the validation also changes for the items in your process. Consider copying the existing validation to create a new one. You can then control who can alter the validation values by setting validation ownership.

## Creating Object Type Fields

To create an object type field:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Object Types**.

The Object Type Workbench window opens.

2. Open an object type.

The Object Type window opens.

3. Click **New**.

The Field window opens.

4. Complete the fields in the Field window as specified in the following table:

Field Name	Description
Field Prompt	Enter the name of the new field.
Token	Type a unique name for the token.
Description	Type a description of the new field.
Enabled	Select <b>Yes</b> to make the field available to the system.

5. In the Field window, in **Validation** field, select a validation.

See [Overview of Object Type Field Validations](#) on page 146 for information regarding the choosing of a validation. If no existing validation meets the requirements, create a one that does.

## 6. Configure field behavior.

This consists of setting options in the field's **Attributes**, **Default**, and **Dependencies** tabs. See *Creating Object Type Fields* on page 146. Note that some field behavior is dependent on other object type fields. You may need to revisit this step after you create the other fields in the object type.

To configure field behavior:

- a. Complete the fields in the **Attributes** tab, as in the following table:

Field Name	Description
Parameter Col.	Indicates the internal database column that the field value will be stored in. These values are then stored in the corresponding column in the package lines table for each Line of the given object type. Information can be stored in up to 30 columns and thus allow up to 30 fields/parameters. No two fields in an object type can use the same column.
Display Only	Indicates whether to display a field using the following options: <ul style="list-style-type: none"> <li>■ <b>Always</b></li> <li>■ <b>Never</b></li> <li>■ <b>Use Dependency Rules</b></li> </ul> Select <b>Use Dependency Rules</b> to use the logic defined on the <b>Dependencies</b> tab.
Display	Indicates if this field is visible in the package line region of the package window.
Required	Indicates if a value needs to be specified for this field using the following options: <ul style="list-style-type: none"> <li>■ <b>Always</b></li> <li>■ <b>Never</b></li> <li>■ <b>Use Dependency Rules</b></li> </ul> Select <b>Use Dependency Rules</b> to use the logic defined in the <b>Dependencies</b> tab.
Updateable	After a package line has been entered and submitted, it starts moving through its workflow. This attribute determines if the field can still be updated. For example, it may be necessary to ensure that a <b>Filename</b> field is not updateable once package lines of File object type start getting processed.

b. Complete the fields in the **Default** tab as specified in the following table:

Field Name	Description
Default Type	Determines whether the field has a default value. Either default the field with a constant value, default it from the value in another field, or default to a parameter.
Visible Value	If a default type of constant is selected, enter the constant value here.
Depends On	If defaulting from another field, enter the token name of that field. At runtime, when using this object type, every time a value is entered or updated in the source field, it is automatically entered or updated in this destination field.

c. Complete the fields on the **Dependencies** tab, as specified in the following table:

Field Name	Description
Clear When _ __ Changes	Indicates that the current field is to be cleared if the specified field changes.
Display Only When	Indicates that the current field is to be editable only if certain logical criteria are met. This field functions with two adjacent fields: a list containing the logical qualifier and a text field. To use this functionality, select <b>Use Dependency Rules</b> from the first list.
Required When	Indicates that the current field should be required when certain logical criteria are satisfied. This field functions with two adjacent fields: a list containing logical qualifier and a text field. To use this functionality, select <b>Use Dependency Rules</b> from the first list.

7. Click **OK**.

The changes to the object type are saved.

## Configuring Field Dependencies

Field behavior and properties can be linked to the value of other fields defined for that entity. For example, an object type field can become required when the value in another field in that object type equals the text Critical.

A field can be configured to:

- Clear when another field changes.
- Become read only when another field meets a logical condition defined in the following table (*Table 5-1*).
- Become required when another field meets a logical condition defined in *Table 5-2*.

*Table 5-1. Field dependencies*

Logical qualifier	Description
like	A like condition looks for the specified value to find any matching values in the chosen field.
not like	A not like looks for values in the chosen field that are not equal to the specified value.
is equal to	An is equal to looks for an exact match of the specified Value to the contents of the field chosen.
is not equal to	An is not equal to is true when there are no results exactly matching the value of the field contents.
is null	An Is null is true when the field selected is blank.
is not null	An Is not null is true when the field selected is not blank.
is greater than	An Is greater than looks for a numerical value in excess of the value entered in the Value field.
is less than	An Is less than looks for a numerical value below the value entered in the Value field.
is less than equal to	An Is less than equal to looks for a numerical value below, or the same as, the value entered in the Value field.
is greater than equal to	An Is greater than equal to looks for a numerical value in excess of, or the same as, the value entered in the Value field.

To configure a field dependency:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Object Types**.

The Object Type Workbench window opens.

2. Open an object type.

The Object Type window opens.

3. Select and edit an existing field or create a new field.

The Field window opens.

4. Click the **Dependencies** tab.

5. Set the field dependencies, using one of the following options:

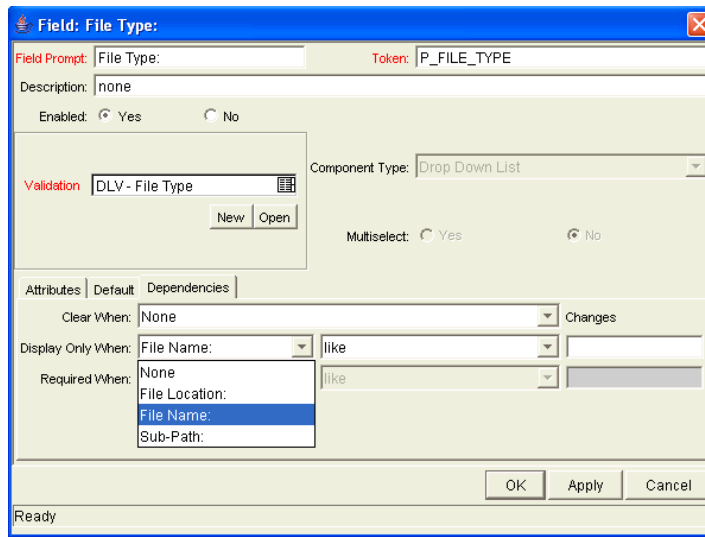

- In the **Clear When** field, select a field name to indicate that the current field is to be cleared if the selected field changes.
- In the **Display Only When** field, select a field name to indicate that, if certain logical criteria are satisfied, the current field is to be read-only.

This field functions with two adjacent lists that contain logical qualifier, and a field which dynamically changes to a date field, list, or text field, depending on the validation of the selected field.

- In the **Required When** field, select a field name to indicate that the current field is to be required if certain logical criteria are satisfied.

This field functions with two adjacent lists that contain logical qualifier, and a field that dynamically changes to a date field, list, or text field, depending on the validation of the selected field.

6. Click **OK**.

This adds the field dependencies to the **Fields** tab of the Object Type window and closes the Field: New window.

7. Click **OK**.

## Copying Object Type Fields

To copy an object type field:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Object Types**.

The Object Type Workbench opens.

2. Open an object type.

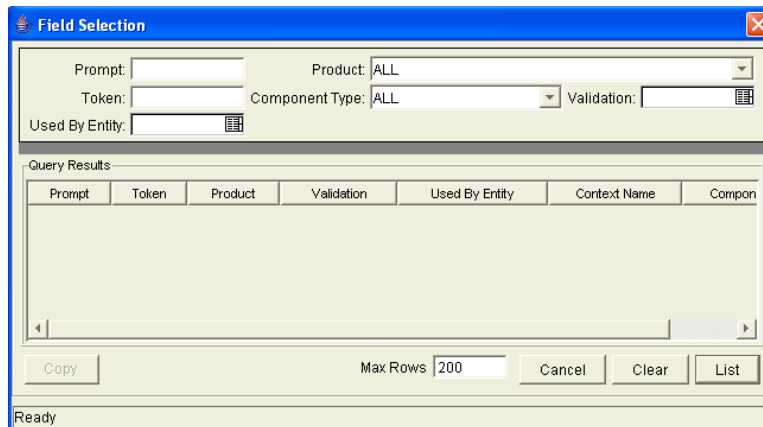

The Object Type window opens to the **Fields** tab.

3. Click **New**.

The Field window opens.

4. Click **Copy From**.

The Field Selection window opens.

5. Query for the field you want to copy.

You can use several criteria, including token name or field prompt, to query fields. You can perform more complex queries. For example, you can list all fields that reference a given validation or that a specific entity uses. Because of the number of Mercury IT Governance Center fields, limit the list of fields by one or more of the query criteria.

6. In the Field Selection window, select the desired field and click **Copy**.

The Field Selection window closes and the definition of the selected field is copied to the New Field window.

7. In the New Field window, modify the fields as required.

8. Click **OK**.

The new field is added to the **Fields** tab.

9. Click **OK**.

## Editing Object Type Fields

Changes to fields for object types already used by existing package lines can have a significant impact. For example, if the column where a field value gets stored in is changed, all existing package lines for this object type will now have incorrect data. Also, remember that tokens can be used in object type commands and notifications. Any changes to these could disrupt the system.

Changing information like the field prompt or description should not affect the behavior of existing package lines.

To edit an existing field:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Object Types**.

The Object Type Workbench opens.

2. Open an object type.

The Object Type window opens.

3. From the **Fields** tab, select a field, and then click **Edit**.

The Field window opens.

4. Modify the field as required, and then click **OK**.

5. Click **OK**.

## Removing Fields

Removing a field from an object type does not change the historical information for existing package lines using the given object type. Any values for the deleted field remain in the package lines table in the column specified in the field definition.

To remove a field permanently from an object type:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Object Types**.

The Object Type Workbench opens.

2. Open an object type.

The Object Type window opens.

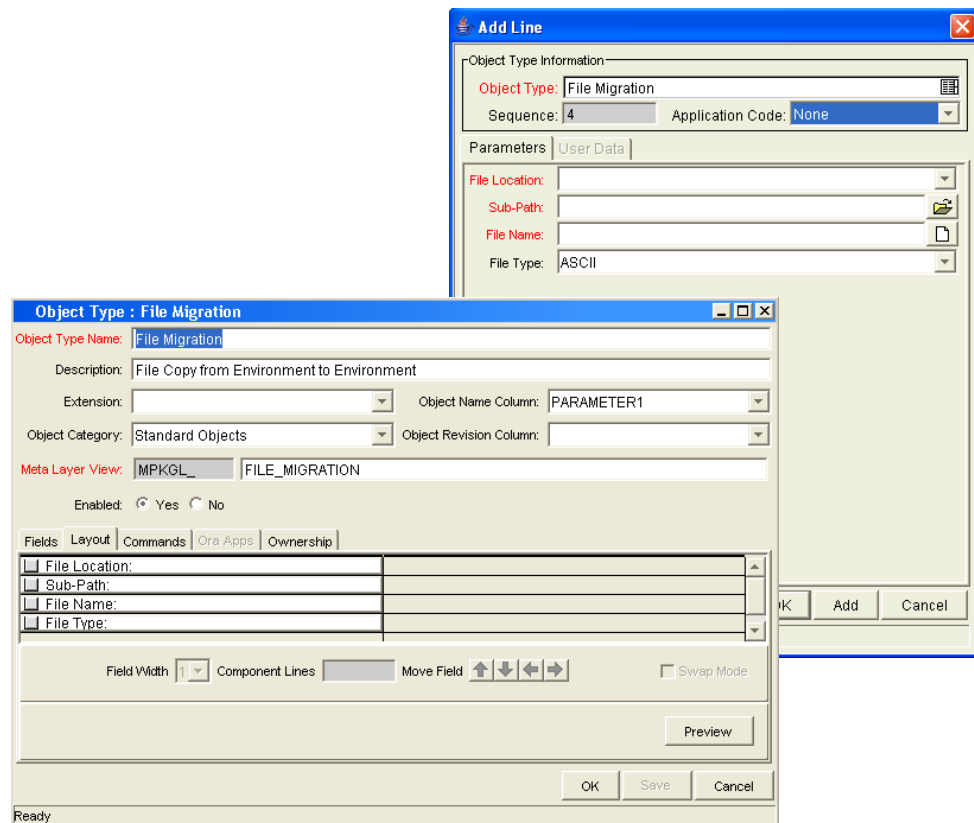

3. From the **Fields** tab, select a field, and then click **Remove**.

4. Click **OK**.

## Configuring Layouts for Object Types

You can change the look of an object type using the **Layout** tab of the Object Type window. Fields can be wide or narrow. Wide fields span two columns. Narrow fields span a single column. You can also move wide fields up and down. Narrow fields can move up and down, and side to side. *Figure 5-3* shows the **Layout** tab of an object type and what the object type looks like.

Figure 5-4. Example of an object type and Layout tab

## Changing Field Widths

To change the width of an object type field:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Object Types**.

The Object Type Workbench opens.

2. Open an object type.

The Object Type window opens.

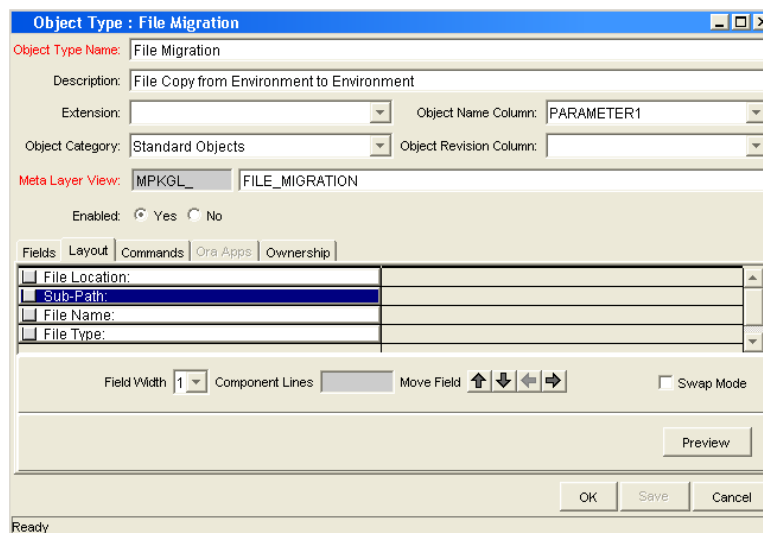

3. Click the **Layout** tab.

4. Select a field.

5. In the **Field Width** field, select **1** or **2**.

The Layout editor does not let you make changes that conflict with another field in the layout. For example, you cannot change the width of a field from 1 to 2 if another field exists in column two on the same row.

For fields of component type Text Area, you can determine the number of lines the text area displays by clicking the Text Area type field and changing the value in the Component Lines attribute. If the selected field is not of type Text Area, this attribute is blank and not updateable.

6. Click **OK**.

## Moving Fields

To move an object type field:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Object Types**.

The Object Type Workbench opens.

2. Open an object type.

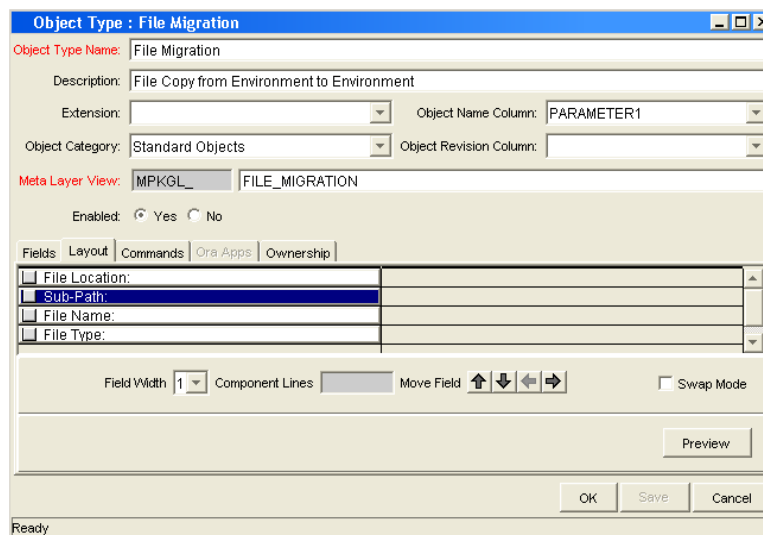

The Object Type window opens.

3. Click the **Layout** tab.

4. Select a field.

To select a range of fields, use the **shift** key. (You cannot use the **ctrl** key to select nonadjacent field names.)

5. Use the arrow pointers to reposition the fields in the layout builder.

6. To switch the positions of two fields:

- a. Select the first field, and then select the **Swap Mode** option.

An S is displayed in the option section of the selected field.

- b. Double-click the second field.

After the fields change positions, the Swap Mode option is cleared.

7. To open a window that displays a preview of your layout, click **Preview**.

Note that:

- If all of the fields are one column wide, then all displayed columns automatically span the available section whenever a user views a package line of the given object type.
- Rows that contain no fields are ignored. They are not displayed as blank lines.
- Any fields that are not displayed do not affect the layout. They are considered the same as a blank field.

8. Click **OK**.

The changes to the object type are saved.

## Setting Object Names

When defining an object type, it is important to choose one field to represent the name of this object in a package line. This field is the object name. To designate a field as the object name, select that field's Parameter Column in the **Object Name Column** field.

For example, to designate File Name as the object name field for a File Migration object type, select the File Name field's Parameter Column in the **Object Name Column** field.

Object Type : File Migration

Object Type Name: File Migration

Description: File Copy from Environment to Environment

Extension: [Dropdown] Object Name Column: PARAMETER1

Object Category: Standard Objects Object Revision Column: [Dropdown]

Meta Layer View: MPKGL\_ FILE\_MIGRATION

Enabled:  Yes  No

Prompt	Token	Parameter Col.	Displayed	Component Type	Validation

Buttons: New, Edit, Remove, OK, Save, Cancel

Ready

In the package window, the object name for each package line is displayed in the **Object Name** column on the **Status** tab.

The object name field drives additional functionality:

- If the object name field is a file chooser or an auto-complete, multi-selection is automatically enabled on this field when users add a line to a package with this object type. If multiple values are selected, a new package line for each value will be created, allowing users to add multiple lines to a package simultaneously.
- All migrations are tracked in the database tables `KENV_ENV_CONTENTS` and `KENV_ENV_CONTENTS_HIST`. The value of a package line's object name field is stored in these tables (along with other relevant data) whenever a migration occurs.
- You can use the Object Type Workbench to query the Object Name.

## Setting Object Revisions

You can create a field on the object type to represent the revision number of the object. This field is often a numeric text field. You can then configure the deployment process to consider the object revision number during package processing.

## Configuring Commands for Object Types

Object types can have many commands and each command can have many command steps. A command can be viewed as a particular function for an object type. Copying a file can be one command and checking that file into version control can be another. To perform these functions, a series of events needs to take place, and these events are defined in the command steps.

An additional level of flexibility is introduced if some commands can only be executed under certain circumstances. This is powered by the **Condition** field of the commands (see [Command Conditions on page 165](#)).

### For More Information

For more information about how to create commands and special commands, see *Commands, Tokens, and Validations Guide and Reference*.

## Adding Commands to Object Types

To add commands to object types:

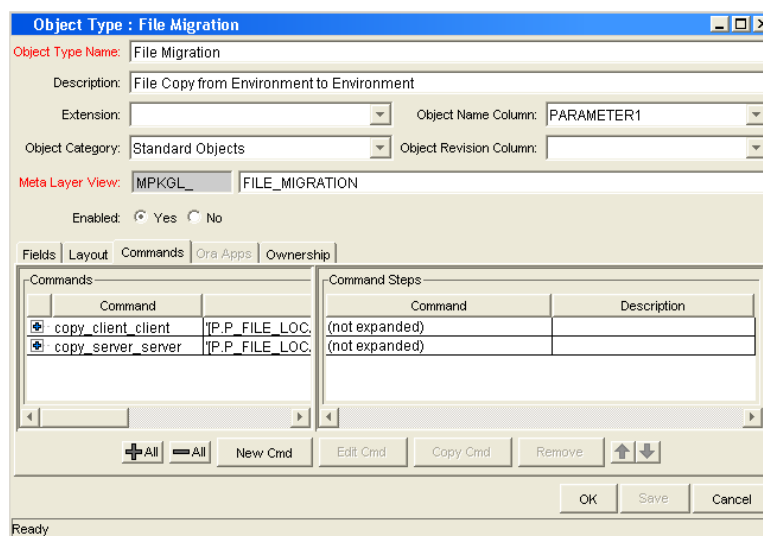

1. From the Workbench shortcut bar, select **Deployment Mgmt > Object Types**.

The Object Type Workbench opens.

