# Welcome to Using System Availability Management

This guide describes how to work with the System Availability Management application in the Mercury Business Availability Center.

## How This Guide Is Organized

This guide contains the following chapters:

### **Chapter 1 Introduction to System Availability Management Reports**

Introduces the System Availability Management application.

### **Chapter 2 SiteScope Over Time Reports**

Describes reports that enable you to analyze the performance of the infrastructure components and servers powering your applications. SiteScope Over Time reports are based on data collected by the SiteScope data collector.

### **Chapter 3 The Event Log**

Describes how to view information about events collected from external applications/software and about SiteScope events.

### **Chapter 4 User Reports**

Provides a pointer to the complete documentation for user reports, which are common to the Service Level Management, End User Management, and System Availability Management applications.

## **Who Should Read This Guide**

This guide is intended for the following users of Mercury Business Availability Center:

- ▶ Mercury Business Availability Center administrators
- ▶ Mercury Business Availability Center end users

Readers of this guide should be knowledgeable about navigating and using enterprise applications, and be familiar with Mercury Business Availability Center and enterprise monitoring and management concepts.

## **Getting More Information**

For information on using and updating the Mercury Business Availability Center Documentation Library, reference information on additional documentation resources, typographical conventions used in the Documentation Library, and quick reference information on deploying, administering, and using Mercury Business Availability Center, refer to *Getting Started with Mercury Business Availability Center*.

# 1

---

## Introduction to System Availability Management Reports

Mercury System Availability Management reports enable you to monitor system availability data across the entire enterprise.

This chapter describes:	On page:
Overview of System Availability Management Reports	1
System Availability Management Reports	3
Working with System Availability Management Reports	4

### Overview of System Availability Management Reports

You use the System Availability Management application to view and analyze reports based on the performance data collected by the SiteScope data collector and stored in the Mercury Business Availability Center database.

In addition, using SiteScope Integration Monitors, you can integrate data collected by enterprise management systems into Mercury Business Availability Center, and view the data in System Availability Management reports.

System Availability Management utilizes data collected by SiteScope and enables you to:

- ▶ monitor system availability across the entire enterprise infrastructure from a centralized, real-time perspective
- ▶ apply a business perspective to system management
- ▶ view data at the application level rather than viewing numerous low-level system metrics
- ▶ view information about events collected from external applications or software and SiteScope events

---

**Note:**

- ▶ You access the System Availability Management reports from the System Availability Management application in the Applications menu.
- ▶ For details on configuring SiteScope, see *Configuring SiteScope Monitors*.
- ▶ For details on working with Mercury Business Availability Center reports, see “Working in Reports” in *Working with Applications*.

---

This section includes the following topics:

- ▶ “Report Access and Permissions” on page 2
- ▶ “Data Aggregation” on page 3

## **Report Access and Permissions**

The availability of report data to a specific user is dependent on the profile access permissions granted that user. Furthermore, access to specific data within a profile may also be filtered by using the group permission filters. For details on granting permissions, see “Configuring User Permissions” in *Platform Administration*. For details on defining group permission filters, see “Group Permissions for Reports” on page 32.

## Data Aggregation

Mercury Business Availability Center uses data aggregation to make data handling and management more efficient and to improve the speed and performance of report generation. For more information on data aggregation in Mercury Business Availability Center, see “Data Aggregation” in *Reference Information*.

## System Availability Management Reports

The following reports are available:

Tab Name	Description	For Details, See...
SiteScope Over Time Reports	View and analyze reports, based on data collected by SiteScope, that help you track the performance of your infrastructure machines and provide insight into application availability and performance.	Chapter 2, “SiteScope Over Time Reports”
Event Log	View event data over time, events that happened at a specific time, the details of a specific event, and event history.	Chapter 3, “The Event Log”
User Reports	Provides tools for creating, and displays, reports that are tailored to the specific monitoring requirements of your organization or business unit.  Report data is based on Business Process Monitor, Client Monitor, WebTrace/Traceroute Monitor, SiteScope, and Custom data.	Chapter 4, “User Reports”

## Working with System Availability Management Reports

System Availability Management reports help you identify server resource usage trends, as well as bottlenecks and other server-related issues that may be contributing to application performance problems. You can continually monitor report data to identify poor server performance or to spot developing trends that may lead to server performance problems.

Alternatively, when you become aware of an application performance problem with your application (for example, after analyzing End User Management reports or receiving an alert), you can use System Availability Management reports to help you identify, or rule out, infrastructure machine-related issues as the root cause of the problem. By analyzing the infrastructure machine resource usage data for the same time period during which the performance problem occurred, you can assess whether one or more infrastructure machine resource measurements are outside normal performance thresholds for that time period.

This section includes the following topics:

- ▶ “Color Coding in Reports” on page 4
- ▶ “Improving Report Generation Times” on page 5

### Color Coding in Reports

System Availability Management reports use the following colors when displaying color-coded performance levels:

Color	Description
Green	All measurements fell within the OK threshold range.
Yellow	At least one measurement fell within the minor threshold range, but no measurements fell within the critical threshold range.
Red	At least one measurement fell within the critical threshold range.
Gray	No measurement data reported.

## Improving Report Generation Times

---

**Note to Mercury Managed Services customers:** This section is not relevant for Mercury Managed Services customers.

---

To optimize the performance of System Availability Management report generation, we recommend that a database administrator perform an update statistics procedure on the database on a regular basis. The regularity of the update depends on the amount of data generated by the applications you are monitoring.

► **MS SQL Server users:**

- ◆ for a small site, you should update once every three to four days
- ◆ for a medium site, you should update daily
- ◆ for a large site, you should update every four hours

For details on MS SQL Server maintenance, see “Maintenance Plan” in *Preparing the Database Environment*.

► **Oracle Server users.** Analyze all tables according to database size.

For details on optimizing performance in Oracle, see “Collecting Statistics for Databases” in *Preparing the Database Environment*.

# 2

---

## SiteScope Over Time Reports

This chapter describes SiteScope Over Time reports which are based on data collected by the SiteScope data collector.

<b>This chapter describes:</b>	<b>On page:</b>
About SiteScope Over Time Reports	8
Monitor Performance Report	10
Cross-Performance Report	12
Group Performance Report	23
Status Summary Report	27
Warning Summary Report	29
Error Summary Report	30
Group Permissions for Reports	32
System Availability Management Data in Custom Reports	34

## About SiteScope Over Time Reports

You use the SiteScope Over Time reports to view and analyze infrastructure machine-related data collected by the SiteScope data collector and stored in the Mercury Business Availability Center database. You cross-reference this data with transaction performance problems, such as slow transaction response times and failed transactions, to understand the root cause of application performance issues.

The contents of SiteScope Over Time reports depend on the types of SiteScope monitors and measurements that are defined in Monitor Administration. For details on configuring SiteScope monitors, see *Configuring SiteScope Monitors*.

Mercury Business Availability Center users can use group permissions filters to control the data that System Availability Management reports display. This enables filtering data that may be irrelevant to a specific user, making reports more manageable and report generation faster. For details, see “Group Permissions for Reports” on page 32.

---

### Note:

- ▶ For details on generating reports, see “Working in Reports” in *Working with Applications*.
  - ▶ Certain System Availability Management reports can be added to custom reports. For details, see “System Availability Management Data in Custom Reports” on page 34.
  - ▶ Data collected by the SiteScope data collector can also be viewed in trend reports. Trend reports enable you to compare multiple measurements from different data sources on the same graph. For details, see “Trend Report Manager” in *Working with Applications*.
  - ▶ If a SiteScope profile contains many measurements, report generation can take a few minutes.
-

The following System Availability Management reports are available:

Report	Description	For Details, See...
Monitor Performance Report	Displays the best- or worst-performing SiteScope monitors across various SiteScope categories.	page 10
Cross-Performance Report	Displays data from more than one SiteScope server filtered by monitored servers, monitor types, and measurements.	page 12
Group Performance Report	Displays the infrastructure machine resource usage data for the monitors in the selected group and its subgroups.	page 23
Status Summary Report	Displays a quick snapshot of the performance of monitored infrastructure machines, organized by SiteScope group.	page 27
Warning Summary Report	Displays a list of the monitors, for the selected group and its subgroups, whose measurements fell within the minor threshold level during the selected time period.	page 29
Error Summary Report	Displays a list of the monitors, for the selected group and its subgroups, whose measurements fell within the critical threshold level during the selected time period.	page 30
Group Permissions for Reports	Enables you to filter data for specific SiteScope groups or subgroups from System Availability Management reports, as well as the SiteScope Monitor Performance component in custom reports.	page 32

## Monitor Performance Report

You generate the Monitor Performance report to view the best- or worst-performing SiteScope monitors across various SiteScope categories, such as monitor type, monitored server, or monitor title. You can generate a Monitor Performance report for multiple SiteScope profiles.

Monitor Title	Server Name	Group	Profile Name	Warning	Error	Total Runs	Quality
Siebel Server Manager: sblapp1	sblapp1	<a href="#">Siebel Group</a>	PRF_S	0%	100%	13150	
URL Sequence: G...ope monitoring	demo.sitescope.com	<a href="#">Application monitors subgroup</a>	PRF_S	0%	100%	9191	
SNMP Trap listener	app1	<a href="#">SNMP Subgroup</a>	PRF_S	0%	100%	6590	
URL Content: demo.sitescope.com	demo.sitescope.com	<a href="#">Application monitors subgroup</a>	PRF_S	0%	0.61%	2622	
URL: demo.sitescope.com	demo.sitescope.com	<a href="#">Application monitors subgroup</a>	PRF_S	0%	0.23%	1327	

This section includes the following topics:

- ▶ “Generating the Monitor Performance Report” on page 10
- ▶ “Understanding the Monitor Performance Report” on page 11

### Generating the Monitor Performance Report

To view the Monitor Performance report, you specify the criteria upon which you want the report to be based and generate the report.

**To generate the Monitor Performance report:**

- 1** Access the Monitor Performance report: **Applications > System Availability Management > SiteScope Over Time Reports > Monitor Performance.**
- 2** Select the SiteScope profiles for which you want to view the report.
- 3** In the **Monitor title** and **Server name** boxes, specify the monitors (by their title, as defined in SiteScope) and/or servers on which you want the custom report data to be based.

Leave a box empty to instruct Mercury Business Availability Center to base the report on all values.

If required, you can use the wildcard asterisk symbol (\*) to instruct Mercury Business Availability Center to base the report on a subset of all values. For example, if you are using the naming convention `cpu_<servername>` to name all CPU monitors in SiteScope, specify `cpu*` to instruct Mercury Business Availability Center to include all CPU monitors in the custom report.

---

**Note:** Using the wildcard asterisk symbol (\*) as the first character in the string slows report generation times, as Mercury Business Availability Center is unable to use the Index tables when querying the database.

---

- 4 From the **Monitor type** list, select the monitor on which you want the report data to be based. To base the report on all monitors, choose **All types**.
- 5 Specify whether you want Mercury Business Availability Center to display the worst- or best-performing monitors, and choose the number of monitors to be displayed in the report.
- 6 Click **Generate** to generate the report.

## Understanding the Monitor Performance Report

The Monitor Performance report displays the following information:

- **Monitor Title.** The monitor title. Hold the pointer over the tooltip to view the full monitor title.
- **Server Name.** The name of the monitored server. Hold the pointer over the tooltip to view the full server name.
- **Group.** The group or subgroup in which the monitor is defined. Hold the pointer over the tooltip to view the path from the displayed group or subgroup to the root group. Click the group or subgroup name to open the management page for the group in SiteScope.
- **Profile Name.** The name of the SiteScope profile in which the monitor is defined.
- **Warning.** The percentage of measurement instances that return a critical-level threshold status.

- ▶ **Error.** The percentage of measurement instances that return an error-level threshold status.
- ▶ **Total Runs.** The total number of measurement instances SiteScope ran for the selected time range.
- ▶ **Quality.** A color-coded representation of quality. Hold the pointer over the tooltip to view the exact percentage for each colored section of the bar.

Monitors are sorted in the report by quality, which is derived using a formula that takes into account the measurement values returned for the monitor during the specified time range relative to the measurement threshold ranges configured in SiteScope.

The formula used is:  $1 - ((0.35 * W + 0.5 * E) / (G + W + E))$ , where G, W, and E represent the number of measurements that occurred during the selected time range whose value was within the OK, Warning, and Error threshold range, respectively. The formula returns values from 0.5 to 1, inclusively. The better a monitor performs, the closer its value is to 1. For example, a monitor with 25% error and 75% OK values would be displayed as better than a monitor with 100% Warning values.

---

**Note:** The Monitor Performance report does not use raw data. All data in the report is based on aggregated data.

---

## Cross-Performance Report

The Cross-Performance reports can include:

- ▶ **Non-consolidated over time graphs.** For details, see “Non-Consolidated Over Time Graphs” on page 19.
- ▶ **Consolidated over time graphs.** For details, see “Consolidated Over Time Graphs” on page 17.
- ▶ **Summary tables.** For details, see “Summary Tables” on page 21.