2. Open an object type.

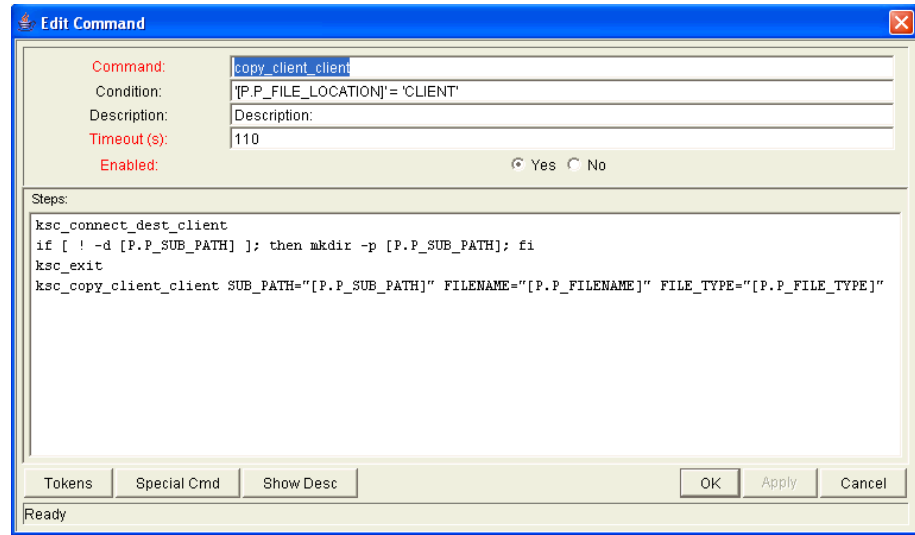

The Object Type window opens.

3. Click the **Commands** tab.

4. Click **New Cmd**.

The New Command window opens.

5. Complete the fields in the New Command window as specified in the following table:

Field Name	Description
Command	A simple name for the command.
Condition	A condition that determines whether the steps for the command are executed or not. For more information, see <a href="#">Command Conditions on page 165</a> .
Description	A description of the command.
Timeout	The amount of time the command can run before its process is terminated. This mechanism is used to abort commands that are hanging or taking an abnormal amount of time to run.
Enabled?	Indicates whether the command is enabled for execution.

6. Click **OK**.

The **Commands** tab lists the new command.

7. Click **OK**.

## Editing Commands of Object Types

To edit a command on an object type:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Object Types**.

The Object Type Workbench opens.

2. Open an object type.

The Object Type window opens.

3. Click the **Commands** tab.

4. Click **Edit Cmd**.

The Edit Command window opens.

5. Select the command to edit.

6. Enter the information specified in the following table:

Field Name	Description
Command	A simple name for the command.
Condition	A condition that determines whether the steps for the command are executed or not. (See <a href="#">Command Conditions</a> on page 165 for more information).
Description	A description of the command.
Timeout	The amount of time the command will be allowed to run before its process is terminated. This mechanism is used to abort commands that are hanging or taking an abnormal amount of time.
Enabled?	Indicates whether the command is enabled for execution.

7. Click **OK**.

The **Commands** tab lists the edited command.

8. Click **OK**.

## Copying Commands in Object Types

To copy a command in an object types:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Object Types**.

The Object Type Workbench opens.

2. Open an object type.

The Object Type window opens.

3. Click the **Commands** tab.

4. Select the command to copy, and then click **Copy Cmd**.

The command is copied to another line in the **Commands** tab.

5. Click **OK**.

The changes to the object type are saved.

## Deleting Commands in Object Types

To copy a command in an object types:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Object Types**.

The Object Type Workbench opens.

2. Open an object type.

The Object Type window opens.

3. Click the **Commands** tab.

4. Select the command to delete, and then click **Remove**.

5. Click **OK**.

## Command Conditions

Depending on the execution context, it might be necessary to run a different set of commands. This flexibility is achieved through the use of conditional commands. The **Condition** field for a command is used to define the situation under which the associated command steps execute.

Conditions are evaluated as boolean expressions. If the expression evaluates to true, the command is executed. If false, the command is skipped and the next command is evaluated. If no condition is specified, the command is always executed. The syntax of a condition is identical to the WHERE clause of a SQL statement, which allows enormous flexibility when evaluating scenarios. Some example conditions are detailed in *Table 5-2*. Be sure to place single quotes around string literals or tokens that are to evaluate strings.

*Table 5-2. Example conditions*

Condition	Evaluates to
BLANK	Command is executed in all situations.
'[P.P_VERSION_LABEL]' IS NOT NULL	Command is executed if the parameter with the token P_VERSION_LABEL in the package line is not null.
'[DEST_ENV.ENVIRONMENT_NAME]' = 'Archive'	Command is executed when the destination Environment is named "Archive".
'[AS.SERVER_TYPE_CODE]' = 'UNIX'	Command is executed if the application server is installed on a UNIX machine.

### For More Information

The condition can include tokens. For more information concerning tokens, see *Commands, Tokens, and Validations Guide and Reference*.

## Configuring Ownership for Object Types

To define ownership groups, you add security groups to the **Ownership** tab. If no ownership groups are associated with the entity, the entity is treated as global and any user who can edit an object type can edit, copy, or delete this object type.

If a security group is disabled or loses the ability to edit object types, its members also can no longer edit an object type.

Note

For more information on access grants, see the document *Security Model Guide and Reference*.

### Adding Ownerships to Object Types

To add an ownership:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Object Types**.

The Object Type Workbench opens.

2. Open an object type.

The Object Type window opens.

3. Click the **Ownership** tab.

4. Select one of the following:

- **All users with the Edit Object Type Access Grant.**
- **Only groups listed below that have the Edit Object Type Access Grant.**

For **Only groups listed below that have the Edit Object Type Access Grant**:

a. Click **Add**.

The Add Security Groups window opens.

b. Select the security groups and click **OK**.

The Add Security Groups window lists the selected security groups.

c. Click **OK**.

The security group is added to the **Ownership** tab.

5. Click **OK**.

## Deleting Ownerships from Object Types

To delete an ownership:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Object Types**.

The Object Type Workbench opens.

2. Open an object type.

The Object Type window opens.

3. Click the **Ownership** tab.

4. Select an ownership.

Note

The **All users with the Edit Object Type access grant** option assigns ownership of the object type to users who can edit object types.

5. Click **Remove**.

6. Click **OK**.

## Using Commands to Change Field Values

Commands can also be used to control certain behavior of object type fields. At specific points (execution workflow steps) in the deployment process, it is possible to run the commands stored in the object type. These commands can then manipulate the data inside an object type field. For example, you can construct a command to consider a number of parameters and then default a field based on those parameters. This provides an advantage over the defaulting features in the Field window, which can only default based on a single field located in the same object type.

The `ksc_store` special command can perform this function. For information on using this and other commands, see *Commands, Tokens, and Validations Guide and Reference*.

You may find it useful to use commands to control field values in the following situations:

- To store a value from an execution in a custom field
- To clear a field after you evaluate several parameters

## Overview of Releases and Distributions

A release is a group of packages and related requests that need to be deployed together. Release management provides an interface through which users can group, view and execute these packages. You can add packages to a release either by including a Ready for Release step in the package workflow or by the release manager through the Release window.

For example, a software company has a product update release scheduled five months from now. In order to ensure a smooth product delivery, they decide to track all changes to their original code using release management. As developers complete their packages, those packages are included in a release and processed together. By grouping every required change in the release, the company is able to quickly and easily assess the state of the product delivery.

### Workflow Scope

Each workflow has an associated workflow scope. The workflow scope determines which release management entities can be processed through that workflow. The workflow scope can be one of the following:

- Packages
- Requests
- Release Distributions

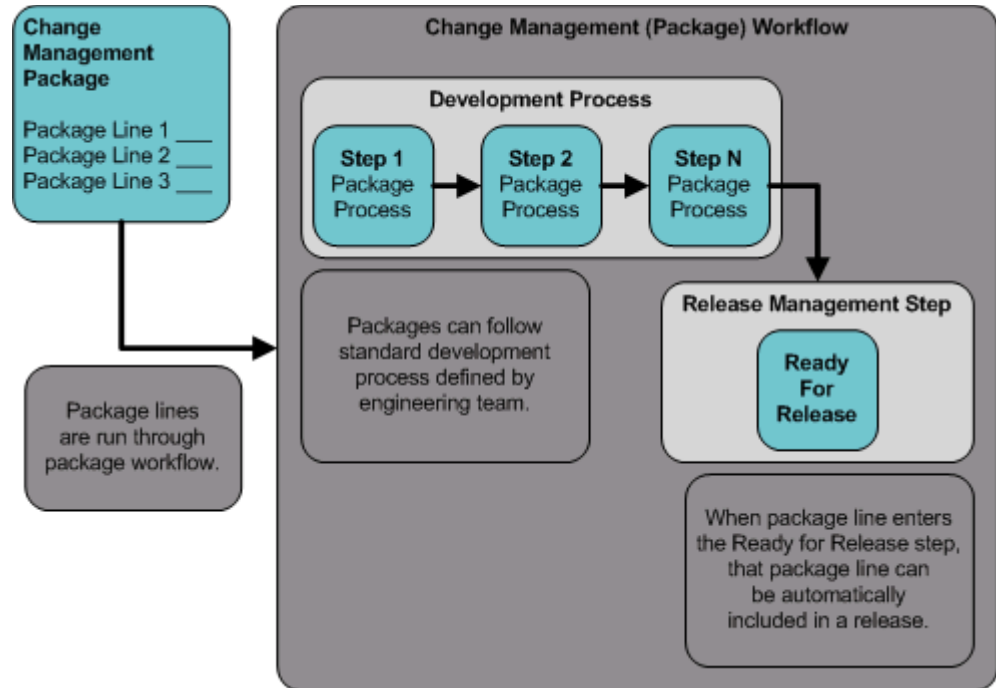

Release management uses workflows with Packages and Release Distribution scopes. Certain workflow configuration restrictions are enforced by the workflow scope. For example, release distribution workflows cannot include the wf\_jump and wf\_receive workflow events.

## Release Management and Package Workflows

You can configure your standard package workflows to feed packages into a release. A Ready for Release workflow step can be included in the package workflow. When a package line enters the Ready for Release step, the developer (or other release management user responsible for that package) can select which release they would like to add the package to. The user selects the release and adds the package and its associated package lines to the release. When all of the package lines are confirmed in the Ready for Release step, the package is ready to be used in the release.

*Figure 6-1* illustrates the process by which developers can add packages to a release.

*Figure 6-1. Ready for release step in workflow*

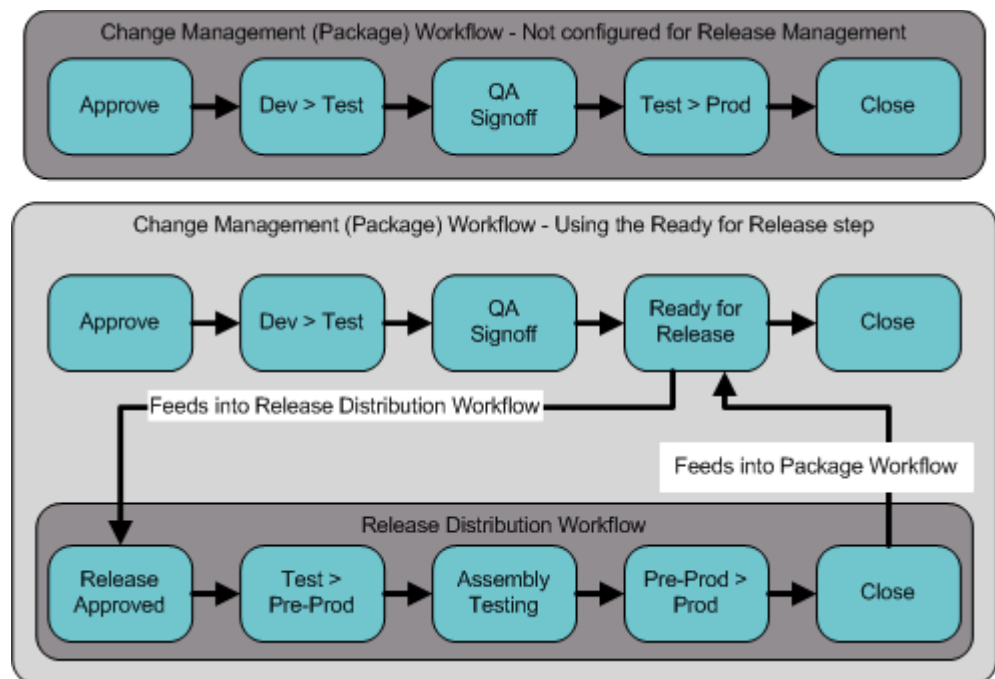

## Release Distribution Workflows

Just as the inclusion of appropriate packages and requests is integral to the release definition, so is the process by which the packages are processed in a release distribution. Distribution workflows are used to define the process by which the release's packages are properly tested, approved, and executed against any required environments.

Release distribution workflows need to include package level subworkflows to perform key package level processing. All package line (object type) execution will occur in the subworkflow.

*Figure 6-2* illustrates the relationships between packages and release workflows.

*Figure 6-2. Role of the distribution workflow*

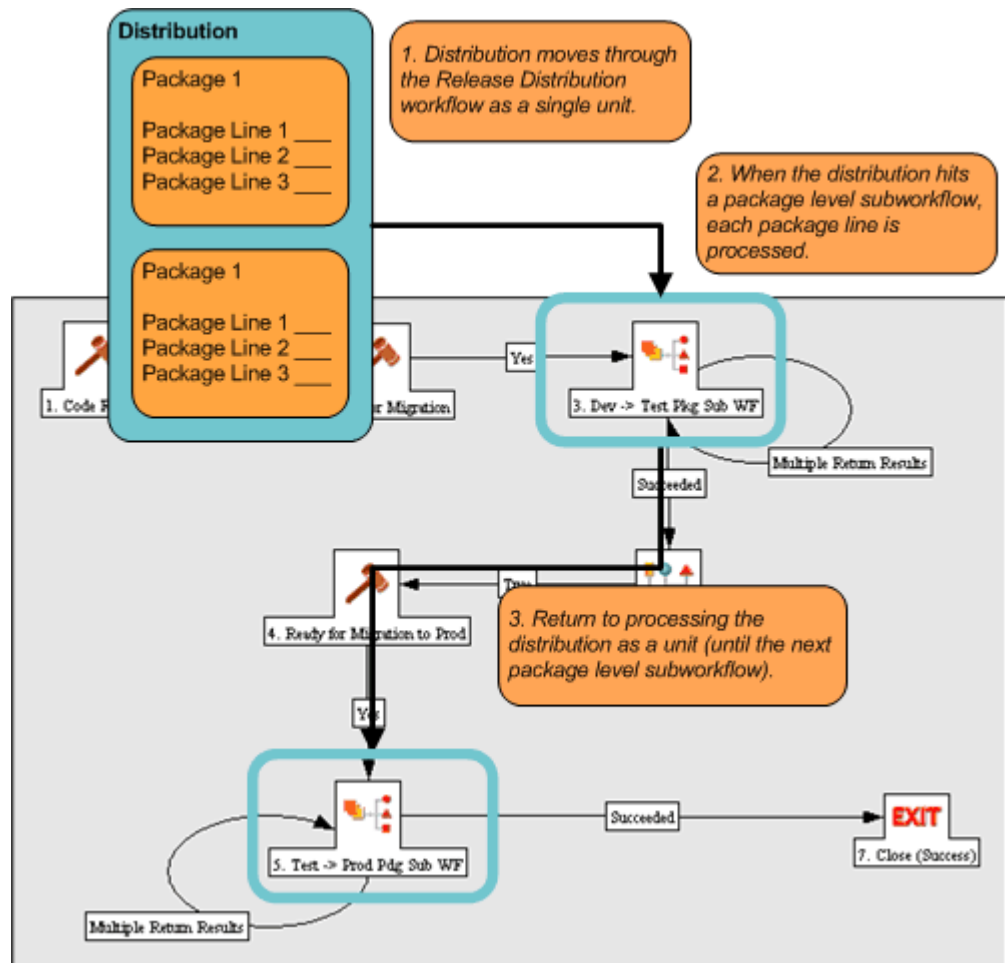

The release distribution workflow provides a way in which the release manager can ensure that all files associated with the release deploy properly. As with any workflow, the distribution workflow can be configured to model your existing or best-practice release processes.

## Package Level Subworkflows

Release distributions include package level subworkflows, which are used to perform key package level processing. Package level subworkflows are any package subworkflows that have the Use in Release Distributions flag set to **Yes**. All package line (object type) execution occurs in these subworkflows. Also, all package and package line tokens are resolved as these workflows are traversed.

Figure 6-3. Distribution workflow

Package level subworkflows are used within release distribution workflows. The release distribution workflow is typically used for release approvals and executing system commands (such as starting or stopping servers). The distribution is processed as a single unit as it proceeds through the release distribution workflow. When the distribution hits a package-level subworkflow, each package line within the distribution is processed. The

package subworkflows are used to process package lines and execute object type commands.

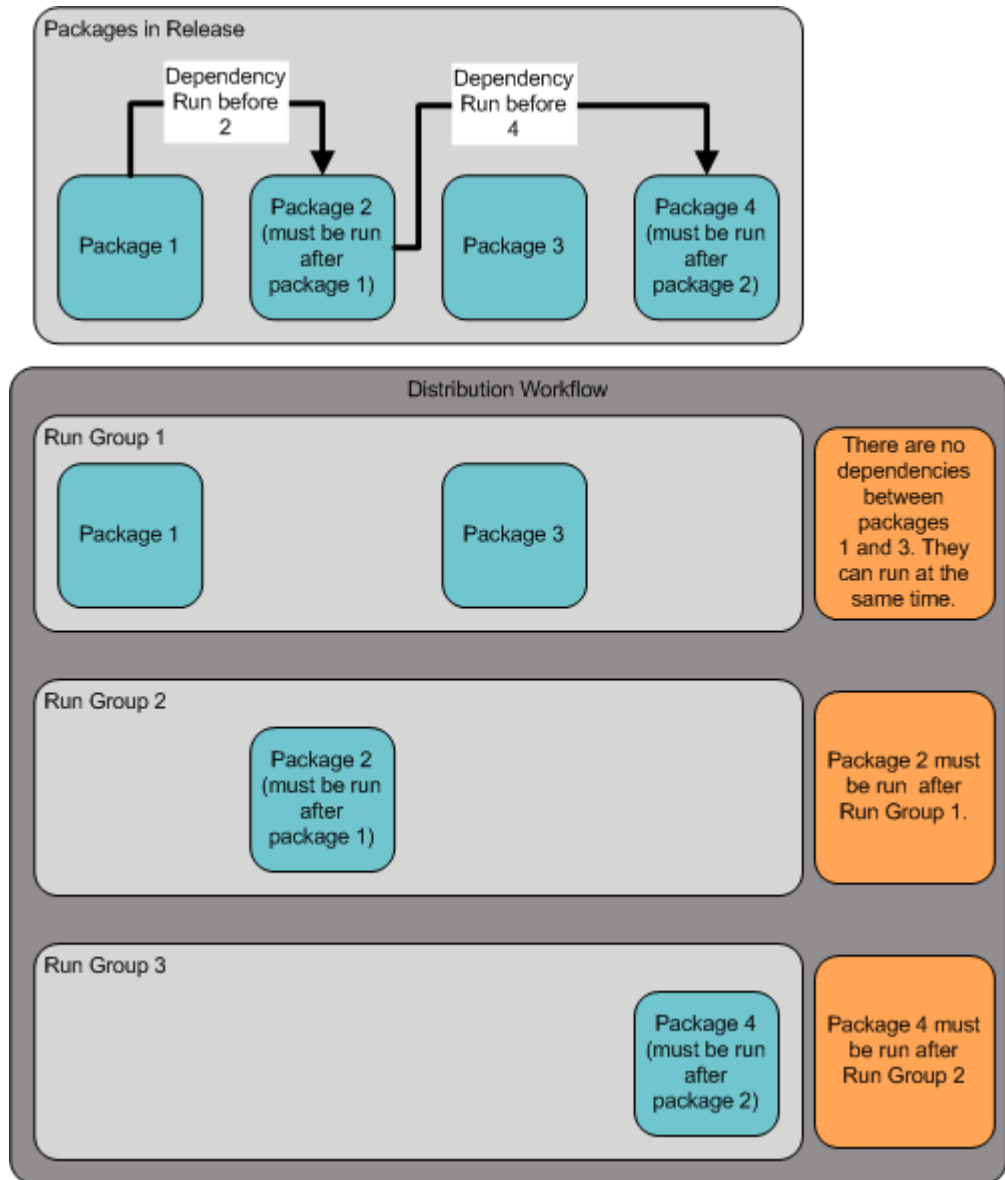

## Dependencies and Run Groups

Within a release, the release manager can configure the order in which the packages are processed. The release manager can select certain packages to run before or after other packages in the release. The ordering of packages segregates them into run groups. When a distribution enters an execution step in a package-level subworkflow, all package lines in the first run group will be executed before the package lines in the next run group can begin.

Run groups are automatically determined as you set dependencies between packages. Run groups present an efficient way to process packages which can be run in parallel without having to serially wait for unrelated dependencies. *Figure 6-4* illustrates how package dependencies result in different run groups.

Run groups are automatically determined when a release distribution is created, based on package dependencies specified in the release.

Figure 6-4. Dependencies and run groups

## Opening Releases

When a release manager first creates a release, only release management users with permission to edit the Release window can add packages. The release manager can enable other users to add packages to the release by clicking **Open Release** in the Release window. By creating an open release, developers processing a Ready for Release workflow step will have the option of adding the package to that release. If a release is not opened, it is not displayed in the list used for that Ready for Release step.