You can rescale a SiteScope cross-performance report to make it more relevant to what you are measuring. For details, see “Rescaling a Cross-Performance Report” on page 22.

You can view data from more than one SiteScope. You can filter the data by monitored servers, monitor type or title, and measurements.

For example, you can display the behavior of a measurement running on several monitored servers, or the behavior of several measurements from various types of monitors running on one monitored server.

You can also choose to display a summary table for each monitor type. The summary table displays the percentage of uptime, warning, and error measurements out of the total number of measurements for each selected server. Each summary table includes a summary row that indicates the uptime, warning, and error percentages for all servers for that type of monitor.

---

**Note:** If you are running a SiteScope Log File or Database Query monitor that is monitoring a different machine, you should select the SiteScope machine running the monitors in the Servers list, and not the monitored machine (the target machine where the log file or database is located).

---

You can rescale the report to make it more relevant to what you are measuring.

This section includes the following topics:

- “Generating a SiteScope Cross-Performance Report” on page 14
- “Consolidated Over Time Graphs” on page 17
- “Non-Consolidated Over Time Graphs” on page 19
- “Summary Tables” on page 21
- “Rescaling a Cross-Performance Report” on page 22
- “Examples” on page 23

## **Generating a SiteScope Cross-Performance Report**

To view the SiteScope Cross-Performance report, specify the time period and granularity, the filters, the type of report, and generate the report.

**To generate the SiteScope Cross-Performance report:**

- 1** Access the SiteScope Cross-Performance report: **Applications > System Availability Management > SiteScope Over Time Reports > SiteScope Cross-Performance**.
- 2** Select the time period and the granularity with which you want to run the report. For details, see “Choosing the Tracking Range and Granularity” in *Working with Applications*.

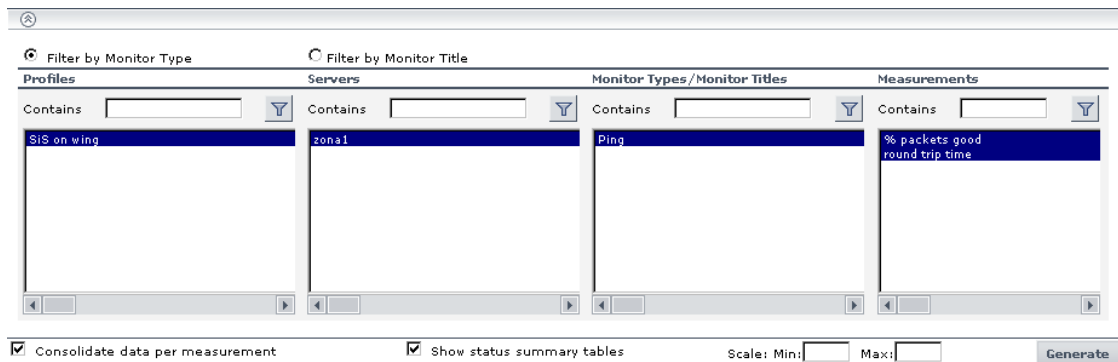

The granularity determines how many measurement samples are displayed in the report for each time interval. By default, the number of samples is limited to the maximum value of the **Max Data Points in Report** setting (32 by default for all reports where you can specify the granularity) and the **Max Data Points in the SiteScope Cross-Performance Report** setting (100 by default).

---

**Note:** You can change these settings in the Infrastructure Settings Manager. To modify these settings, select **Admin > Platform > Setup and Maintenance > Infrastructure Settings**, click **Applications**, select **End User/System Availability Management** and locate **Max Data Points in Report** and **Max Data Points in the SiteScope Cross-Performance Report** in the **End User/System Availability Management - Data** table. For details on using the Infrastructure Settings Manager, see “Infrastructure Settings” in *Platform Administration*.

---

- 3 Choose whether to display the monitor type or title when selecting the component to add to the report:
  - ◆ **Monitor type.** The type of monitor is displayed, for example, Ping, CPU.
  - ◆ **Monitor title.** The name given to the specific monitor is displayed, for example, ping: myserver, CPU finance\_server.
- 4 Filter the data you want to include in the report:

- ◆ From the **Profile** list (sorted alphabetically), select one or more SiteScope profiles.
- ◆ From the **Server** list, select one or more servers. The list includes all monitored servers associated with the selected profiles, in alphabetical order.
- ◆ Depending on whether you chose **Filter by Monitor Type** or **Filter by Monitor**, the **Monitor Types/Monitor Titles** list displays monitor types or monitor names, associated with the selected profiles and servers, in alphabetical order. Select one or more monitors.
- ◆ From the **Measurements** list, select one or more measurements. The list includes the measurements that are associated with the selected profiles, servers, and monitor types, in alphabetical order.

If you select a measurement for which data exists from more than one group or profile for the same target server, the data is averaged together in the report. For example, if you have two SiteScope profiles each containing two groups, and in three of those groups the Ping monitor is set up to monitor the same server, if you select both profiles and the round trip time measurement, all round trip time data collected from all three groups in both profiles is displayed in the report as an average value.

**Note:** To list all the elements whose name includes the string, enter a string in one of the **Contains** boxes and click the filter button,

---

- 5** To consolidate data per measurement, select **Consolidate data per measurement**. For details, see “Consolidated Over Time Graphs” on page 17 and “Non-Consolidated Over Time Graphs” on page 19. This option is selected by default.
- 6** To display uptime summary tables, select **Show uptime summary table**. For details, see “Summary Tables” on page 21. This option is cleared by default.
- 7** If required, enter scale information in the **Scale Min** and **Max** boxes. For details, see “Rescaling a Cross-Performance Report” on page 22.

- 8 Click **Generate** to generate the report. The filter area of the page closes and the report is displayed.
- 9 You can print the report, send it by e-mail, or open it in CSV or PDF format. For details, see “Sharing and Storing Reports” in *Working with Applications*.

---

**Note:**

- You cannot generate a report if you have not selected at least one measurement.
- In certain reports the selected time range is displayed along the x-axis. System Availability Management breaks down the time range according to segments, which differ depending on the selected time range. For details on how System Availability Management breaks down each time range in reports where time is displayed along the x-axis, see “Report Times” in *Reference Information*.
- Depending on the time range you select, System Availability Management generates reports using either raw data or aggregated data. The text: **Note: Report uses aggregated data** is displayed in the report when aggregated data is used. For details on how System Availability Management determines when to use aggregated data, see “Data Aggregation” in *Reference Information*.
- The number of selected profiles and graph lines are calculated after you click **Generate**. If these numbers exceed the allowed limit, a message is displayed.