## Submitting Releases

When a release manager submits a release, the release enters a code freeze state. In this state, packages cannot be added or removed from the release by anyone other than the release manager. When the release is submitted, a distribution is automatically created. You can then process the distribution or cancel it and create a new one later.

## Overview of Using Release Management - Process

Release management introduces repeatable, reliable processes surrounding software and application releases. Release management provides an interface for grouping and processing the packages and requests associated with a specific release.

### ***Release Management Pre-Configuration***

Planning for an application or software release should begin immediately upon recognition that a release is pending. Before the release manager creates a release, it is often necessary to pre-configure the following in release management:

1. Modify package workflows to include the Ready for Release workflow step.
2. Create all required distribution workflows (including all package-level subworkflows).

By adding the Ready for Release workflow step to workflows, you provide developers with the ability to add a required package to a release at the appropriate time. Development package workflows will typically address necessary approval and execution steps directly related to that package. The Ready for Release workflow step indicates that the developer has signed off on

the package and the package is ready to be integrated and shipped with other packages related to the release.

The release manager should also create the distribution workflows. This includes defining any subworkflows (package level or distribution level) that will be used in the release distribution workflow. These workflows define the process by which the release's packages are properly tested, approved, and executed against any required environments. The release distribution workflow and associated subworkflows ensure that all files associated with the release are properly deployed. As with any workflow, the distribution workflow can be configured to model your existing or best-practice release processes.

## ***Creating Releases***

To create a release in release management:

1. Create a new release in the Release window.
2. Open the release by clicking **Open Release**.

This allows developers working in the Deployment Management Package window to add packages to the release via the Ready for Release workflow step.

3. Add packages and requests to the release.

Packages can be added through the Ready for Release workflow step in the Packages window or directly by the release manager through the Release window.

4. Click **Dependencies** in the **Package** tab to set package dependencies.
5. Configure dependencies between packages in the release.
6. Verify the release.

## ***Processing Releases***

When the appropriate data is collected in the release (packages, requests and dependencies) and the appropriate workflows have been created, the release manager can then process the release.

To process a release the release manager will:

1. Submit the release.
  - a. Create a distribution. This consists of selecting a workflow for the distribution and disabling any package lines that should not run with that distribution.
  - b. Submit the distribution.
2. Send feedback to packages. Send feedback to the packages at any time from the Distribution window. Select the value from the feedback drop-down list and click **Feedback**. This value is sent back to the package line in the Ready for Release workflow step and is used to transition out of that step.
3. Close the release only if there is no need to create additional distributions for use at a later date.
  - When the release is closed, any in-progress distributions are cancelled.
  - If a distribution is not submitted, it is not cancelled when the release is closed. However, after the release is closed the distribution cannot be edited.

## **Distributions**

A distribution is a deployment of a release. In a distribution, the release manager specifies which workflow will control the release process and which of the release's packages will be included.

For example, a software company has a product update release scheduled five months from now. As a part of their release process, they need to update their testing, production, and training instances of the product. The processes required for delivering the product to these different environments differs in the following ways:

- Not all of the packages in the release need to be applied to each instance, such as the training instance requires custom code to establish additional product security which is not required in the production instance.

- There is a different review process for each instance, such as the testing instance does not require the department head sign-off for each iteration of the release.

The software company creates a distribution for each of these release instances. For each distribution the release manager defines:

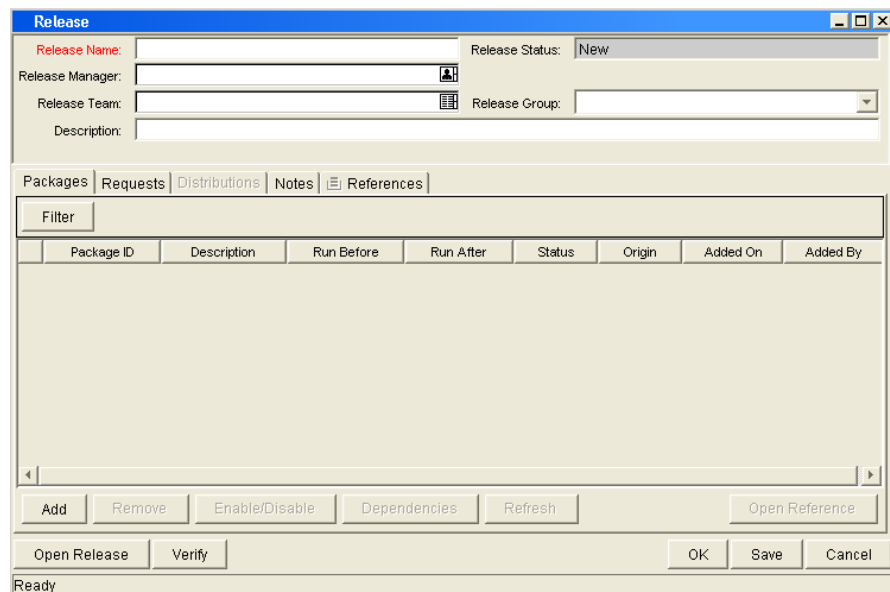

- Which packages are included in the specific release instance.
- Which workflow the release follows.

## Overview of Configuring Releases

Setting up a successful software or application release requires a comprehensive view of the release process. Release management provides the tools for capturing the entire release process. See [Overview of Using Release Management - Process on page 176](#) for an overview of the items and processes involved in creating a release.

One of the first steps in establishing a controlled release is to create a new release in the Release Workbench.

Figure 6-5. Release window

The following lists the major section found in the Release window:

- **General information.** General information includes basic information concerning the environment, such as the environment name and description. See *Creating Releases* on page 181.
- **Packages.** The **Packages** tab allows packages to be added to the release. See *Adding Packages to Releases* on page 182.
- **Requests.** The **Requests** tab allows requests to be added to the release. See *Adding Requests to Releases* on page 187.
- **Distributions.** The **Distributions** tab creates distributions for releases. See *Creating Distributions* on page 190.
- **Notes.** The **Notes** tab lets you add notes to a release.
- **References.** The **References** tab tracks information regarding the release.

## Opening the Release Workbench

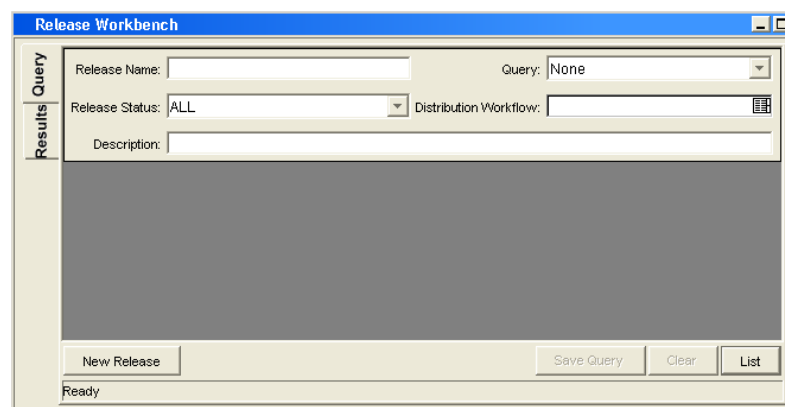

To open the Release Workbench:

1. Log on to Mercury IT Governance Center.
2. From the menu bar, select **Administration > Open Workbench**.

The Workbench opens.

3. From the shortcut bar, select **Deployment Mgmt > Releases**.

The Release Workbench opens.

## Creating Releases

To configure general information and create a release:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Releases**.  
The Release Workbench opens.
2. Click **New Release**.

The Release window opens.

3. Complete the fields as specified in the following table:

Field Name	Description
Release Name	The name of the release.
Release Status	The current status of the Release. <ul style="list-style-type: none"> <li>■ <b>New</b></li> <li>■ <b>Open</b></li> <li>■ <b>Code Freeze</b></li> <li>■ <b>Closed</b></li> </ul>
Release Manager	The name of the release management user who has control over the particular release. Only release management users who can manage releases are listed.

Field Name	Description
Release Team	The users who have access to the particular release. This is a validated list of security groups and is used for informational purposes only.
Release Group	A generic grouping of releases which allows the release manager to group releases into logical categories such as customization.
Description	The description of the release.

4. Add packages to the release.

For information on how to add packages, see [Adding Packages to Releases on page 182](#).

5. Add requests to the release.

For information on how to add requests, see [Adding Requests to Releases on page 187](#).

6. To allow other release management users to add packages and requests to the release, click **Open Release**.

7. Click **OK**.

## Adding Packages to Releases

You can add packages to release in one of the following ways.

### Adding Packages Through the Release Window

When defining a release in the Release window, the release manager can decide to manually add packages to the release.

To manually add a package to a release:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Releases**.

The Release Workbench opens.

2. Open a release.

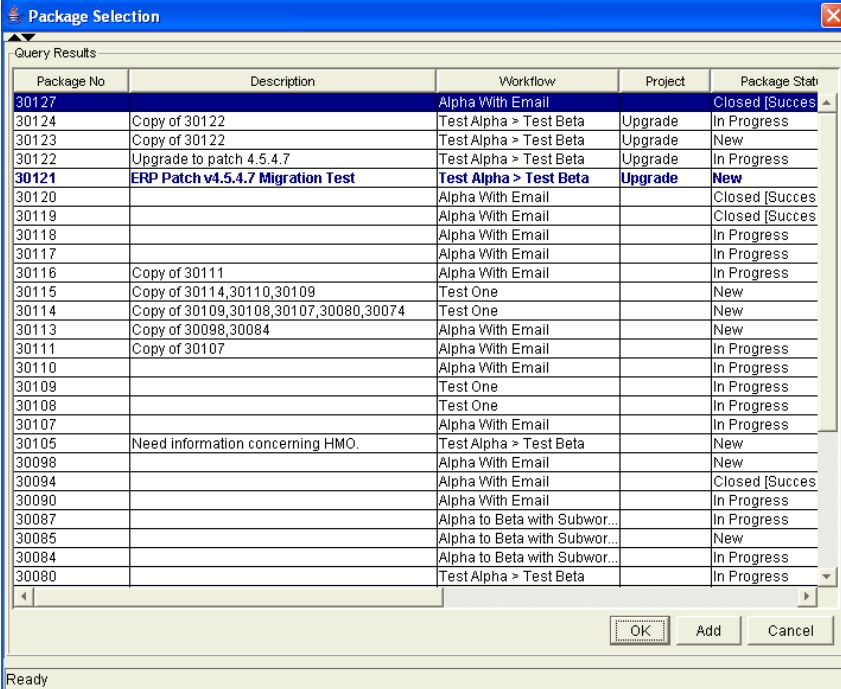

The Release window opens to the **Packages** tab.

3. Click **Add**.

The Package Selection window opens.

4. Specify your search criteria, and then click **List**.

The **Query Results** field displays the packages that match the search criteria.

The screenshot shows a window titled "Package Selection" with a "Query Results" section. The results are displayed in a table with the following columns: Package No, Description, Workflow, Project, and Package Stat. The table contains 30 rows of data, with the first row (30127) highlighted in blue. The status of each package is indicated in the "Package Stat" column, with some entries showing a dropdown arrow.

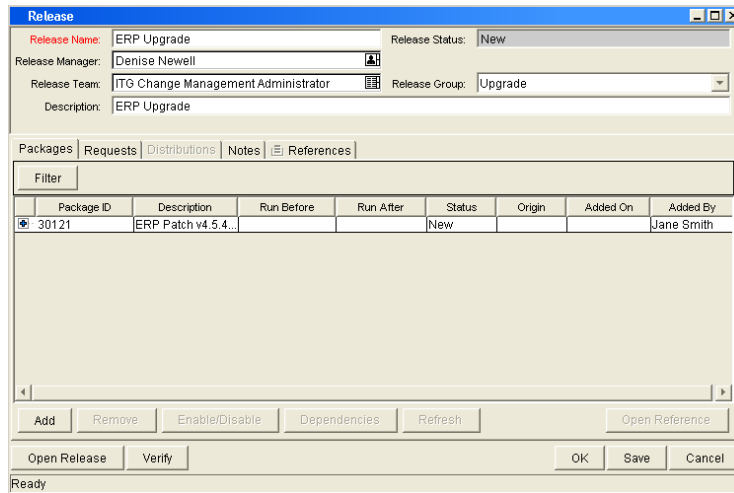

Package No	Description	Workflow	Project	Package Stat
30127		Alpha With Email		Closed [Success]
30124	Copy of 30122	Test Alpha > Test Beta	Upgrade	In Progress
30123	Copy of 30122	Test Alpha > Test Beta	Upgrade	New
30122	Upgrade to patch 4.5.4.7	Test Alpha > Test Beta	Upgrade	In Progress
30121	ERP Patch v4.5.4.7 Migration Test	Test Alpha > Test Beta	Upgrade	New
30120		Alpha With Email		Closed [Success]
30119		Alpha With Email		Closed [Success]
30118		Alpha With Email		In Progress
30117		Alpha With Email		In Progress
30116	Copy of 30111	Alpha With Email		In Progress
30115	Copy of 30114,30110,30109	Test One		New
30114	Copy of 30109,30108,30107,30080,30074	Test One		New
30113	Copy of 30098,30084	Alpha With Email		New
30111	Copy of 30107	Alpha With Email		In Progress
30110		Alpha With Email		In Progress
30109		Test One		In Progress
30108		Test One		In Progress
30107		Alpha With Email		In Progress
30105	Need information concerning HMO.	Test Alpha > Test Beta		New
30098		Alpha With Email		New
30094		Alpha With Email		Closed [Success]
30090		Alpha With Email		In Progress
30087		Alpha to Beta with Subwor...		In Progress
30085		Alpha to Beta with Subwor...		New
30084		Alpha to Beta with Subwor...		In Progress
30080		Test Alpha > Test Beta		In Progress

5. In the **Query Results** field, select the packages to add to the release.6. Click **Add**.

If the packages reference any other packages or requests, you are prompted to indicate whether to include or exclude them.

7. Click **Close**.

The Release window now lists the packages you added.

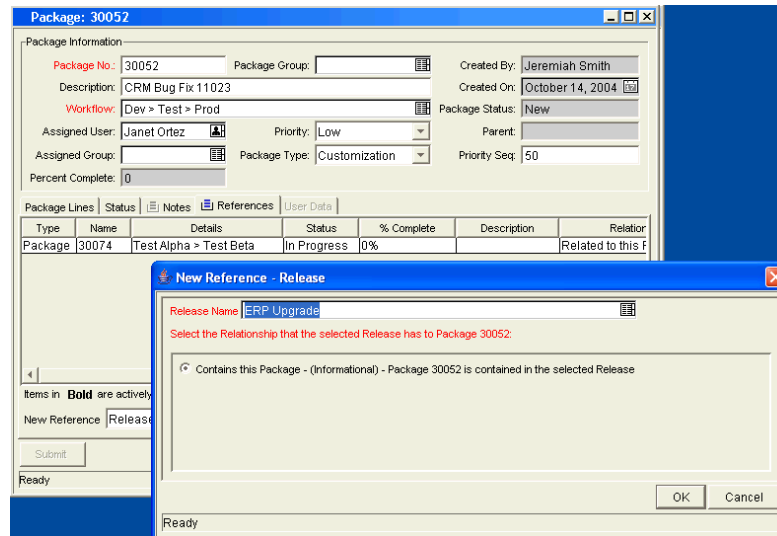

8. Click **Save**.

## Adding Packages Through the Package Window

To add packages to a release from the Package window, you reference the release on the package **References** tab.

The References window is shown in *Figure 6-6*.

*Figure 6-6. Package added to a release through the package reference*

## Adding Packages by the Ready for Release Workflow Step

Release management provides a Ready for Release workflow step source which can add significant value to your release process. When a package line reaches the Ready for Release workflow step and is executed, the status of the package line changes to Confirmed. As soon as all of the lines in a package reach this status, the entire package status changes to Ready for Release. The release distribution can then feed back to each of its associated packages so that each package can progress to the next workflow step.

To reject the Ready for Release workflow step, select **Bypass Execution** or **Override Status**. This stops package release, but allows the package to continue through its own workflow.

To act on a Ready for Release workflow step:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Packages**.

The Package Workbench opens.

2. Open a package.

The Package window opens.

3. Click the **Status** tab.

4. Select the workflow step to act on.

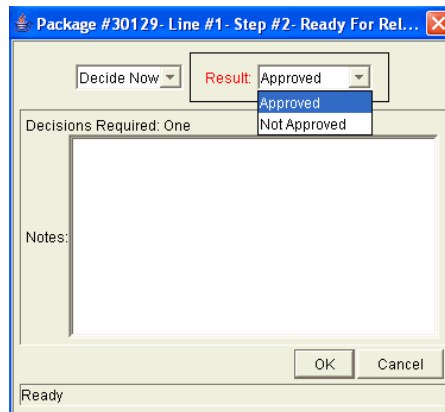

Workflows that are available for action are displayed in bold text. After you select an available workflow step, the **Action** button label changes to the workflow step name.

The screenshot shows the 'Package: 30129' window. The 'Package Information' section includes fields for Package No. (30129), Package Group, Description (ERP Package No. 12), Workflow (Alpha With Release), Assigned User (Denise Newell), Priority (High), Package Type (Customization), and Package Status (In Progress). Below this is a table of Package Lines with columns for Seq, Object Name, Object Type, and workflow steps. The workflow steps are: 1. Approve Package (Approved), 2. Ready For Release (Eligible), and 3. Release. The 'Ready For Release' step is highlighted in blue. At the bottom, there are buttons for Refresh, Select All, View -->, Line Exec Log (Latest), Ready For Release, Submit, OK, Save, and Cancel.

Seq	Object Name	Object Type	1	2	3
1	ERP_4.5.2_12.zip	File Migration	Approve Package Approved	Ready For Release <b>Eligible</b>	Release

5. Click **Ready for Release**.

The Package Action window opens.

6. In the **Results** field, select the workflow step result.  
You can also enter any relevant notes in this window.
7. Use the **Add to Release** field to select the release to associate with the package.  
This field may be required, depending on the workflow step configuration.
8. Click **OK**.
9. In the Package window, click **OK**.  
The package is now ready for release.

## Adding Packages from Requests

When a request that is included in a release spawns a package, that package is included in the release automatically. This becomes a powerful method for including packages in a release.

For example, a development manager can include a request to fix a software bug in the release. You can configure that request workflow to automatically create a package to migrate changes into production. That package is then included in the release.

## Adding Requests to Releases

You can add requests to a release to track information associated with the release. For example, the release manager may want to track which software bugs or enhancements (captured using a request) were implemented during the release timeframe.

### Adding Requests Through the Release Window

To add a request to a release from the Release window:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Releases**.

The Release Workbench opens.

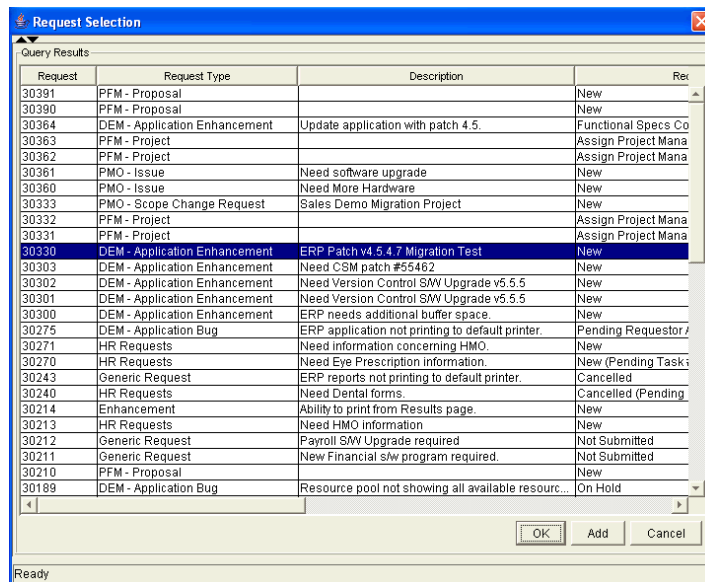

2. Open a release.

The Release window opens.

3. Click the **Requests** tab.

4. Click **Add**.

The Request Selection window opens.

5. Enter search criteria, and then click **List**.
6. In the **Query Results** field, select the request to add to the release.

7. Click **Add**.

If there are any referenced entities, you are prompted to indicate whether to include or exclude them.

8. Click **Close**.
9. In the Release window, click **Save**.

## Adding Requests Through the Requests Window

Users can only add requests to an open release. Once the release reaches the code freeze or closed state, requests can only be added through the Release window by the release manager.

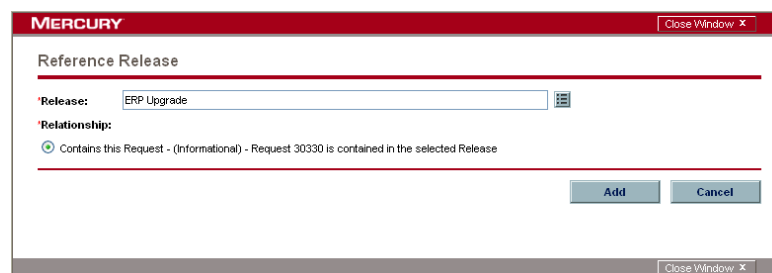

To add a request to a release:

1. From the Dashboard, open a request.
2. In the request, select the References section.
3. In the **New Reference** field, select **Release**.
4. Click **Add**.

The Reference Release window opens.

5. Use the **Release** field to select a release.

The **Release** field displays only the releases that the release manager has opened.

## Verifying Releases

After you assemble a release (packages, requests, and dependencies), verify that the release is properly configured.

To verify your release:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Releases**.

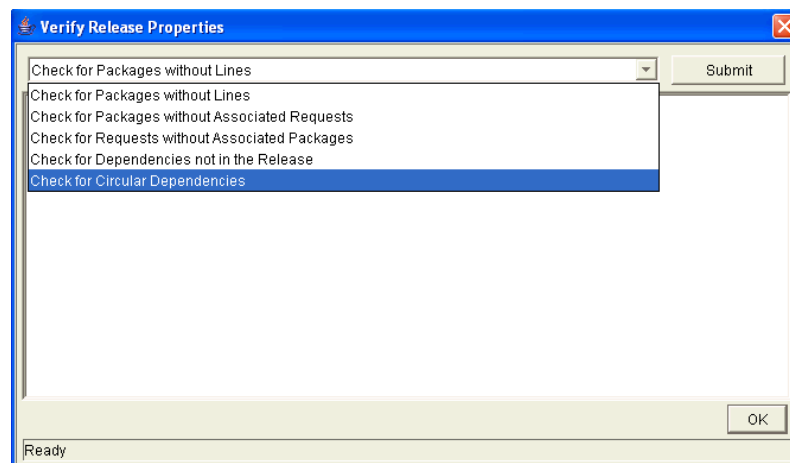

The Release Workbench opens.

2. Open a release.

The Release window opens to the **Packages** tab.

3. Click **Verify**.

The Verify Release Properties window opens.

4. In the list at the top of the window, select one of the following options:

- **Check for packages without lines**
- **Check for packages without associated requests**
- **Check for packages without associated packages**
- **Check for dependencies not in the release**
- **Check for circular dependencies**

5. Click **Submit**.

Any errors are reported in the window.

6. After you examine the results, click **OK**.

## Creating Distributions

A distribution is a deployment of a release. In a distribution, the release manager specifies the workflow to control the release process and specifies which release packages to include.

To create a distribution:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Releases**.

The Release Workbench opens.

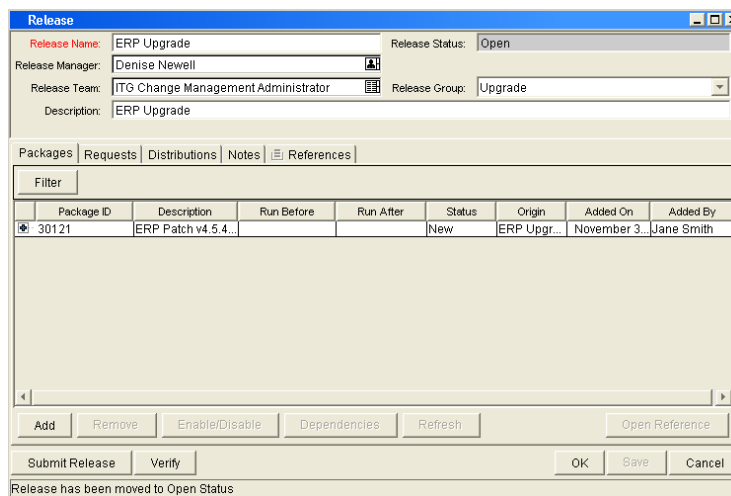

2. Open a release.

The Release window opens.

3. Click **Open Release**.

This enables the **Distributions** tab.

4. Click the **Distributions** tab.

5. Click **New**.

The Distribution window opens.

6. Enter the new distribution name and description.

7. Select the workflow for this distribution to follow.

8. Select any packages that you want to disable, and then click **Enable/Disable**.

The names of disabled packages are displayed in italic text.

9. Click **Submit Release**.

The distribution runs through the workflow specified. The release begins to run through the assigned workflow.

## Enabling/Disabling Package Lines in a Distribution

To disable a package line in a distribution:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Releases**.

The Release Workbench opens.

2. Open a release.

The Release window opens.

3. Click the **Distributions** tab.

4. Click the **Package Status** tab.

5. Locate the package line that you want to disable.

6. To display all of the packages, click **Run Groups**.

Note that you may have to change your filter to see the package you want.

7. Select the package line to disable.

You can disable an entire package. Disabling a package line in an active run group (within a package-level subworkflow) cancels the package line.

8. Click **Disable**.

The name of the disabled package line is displayed in italic text.

If you disable a package line in an active run group, you cannot re-enable the package line until the run group completes. If the disabled package line was not in an active run group, you can re-enable it immediately.

## Running Distributions through a Workflow

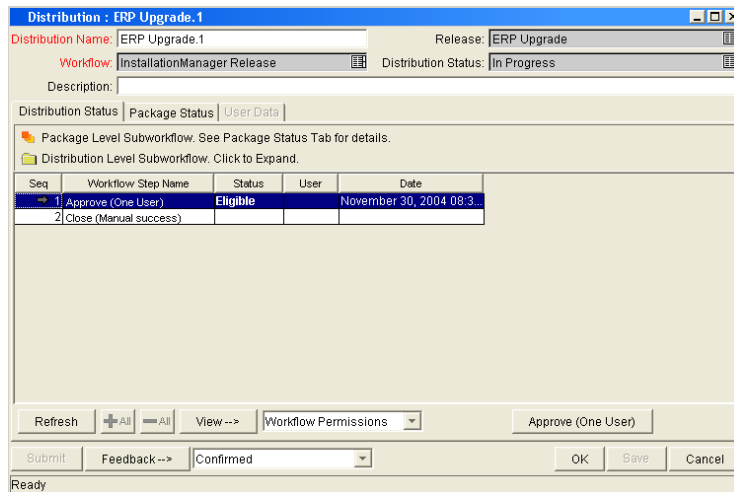

The last step involved in creating a release is running the release through a Deployment Management workflow. This involves running any decisions, commands, token evaluations, or other tasks for the entire distribution.

Processing the distribution requires that you process steps on both the **Distribution Status** and **Package Status** tabs.

### *Processing Distribution Steps*

Active workflow steps appear in bold text. Select the active line and click **Action** to process that workflow step. On the **Distribution Status** tab, you can expand and act on all distribution steps (including distribution-level subworkflow steps). To process package lines, you must use the **Package Status** tab.

Figure 6-7. Distribution Status tab

## Processing Package Lines

Package lines can be processed individually or in groups. Package lines that are available for your action appear in bold text. Select an active package line and click **Action** to process that individual workflow step.

Release management provides a convenient interface for processing groups of package lines (in the same workflow step) simultaneously. This is done by viewing and selecting the package statuses.

To select all package lines within a workflow step of a particular status:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Releases**.

The Release Workbench opens.

2. Open a release.

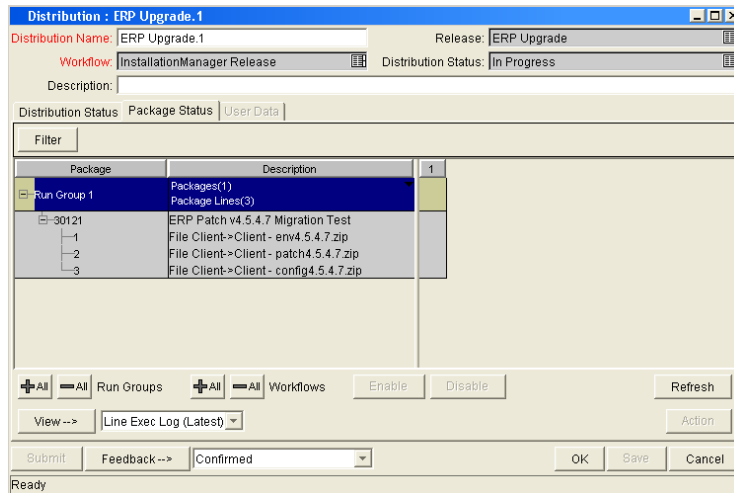

The Release window opens.

3. Select the **Distributions** tab.

4. Click the **Package Status** tab.

5. Expand all run groups and workflows.

6. To display a status summary of all the package lines in each workflow step, in the Description column, click the plus character (+).

7. Select the summary.

Again, items that are available for your action appear in bold text. When you select the summary, all package lines in that state are automatically selected. You can deselect individual items using **Ctrl + click**.

8. Click **Action** to process all of the selected package lines.
9. Proceed to the next workflow step in the package process or distribution process (depending on your pre-configured process).

To view updates in the **Distribution Status** tab, click in the **Distribution Status**, and then click **Refresh**.

## Completing Distributions

When the distribution completes and the workflow closes, a value can be returned to the Ready for Release workflow steps. Those packages can then continue to process based on that validation. That value is sent by clicking **Feedback** in the Distribution window.

  - *Overview of Environment Refresh*
    - *Overview of Configuring Environment Refresh*
    - *Opening the Environment Refresh Workbench*
    - *Configuring General Information for Environment Refreshes*
-

## Overview of Environments

When migrating objects, Mercury Deployment Management logs onto remote computers in the same way any other user would (using FTP, SCP, SSH, or Telnet). Mercury Deployment Management can log on using any existing username and password. However, Mercury recommends that you generate a new user on each computer that Mercury Deployment Management is to access. This helps to clarify the setup and relieve some administrative burden.

Make sure that you have full access to the `<ITG_Home>` directory on the Mercury IT Governance Server as well as the correct read and write permissions on other required directories. In addition, on Windows servers, the Administrators group must have read access to the Mercury IT Governance Server home directory. Any Windows server that Mercury Deployment Management will access should have been configured as described in *System Administration Guide and Reference*.

## Environment Connection Protocols

The communication protocol that will be used to connect to the server or client must be specified in the environment. This protocol will be used by commands to connect to source and destination environments in the deployment system. Work with the application administrator to determine which connection protocols are supported at your site for the machines housing the deployment environments.

Mercury Deployment Management supports the following connection protocols:

- Telnet
- SSH
- SSH2

## Environment Transfer Protocols

The transfer protocol that will be used to transfer files to the server or client must be specified in the environment.

Mercury Deployment Management supports the following transfer protocols:

- FTP
- FTP (active)
- FTP (passive)
- Secure Copy
- Secure Copy 2

### *Transfer Protocol Configuration Notes*

Choose the transfer protocol best suited to the business and technology needs. Consider factors related to security and performance when selecting the transfer protocol. Work with the application administrator to determine which connection protocols are supported for the machines housing the deployment environments. The following list provides some suggestions for when to use the above protocols.

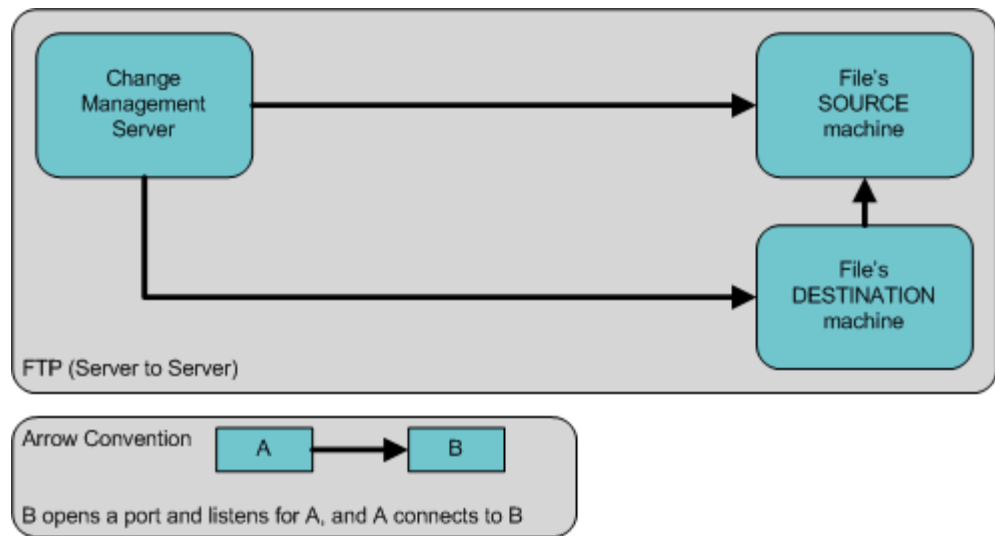

No additional product configuration is required to enable one FTP mode over another. Application administrators need to consider their FTP server configuration (particularly as they relate to security and firewall settings) when selecting an FTP protocol for transferring data.

### *Selecting the FTP Protocol*

The following capabilities must be enabled on the source and destination machines for the following FTP protocol selection to function properly.

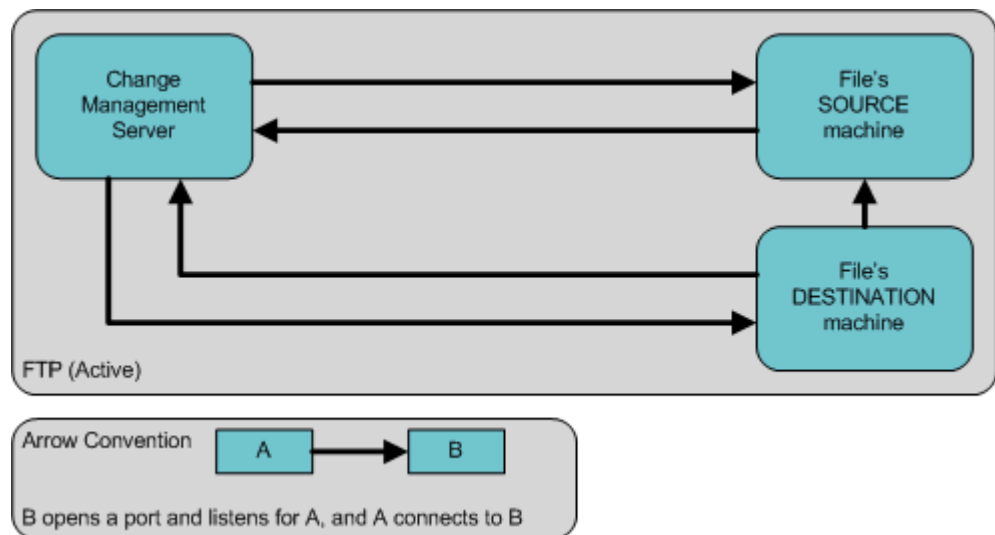

- FTP (server to server). See *Figure 7-1*.
  - Either the source or the destination environment needs to allow outgoing connections to a third party
  - FTP PORT command must be enabled on one of the environments
  - FTP PASV command must be enabled on the other environment

Figure 7-1. FTP (server to server)

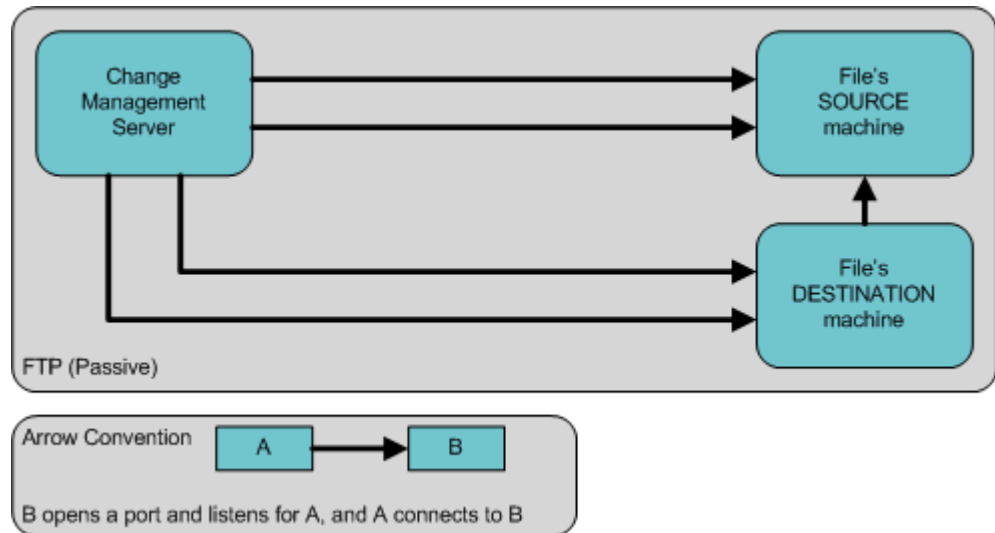

- FTP (active). See [Figure 7-2](#).
  - PORT command must be enabled on both the source and destination environments (allows outgoing back to the requestor)

Figure 7-2. FTP (active)

- FTP (passive). See *Figure 7-3*.
  - PASV must be enabled on both the source and destination environments. In this configuration, the Mercury Deployment Management server sends a command to the source or destination instructing that environment to open a port. The Mercury Deployment Management server then connects to that port.

*Figure 7-3. FTP (passive)*

## Overview of Configuring Environments

Environments are configured in the Environments window. Some of the information entered on the Environments window can be gathered from the appropriate Workflow Step Worksheets (see *Figure 7-4*).

Figure 7-4. Worksheet and Environments window

## Execution Workflow Step Worksheets

Table A-2. Workflow step [execution]\_step number \_\_\_\_\_

	Value
Step Name	
Goal / Result of Step	
Validation*	
Execution Type**	
Processing Type	
Transfer Group	
Source Environment (Group)	
Dest Environment (Group)	
Security (only can act on step):	
= User Name	
= Standard Token	
= User Defined Token	
Include Notification (Yes/No)	
Notification Event	
Notification Recipient:	
= Username	
= Email Address	
= Security Group	
= Standard Token	
= User Defined Token	
Notification Message	
Request Status at Step	
Request % Complete at Step	
Authentication Required (Y/N)	
Authentication Type (if Y)	

The following lists the major section found in the Environments window:

- General information.** General information includes basic information concerning the environment, such as the environment name and description. See [Configuring General Information for Environments on page 202](#).
- Host.** The **Host** tab defines basic information about the client, server, and database for the environment. The fields for the client and server sections are identical. See [Creating Environments on page 202](#).
- Applications.** Every Mercury Deployment Management environment can contain its own set of applications. See [Using Application Codes Environments on page 206](#).
- Extension Data.** Mercury Deployment Management Extensions requires specially configured environments. If Mercury Deployment Management Extensions products are not installed, the **Extension Data** tab is disabled.

- **Ownership.** Configure who can edit the environment. See *Setting Ownership and Participants for Environments* on page 211.
- **User Access.** Configures participants of the environment. Participants can then be given specific access rights to the environment. See *Adding Participants to Environments* on page 213.
- **User Data.** Product entities such as packages, workflows, requests, and projects include a set of standard fields that provide information about those entities. While these fields are normally sufficient for day to day processing, user data fields provide the ability to capture additional information specific to each organization. User data is defined under the **User Data** tab. If there are no user data fields, the **User Data** tab is disabled.

## Opening the Environments Workbench

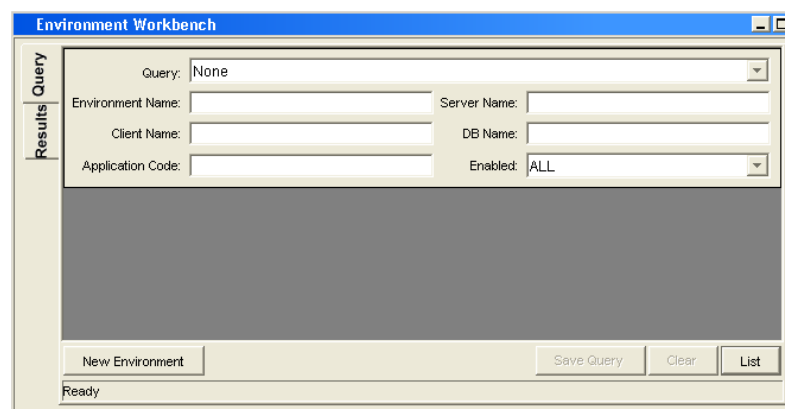

To open the Environments Workbench:

1. Log on to Mercury IT Governance Center.
2. From the menu bar, select **Administration > Open Workbench**.

The Workbench opens.

3. From the shortcut bar, select **Environments > Environments**.

The Environments Workbench opens.

## Configuring General Information for Environments

To configure the general information of an environment:

1. From the Workbench shortcut bar, select **Environments > Environments**.

The Environments Workbench opens.

2. Open an environment.

The Environment window opens.

3. Complete the fields as specified in the following table:

Field Name	Description
Environment Name	The name of the environment.
Location	The location of the environment. For example, In the server room.
Description	A brief description of how the environment is being used.
Enabled	To make the environment available to the system, select <b>Yes</b> .

4. Click **OK**.

## Creating Environments

To define a new environment:

1. From the Workbench shortcut bar, select **Environments > Environments**.

The Environments Workbench opens.