---

## Consolidated Over Time Graphs

If you select **Consolidate data per measurement**, System Availability Management displays each measurement in a separate graph. The graph legend displays the server on which the measurement is running.

The graph legend displays information about the servers. The x-axis displays date and time information and the y-axis displays the measurement value and the monitor type.

For example, the following graph displays three measurements running on two servers, kari and mariland.

## Non-Consolidated Over Time Graphs

If you clear **Consolidate data per measurement**, System Availability Management displays measurements by server.

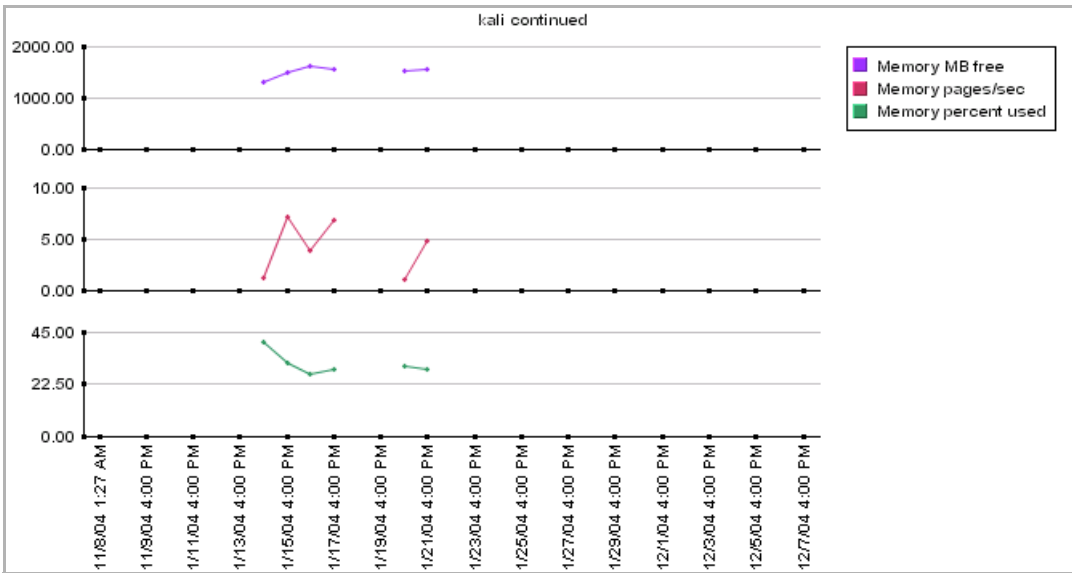

The graph legend displays the measurement value and the monitor type. The x-axis displays the date and time information, and the y-axis shows the measurement values.

For example, the following graph displays three measurements running on one of the servers (kali).

## Chapter 2 • SiteScope Over Time Reports

Each graph displays data for three measurements for each server. If there are more than three measurements running on a server, additional graphs are added to the report with the title `<server_name> continued`.

## Summary Tables

If you select **Show uptime summary** table, the report displays the summary tables. Each table displays the OK, minor, and critical percentages for one measurement and the servers on which the measurement is running. The tables are sorted alphabetically by monitor type.

<b>CPU</b>			
<b>Server</b>	<b>Uptime %</b>	<b>Warning %</b>	<b>Error %</b>
kali	99.818	0.000	0.182
mariland	0.000	0.000	100.000
net	0.000	0.000	100.000
oui	0.000	0.000	100.000
<b>weighted average</b>	<b>11.455</b>	<b>0.000</b>	<b>88.545</b>

<b>Memory</b>			
<b>Server</b>	<b>Uptime %</b>	<b>Warning %</b>	<b>Error %</b>
kali	100.000	0.000	0.000
mariland	7.900	0.000	92.100
net	0.000	0.000	100.000
oui	0.000	0.000	100.000
<b>weighted average</b>	<b>7.949</b>	<b>0.000</b>	<b>92.051</b>

Summary tables display the following information:

- **Server.** The name of the server.
- **OK %.** The percentage of good measurements out of the total number of measurements.
- **Minor %.** The percentage of measurements with a minor status out of the total number of measurements.
- **Critical %.** The percentage of measurements with a critical status out of the total number of measurements.
- **Weighted Average.**

OK, Minor, and Critical thresholds are defined during profile creation. For details, see *End User Management Data Collector Configuration*.

## Rescaling a Cross-Performance Report

Cross-performance reports are generally scaled so that the lowest y-axis value is zero and the highest y-axis value is the highest result of the data.

You can rescale the report to make it more relevant to the measurement. For example, to measure CPU utilization, you can rescale the report so that the y-axis range is 0 to 100.

To rescale the report, specify a minimum, a maximum, or both a minimum and a maximum value in the **Scale Min** and **Max** boxes.

For example, the original report displays as follows:

To rescale the range to 0-100, enter **0** in the Scale Min box and **100** in the Max box, or enter **100** in the Max box. The report redisplay as follows:

## Examples

You can use the SiteScope Cross-Performance reports to identify a problem in a server. For example, select the SiteScope profile that refers to the SiteScope that samples the problematic server, select the relevant server, the monitor types (**CPU**, **memory**, and so on), the measurements that can help find the problem (**utilization**, **pages/sec**, **percent used**, and so on), and generate the report.

You can also compare memory usage in several servers. For example, select the SiteScope profile that refers to the SiteScope that samples the servers you want to compare, the relevant servers, the **memory** monitor type, the **pages/sec**, **percent used**, and **MB free** measurements, **Consolidate data per measurement**, and then generate the report to compare the memory usage.

You can find out if a sub-system needs an additional server. For example, select the SiteScope profile that refers to the SiteScope that samples all servers in your sub-system, select all the servers of your sub-system, the **CPU** monitor type, the **utilization** measurements, **Consolidate data per measurement**, and generate the report to see whether the sub-system needs an additional server.

## Group Performance Report

You generate the Group Performance report and its subreports to view data that helps you spot trends in server performance that could lead to application performance problems. You can also analyze whether slow or failed transactions are being caused by server resource bottlenecks or other infrastructure machine-related problems.

This section includes the following topics:

- ▶ “Group Performance” on page 24
- ▶ “SiteScope Performance” on page 24
- ▶ “SiteScope Data over Time” on page 26

## Group Performance

The Group Performance table is the top level of the report. For each group, the table displays a color-coded quality level, the number of subgroups, and the number of included measurements. The quality-level indicators enable you to see how monitors in the defined groups are performing. Click a group name to generate the SiteScope Performance subreport.

## SiteScope Performance

The SiteScope Performance subreport displays a list of measurements collected by SiteScope for the specified group, over the selected time range. If the specified group contains subgroups, these are displayed at the top of the page. Click subgroups to view their SiteScope Performance subreports.