2. Open an environment.

The Environment window opens to the **Hosts** tab. The **Hosts** tab has the following three sections:

- **Server**
- **Client**
- **Database**

t

3. Complete the fields in the **Server** section as specified in the following table:

Field Name	Description
Name	The DNS name or IP address of the computer.
Type	A list of supported server/client operating systems. Should be set to the operating system for the computer defined in the <b>Name</b> field.
Username	The username that Mercury Deployment Management uses to log on to the server/client to transfer files or execute commands. If that user account was generated on the local machine, this is "Mercury ITG."
Password	The password for the given username. The password is hidden. You can change it by clicking the button to the right of the field.
NT Domain	The domain name to use if this is a Window Server.
Base Path	The path for applications on this computer. In many instances, this is the home directory of the defined username. When Mercury Deployment Management transfers a file or executes a command on this server, it logs in and changes directories to this base path before proceeding. Use forward slash characters (/) as directory separators, even for Windows systems.

Field Name	Description
Connection Protocol	The protocol to be used for server or client connections. SSH is a secure connections protocol, whereas Telnet is not. In order to use SSH as your connection protocol, you must first set up SSH on the destination machine.
Transfer Protocol	The protocol to be used for moving files between various clients and servers. SCP is a secure transfer protocol, whereas FTP is not. In order to use SCP as your transfer protocol, you must first set up SCP on the destination machine.
Enable Server	Make the server information available to the system. Select the checkbox to make the server information available to the system.

4. Complete the fields in the **Client** section as specified in the following table:

Field Name	Description
Name	The DNS name or IP address of the computer.
Type	A list of supported server/client operating systems. Should be set to the operating system for the computer defined in the <b>Name</b> field.
Username	The username that Mercury Deployment Management uses to log onto the server/client in order to transfer files or execute commands. This will usually be "Mercury ITG" if that user account has been generated on this computer.
Password	The password for the given username. The password is hidden, and can be changed by clicking the button to the right of the field.
NT Domain	The domain name to use if this is a Window Server.
Base Path	The path for applications on this computer. In many instances, this is the home directory of the defined username. When Mercury Deployment Management transfers a file or executes a command on this server, it logs in and changes directories to this base path before proceeding. Note that the directory separators should utilize forward slashes ('/'), even for Windows systems.

Field Name	Description
Connection Protocol	The protocol to be used for server or client connections. SSH is a secure connections protocol, whereas Telnet is not. To use SSH as your connection protocol, you must first set up SSH on the destination machine.
Transfer Protocol	The protocol to be used for moving files between various clients and servers. SCP is a secure transfer protocol, whereas FTP is not. In order to use SCP as your transfer protocol, you must first set up SCP on the destination machine.
Enable Client	Make the client information available to the system. Select the checkbox to make the client information available to the system.

5. In the Environment window, in the **Database** section, enter the database server type in the **Server Type** field.

- If **Oracle Server** is selected, complete the fields as specified in the following table:

Field Name	Description
Host Name	The DNS name or IP Address of the system running the Oracle database instance.
Connect String	The Oracle SQL*NET connection string used to connect to this database from a remote system. This is usually the same as the Oracle SID.
User Name	The username for the schema in the database that will be used by Mercury Deployment Management to make remote database connections.
Password	The password for the given username. The password is hidden, and can be changed by clicking the button to the right of the field.
Oracle SID	The SID of the database. This is used in conjunction with the Port Number for Environment Comparison reporting.
Port Number	The port number of the TNS Listener database. Used for Environment comparison reporting.
DB Link	Reference to a remote Oracle database, if applicable.
Version	The Oracle version number for this database. Used for reporting purposes.
Enable Database	Make the database information available to the system. Select the checkbox to make the database information available to the system.

- If **SQL Server** is selected, complete the fields as specified in the following table:

Field Name	Description
Server Name	The DNS name or IP Address of the system running the SQL database.
DB Name	The DB name used by Mercury Deployment Management when connecting to the SQL database.
User Login	The login ID used by Mercury Deployment Management when connecting to the SQL database.
Password	The password for the given login ID.
Port Number	The port number of the database. Used for Environment comparison reporting.
Version	The SQL version number for this database. Used for reporting purposes.
Enable Database	Make the database information available to the system. Select the checkbox to make the database information available to the system.

6. Click **OK**.

## Using Application Codes Environments

Complex environments are often segmented into subsections called environment applications. The environment information consists of the default set of attributes for an environment. It is rare, however, that an actual environment could be described simply by this set of defaults. For example, files belonging to different applications may reside at different paths and may be owned by different users. SQL scripts may need to be run against a different schema than the one defined on the **Host** tab.

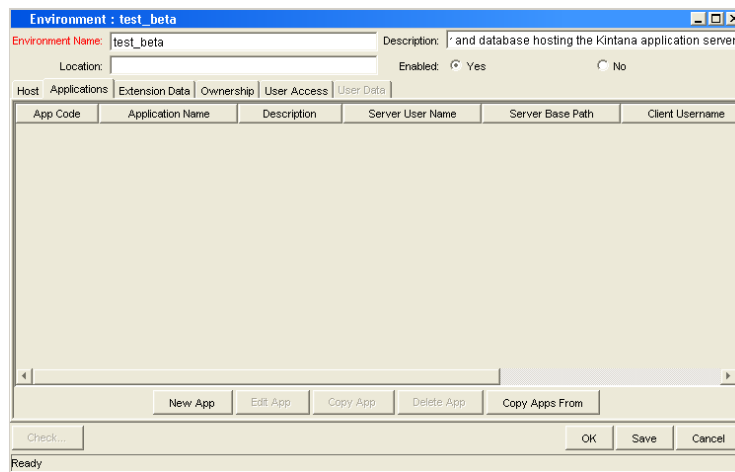

When adding a line to a package, there is the option of choosing the application code to specify the application that the migration object belongs to. When that object is subsequently migrated, the application-specific environment items are referenced in place of the default environment items. As a general rule, any application specific environment item that has no value is substituted by the corresponding environment value.

**Environment User Data** fields are inherited by each application code and are displayed on the application code's **User Data** tab. **Application Code User Data** fields behave like other application code fields (such as host name and base path), in that blank field values indicate that the application code has the same

value as its parent environment. Therefore, required **Environment User Data** fields are not also required at the application code level.

Each environment can contain its own set of applications. The **Applications** tab in the Environment window is shown in *Figure 7-5*.

*Figure 7-5. Applications tab*

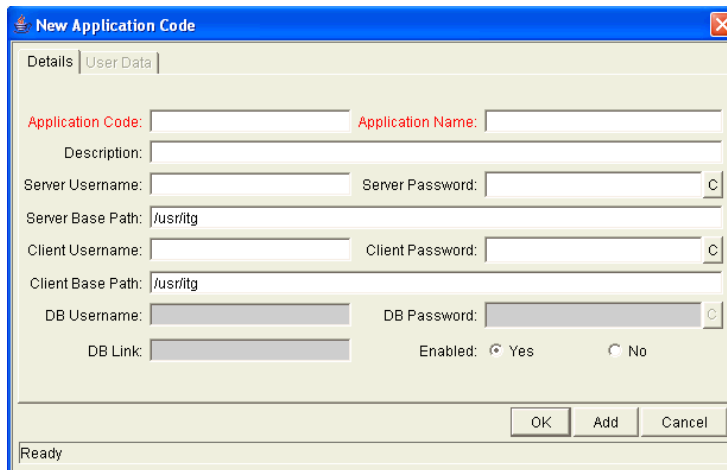

The **Applications** tab consists of the various fields and buttons shown in the *Figure 7-5*. Application fields do not always have to be populated. Click **New App** to open the New Application Code window, where a new application code can be defined.

To define the application codes:

1. From the Workbench shortcut bar, select **Environments > Environments**.  
The Environments Workbench opens.
2. Open an environment.  
The Environment window opens.
3. Click the **Applications** tab.
4. Click **New App**.

The New Application Code window opens.

5. Complete the fields in the New Application Code window as specified in the following table:

Field Name	Description
App Code	Short name abbreviation for the application.
Application Name	Long name for the application.
Description	A description of the application.
Server User Name	User name that Mercury Deployment Management should log on as when transferring files or running commands on the environment server for this application, if it is different from the default server username.
Server Password	Password for logging on to the server, if different from the default server password. This field is encrypted.
Server Base Path	Base path for the application on the server machine.
Client User Name	User name that Mercury Deployment Management should log in as when transferring files or running commands on the environment client for this application, if different from the default client name.
Client Password	Password for logging on to the client, if different from the default client password. This field is encrypted.
Client Base Path	Base path for the application on the client machine.
DB Username	Database username for the application. It is used when running database level commands (such as SQL scripts) for this application.

Field Name	Description
DB Password	Database password for the application. It is used when running database level commands (such as SQL scripts) for this application. This field is encrypted.
DB Link	Name of the database link for this application, if different from the default environment database link.
Enabled	Indicates whether this application environment is enabled.

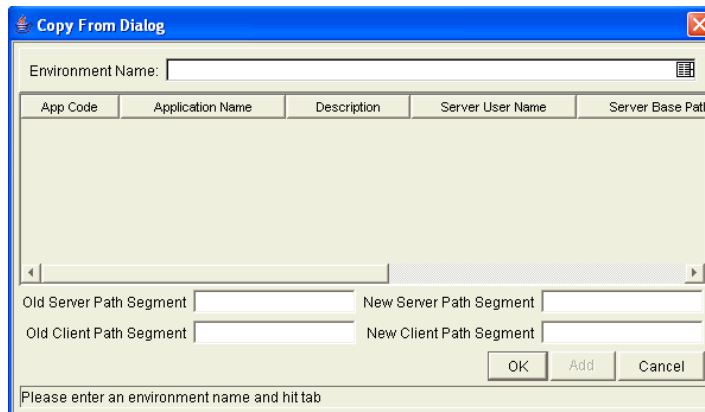

6. Click **OK**.
7. From the **Applications** tab, click **OK**.

### *Copying Application Codes from Other Environments*

When generating a new environment, all or some of the applications attached to an existing environment can be copied to the new environment to speed up the setup process.

To copy the application codes:

1. From the Workbench shortcut bar, select **Environments > Environments**.  
The Environments Workbench opens.
2. Open an environment.  
The Environment window opens.
3. Click the **Applications** tab.
4. Click **New App**.  
The New Application Code window opens.
5. Click **Copy Apps From**.  
The Copy From Dialog window opens.

6. In the **Environment Name** field, select the environment from which to copy the applications.

The application code names are listed.

7. To change the base path segment of all the application codes selected, enter the old server and client base path segment and the new server and client base path segment in their respective fields.
8. Select all the applications to copy.
9. Click **Add**.

These fields have, by default, the server or client base path of the environment from which the applications are being copied. For example, suppose that two applications have been selected. The server base paths for these two applications are `/u2/apps/isi` and `/u2/apps/demo_107`. To change `u2` to `u3`, enter `u2` in Old Server Base Path and `u3` in New Server Base Path before you copy these applications. Every occurrence of the old server and client base path segment is changed to the new base path segment in all the selected applications. The changes will be reflected in the applications in the environment into which they were copied.

10. After copying the application codes, any necessary modifications such as adding additional applications, deleting applications, or editing any of the applications can be made.
11. Click **OK**.

## Setting Ownership and Participants for Environments

Ownership groups are defined by adding security groups to the **Ownership** tab. If no ownership groups are associated with the entity, the entity is considered global and any user who can edit environments can edit, copy or delete the environment. For more information about access grants, see the document *Security Model Guide and Reference*.

If a security group is disabled or loses its ability to edit environments, that group can no longer edit the entity.

### *Adding Ownerships to Environments*

To add an ownership:

1. From the Workbench shortcut bar, select **Environments > Environments**.
2. Open an environment.

The Environment window opens.

3. Click the **Ownership** tab.

Security Group	Description
ITG Administrator	Provides ITG Administrator access grants
ITG Change Management Administrator	Provides administrative access to Change Management
ITG Demand Management Administrator	Provides administrative access to Demand Management
ITG Project Manager	Provides access to Projects, Project Templates, and Calendars
ITG Service Security Group	Used for itg_service user only - Please do not modify

4. Select the ownership option.
  - **All users with the Edit Environment Access Grant**
  - **Only groups listed below that have the Edit Environments Access Grant**

For **Only groups listed below that have the Edit Environments Access Grant**:

- a. Click **Add**.

The Add Security Groups window opens.

- b. Select the security groups and click **OK**.

The security groups are added to the **Ownership** tab.

5. From the **Ownership** tab, click **OK**.

### ***Deleting Ownerships from Environments***

To delete an ownership:

1. From the Workbench shortcut bar, select **Environments > Environments**.
2. Open an environment.

The Environments window opens.

3. Click the **Ownership** tab.
4. Select an ownership.
5. Click **Remove**.
6. Click **OK**.

## Adding Participants to Environments

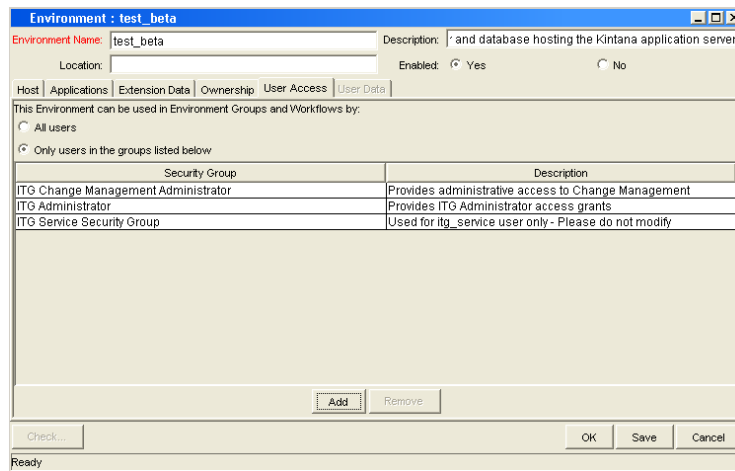

It is possible to control which users can access an environment for use in environment groups and workflows.

To add participants to the environment:

1. From the Workbench shortcut bar, select **Environments > Environments**.
2. Open an environment.

The Environment window opens.

3. Click the **User Access** tab.

4. Select one of the following options:

- **All Users**
- **Only Users in the groups listed below**

If you selected **Only Users in the groups listed below**:

- a. In the **User Access** tab, click **Add**.

The Add Security Group window opens.

- b. Select the security groups and click **OK**.

The security groups are added to the **User Access** tab.

5. From the **User Access** tab, click **OK**.

## ***Deleting Participants from Environments***

To delete participants from the environment:

1. From the Workbench shortcut bar, select **Environments > Environments**.  
The Environments Workbench opens.
2. Open an environment.  
The Environment window opens.
3. Click the **User Access** tab.
4. Select a participant to delete.
5. Click **Remove**.
6. Click **OK**.

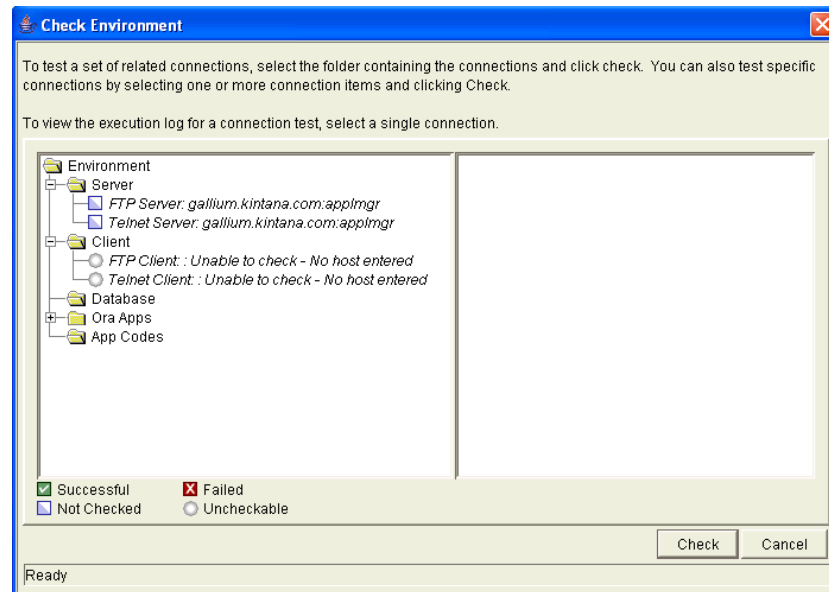

## **Environment Maintenance and Utilities**

This section provides information on validating and maintaining the environment definitions in Mercury Deployment Management.

## ***Testing Environment Setups***

To check the validity of the Environment:

1. From the Workbench shortcut bar, select **Environments > Environments**.
2. Open an environment.  
The Environment window opens.
3. Click **Check**.  
The Check Environment window opens.

4. Select the environment connections to check.

Select a folder, such as Server, to check all connections defined for that category. Specific connections can also be tested by selecting the individual checkboxes by the connection item.

5. Click **Check**.

The system verifies the environment definition. Results from the environment check commands are displayed in the Log File section of the Check Environment window. Use log file output to troubleshoot any connection problems identified during the environment check.

Environment definition testing includes actions performed during regular code migration, such as opening a Telnet session to the server, opening an FTP session to the server, and connecting to the database. While the environment checker cannot guarantee that all migrations will be successful, it can help catch some of the most common setup problems.

While the check process can take a significant amount of time, it is recommended that any new environment is checked once all the data for it is entered. Additionally, it is good practice to periodically check all environments to catch any obvious problems, such as changed passwords or disabled accounts.

6. In the Check Environment window, click **Cancel**.
7. In the Environment window, click **Cancel**.

## Mass Updates of Base Paths

It is possible to update server and client base path segments in the environment and all of its applications at the same time. This functionality is useful to relocate a particular environment and all of its applications onto a new disk or partition.

To perform a mass update of the base paths:

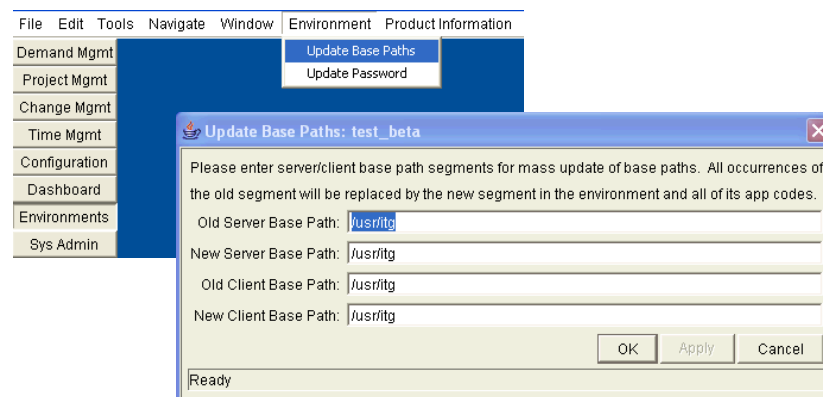

1. From the Workbench shortcut bar, select **Environments > Environments**.

2. Open an environment.

The Environment window opens.

3. From the Environment menu, select **Update Base Paths**.

The Update Base Path window opens.

4. Enter the old server/client base path segment and the new server/client base path segment in the fields provided.

The default value in the old server/client base path field is the environment's current server/client base path segment.

5. Click **Apply** or **OK**.

Every occurrence of the old server/client base path segment will be replaced by the new server/client base path segment in the Environment and all of its applications.

For example, suppose that two applications have been selected. The server base paths for these two applications are `/u2/apps/isi` and `/u2/apps/demo_107`. To change `u2` to `u3`, type `u2` in Old Server Base Path and `u3` in New Server Base Path before you copy these applications. Every occurrence of the old server/client base path segment is then changed to the

new base path segment in all selected applications. The changes are reflected in the applications in the Environment into which you copy them.

The Environment window opens.

6. Click **OK**.

## *Environment Password Management Utility*

A single user can have access to multiple password protected environments. It is often convenient to use a single username and password for all of the environments that a single user encounters. If the user decided to change their password or if that user's job functions were transferred to another user, it would take hours to update the environment passwords in each environment window.

The Environment Password Management Utility enables a user to update their password in all of the environments located on a single host, simultaneously. This utility only updates passwords with matching parameters, such as Hostname, Username, Old Password, and Connect String. These updates can be made using the Environments interface.

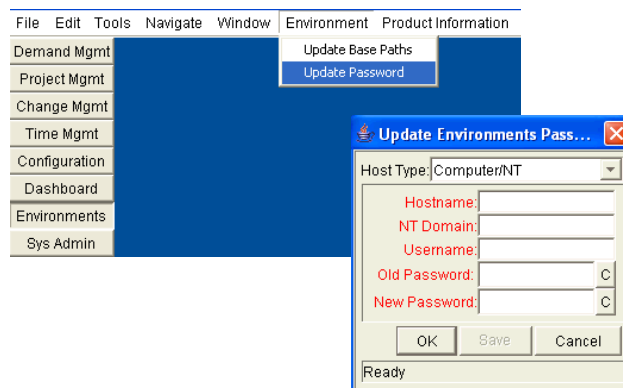

To change the environment password for a user:

1. From the Workbench shortcut bar, select **Environments > Environments**.
2. Open an environment.

The Environment window opens.

3. From the Environment menu, select **Update Password**.

The Update Environments Password window opens.

- In the **Host Type** field, select the host type.

The required fields change to match requirements of the selected host type.

- Complete the fields in the Update Environments Password window as specified in the following table:

Field Name	Description
Host Name	The DNS name or IP Address of the system running the Oracle database instance.
NT Domain	The domain name to use if this is a Window Server.
Username	The username for the schema in the database that will be used by Mercury Deployment Management to make remote database connections.
Old Password	The old password for the given username. The password is hidden, and can be changed by clicking the button to the right of the field.
New Password	The new password for the given username. The password is hidden, and can be changed by clicking the button to the right of the field.

- Click **OK**.

The Environment window opens.

- Click **OK**.

## Overview of Environment Groups

Environment groups define a set of environments which can be referenced as the source or destination for object migrations. Environment groups are defined and edited using the Environment Group Workbench.

Use environment groups where you want to execute a workflow step on multiple environments. For example, it may be necessary to migrate an object to multiple testing environments for different targeted tests. These multiple environments can be referenced together as one environment group (*Figure 7-6*).

Note

The `ksc_connect` command works with environment groups in the “At least one” mode. When the `ksc_connect` command attempts to connect to the first server in the environment group, and in case it fails to connect, then the `ksc_connect` command tries to connect to the second server in the environment group, and then the third, and so on. When the `ksc_connect` command does succeed in connecting to a server, the remaining commands in the object type are run before the command again tries to connect to the next server in the environment group. If the `ksc_connect` command fails to connect to all servers in the environment group, the command exits with a failure.

Figure 7-6. Environment group

## Overview of Configuring Environment Groups

Environment groups are configured in the Environment Group window. The following lists the main areas found in the Environment Group window:

- **Refresh Group Information.** General information includes basic information concerning the environment group, such as the environment group name and description. For more information, see *Opening the Environment Group Workbench* on page 220.
- **Environments.** Use the **Environments** tab to add existing Mercury Deployment Management environments to an environment group.
- **Host.** The **Host** tab lists basic information about the client, server, and database for the associated environments. For more information, see *Creating Environment Groups* on page 221.
- **Applications Codes.** The **Applications Codes** tab lists basic information about the application codes linked to the associated environments.
- **Serial Execution Order.** The **Serial Execution Order** tab displays the order in which environments are acted on. For more information, see *Setting the Order of Executions* on page 222.

- **Ownership.** Configure who can edit the environment group. For more information, see [Setting Ownership and Participants for Environment Groups](#) on page 223.
- **User Access.** Configures participants of the environment group. Participants can then be given specific access rights to the environment group. For more information, see [Adding Participants to Environment Groups](#) on page 225.

## Opening the Environment Group Workbench

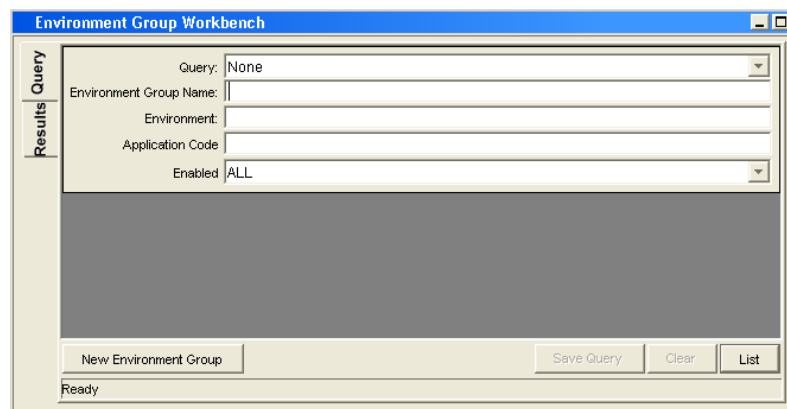

To open the Environment Group Workbench:

1. Log on to Mercury IT Governance Center.
2. From the menu bar, select **Administration > Open Workbench**.

The Workbench opens.

3. From the shortcut bar, select **Environments > Environment Groups**.

The Environment Group Workbench opens.

## Configuring General Information for Environment Groups

To configure the general information of an environment group:

1. From the Workbench shortcut bar, select **Environments > Environment Groups**.

The Environment Group Workbench opens.

2. Open an environment group.

The Environment Group window opens.

3. Enter the information specified in the following table:

Field Name	Description
Environment Group Name	The name of the environment group.
Enabled	Makes the environment available to the system. Select <b>Yes</b> to make the environment available to the system.
Description	A brief description of how the environment group is being used.
Execution Order	Indicates whether the environments associated with an environment group are executed in parallel order (all at once) or in a specific serial order. Enables the <b>Serial Execution Order</b> tab when <b>Serial</b> is selected.
Source Environment (No App Code)	Indicates the default environment selected when the environment group is used as the source environment in an execution workflow step with no application code specified.

4. To save the changes to the environment, do one of the following:

Click **OK** to save the changes and close the Environment Group window.  
 Click **Save** to save the changes and leave the Environment Group window open. Click **Cancel** to lose the changes and close the Environment Group window.

## Creating Environment Groups

To define a new environment group:

1. From the Workbench shortcut bar, select **Environments > Environment Groups**.

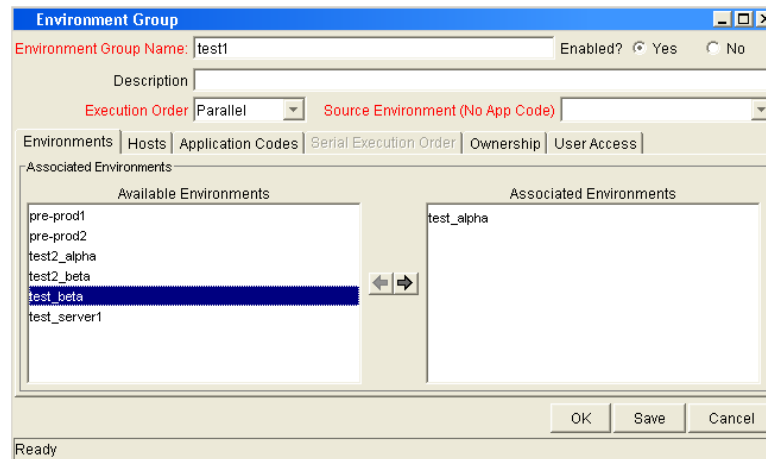

The Environment Group Workbench opens.

2. Open an environment group.

The Environment Group window opens to the **Environments** tab.

3. In the **Available Environments** field, select an environment name.
4. Click the right pointer.

The selected environment is moved to the **Associated Environments** field

5. In the **Environments** tab, click **OK**.

The changes to the environment group are saved.

## Setting the Order of Executions

The environments are executed in sequential order until all executions have completed. Each environment execution waits for the previous environment execution to complete (success or fail) before beginning.

To set the environment execution order:

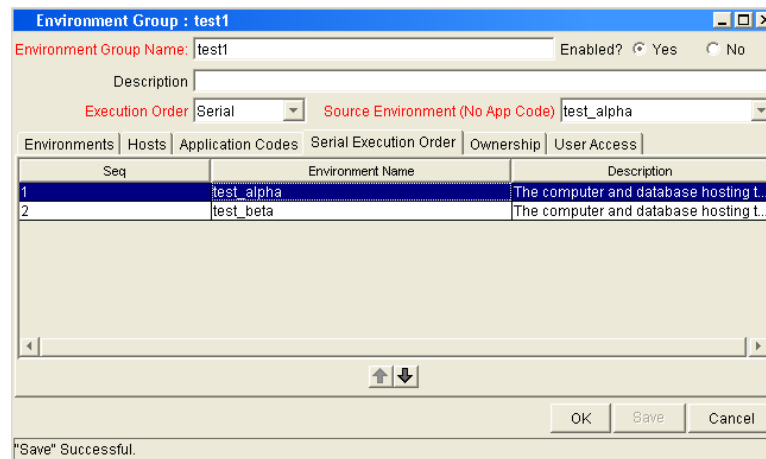

1. From the Workbench shortcut bar, select **Environments > Environment Groups**.

The Environment Group Workbench opens.

2. Open an environment group.

The Environment Group window opens.

3. Click the **Serial Application Order** tab.

4. Select a row to move.
5. To move the selected environment to a new sequence position, use the arrow pointers under the tab.
6. Click **OK**.

## Setting Ownership and Participants for Environment Groups

Ownership groups are defined by adding security groups to the **Ownership** tab. If no ownership groups are associated with an environment group, that environment group is treated as global, and any user who can edit environments for the entity can edit, copy or delete the entity. If a security group is disabled or loses the ability to edit environments, its members can no longer edit the environment group. For more information on access grants, see the document *Security Model Guide and Reference*.

### *Adding Ownerships to Environment Groups*

Different groups of users can have exclusive control over the environment groups used by their group. These groups are referred to as ownership groups. Members of the ownership group are the only users who can edit, delete or copy the environment group. Each environment group can be assigned multiple ownership groups.

Ownership groups are defined by adding security groups to the **Ownership** tab.

To set the ownership for an environment group:

1. From the Workbench shortcut bar, select **Environments > Environment Groups**.

The Environment Group Workbench opens.

2. Open an environment group.

The Environment Group window opens.

3. Click the **Ownership** tab.

Security Group	Description
ITG Administrator	Provides ITG Administrator access grants
ITG Change Management Administrator	Provides administrative access to Change Managem...
ITG Demand Management Administrator	Provides administrative access to Demand Managem...

4. Select the ownership option.

- **All user with the Edit Environments Access Grant**
- **Only groups listed below that have the Edit Environments Access Grant**

If **Only groups listed below that have the Edit Environments Access Grant** is selected:

- a. Click **Add**.

The Add Security Groups window opens.

- b. Select the security groups and click **OK**.

The security groups are added to the **Ownership** tab.

5. Click **OK**.

## Deleting Ownerships from Environment Groups

To delete an ownership:

1. From the Workbench shortcut bar, select **Environments > Environment Groups**.

The Environment Group Workbench opens.

2. Open an environment group.

The Environment Group window opens.

3. Click the **Ownership** tab.
4. Select the ownership to remove.
5. Click **Remove**.
6. Click **OK**.

## Adding Participants to Environment Groups

To add participants to the environment:

1. From the Workbench shortcut bar, select **Environments > Environment Groups**.

The Environment Group Workbench opens.

2. Open an environment group.

The Environment Group window opens.

3. Click the **User Access** tab.

The screenshot shows the 'Environment Group : test1' window. The 'Environment Group Name' is 'test1' and 'Enabled?' is set to 'Yes'. The 'Description' field is empty. The 'Execution Order' is set to 'Serial' and the 'Source Environment (No App Code)' is 'test\_alpha'. The 'User Access' tab is selected, showing a table of security groups that can be used in workflows. The table has two columns: 'Security Group' and 'Description'. The table lists three groups: 'ITG Change Management Administrator', 'ITG Demand Management Administrator', and 'ITG Service Security Group'. Below the table are 'Add' and 'Remove' buttons. At the bottom of the window are 'OK', 'Save', and 'Cancel' buttons. The status bar at the bottom left says 'Ready'.

Security Group	Description
ITG Change Management Administrator	Provides administrative access to Change Managem...
ITG Demand Management Administrator	Provides administrative access to Demand Managem...
ITG Service Security Group	Used for itg_service user only - Please do not modify

4. Under **This Environment Group can be used in Workflows by** field, select one of the following.

- To allow all users to edit this environment, select **All Users**.
- To allow only members of a listed security group to edit the environment, select **Only Users in the groups listed below**.

If you select **Only Users in the groups listed below**:

a. Click **Add**.

The Add Security Group window opens.

b. Select a security group and click **OK**.

The **User Access** tab displays the security group name.

5. Click **OK**.

### ***Deleting Participants from Environment Groups***

To delete participants from an environment group:

1. From the Workbench shortcut bar, select **Environments > Environment Groups**.

The Environment Group Workbench opens.

2. Open an environment group.

The Environment Group window opens.

3. Click the **User Access** tab.

4. Select a participant to delete, and then click **Remove**.

5. Click **OK**.

## Overview of Environment Refresh

Deployment Management enables controlled migration of software and application changes to various instances. Deployment Management maintains an audit trail of all this activity, providing visibility into the changes for each environment. There are, however, situations when you need to refresh an environment, essentially replacing that environment with a physical copy of another environment.

Figure 7-7. Example software migration

If a standard software migration is from a Development environment to a Test environment (see *Figure 7-7*) to a Production environment, you may want to periodically copy the Production environment into both the Development and Test environments. This activity would involve copying all objects at the file system and database level from Production into the Development and Test areas, producing mirror images of the Production environment. This refresh function synchronizes the environments, and moves additional production data into development and testing environments.

After using the refresh function, Deployment Management has the ability to update its audit history and its in-process Packages. This update is performed using Deployment Management's Environment Refresh Workbench functionality.

The environment refresh function in Deployment Management does not perform the actual physical refresh of one environment with another. It updates the Deployment Management data to be consistent with the refreshed physical occurrence.

Deployment Management's Environment Refresh performs the following functions:

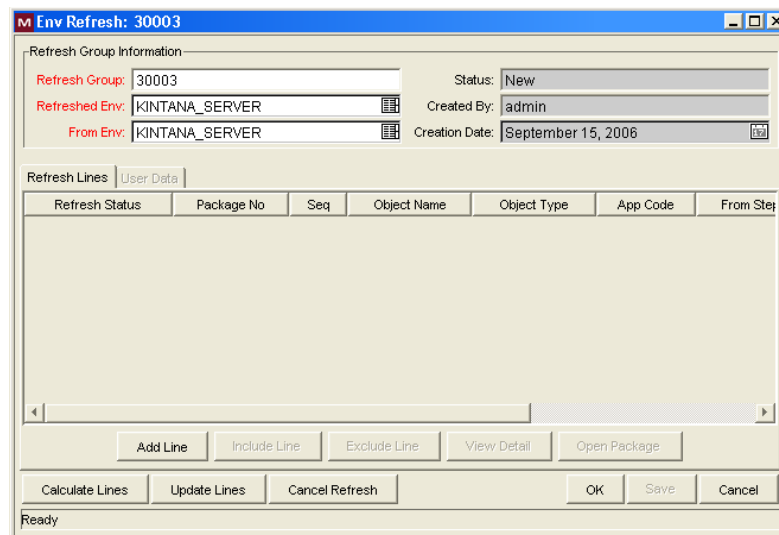

- Identifies open package lines that have migrated through the environment and are now inaccurate due to the software changes. In the example described in *Figure 7-7*, the refreshed environments would be Development and Test, while the source environment would be Production. After the physical refresh, these package lines will be inaccurate due to the software changes no longer being present in the refreshed environment.

- Updates the list of affected package lines as necessary, including adding or deleting lines from the list.
- Updates the Deployment Management internal object inventory tables to reflect the physical refresh. This copies the audit history from the source environment to the audit history of the refreshed environment. Since they are now physical matches of each other, their audit history should be the same.
- Updates the open package lines in the refresh list and resets them so they are eligible for migration into the refreshed environment again.

## Overview of Configuring Environment Refresh

Environment refresh consists of an Environment Refresh window. Typically, environment refreshes are performed as part of maintaining environments between test systems.

Figure 7-8. Environment refresh window

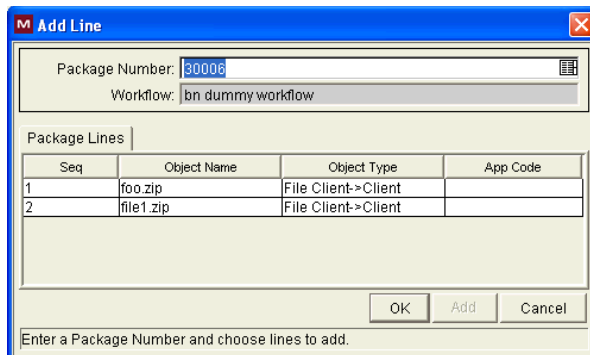

The following lists the major sections found in the Environment Refresh window:

- **Refresh Group Information.** General information stores the basic information for the refresh group, such as the names of the source and refreshed environment.
- **Refresh Lines tab.** The list of refresh lines includes basic information such as the package number and the line sequence as well as the refresh status of the individual line. In addition to viewing refresh line information, several actions can be performed from the **Refresh Lines** tab:
  - **Add Line.** Manually adds a new refresh line to the list of refresh lines for this refresh group. This command generates the list of lines to be updated (such as a replacement of the calculate lines action), and adds additional lines to the list that might not be picked up by the calculate lines logic.

When this action is selected, a prompt to add the refresh line information through the Add Line window appears (see [Figure 7-9](#)). In this window, enter a package number and select one or more package lines.

This action can only be performed before the refresh group has been processed.

*Figure 7-9. Add Line window*

- **Include Line and Exclude Line.** Use **Include Line** and **Exclude Line** to change the status of each individual refresh line on the list before the refresh group has been updated. All refresh lines are originally marked with a refresh status of **Pending**. When a refresh group is actually processed, using **Update Lines**, all lines in the list with a status of **Pending** are updated. Any refresh lines with a status of **Exclude** are not processed and are only used for reporting purposes.

This action can only be performed before the refresh group has been processed.

- **View Detail.** If a single refresh line is selected in the list, certain details regarding the refresh line can be viewed. Use this action to open up a read-only Line Detail window to view the information.
- **Open Package.** For the complete details on the refresh line and the parent package, select a single line and click **Open Package** to navigate to the Package window and automatically open up the appropriate package. Then view the complete package as well as perform any eligible package activities.
- **User Data tab.** Each Deployment Management implementation can add custom fields that are common to all refresh groups. These new user data fields essentially become additional refresh group header data. These fields are normally determined during initial system configuration. As part of the configuration, the layout of the fields is determined. This configuration includes:
  - The look and feel of the field (whether the field is a drop down menu or auto-complete or free form text)
  - The logic behind the field (how is the information in the field validated)
  - Graphic characteristics (such as field height and width and placement in the tab)

## Opening the Environment Refresh Workbench

To open the Environment Refresh Workbench:

1. Log on to Mercury IT Governance Center.
2. From the menu bar, select **Administration > Open Workbench**.

The Workbench opens.

3. From the shortcut bar, select **Deployment Mgmt > Environment Refresh**.

The Environment Refresh Workbench opens.

## Configuring General Information for Environment Refreshes

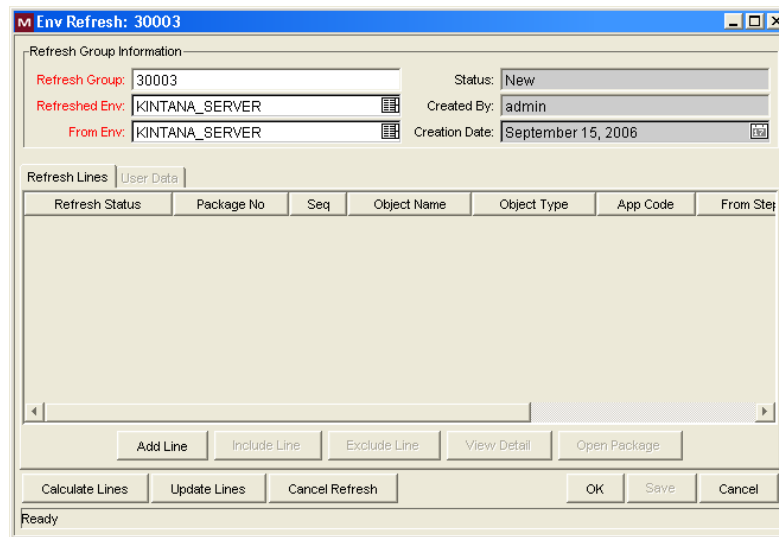

To configure the general information of an environment refresh:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Environment Refresh**.

The Environment Refresh Workbench opens.

2. Click **New Env Refresh** to open the Environment Refresh window.

The Environment Refresh window opens.

3. Fill in the following information:

- **Refresh Group.** Automatically filled-in.
- **Refreshed Env.** Select the destination environment to be refreshed.
- **From Env.** Select the source environment.

4. Click **Calculate Lines**.

This action is non-reversible. Once performed, the status of the refresh group is changed to Completed.

This action queries all open package lines and generates a list of lines that have been migrated to the environment being refreshed but not to the source environment. (After the physical refresh, these package lines will be inaccurate because the software changes are no longer present in the refreshed environment). This action only looks for packages using workflows containing both the source and refreshed environment.

All package lines matching this criteria will be added to the package lines list for the refresh group.

If the refresh group already contains a list of package lines, this list will be deleted before the new calculation of eligible lines is performed.

Clicking **Calculate Lines** can only be performed if the status of the refresh group is New or Open (which means that no updates have been performed). If the original status of the group was New, the status is updated to Open once the package lines are added.

5. Click **Update Lines**.

This action is non-reversible. Once performed, the status of the refresh group is changed to Completed.