The SiteScope Performance subreport displays the following information:

**SiteScope Measurements for Group: test**

	Monitor Title	Measurement Name	Host Name	Avg. Value	Errors / Total
<input type="checkbox"/>	 Ping: sift	<a href="#">round trip time</a>	sift	0.01	0 / 67
<input type="checkbox"/>	 Ping: sift	<a href="#">% packets good</a>	sift	100.0	0 / 67
<input checked="" type="checkbox"/>	 CPU Utilization on nack	<a href="#">utilization</a>	nack	-	101 / 101
<input checked="" type="checkbox"/>	 Memory	<a href="#">pages/sec</a>	nack	-	97 / 97

- ▶ **Check box.** An enabled check box at left indicates that there is monitor data that can be viewed in the SiteScope Data over Time report. For details on generating this report, see “SiteScope Data over Time” on page 26.
- ▶ **Status.** The status column, to the left of the monitor title, displays measurement threshold icons, which indicate whether the average measurement is within the OK, Warning, or Error range, as reported by SiteScope. You define measurement thresholds for each measurement when you configure the monitor in the Monitor Administration area in the Administration Console.
- ▶ **Monitor Title.** The monitor title.

- ▶ **Measurement Name.** The name of the measurement. Click the link to generate the SiteScope Data over Time report for that measurement. Mercury Business Availability Center displays the link only if data exists for the selected time range. For details on the SiteScope Data over Time report, see “SiteScope Data over Time” on page 26.
- ▶ **Host name.** The name of the SiteScope host machine.
- ▶ **Avg. Value.** The average value of each listed measurement, or counter, for the specified time period.
- ▶ **Last Value (Updated).** The last received SiteScope measurement, as well as the most recent date and time that SiteScope received the measurement (shown in parentheses). Mercury Business Availability Center displays the date and time in italics if the current time frame is different from the displayed date and time.

If no value was collected within the past four hours, no value is displayed.

If the last received SiteScope measurement returned the Error status, Mercury Business Availability Center displays the term Error in the Last Value (Updated) column.

- ▶ **Errors/Total.** The number of errors that occurred while collecting measurement data, out of the total number of measurements taken during the defined time period. Click the link to view a list of errors that returned measurement error messages. Mercury Business Availability Center displays the link only if errors occurred.

## SiteScope Data over Time

The SiteScope Data over Time report displays specific measurement data over the selected time range. You can view this report for a single measurement, or for several measurements simultaneously.

---

**Note:** You can add the SiteScope Data over Time report to custom reports. For details, see “Custom Report Manager” in *Working with Applications*.

---

### To view the SiteScope Data over Time subreport for one measurement:

- 1** Click a measurement in the **Measurement Name** column in the SiteScope Performance subreport. Mercury Business Availability Center generates and displays the SiteScope Data over Time subreport.
- 2** Place your cursor over a point in the graph to see a tooltip with measurement details.
- 3** Click the **View as Table** link to view the data in table format.

---

**Note:** For details on SiteScope monitors and measurements, see *Configuring SiteScope Monitors*.

---

**To view the SiteScope Data over Time subreport for several measurements:**

- 1** In the SiteScope Performance subreport, select the check boxes beside the measurements that will appear in the multi-measurement graph.
- 2** Click the **Generate** button at the bottom of the table. Mercury Business Availability Center generates and displays the multi-measurement SiteScope Data over Time subreport. You use the color codes to identify each measurement in the graph.

The y-axis of the merged graph is a normalized scale from 0-100. Mercury Business Availability Center uses the following formula to convert the original y-axis value to a value in the merged y-axis:

[original y-axis value] x [scale value] = y-axis value in merged graph

Place the pointer over a point in the graph to view a tooltip with measurement details, including the measurement's original value.

- 3** Click the **View as Table** link to view the data in table format. The table displays actual measurement values, not normalized values.

## Status Summary Report

You generate the Status Summary report and its subreport to get an overall view of the performance of defined SiteScope groups and the monitors defined therein.

This section includes the following topics:

- “SiteScope Status Summary” on page 28
- “SiteScope Uptime Details” on page 28

## SiteScope Status Summary

The SiteScope Status Summary table is the top level of the report. For each SiteScope group in the selected profile, the report displays a color-coded quality level, the number of subgroups, and the number of included measurements. The quality-level indicators enable you to get a quick snapshot of how monitors in the defined SiteScope groups are performing.

	Group Name	Number Of Subgroups	Number Of Measurements
	<a href="#">Examples</a>	4	0
	<a href="#">Group1</a>	1	60

Click a group name to generate the SiteScope Uptime Details subreport.

## SiteScope Uptime Details

The SiteScope Uptime Details subreport displays OK, Minor, and Critical information for each monitor in the group, over the selected time range, enabling you to determine the overall performance trend of a given monitor. If the specified group contains subgroups, these are displayed at the top of the page. Click subgroups to view their SiteScope Uptime Details subreports.

### SiteScope Uptime for Group: Net\_Mon

Monitor Title	Uptime %	Warning %	Error %
Ping Intranet	88.889	0.0	11.111
Network Interface	100.0	0.0	0.0
Ping: www.freshwater.com	100.0	0.0	0.0

The SiteScope Uptime Details subreport displays the following data:

- ▶ **OK %.** The percentage of measurement instances that completed successfully.
- ▶ **Minor %.** The percentage of measurement instances whose values fell within the Minor threshold level.
- ▶ **Critical %.** The percentage of measurement instances whose values fell within the Critical threshold level.

## Warning Summary Report

You generate the Warning Summary report and its subreport to identify the SiteScope groups whose measurements fell within the minor threshold level during the selected time period.

This section includes the following topics:

- “Warning Summary” on page 29
- “Warning Details Report” on page 29

### Warning Summary

The Warning Summary table is the top level of the report. For each SiteScope group in the selected profile, the report displays a color-coded quality level, the number of subgroups, and the number of included measurements. The quality-level indicators enable you to get a quick snapshot of how monitors in the defined SiteScope groups are performing.

	Group Name	Number Of Subgroups	Number Of Measurements
	<a href="#">Examples</a>	4	0
	<a href="#">Group1</a>	1	60

Click a group name to generate the Warning Details subreport.

### Warning Details Report

The Warning Details subreport displays minor status information for each measurement instance of each monitor in the group, over the selected time range. If the specified group contains subgroups, these are displayed at the top of the page. Click subgroups to view their SiteScope Warning Details subreports.

Time	Monitor Title	Measurement Name	Status
7/24/04 7:47 AM	alerts	Number o...d Agents	0.0
7/24/04 7:47 AM	alerts	Received...l Alerts	0.0
7/24/04 7:37 AM	alerts	Number o...d Agents	0.0
7/24/04 7:37 AM	alerts	Received...l Alerts	0.0

The Warning Details subreport displays the following data:

- **Time.** The date and time of the measurement instance.
- **Monitor Title.** The monitor to which the measurement is associated.
- **Measurement Name.** The measurement instance whose threshold fell within the Minor level.
- **Status.** The value of the measurement.

---

**Note:** System Availability Management displays raw data only in the SiteScope Warning Details report. Aggregated data is not used. Therefore, if raw historical data is removed from the profile database using the Purging Manager, you will be unable to view data in the SiteScope Warning Details report for the time period for which the data was removed.

---

## Error Summary Report

You generate the Error Summary report and its subreport to identify the SiteScope groups whose measurements fell within the critical threshold level during the selected time period.

This section includes the following topics:

- “Error Summary” on page 31
- “Error Details” on page 31

## Error Summary

The Error Summary table is the top level of the report. For each SiteScope group in the selected profile, the report displays a color-coded quality level, the number of subgroups, and the number of included measurements. The quality-level indicators enable you to get a quick snapshot of how monitors in the defined SiteScope groups are performing.

	Group Name	Number Of Subgroups	Number Of Measurements
	<a href="#">Examples</a>	4	0
	<a href="#">Group1</a>	1	60

Click a group name to generate the Error Details subreport.

## Error Details

The Error Details subreport displays error status information for each measurement instance of each monitor in the group, over the selected time range. If the specified group contains subgroups, these are displayed at the top of the page. Click subgroups to view their Error Details subreports.

Time	Monitor Title	Measurement Name	Status
7/22/04 11:11 PM	IIS on san3	Web Serv...Web Site	Anonymous Use...equests n/a,
7/22/04 11:11 PM	IIS on san3	Web Serv...Web Site	Anonymous Use...equests n/a,
7/22/04 11:11 PM	IIS on san3	Web Serv...c:_Total	Anonymous Use...equests n/a,
7/22/04 11:11 PM	IIS on san3	Web Serv...Web Site	Anonymous Use...equests n/a,

The Error Details subreport displays the following data:

- **Time.** The data and time of the measurement instance.
- **Monitor Title.** The monitor to which the measurement is associated.
- **Measurement Name.** The measurement instance whose threshold fell within the Error level.
- **Status.** Error information as reported by SiteScope.

---

**Note:** System Availability Management displays raw data only in the SiteScope Error Details report. Aggregated data is not used. Therefore, if raw historical data was removed from the profile database using the Purging Manager, you will be unable to view data in the SiteScope Error Details report for the time period for which the data was removed.

---

## Group Permissions for Reports

Group permissions filters enable you to filter data for specific SiteScope groups or subgroups from System Availability Management reports, as well as the SiteScope Monitor Performance component in custom reports. When a user views a report, System Availability Management displays only the data from the groups and subgroups for which permissions are set. A user's ability to modify group permissions enables filtering data from reports that may be irrelevant to the specific user, making reports more manageable and increasing the speed of report generation.

This section includes the following topics:

- ▶ "Usage Privileges for Group Permission Filters" on page 32
- ▶ "Setting Group Permission Filters" on page 33

### Usage Privileges for Group Permission Filters

Every Mercury Business Availability Center user can set personal group permission filters. Administrators can set group permission filters for other users, but each individual user can override those settings as required.

Users can apply group permission filters only to SiteScope profiles for which they have been granted permissions. When a user is assigned permissions for a SiteScope profile, group permission filters for that user are not enabled by default. Either the system administrator or the user must explicitly assign the required group permission filters. The user that originally connects to the SiteScope in Monitor Administration is automatically assigned full group permissions. For details on granting permissions, see “Configuring User Permissions” in *Platform Administration*.

## Setting Group Permission Filters

You specify which SiteScope groups and subgroups to include in or filter from System Availability Management reports, for a specific SiteScope profile.

### To set group permission filters:

- 1** From the **SiteScope Over Time Reports** tab in System Availability Management, select **Group Permissions for Reports** to open the SiteScope Group Permissions page.
- 2** Choose the user whose permissions you want to change.

If you plan to apply the permissions to multiple users, this step is not required.

- 3** Choose the SiteScope profile from the list of profiles that the selected user has permission to view.

Mercury Business Availability Center displays the SiteScope groups associated with the profile.

**4** To make changes to the existing permissions:

- ◆ with the **Full Permission** check box cleared, select or clear the check boxes next to a group or subgroup. Click the expand (+) and collapse (-) symbols to reveal or hide the subgroups.
- ◆ select the **Full Permission** check box if you want the user to see data from all groups and subgroups. The user will also see data from any new monitors added to this group.
- ◆ clear the **Full Permission** check box, but leave all the group and subgroup check boxes selected, if you want the user to see all data, except the data from any new monitors that are added to the groups.

When you select a group, all its subgroups are also automatically selected. If you clear the check box of a group, the check boxes of all its subgroups are automatically cleared. This is because you cannot grant permissions for a user to view a subgroup, but not to view the parent group.

**5** Click **Apply** to save the changes.

To apply specified permissions to multiple users, click **Apply Multiple Users**, select the users to which you want to apply permissions, and click **Apply**.

You can restore a previous configuration by clicking **Revert** before clicking **Apply**. Note also that if you move to another page before clicking **Apply**, the changes you made are not saved. When you return to this page, the previous configuration is displayed.

## System Availability Management Data in Custom Reports

You can add System Availability Management reports to custom reports from the User Reports tab. For details, see “Custom Report Manager” in *Working with Applications*.

This section includes the following topics:

- “Monitor Performance Report” on page 35
- “SiteScope Data over Time Report” on page 35
- “Group Performance Report” on page 35
- “Overall Performance Report” on page 35

## Monitor Performance Report

To add this report to a custom report, select the SiteScope Monitor Performance component type in the Custom Report Manager. For details on the Monitor Performance report, see “Monitor Performance Report” on page 10.

## SiteScope Data over Time Report

To add this report to a custom report, select the Reports component type in the Custom Report Manager, then select the SiteScope Reports category from the Add Component dialog box. For details on the SiteScope Data over Time report, see “SiteScope Data over Time” on page 26.

## Group Performance Report

To add this report to a custom report, select the Reports component type in the Custom Report Manager, choose the SiteScope Reports category from the Add Component dialog box, then select SiteScope Profile Summary from the Type list. For details on the Group Performance report, see “Group Performance Report” on page 23.