Once all the appropriate package lines have been added to the lines list and reviewed, this action is used to perform the actual update of the Deployment Management data. This action performs two activities:

- The Deployment Management internal object inventory tables are updated to reflect the physical refresh. This copies the audit history from the source environment to the audit history of the refreshed environment. Since they are now physical matches of each other, their audit history should be the same.
- All package lines in the refresh lines list that have a refresh status of Include are reset to be eligible for migration into the refreshed environment again. This is done using special workflow transitions from the currently eligible step to the migration step for the refreshed environment. This allows all the changes that were erased during the physical refresh to be easily migrated back into the environment. After each refresh line is updated, its refresh status is updated to Completed.

## 6. The refresh status is now completed.

For refresh groups with a status of New and Open, it is possible to cancel the environment refresh. To cancel the environment refresh, click **Cancel Refresh**. This sets the status of the refresh group to Cancel, preventing any further action on the refresh group but allowing the details of the specific refresh group to be queried.

## ***Configuring a Workflow with an Environment Refresh***

For this example Development and Test are two IT Governance servers.

To create a workflow environment refresh:

1. From the Workbench shortcut bar, select **Configuration > Workflows**.

The Workflows Workbench opens.

2. Click **New Workflow** to open a new workflow.

A Workflow window opens.

3. In the Workflow window, fill in the required information.
4. In the Workflow window, select the **Layout** tab.

5. From the Workflow Step Sources window, drag a Deployment Management execution step onto the **Layout** tab.

The Workflow Step window opens.

6. In the Workflow Step window, complete the required fields.

- Type **DeveLopment** in the **Source Environment** field.
- Type **test** in the **Dest Environment** field.

7. From the Workflow Step Sources window, drag another Deployment Management execution step onto the **Layout** tab.

The Workflow Step window opens.

8. In the Workflow Step window, complete the required fields.

- Type **test** in the **Source Environment** field.
- Type **DeveLopment** in the **Dest Environment** field.

9. Add a transition from the first Deployment Management execution step to the second Deployment Management execution step.

The Step Transitions window opens.

10. Complete the information in the Step Transitions window.

11. From the Workflow Step Sources window, drag a Deployment Management Close step onto the **Layout** tab.

The Workflow Step window opens.

12. In the Workflow Step window, complete the required fields.

13. Add a transition from the second Deployment Management execution step to the Deployment Management Close step.

The Step Transitions window opens.

14. Complete the information in the Step Transitions window.

15. Save and close the workflow.

## ***Configuring a Package with an Environment Refresh***

To create a package environment refresh:

1. From the Workbench shortcut bar, select **Deployment Mgmt > Packages**.

The Package Workbench opens.

2. Click **New Package** to open a new package.

The Package window opens.

3. Fill in the required Package information.

- Select the Workflow configured in *Configuring a Workflow with an Environment Refresh*.

4. In the Package window, click **New Line** to add a line to the package.

The Add Line window opens.

5. In the **Object Type** field, select **File Migration**.

6. In the Add Line window, complete the remaining fields.

7. Click **Submit** and run the package through to completion.

It might be necessary to manually set the override status to Succeed in the **Status** tab.

## **Configuring Notification Templates**

---

### **In This Chapter:**

- *Overview of Notification Templates*
  - *Opening the Notification Template Workbench*
    - *Deleting Notification Templates*
  - *Creating Notification Templates*
    - *Configuring Ownership of Notification Templates*
    - *Deleting Ownerships from Notification Templates*
  - *Configuring Notification Intervals*
  - *Checking the Usage of Notification Templates*
-

## Overview of Notification Templates

Notification templates are pre-configured notifications that can be used to quickly construct the body of your message (see *Figure 8-1*). Notification templates are used with the following Mercury IT Governance Center entities:

- Tasks
- Projects
- Requests
- Packages
- Releases
- Workflows
- Reports

Figure 8-1. Notifications Template window

Notification Template : Standard Message

Template Name: Standard Message

Notification Scope: Packages

Notification Format: Plain Text

Enabled:  Yes  No      Default:  Yes  No

From:   Choose... Clear

Reply To:   Choose... Clear

Subject: IT Governance - Change Management Alert

Body:

Description: [PKG.DESCRPTION]

Workflow: [WF.WORKFLOW\_NAME]

Workflow Step: [WFS.STEP\_NO]. [WFS.STEP\_NAME]

Priority: [PKG.PRIORITY\_NAME]

Available Tokens		Linked Tokens	
Token Name	Token	Col#	Token Name
Execution Batch ID	[WST.EXECUTION_BATCH]	1	PKGL Seq
Hidden Status	[WST.HIDDEN_STATUS]	2	PKGL Object Name
Last Updated By	[WST.LAST_UPDATED_BY]	3	PKGL Object Type
Object Revision	[PKGL.OBJECT_REVISION]	4	Last Updated By
Object Type ID	[PKGL.OBJECT_TYPE_ID]		
Object Type Workbench URL	[PKGL.WORKBENCH_URL]		

Tokens    Used By    Ownership    OK    Save    Cancel

Ready (Read-Only, Seed Data)

## Opening the Notification Template Workbench

To open the Notification Template Workbench:

1. Log on to Mercury IT Governance Center.
2. From the menu bar, select **Administration > Open Workbench**.

The Workbench opens.

3. From the shortcut bar, select **Configuration > Notification Templates**.

The Notification Template Workbench opens.

## Deleting Notification Templates

You can not delete notification templates that are referenced from an existing notification. To delete a notification template you must first remove these references. Referenced notification templates can be disabled. To see if a notification template is referenced, see *Checking the Usage of Notification Templates* on page 248.

## Creating Notification Templates

To create a new notification template:

1. From the Workbench shortcut bar, select **Configuration > Notification Templates**.

The Notification Template Workbench opens.

2. Click **New Notification Template**.

The Notification Template window opens.

Token Name	Token
Execution Batch ID	[MST.EXECUTION_BAT]
Hidden Status	[MST.HIDDEN_STATUS]
Last Updated By	[MST.LAST_UPDATED_BY]
Object Revision	[PKGL.OBJECT_REVISION]
Object Type ID	[PKGL.OBJECT_TYPE_ID]
Object Type Workbench URL	[PKGL.WORKBENCH_URL]

Col#	Token Name	Token
1	PKGL Seq	[PKGL.SEQ]
2	PKGL Object Name	[PKGL.OBJECT_NAME]
3	PKGL Object Type	[PKGL.OBJECT_TYPE]
4	Last Updated By	[MST.LAST_UPDATED_BY]

3. Enter the information specified in the following table.

Field Name	Description
Template Name	Enter the name of the new notification template.
Notification Scope	<p>Include the product section where this notification template is to be used. In the list, select one of the following:</p> <ul style="list-style-type: none"> <li>■ <b>Packages</b></li> <li>■ <b>Projects</b></li> <li>■ <b>Release Distribution</b></li> <li>■ <b>Reports</b></li> <li>■ <b>Request Field Changes</b></li> <li>■ <b>Requests</b></li> <li>■ <b>Task Dates</b></li> <li>■ <b>Task Exceptions</b></li> </ul> <p>The default notification scope is <b>Packages</b>. Selecting another notification scope changes the format of the notification template.</p>
Notification Format	<p>Include the format of the body of the notification. In the list, select one of the following:</p> <ul style="list-style-type: none"> <li>● <b>Plain Text</b></li> <li>● <b>HTML</b></li> </ul>
Enabled	Make the notification template available to the system. To make the notification available to the system, select <b>Yes</b> .
Default	Make the notification template the default notification template for the system. To make the notification template the default notification template, select <b>Yes</b> .

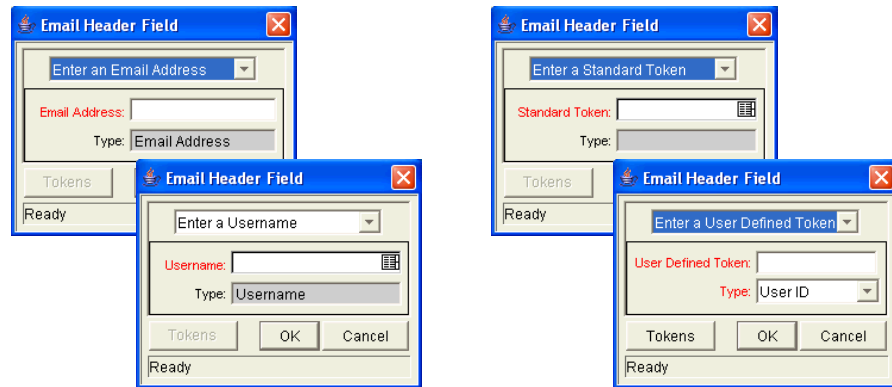

4. Enter a **From** address.

- a. In the Notification Template window, in **From**, click **Choose....**

The Email Header Field window opens.

- b. Select the recipient category.

The context-sensitive required field is dynamically updated to gather the necessary information for that category. For instance, if **Enter an Email Address** is selected from the list, then it is necessary to enter an Email Address. If you select **User Defined Token**, click **Tokens** to bring up a complete list of available tokens or type in a specific token.

- c. Enter the appropriate information in the required field.
  - d. If a user defined token has been entered, select the token type that corresponds to the evaluated token value.
  - e. In the Email Header Field window, click **OK**.
5. In the Notification Template window, enter a **Reply** address, as follows:
- a. Next to **From**, click **Choose**.  
 The Email Header Field window opens.
  - b. Select the recipient category.  
 The context-sensitive required field is dynamically updated to gather the necessary information for that category. For instance, if **Enter an Email Address** is selected, then it is necessary to enter an Email Address. If **User Defined Token** is selected, click **Tokens** to bring up a complete list of available tokens or type in a specific token.
  - c. Enter the information in the required field.
  - d. If **User Defined Token** is entered, select the token type that corresponds with the evaluated token value.
  - e. In the Email Header Field window, click **OK**.
6. In the **Body** field, enter the body of the notification text.

Make sure the format of the body of the notification is the same as specified in **Notification Format**. HTML notifications for Mercury Deployment Management must include the token '[NOTIF.NOTIFICATION\_DETAILS]' within the `<body>` tags to incorporate linked tokens.

Notification Template : Standard HTML Message

Template Name: Standard HTML Message

Notification Scope: Packages

Notification Format: HTML

Enabled:  Yes  No Default:  Yes  No

From:  Choose... Clear

Reply To:  Choose... Clear

Subject: IT Governance - Change Management Alert

Body:

```
<tr>
<td colspan="2">[NOTIF.NOTIFICATION_DETAILS]</td>
</tr>
</table>
```

Use the token [NOTIF.NOTIFICATION\_DETAILS] to include an HTML table of linked tokens for associated Package lines.

Available Tokens		Linked Tokens	
Token Name		Col#	Token Name
Execution Batch ID	[WST.EXEC	1	PKGL Seq
Hidden Status	[WST.HIDDI	2	PKGL Object Name
Last Updated By	[WST.LAST	3	PKGL Object Type
Object Revision	[PKGL.OBJI	4	Last Updated By

Tokens Used By Ownership OK Save Cancel

Ready (Read-Only, Seed Data)

7. In the **Body** field, add tokens to the body of the text.

To add tokens to the body of the notification template:

a. Click **Tokens**.

The Token Builder window opens.

b. Select a token.

c. In the **Token** field, copy the name of the token and paste the name in the **Body** field.

d. Click **Close**.

8. Configure the ownership of the notification template.

For detailed information about how to configure the ownership of the notification template, see *Configuring Ownership of Notification Templates* on page 244.

9. Click **OK**.

## Configuring Ownership of Notification Templates

Ownership groups are defined by adding security groups to the Ownership window. If no ownership groups are associated with the entity, the entity is considered global and any user with the edit access grant for the entity can edit, copy or delete it. For more information about access grants, see the document *Security Model Guide and Reference*.

If a security group is disabled or loses the edit access grant, members of that group can no longer edit the entity.

To configure the ownership of a notification template:

1. From the Workbench shortcut bar, select **Configuration > Notification Templates**.

The Notification Template Workbench opens.

2. Open a notification template.

The Notification Template window opens.

The screenshot shows the 'Notification Template : Standard HTML Message' window. It includes fields for Template Name, Notification Scope (Packages), Notification Format (HTML), and status options (Enabled, Default). The 'Body' field contains HTML code for a table. Below the body is a section for linking tokens, with two tables: 'Available Tokens' and 'Linked Tokens'.

Available Tokens		Linked Tokens		
Token Name		Col#	Token Name	Ti
Execution Batch ID	[WST.EXEC	1	PKGL Seq	[PKGL.SEQ]
Hidden Status	[WST.HIDDI	2	PKGL Object Name	[PKGL.OBJECT
Last Updated By	[WST.LAST	3	PKGL Object Type	[PKGL.OBJECT
Object Revision	[PKGL.OBJI	4	Last Updated By	[WST.LAST_UP

At the bottom of the window, there are buttons for 'Tokens', 'Used By', 'Ownership', 'OK', 'Save', and 'Cancel'. The status bar indicates 'Ready (Read-Only, Seed Data)'.

3. At the bottom of the window, click **Ownership**.

The Ownership window opens.

4. Select one of the following ownership options:

- **All users with the Edit Notification Template access grant**
- **Only groups listed below that have the Edit Notification Template access grant**

If **Only groups listed below that have the Edit Notification Template access grant** is selected:

a. Click **Add**.

The Add Security Groups window opens.

b. In the **Security Groups** field, select the security groups.

c. Click **OK**.

The **Ownership** tab lists the selected security groups.

5. Click **OK**.

The changes to the notification template are saved.

## Deleting Ownerships from Notification Templates

To delete an ownership:

1. From the Workbench shortcut bar, select **Configuration > Notification Templates**.

The Notification Template Workbench opens.

2. Open a notification template.

The Notification Template window opens.

3. Click **Ownership**.

The Ownership window opens.

4. Select an ownership to remove.
5. Click **Remove**.
6. Click **OK**.

## Configuring Notification Intervals

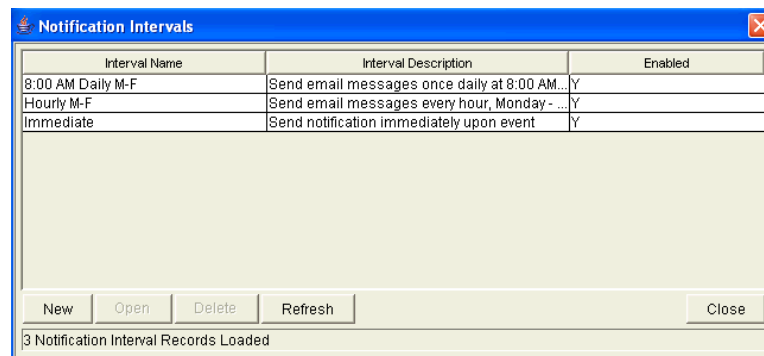

To create a new notification template:

1. From the Workbench shortcut bar, select **Configuration > Notification Templates**.

The Notification Template Workbench opens.

2. From the Notification Templates menu, select **Intervals**.

The Notification Intervals window opens.

3. Click **New**.

The Notification Interval: New window opens to the **Interval** tab.

4. Enter the information specified in the following table:

Field Name	Description
Interval Name	Name assigned to the interval.
Description	Optional description of the interval.
Interval Type	For internal use. This is always set to <b>Periodic</b> , unless <b>Immediate Interval</b> is used.
Start Time	Time to start sending out notifications and to start counting down the time interval until the next batch.
End Time	Time to stop sending out notifications.
Time Interval (Hours)	Number of hours to wait after the Start Time or the last batch sent, before sending out the next batch of notifications.
Days	Used to select which days on which this interval is to execute.
Enabled	If set to <b>Yes</b> , this interval is selectable. If set to <b>No</b> is set, this interval is unavailable.

5. Click **OK**.

6. Click **Close**.

The new notification interval can now be used in any workflow step notification.

If notifications are sent at an hourly or daily interval, there are sometimes several notifications pending for a particular user. In this case, all notifications are grouped together in one email message. The subject of each notification is displayed in a **Summary** section at the top of the email message.

## Checking the Usage of Notification Templates

To check the usage of a notification template:

1. From the Workbench shortcut bar, select **Configuration > Notification Templates**.

The Notification Template Workbench opens.

2. Open notification template.

The Notification Template window opens.

Notification Template : Standard HTML Message

Template Name: Standard HTML Message

Notification Scope: Packages

Notification Format: HTML

Enabled:  Yes  No      Default:  Yes  No

From:  Choose... Clear

Reply To:  Choose... Clear

Subject: IT Governance - Change Management Alert

Body:

```
<tr>
<td colspan="2">[NOTIF.NOTIFICATION_DETAILS]</td>
</tr>
</table>
```

Use the token [NOTIF.NOTIFICATION\_DETAILS] to include an HTML table of linked tokens for associated Package lines.

Available Tokens		Linked Tokens	
Token Name		Col#	Token Name
Execution Batch ID	[WST.EXEC]	1	PKGL Seq [PKGL.SEQ]
Hidden Status	[WST.HIDDEN]	2	PKGL Object Name [PKGL.OBJECT_NAME]
Last Updated By	[WST.LAST_UPDATED_BY]	3	PKGL Object Type [PKGL.OBJECT_TYPE]
Object Revision	[PKGL.OBJECT_REVISION]	4	Last Updated By [WST.LAST_UPDATED_BY]

Ready (Read-Only, Seed Data)

3. Click **Used By**.

The Used By window opens and lists all references to the notification template.

4. Click **OK**.

5. In the Notification Template window, click **OK**.

**Chapter**

**Configuring User Data**

**In This Chapter:**

- *Overview of User Data*
    - *Referring to User Data*
    - *Migrating User Data*
    - *Overview of Configuring User Data*
  - *Opening the User Data Workbench*
  - *Configuring General Information for User Data Types*
  - *Creating User Data Fields*
    - *Copying a Field Definition*
    - *Editing User Data Fields*
    - *Configuring User Data Field Dependencies*
    - *Removing Fields*
  - *Configuring User Data Layouts*
    - *Changing Column Widths*
    - *Moving Fields*
    - *Swapping Positions of Two Fields*
    - *Previewing the Layout*
-

## Overview of User Data

Product entities such as packages, workflows, requests, and projects include a set of standard fields that provide information about those entities. While these fields are normally sufficient for day-to-day processing, you can use “user data fields” to capture additional information specific to organizations. For example, if you want to include an additional field on every package, you can open **Validation Value User Data** and define the extra field. The field would then be displayed on the **User Data** tab for a validation.

You configure user data types from the User Data Workbench in the User Data Context window. In *Figure 9-1* the **Results** tab in User Data Workbench shows a partial list of the available user data types.

Figure 9-1. User data types

User Data Type	Scope	Context Field	Context Value	Enabled
Resource Pool User Data	Global			Y
Security Group User Data	Global			Y
Skill User Data	Global			Y
Staff Prof Line User Data	Global			Y
Staffing Profile User Data	Global			Y
Task User Data	Global			Y
User User Data	Global			Y
Validation Value User Data	Global	Validation Name		Y
Validation Value User Data	Context	Validation Name	CONNECTION_PR...	Y
Validation Value User Data	Context	Validation Name	DATA_MASK	Y
Validation Value User Data	Context	Validation Name	TRANSFER_PROT...	Y
Workflow Step User Data	Global			Y
Workflow User Data	Global			Y

Each user data type consists of the following four components, all of which are required to fully define a user data type. The following lists these components:

- **User Data Type.** This column lists the user data type. Mercury IT Governance Center creates all of these. You cannot create new user data types. However, you can define fields for a user data type.
- **Scope.** This column lists the scope of the user data type field. The two possible values are:
  - **Global.** If the scope is global, the **User Data** tab for every designated entity contains the defined field.
  - **Context.** This is a context-sensitive user data type field. If the scope is context, the defined user data field is added only to the **User Data** tab of entities with specific **Context Field** and **Context Value** definitions.

- **Context Field.** This column lists the name of the context-sensitive field. It applies only to user data type fields with context scope. Because only one Context Field value is available for each user data type, the cells in this column are populated automatically.
- **Context Value.** This column lists the value (context) for the context-sensitive field. It applies only to user data type fields with a context scope. You cannot create a new context value. You can only assign an existing one.

You can define up to 20 user data type fields for display on the **User Data** tab of the defined entity. You can configure the major attributes of each field, including its graphical presentation, the validation method, and whether it is required.

## Referring to User Data

Once a user data field is created, you can refer to it from other parts of the product by its token name, preceded by the entity abbreviation and the user data (UD) qualifier. For example, Validation Value User Data might have a field name of Class Name:, a token value of CLASS\_NAME, and a user data qualifier of USER\_DATA1.

## Migrating User Data

For any configuration entity with user data type fields, the data in the user data type fields is migrated along with the entity.

- If two instances have identical user data configurations, then the user data is migrated correctly.
- If two instances do not have identical user data configurations, then the user data is mapped to the data model according to the storage configuration in the source instance. Check to make sure that the two instances have the same user data fields. Otherwise, you must correct the user data after migration.
- If the user data is context-sensitive, then a corresponding context-sensitive configuration must exist in the destination instance, or the migration fails.
- User data fields that have hidden and visible values can cause problems. If the hidden value of a user data field refers to a primary key (such as Security Group ID) that is different in the source and destination instances, the migrator does not correct the hidden value. In this case, you must correct the user data manually, after migration.

## Overview of Configuring User Data

This section provides information about the main components of the User Data Context window.

- **General information.** This section displays basic information about the user data, including as the user data type and the user data context value. For more information, see *Configuring General Information for User Data Types* on page 253.
- **Fields.** Used to create additional fields for a user data type. See *Creating User Data Fields* on page 255.
- **Layout.** Once all of the fields are created for a user data type, the layout of those fields can be configured on the **Layout** tab. See *Configuring User Data Layouts* on page 264.

## Opening the User Data Workbench

To open the User Data Workbench:

1. Log on to Mercury IT Governance Center.
2. From the menu bar, select **Administration > Open Workbench**.

The Workbench opens.

3. From the shortcut bar, select **Configuration > User Data**.

The User Data Workbench opens.

## Configuring General Information for User Data Types

To configure the general information for a user data type:

1. From the Workbench shortcut bar, select **Configuration > User Data**.  
The User Data Workbench opens.
2. Select an existing user data type or create a new user data type.

To configure a global user data type, you must open an existing user data type such as Skill User Data, which already exists Mercury IT Governance Center.

When configuring a context-sensitive user data type, you can select an existing context-sensitive user data type or click **New** to create a context-sensitive user data type.

The User Data Context window opens.

The screenshot shows the 'User Data Context : Validation Value User Data' window. It contains the following fields and options:

- User Data Type: Validation Value User Data
- Context Field: Validation Name
- Context Value: CONNECTION\_PROTOCOL
- Enabled:  Yes  No
- Scope: Context
- Meta Layer View: (empty)

Below these fields is a table with two tabs: 'Fields' and 'Layout'. The 'Fields' tab is active, showing a table with the following data:

Prompt	Token	User Data Col.	Displayed	Component Type	Validation	Required	Display Only
Class Name: CLASS_N...	USER_DATA1	Y	Y	Text Area	Text Area	N	N

At the bottom of the window are buttons for 'New', 'View', 'Remove', 'OK', 'Save', and 'Cancel'. The status bar at the very bottom reads 'Ready (Read-Only, Seed Data)'.

3. Enter the information specified in the following table:

Field Name	Description
User Data Type	<p>Selects the name of the user data type. For global user data types, this field is automatically populated.</p> <p>For context-sensitive user data types, select the context-sensitive user data type from the list. You can choose one of the following context-sensitive user data types:</p> <ul style="list-style-type: none"> <li>■ <b>Package User Data</b></li> <li>■ <b>Validation Value User Data</b></li> </ul>
Context Field	<p>The name of the context-sensitive field. This field is disabled for user data types where Scope = Global. This field is automatically filled in for context-sensitive user data. The following lists the <b>User Data Types</b> and the <b>Context Field</b>:</p> <ul style="list-style-type: none"> <li>■ <b>Package User Data - Priority</b></li> <li>■ <b>Validation Value User Data - Validation Name</b></li> </ul>
Context Value	<p>Selects the value for the <b>Context Field</b>. This field is disabled for user data types where Scope = Global. For context-sensitive user data types, select the context value from the list. Only one <b>Context Value</b> can be defined at a time. For example, you cannot have two context-sensitive user data types with the same Context Field and Context Value (such as Priority = Critical).</p>
Enable	<p>Indicates whether or not the user data type is available to Mercury IT Governance Center.</p>
Scope	<p>The category of user data type. This field is automatically filled in based on the user data type. The possible scopes for a user data type are:</p> <ul style="list-style-type: none"> <li>● <b>Global.</b> The standard user data type scope. When Scope = Global, every designated entity has the defined field added to the <b>User Data</b> tab.</li> <li>● <b>Context.</b> A context-sensitive user data type. When Scope is defined as Context, only those entities with the correct <b>Context Field</b> definition and <b>Context Value</b> definition receive the defined user data field.</li> </ul>
Meta Layer View	<p>Meta layer views relate information specific Mercury IT Governance Center. For example, the reporting meta layer view MREQ_OPENED_CLOSED_BY_TYPE_D provides summary information for request submission and completion activity, broken down by request type and by calendar day.</p>

4. Do one of the following:
  - To save the changes and close the User Data Context window, click **OK**.
  - To save the changes and leave the window open, click **Save**.

## Creating User Data Fields

Note

Not all user data field types have **Dependency** and **Security** tabs.

To create a new user data field:

1. From the Workbench shortcut bar, select **Configuration > User Data**.

The User Data Workbench opens.

2. Select an existing user data type or create a new user data type.

The User Data Context window opens to the **Fields** tab.

3. Click **New**.

The Field window opens.

4. Enter the information specified in the following table:

Field Name	Description
Field Prompt	The prompt visible for the user data field in the request.
Token	An uppercase text string used to identify this field. The token name must be unique for the specific user data. An example of a token name is ASSIGNED_TO_USER_ID.
Description	A description of the user data field.
Enabled	Indicates whether or not the field is turned on for this user data.
Validation	Indicates the validation logic to determine the valid values for this field. This could be a list of user-defined values, a rule that the result has to be a number, and so on.
Component Type	Defines the visual characteristics of the field (list, free form text field, and so on). This is derived from the selected validation. This field is read-only.
Multiselect	Indicates whether or not the field lets users select more than one entry. Only valid for fields with an auto-complete component for the validation.

5. Click the **Attributes** tab.

6. Enter the information specified in the following table:

Field Name	Description
User Data Col	Indicates the internal column in which the field value is to be stored. These values are then be stored in the corresponding column in the table for the given entity (such as KNTA_USERS for the users entity). User data provides the ability to store information in up to 20 columns, thus allowing for up to 20 fields. No two fields in user data can use the same column.
Display Only	Indicates whether the field is read-only. Select Use Dependency Rules to use the logic defined on the <b>Dependencies</b> tab.
Display	Indicates if the user sees this field on the <b>User Data</b> tab.
Required	Indicates whether the user must specify a value for this field. Select Use Dependency Rules to use the logic defined on the <b>Dependencies</b> tab.

7. Click the **Defaults** tab.

8. Enter the information specified in the following table:

Field Name	Description
Default Type	Defines if the field will have a default value. Either default the field with a constant value or default it from the value in another user data field.
Visible Value	If a default type of <b>Constant</b> is selected, the constant value can be entered here.
Depends On	To default from another field, choose the token name of that field. When using this user data, every time a value is entered or updated in the source field, it will automatically be entered or updated in this destination field.

9. Click the **Dependencies** tab.

10. Enter the information specified in the following table:

Field Name	Description
Clear When _ __ Changes	Indicates that the current field should be cleared when the specified field changes.
Display Only When	Indicates that the current field should only be editable when certain logical criteria are satisfied. The field functions with two adjacent fields, a list that contains logical qualifiers, and a text field. To use this functionality, select <b>Use Dependency Rules</b> in the <b>Attributes</b> tab.
Required When	Indicates that the current field should be required when certain logical criteria are satisfied. The field functions with two adjacent fields, a list that contains logical qualifiers, and a text field. To use this functionality, select <b>Use Dependency Rules</b> in the <b>Attributes</b> tab.

11. To specify the users who can view and edit this field:

- a. Click the **Security** tab.
- b. Click **Edit**.

The Edit Field Security window opens.

- c. Enter the information specified in the following table:

Field Name	Description
Visible to all users	<p>Checking this option allows all users to see the field. If this option is not checked, you can set who can see the field. The default is for all users to be able to see a field. If this option is not checked, the Select User/ Security Group that can view this field is enabled.</p> <p>Deselecting the <b>Visible to all users</b> or <b>Editable by all users</b> checkboxes enables the Select Users/Security Groups that can view this field section of the Edit Field Security window.</p>
Editable by all users	<p>Checking this option allows all users to edit the field. If this option is not checked, you can set who can edit the field. The default is for all user to be able to edit a field.</p> <p>De-selecting the <b>Visible to all users</b> or <b>Editable by all users</b> checkboxes enables the Select Users/Security Groups that can view this field of the Edit Field Security window.</p>
Enter a Security Group (list)	<p>To select the format for specifying users to grant visibility and edit permission, use the <b>Enter a Security Group</b> field. The field displays the formats to choose users. The list dynamically updates the Security Group Validate auto-complete.</p> <p>The choices are:</p> <ul style="list-style-type: none"> <li>• <b>Enter a Username.</b> Select a specific user a to see and/or edit the field. The user must have an email address.</li> <li>• <b>Enter a Security Group.</b> Select a specific security group to see and/or edit the field.</li> <li>• <b>Enter a Standard Token.</b> Select a standard token to see and/or edit the field.</li> <li>• <b>Enter a User Defined Token.</b> Select a user defined token to see and/or edit the field. Selecting the Enter a User Defined Token format enables the <b>Tokens</b> button.</li> </ul> <p>Selecting an item from the Enter a Security Group list dynamically updates the <b>Enter a Security Group</b> field.</p>
Security Group	<p>Provides a field for specifying the recipient. If the <b>Enter a Security Group</b> field displays:</p> <ul style="list-style-type: none"> <li>• <b>Enter a Username</b>, then the Validate: Username window is returned.</li> <li>• <b>Enter a Security Group</b>, then the Validate: Security Group window is returned.</li> <li>• <b>Enter a Standard Token</b>, then the Validate: Standard Token window is returned.</li> <li>• <b>Enter a User Defined Token</b>, then the Validate: User Defined Token window is returned.</li> </ul>

12. Click **OK**.

The Field window displays the new field.

13. Click **OK**.

## Copying a Field Definition

You can streamline the process of adding fields by copying the definitions of existing fields.

To copy a field definition:

1. From the Workbench shortcut bar, select **Configuration > User Data**.

The User Data Workbench opens.

2. Select an existing user data type or create a new user data type.

The User Data Context window opens to the **Fields** tab.

3. Click **New**.

The Field window opens to the **Fields** tab.

4. Click **New**.

The Field: New window opens.

5. Click **Copy From**.

The Field Selection window opens.

6. Enter the required information.

7. Click **Copy From**.

The Field Selection window refreshes with fields matching the search criteria.

8. Select a field to copy.

You can query fields using several criteria, including the token name or field prompt. You can also perform more complex queries. For example, you could list all fields that reference a specific validation or all fields that a specific entity uses.

9. Select the field to copy, and then click **Copy**.
10. Make any necessary changes, and then click **OK**.

## Editing User Data Fields

To edit an existing field:

1. From the Workbench shortcut bar, select **Configuration > User Data**.

The User Data Workbench opens.

2. Select an existing user data type or create a new user data type.

The User Data Context window opens to the **Fields** tab.

3. Select the field to edit, and then click **Edit**.

The Field window opens.

4. Make the required changes.

Be sure to include the **Attributes**, **Default**, and **Dependencies** tabs. For information about these tabs, see [Creating User Data Fields on page 255](#).

5. Click **OK**.

6. In the User Data Context window, click **OK**.

## Configuring User Data Field Dependencies

Field behavior and properties can be linked to the value of other fields defined for that entity. A **Report Type** field can become required when the value in another field in that report type is **Critical**.

You can configure a field to:

- Clear after the value in another field changes.
- Become read-only after another field meets a logical condition defined in [Table 9-1](#).
- Become required after another field meets a logical condition defined in [Table 9-1](#).

Table 9-1. *Field dependencies*

Logical Qualifier	Description
like	A like condition looks for close matches of the value to the contents of the field chosen.
not like	A not like condition looks for contents in the selected field that are not close matches to the Value field.
is equal to	An is equal to condition looks for an exact match of the Value to the contents of the Field chosen.
is not equal to	An is not equal to condition is true when there are no results exactly matching the value of the field contents.
is null	An Is null condition is true when the field selected is blank.
is not null	An Is not null condition is true when the field selected is not blank.
is greater than	An Is greater than condition looks for a numerical value larger than the value entered in the Value field.
is less than	An Is less than condition looks for a numerical value below the value entered in the Value field.
is less than equal to	An Is less than equal to condition looks for a numerical value below or the same as the value entered in the Value field.
is greater than equal to	An Is greater than equal to condition looks for a numerical value larger than or the same as the value entered in the Value field.

To configure a user data field dependency:

1. From the Workbench shortcut bar, select **Configuration > User Data**.  
The User Data Workbench opens.
2. Select an existing user data type or create a new user data type.  
The User Data Context window opens to the **Fields** tab.
3. Select the field, and then click **Edit**.  
The Field window opens.
4. Click the **Dependencies** tab.

5. Set the field dependencies, as follows:
  - In the **Clear When** field, select a field name to indicate that the current field is to be cleared if the selected field changes.
  - In the **Display Only When** field, select a field name to display the field only (for example, not editable) if specific logical criteria are satisfied. This field functions with a list that contain logical qualifiers and with another field that dynamically changes to a date field, list, or text field, depending on the validation for the selected field.
  - In the **Required When** field, select a field name to indicate that the field is to be required if certain logical criteria are satisfied. This field functions with a list that contains logical qualifiers and with field that dynamically changes to a date field, list, or text field, depending on the validation for the selected.
6. Click **OK**.
7. In the Field window, click **OK**.
8. In the User Data Context window, click **OK**.

## Removing Fields

To permanently remove a field from a user data type:

1. From the Workbench shortcut bar, select **Configuration > User Data**.

The User Data Workbench opens.

2. Select an existing user data type or create a new user data type.

The User Data Context window opens to the **Fields** tab.

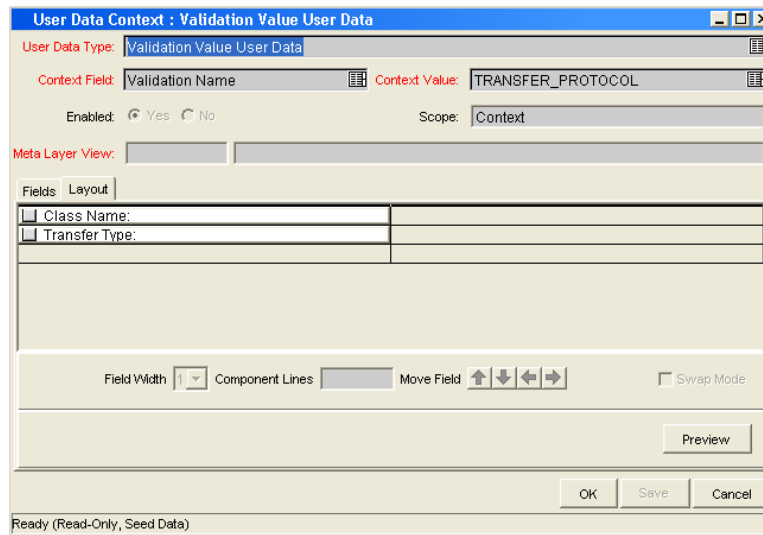

3. Select the field to remove, and then click **Remove**.

4. Click **OK**.

## Configuring User Data Layouts

The layout of user data fields can be changed in the **Layout** tab of the User Data Context window.

Figure 9-2. User Data window Layout tab

## Changing Column Widths

To change the column width of a field:

1. From the Workbench shortcut bar, select **Configuration > User Data**.

The User Data Workbench opens.

2. Select an existing user data type or create a new user data type.

The User Data Context window opens to the **Fields** tab.

3. Click the **Layout** tab.

4. Select the field.

5. In the **Field Width** field, select either **1** or **2** inches.

The Layout editor does not let you make changes that conflict with another field in the layout. For example, you cannot change the width of a field from 1 to 2 if another field exists in column two on the same row.

Additionally, for fields of component type Text Area, it is possible to determine the number of lines the text area will display. Select the Text Area type field and change the value in the Component Lines attribute. If the selected field is not of type Text Area, this attribute is blank and read-only.

6. Click **OK**.

## Moving Fields

To move a field or a set of fields:

1. From the Workbench shortcut bar, select **Configuration > User Data**.

The User Data Workbench opens.

2. Select an existing user data type or create a new user data type.

The User Data Context window opens to the **Fields** tab.

3. Click the **Layout** tab.

4. Select the field.

To select more than one field, press **SHIFT** and then select the first and last fields in a set. You can only select adjacent fields.

You cannot move a field to where another field exists.

5. Use the arrow pointers to move the fields in the layout builder.
6. Click **OK**.

## Swapping Positions of Two Fields

To swap the positions of two fields:

1. From the Workbench shortcut bar, select **Configuration > User Data**.

The User Data Workbench opens.

2. Select an existing user data type or create a new user data type.

The User Data Context window opens to the **Fields** tab.

3. Click the **Layout** tab.
4. Select the field.
5. Select the **Swap Mode** option.

An S is displayed in the option section of the selected field.

6. Double-click the field to swap positions with the selected field.
7. Click **OK**.

## Previewing the Layout

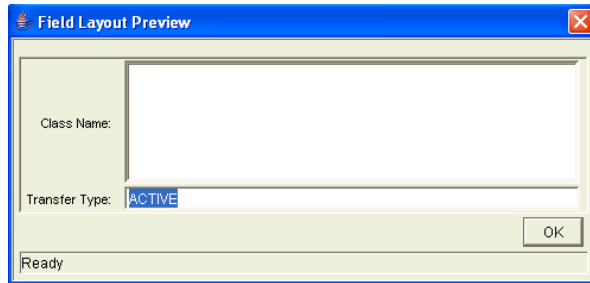

You can check to see what the layout looks like to users.

To preview field layout:

- In the User Data Content window, on the **Layout** tab, click **Preview**.

A window shows a preview of the fields as they are to be displayed.

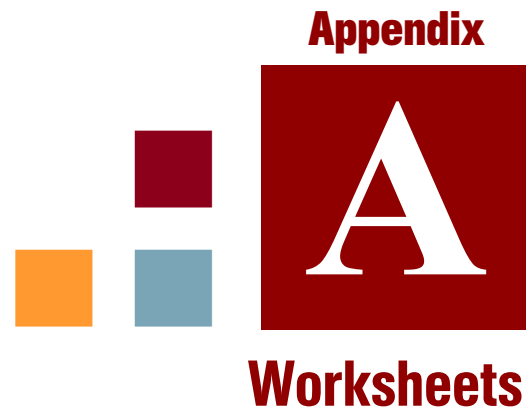

Figure 9-3. Preview mode

If all fields have a width of one column, all displayed columns automatically span the entire available section when an entity of the given user data is viewed or generated.

Hidden fields do not affect the layout.

The graphic consists of four colored squares (orange, teal, maroon, and dark red) arranged in a 2x2 grid. To the right of these squares is a large dark red square containing a white stylized letter 'A'. Above the 'A' square is the word 'Appendix' and below it is the word 'Worksheets', both in a bold, dark red font.

Table A-23. Field validation for File Name

---

Validation	Definition
Existing Validation?	File Chooser - Full File Name
New Validation?	Not Applicable
Validation Type: (text field, auto-complete, drop-down list, and so on.)	File Chooser
Validation Definition (list of values or SQL)	Default Behavior

## A

- access grants **20, 41**
- adding
  - notification intervals to notification templates **246**
  - ownerships to environment groups **223**
  - ownerships to environments **211**
  - packages to releases using Package window **184**
  - packages to releases using Release window **182**
  - participants to environments **213**
  - requests to releases **187**
  - requests to releases with Release window **187**
  - requests to releases with Requests window **188**
  - transitions back to the same step **86**
- AND condition workflow steps **53**
- application codes
  - copying from other environments **209**
  - environments **206**

## B

- base paths **203, 204**
  - mass updates **216**

## C

- closing
  - packages as failed **124**
  - packages as success **123**
  - workflow steps **56**
- commands
  - changing field values **168**
  - conditions **165**
  - conditions examples **165**
  - requirements **35**
- condition steps
  - defining **29**
- condition workflow steps **53**
- configuring
  - dynamic security for workflow steps **65**
  - environment groups information **221**
  - environments information **202**
  - environments overview **199**
  - field dependencies **151**
  - field widths in object types **157**
  - first workflow step **58**
  - follow up notifications **73**
  - intervals for notifications **73**
  - marking packages ready for release **125**
  - moving object type fields **158**
  - notification intervals on notification templates **246**

- notification message for workflow steps 76
  - notification setup for workflow steps 68
  - notification templates 240
  - notification templates creating
    - notification templates 240
  - notifications for workflow steps 66
  - object type field dependencies 151
  - object type fields 154
  - object type names 159
  - ownership for environments 211
  - ownership of notification templates 244
  - ownership of workflow step sources 112
  - recipients for notifications 74
  - releases 176
  - releases overview 179
  - security for workflow steps 62
  - sending notifications at specific times 73
  - sending notifications on specific errors 71
  - sending notifications on specific results 69
  - sending notifications when workflow step eligible 68
  - swapping object type fields 158
  - timeouts for workflow steps 79
  - transitions back to step 86
  - transitions based on all but one specific value 84
  - transitions based on all results 85
  - transitions based on data 84
  - transitions based on errors 85
  - transitions based on specific results 82
  - transitions based on workflow results 88
  - transitions for subworkflows 90
  - transitions for workflow steps 81
  - transitions not based on specific results 83
  - user access for environment groups 225
  - user data column widths 265
  - user data field dependencies 261
  - user data field widths 265