## Overall Performance Report

The Overall Performance report is based on SiteScope data, and is only available in custom reports. To add it to a custom report, select **Reports** in the **Component type** list in the Custom Report Manager page and click **Add Component**. Select the **SiteScope Reports** in the **Category** list from the Add Component dialog box, and then select **Overall Performance** in the **Type** list.

You view the Overall Performance report to get a quick snapshot of the performance of the monitored infrastructure machines in the selected SiteScope profile(s). The chart displays—for the SiteScope profile(s) and defined time frame—a pie chart for each element of the infrastructure that SiteScope is monitoring.

To get additional information, point to a segment to view a tooltip describing the exact number and percentage of measurements for each segment of the chart.

# 3

---

## The Event Log

The Mercury System Availability Management event log displays SiteScope events, as well as events collected from external applications or software by enterprise management systems (EMS) using SiteScope.

<b>This chapter describes:</b>	<b>On page:</b>
About the Event Log	38
Working with the Event Log	39
Working with Additional Filters for SiteScope	41
Viewing Common Event Data in the Event Log Page	42
Working with Event Details	44
Working with Event History	46

## About the Event Log

The event log enables you to view event data over time, events that happened at a specific time, the details of a specific event, and (where possible) the event history.

The type of event that is collected depends on what is defined as an event in the external applications or software. Event types can be warnings, alerts, user logins, and so on.

The event log displays event data that is common to all data sources: the severity of the event, the application or software from which the event is collected, the time the event occurred, the hierarchy of the event source, the name (or the IP address) of the host or device that caused the event, the status or type of event, and the external system description of the event.

You can filter the events for a specific time frame, data source, severity, and target name. For details, see “Working with the Event Log” on page 39.

You can then drill down to the common data to display data that is specific to the data source where the event occurred (for details, see “Working with Event Details” on page 44) and to display the history of a specific event (for details, see “Working with Event History” on page 46).

The event log enables you to diagnose specific issues in real time and to generate trend reports.

## Working with the Event Log

The Event Log page displays the logs of events that are sent to the system (for details, see “Displaying the Event Log” on page 39). You can use filters (time frame, data source, severity, and target name) to display specific information. If you select the SiteScope data source, you can then select additional filters: SiteScope profile, groups, and monitor type (for details, see “Working with Additional Filters for SiteScope” on page 41).

When you generate the event log, the Event Log page displays the events sorted by the time of their occurrence in descending order. It also shows columns that are common to all the data sources that can send events (for details, see “Viewing Common Event Data in the Event Log Page” on page 42). The data of the SiteScope data source is filtered according to SiteScope Profile permissions (for details, see “Configuring User Permissions” in *Platform Administration*).

The Event Log page has two areas: the filter and action area and the data table.

This section includes the following topics:

- “Displaying the Event Log” on page 39
- “Customizing Event Logs” on page 40

### Displaying the Event Log

You can display the logs of events sent to Mercury Business Availability Center.

#### To display the Event Log:

- 1** Select **Applications > System Availability Management > Event Log** to display the Event Log page.
- 2** Select the time period for which you want to gather information to display in the report in the **View** list. For details, see “Choosing the Tracking Range and Granularity” in *Working with Applications*.

- 3 Click **Active Filters**, if you want to edit the filters. For more details, see “Filtering Data Using Active Filters” in *Working with Applications*. Note that only one or **All** data sources can be selected in the Event Source tab. If no data source exists, only **All** appears in the list. **SiteScopeAlert** or **SiteScopeStatusChange** data sources appear only if the current user has permissions to view at least one SiteScope profile. Severities are pre-defined. By default, all check boxes are selected.

If you select **SiteScopeAlert** or **SiteScopeStatusChange**, the SiteScope Filters window is displayed. For details, see “Working with Additional Filters for SiteScope” on page 41.

- 4 Click one of the action buttons to print, e-mail, or open a report in Excel or PDF format. For details, see “Sharing and Storing Reports” in *Working with Applications*.
- 5 Click **Generate** to generate the report.

---

**Note:** If the number of events that occur during the specified time frame is larger than the maximum number of events that can be displayed in the report, a message is displayed. To reduce the number of events, select a more specific time range. For example, to see events for the past week, select the individual days of the week.

---

## Customizing Event Logs

You can change the default setting of the maximum number of rows that can be displayed in the page. You can also change the maximum number of events that can be listed in the event log.

### To change the maximum number of rows displayed in a page:

When there are too many events to display in one page of a table, a paging bar is automatically displayed.

- 1 Select **Admin > Platform > Setup and Maintenance > Infrastructure Settings**, click **Application**, select **End User/System Availability**, and locate the **Max Table Rows** in the **Event Reports** table.
- 2 Modify the value to the required number of rows per page.

**To change the maximum number of rows displayed in the Event Log:**

The maximum number of rows that can be displayed in the Event Log is 1000, by default.

- 1 Select **Admin > Platform > Setup and Maintenance > Infrastructure Settings**, click **Application**, select **End User/System Availability**, and locate the **Max Fetched Rows** in the **Event Reports** table.
- 2 Modify the value to the required number of rows per Event Log.

## Working with Additional Filters for SiteScope

If you select a SiteScope data source in the active filter, an additional filter is automatically provided to filter the data by SiteScope profile, group, and monitor type.

Event Log	
<b>Active Filters:</b>	Event Source: SiteScopeAlert, Severity: All, Target: * <a href="#">(Clear All)</a>
<b>SiteScope Filter:</b>	Monitor Type: All Monitor Types Profile: All Profiles <a href="#">(Clear All)</a>
To generate a report, click the <b>Generate</b> button.	

**To work with additional filters for SiteScope data sources:**

- 1 Click **SiteScope Filters**, to open the **SiteScope Filter** page.
- 2 Select the type of monitor in the **Monitor Type** list. The default is **All Monitor Types**.
- 3 Select the SiteScope profile in the **Profile** list. The default is **All Profiles**. To view events of interest regarding the profile or group permissions, select one of the profiles in the **Profile** list. The list of groups allowed for the selected profile is displayed. For details on profile or group permissions, see “Configuring User Permissions” in *Platform Administration*.

---

**Note:** If you select **All Profiles**, your profile or group permissions are not applied to the displayed events.

---

- 4 If available, select the appropriate group in the group tree. Select **All Groups** if you want to select all the groups in the tree. When a tree CI changes its status (from selected to unselected or from unselected to selected) the status of the whole sub-tree changes.

## Viewing Common Event Data in the Event Log Page

The event data common to all event data sources is displayed in this table. The data is sorted by time in descending order.

To sort the report by a column, click the column title (an arrow appears in the column title to indicate whether the sort is descending or ascending).

Click a value in a specific row to add this selection to the active filter. The addition is reflected in the display.

**Active Filters:** Event Source: All, Severity: All, Target: etoile [\(Clear All\)](#)

Severity	Event Source	Time ▾	Hierarchy	Target Name
	SiteScopeAlert	11/4/04 7:54 AM	kuku:CPU alert	etoile
	SiteScopeAlert	11/4/04 7:54 AM	kuku:CPU alert	etoile
	SiteScopeAlert	11/4/04 7:53 AM	kuku:CPU alert	etoile
	SiteScopeAlert	11/4/04 7:53 AM	kuku:CPU alert	etoile

Each row in the table contains the data associated with one event:

- **Severity.** The icon and its tooltip display the severity of the event.

Icon	Severity
	Unknown
	OK
	Warning
	Minor
	Major
	Critical

- **Event Source.** The application or software from which the event is collected. Event sources can be: HP OVO, Remedy ARs, SitescopeAlert, SitescopeAlertStatusChange, Tivoli TEC, BMC Patrol, CA Unicenter, HP SIM, Compaq Insight Manager, Whatsup, or Compaq Insight Manager, depending on the external systems that sent the events to Mercury Business Availability Center.
- **Time.** The time when the event occurred. By default, the data sorted in this column is in descending order.
- **Hierarchy.** The hierarchy description of the event source. It can include the path to where the event occurred in the area, sub area, or instance and/or the event depending on the application or software from which the event is collected. Depending on the data source, the hierarchy can have two to four branches. If the hierarchy is very long, this field displays the shortened string and the tooltip displays the complete hierarchy.
- **Target Name.** The name or the IP address of the host or device that caused the event.
- **Status.** The status or type of the event. If the hierarchy is very long, the value is shortened and the tooltip displays the full hierarchy.

- **Description.** The event description. If the description is very long, the value is shortened and the tooltip displays the full hierarchy.

To view additional data for this event, click the **Event Details** button to open the Event Details page. For details, see “Working with Event Details” on page 44.

To view details about the event history data, click the **History** button to open the Event History page. For details, see “Working with Event History” on page 46.

---

**Note:** By default, some data sources include a history view and others do not (the History button is disabled or does not display). You can enable the history view by changing the setting in the Infrastructure Settings Manager. To modify the setting, select **Admin > Platform > Setup and Maintenance > Infrastructure Settings**, click **Applications**, select **End User/System Availability Management**, and locate the **Event Log Report Data Sources History** entry in the **End User/System Availability Management - Data** table. Set the property value by adding the data source names for which you want to enable the History button (separate data source names with commas)—in the Value box. The change takes place after restart. For details, see “Infrastructure Settings” in *Platform Administration*.

---

## Working with Event Details

To display all the data (common and specific) related to an event, you display the event details.

Click the **Event Details** button in the Event Log page to open the Event Details report in a new window.

The Event Details report displays detailed information about the specified event as well as the fields and the field values from the event data. The type of information provided depends on the data source.

The Event Details report can display any of the following fields:

- **Time.** The time of the event.
- **Severity.** The severity of the event.
- **Original Severity.** The original severity of the event.
- **Status.** The event status or type. If the hierarchy is very long, this field displays a shortened string and the tooltip displays the complete status.
- **Event Source.** The application or software from which this event is collected.
- **Logical Group.** The additional logical level of event hierarchy
- **Hierarchy.** The hierarchy of the event source. It can include the path to where the event occurred in the area, sub area, or instance and/or the event depending on the application or software from which the event is collected.  
  
Depending on the data source, the hierarchy can have two to four branches. If the hierarchy is very long, this field displays the shortened string and the tooltip displays the complete hierarchy.
- **Target Name and IP.** The name or IP address of the host or device that caused this event.
- **Collector host.** The name of the machine that collected the data.
- **Description.** A description of the event.
- **Acknowledged By.** The operator who acknowledged this event.
- **Value.** Any numeric values that are sent with the event.
- **Additional information field (1... 5).** Additional rows (up to 5) that contain additional information for the current event.

## Working with Event History

Click the **Event History** button in the Event Log page to open the Event History report in a new window.

Severity	Events Source	Time	Hierarchy	Target Name	Status	Description
	NETIQ	10/21/04 1:32 PM	NT_CpuLoad...UFolder:CPU	EMS	0	Event ID [ ...tate Change
	NETIQ	10/21/04 1:32 PM	NT_CpuLoad...UFolder:CPU	EMS	2	Overall CPU Overloaded

The Event History report displays detailed information about the specified event for different time periods.

The data displayed provides a historical view of the event:

- ▶ **Event Source.** The application or software from which the event was collected. Event sources can be: HP OVO, Remedy ARs, SitescopeAlert, SitescopeAlertStatusChange, Tivoli TEC, BMC Patrol, CA Unicenter, HP SIM, Compaq Insight Manager, Whatsup, or Compaq Insight Manager, depending on the external systems that sent the events to Mercury Business Availability Center.
- ▶ **Time.** The time when the event occurred. By default, the data sorted in this column is in descending order.
- ▶ **Hierarchy.** The hierarchy description of the event source. It can include the path to where the event occurred in the area, sub area, or instance and/or the event depending on the application or software from which the event was collected. Depending on the data source, the hierarchy can have two to four branches. If the hierarchy is very long, this field displays the shortened string and the tooltip displays the complete hierarchy.
- ▶ **Target Name.** The name or the IP address of the host or device that caused the event.
- ▶ **Status.** The status or type of the event. If the hierarchy is very long, the value is shortened and the tooltip displays the full hierarchy.

- **Description.** The event description. If the description is very long, the value is shortened and the tooltip displays the full hierarchy.

To view different periods of the event history select the appropriate time frame in the **View** list. This selection has no effect on the time frame selected in the **View** list in the Event Log page.

---

**Note:** By default, some data sources include a history view and others do not (the History button is disabled or does not display). You can enable the history view by changing the setting in the Infrastructure Settings Manager. To modify the setting, select **Admin > Platform > Setup and Maintenance > Infrastructure Settings**, click **Applications**, select **End User/System Availability Management**, and locate the **Event Log Report Data Sources History** entry in the **End User/System Availability Management - Data** table. Set the property value by adding the data source names for which you want to enable the History button (separate data source names with commas)—in the Value box. The change takes place after restart. For details, see “Infrastructure Settings” in *Platform Administration*.

## User Reports

User reports is a feature common to the Mercury Business Availability Center applications. You configure and view user reports from the User Reports tab.

For complete details on creating, viewing, and administering user reports, see “Configuring and Viewing User Reports” in *Working with Applications*.
